# ABSTRACTS

**17<sup>th</sup> International Pragmatics Conference**

Winterthur  
*27 June – 2 July 2021*

# 17th INTERNATIONAL PRAGMATICS CONFERENCE

## SPECIAL THEME: The Pragmatics of Inclusion

**Conference chair:** Christiane Hohenstein (ZHAW)

**Other Local Site Committee members:** Noah Bubenkofer (UZH University of Zürich), Andreas Jucker (UZH University of Zürich), Liana Konstantinidou (ZHAW), Jacques Moeschler (Université de Genève), Daniel Perrin (ZHAW), Andrea Roccia (Università della Svizzera italiana, Lugano), Felix Steiner (ZHAW), Patrick Studer (ZHAW), Larysa Zavgorodnia (ZHAW)

**Other members of the International Conference Committee:** Barbara Bokus (Warsaw, Poland), Diana Boxer (Gainesville, USA), Frank Brisard (Antwerp), Winnie Cheng (Hong Kong), Jenny Cook-Gumperz (Santa Barbara, USA), Anita Fetzer (Würzburg, Germany), Helmut Gruber (Vienna, Austria), Yueguo Gu (Beijing, China), Michael Haugh (Brisbane, Australia), Janet Holmes (Wellington, New Zealand), Sachiko Ide (Tokyo, Japan), Cornelia Ilie (Strömstad, Sweden), Helga Kotthoff (Freiburg, Germany), Sophia Marmaridou (Athens, Greece), Yael Maschler (Haifa, Israel), Jacob Mey (Odense), Neal Norrick (Saarbrücken, Germany), Marina Sbisà (Trieste, Italy), Jef Verschueren (Antwerp), Tuija Virtanen (Abo, Finland)

IPrA owes a debt of gratitude to its host and sponsors:

**INTERNATIONAL PRAGMATICS ASSOCIATION (IPrA)**  
<https://pragmatics.international>

**IPrA President:** 2018-2023: *Stephen Levinson* (Max Planck Institute, Nijmegen)

**IPrA Secretary General:** *Jef Verschueren* (Linguistics, Antwerp)

**IPrA Deputy Secretary General:** *Mieke Vandenbroucke* (Linguistics, Antwerp)

**IPrA Executive Secretary:** *Ann Verhaert* (IPrA Secretariat, Antwerp)

**Members of the IPrA Consultation Board** (2018-2023):

Nana Aba Appiah Amfo (Accra, Ghana), Charles Antaki (Loughborough, UK), Rukmini Bhaya Nair (New Delhi, India), Barbara Bokus (Warsaw, Poland), Diana Boxer (Gainesville, USA), Charles Briggs (Berkeley, USA), Frank Brisard (Antwerp, Belgium), Winnie Cheng (Hong Kong, China), Jenny Cook Gumperz (Santa Barbara, USA), Anita Fetzer (Würzburg, Germany), Pilar Garces-Conejos Blitvich, Helmut Gruber (Vienna, Austria), Yueguo Gu (Beijing, China), Susanne Günthner (Münster, Germany), Hartmut Haberland (Roskilde, Denmark), Michael Haugh (Brisbane, Australia), Janet Holmes (Wellington, New Zealand), Sachiko Ide (Tokyo, Japan), Cornelia Ilie (Malmö, Sweden), Shoichi Iwasaki (Los Angeles, USA), Ferenc Kiefer (Budapest, Hungary), Helga Kotthoff (Freiburg, Germany), Dennis Kurzon (Haifa, Israel), Stephen Levinson (Nijmegen, The Netherlands), Sophia Marmaridou (Athens, Greece), Rosina Marquez Reiter (Surrey, UK), Yael Maschler (Haifa, Israel), Yoshiko Matsumoto (Stanford, USA), Michael Meeuwis (Ghent, Belgium), Jacob Mey (Odense, Denmark), Maj-Britt Mosegaard Hansen (Manchester, UK), Melissa Moyer (Barcelona, Spain), Neal Norrick (Saarbrücken, Germany), Tsuyoshi Ono (Edmonton, Canada), Jan-Ola Östman (Helsinki, Finland), Salvador Pons Bordería (Valencia, Spain), Marina Sbisà (Trieste, Italy), Gunter Senft (Nijmegen, The Netherlands), Tuija Virtanen (Abo, Finland), John Wilson (Belfast, Northern Ireland, UK)

**Editors of *Pragmatics*** (2017 onwards):

*Editor-in-chief:* **Helmut Gruber** (University of Vienna)

*Associate Editors:* **Frank Brisard** (University of Antwerp), **Yoko Fujii** (Japan Women's University, Tokyo), **Inmaculada García Sánchez** (Temple University, Philadelphia),

**Sophia Marmaridou** (University of Athens), **Rosina Márquez**

**Reiter** (University of Surrey), **Catrin S. Rhys** (University of Ulster at Jordanstown), **Daniel Silva** (Federal University of Santa Catarina - UFSC), **Elda Weizman** (Bar-Ilan University)

## USER NOTES:

1. This abstracts book only exists in electronic format. To go to the appropriate sections, just click the corresponding bookmark on your pdf-screen.
2. All abstracts within the different sections are ordered alphabetically by title.
3. To identify the panel to which a panel contribution belongs, consult the program (online at <https://ipra2021.exordo.com> after log-in as IPrA member at <https://pragmatics.international>, or in the pdf-version downloadable from <https://pragmatics.international/page/Program2021>).
4. At the end of this book, there is a complete author index. To find the right page for the author you're looking for, just click the page number.
5. ***The abstracts contained in this book are in the form in which they were submitted. Authors were given the opportunity to edit their abstracts themselves. Yet, the end result may still not be fully satisfactory in all cases.***

*This abstracts book was finalized about ten days before the definitive pdf-version of the program was made. As a result of some cancellations, there may be abstracts here that do not correspond to anything in the final program.*

*All abstracts are also accessible online through the program at <https://ipra2021.exordo.com> after log-in as IPrA member at <https://pragmatics.international>.*

# Plenary Lectures

# Bringing Academic Research to the Public Stage: Looking Back on How and Why

---

Plenary lecture

---

***Prof. Deborah Tannen<sup>1</sup>***

*1. Georgetown University*

It is exactly forty years since I first published an essay in a general-audience publication. In March 1981 “Talking New York: It’s Not What You Say, It’s The Way That You Say It,” based on the doctoral dissertation I had written two years before, appeared in *New York Magazine*. How did I go about placing it there? How did I reframe my academic research for a general audience? Why did I want to? Looking back on the articles, op-eds and books I’ve written in the four intervening decades, I explore what motivated me to talk about my academic research to a broader audience, how I went about it, and how the two types of writing compare. I’ll discuss some of the challenges, frustrations, and satisfactions I encountered in both types of writing and what I learned along the way—including my most recent book, *Finding My Father: His Century-Long Journey from WWI Warsaw and My Quest to Follow*, a memoir about my father that is completely different from all the books I wrote before.

# Context, Social Interaction, and Language – The Impact of Susan Ervin-Tripp's Work on Pragmatics

---

Plenary lecture

---

***Prof. Amy Kyrtatzis<sup>1</sup>***

*1. University of California at Santa Barbara*

Susan Ervin-Tripp (1922-2018) had a central role in the establishment of three academic fields that overlap with pragmatics – psycholinguistics, sociolinguistics, and child language. This talk describes her impact on pragmatics. From her work on address terminology and requests revealing subtle social rule systems that underlie and help constitute power dynamics in education, the family, and society, to contributing to a major paradigm shift in child language study towards a more discourse-centered approach and to her work on young adults' communicative competence in humor and conversational narratives, Sue's impact on the field was profound. This talk documents some of these contributions and her continued influence on pragmatics scholarship.

## Two Minutes Hate

---

Plenary lecture

---

***Prof. David Beaver<sup>1</sup>***

*1. The University of Texas at Austin*

Hateful and oppressive communication surrounds us: cat calls and bullshit and (to paraphrase Kamala Harris) dogwhistles through bullhorns. Yet the standard paradigm for analyzing meaning in analytic philosophy of language and generative linguistics involves identifying “content”, the neat and sterile way that a description of the world is “packaged” into words. Orwell saw clearly that the power of propaganda rests not in what it describes, but in how it takes hold of people, and forms them into a mass with collective behaviors and emotions: “The horrible thing about the Two Minutes Hate was not that one was obliged to act a part, but, on the contrary, that it was impossible to avoid joining in. Within thirty seconds any pretence was always unnecessary. A hideous ecstasy of fear and vindictiveness, a desire to kill, to torture, to smash faces in with a sledge-hammer, seemed to flow through the whole group of people like an electric current, turning one even against one’s will into a grimacing, screaming lunatic.”

Oppressive speech practices must be understood not in terms of how they describe the world, but in terms of their emotional impact, cultural resonances, and power to mark group affiliation. I will outline a model in which the resonances of words help establish collective attunement to communicative practices and to the broader oppressive ideologies. In this model, notions of attitudinal accommodation (from David Lewis) and behavioral accommodation (from Howard Giles) are seen as special cases of a general tendency people have to harmonize attitudes, dispositions and emotions both internally, and with the groups to whom they are affiliated.

On the standard view, information is exchanged primarily by deliberative uptake following recognition of a speaker’s plan. On this view, intentions and truth conditions are central. Pivoting off literatures in the psychology of persuasion and sociolinguistics, I suggest that while deliberative uptake might describe idealized cases of communication, it is unhelpful for understanding propaganda and hate speech. In these cases we must consider not only uptake, but also typically unconscious adaptive processes at both individual and group levels.

Such adaptive processes include a mixture of short-term, somewhat reflexive behavioral and emotional reactions, but also longer term accommodative changes. Victor Klemperer captures the long term effects well when he talks of words as “like tiny doses of arsenic: They are swallowed unnoticed, appear to have no effect, and then after a little time the toxic reaction sets in after all.” With regard to longer term changes, which may involve many exposures to oppressive speech practices, propaganda can shape the dissonances that people attend to, and act as a driver as people attempt to find harmony.

My presentation will be drawn from a forthcoming book with Jason Stanley, “The politics of Language”, to appear with Princeton University Press. The view we develop is in line with Orwell and Klemperer: what is central in shaping both short and longterm impacts of oppressive speech is not intentions and truth conditions, but resonance and coherence.

# Understandings of politeness in the COVID-19 era and beyond

Plenary lecture

***Prof. Maria Sifianou***<sup>1</sup>

**1.** National and Kapodistrian University of Athens

What im/politeness means changes over time. As this change is usually gradual we tend to be relatively unaware of it. However, when change is abrupt, people not only notice changes but are also concerned with them. The COVID-19 pandemic seems to entail such abrupt changes which are largely imposed by external factors. The new rules are unclear and most of them “deeply at odds with widely practiced and deeply ingrained sociocultural patterns of behavior in societies such as ours” (Blommaert 2020).

My aim in this presentation is to try and explore what politeness means to non-academics, how similar or different their understandings are from academic accounts and what changes they experience and/or envision as a result of the pandemic. To do so, I will draw from an online article entitled “Your politeness is a public health hazard” and the user-generated comments it triggered.

The discussion will be placed within the discursive turn in im/politeness research, considering the key distinction drawn between first order (i.e. lay) politeness and second order (i.e. scientific) politeness (see, e.g., Watts, Ide and Ehlich 1992; Eelen 2001; Watts 2003) and the suggestion that the focus of politeness research should be on first order conceptualisations, that is, “the various ways in which polite behaviour is perceived and talked about by members of socio-cultural groups” (Watts et al. 1992: 3).

The results of this study suggest that politeness is mostly understood as consideration for the feelings of the other with the basic human need for closeness and haptic behaviour emerging as significant but challenged during the pandemic. The posters draw their views from the journalist’s article, who in turn draws from scholarly work; posters seem to agree and/or disagree with these views and also add their own. These include the interrelationship of politeness with ‘respect’ and ‘authenticity’ and whether politeness is a virtue, issues which reflect understandings of the broader concept of ‘civility’. Posters’ views reflect their knowledge as observers and participants of social reality but also reveal that they are in dialogue with scholarly work. Posters also suggest alternatives as to how the norms of polite behaviour should/might change during and perhaps also after the pandemic echoing the journalist’s outlook (e.g., replacing the handshake with verbal action or lower-risk gestures) but also their own viewpoints (e.g., becoming more assertive but not aggressive).

These results indicate that non-academics share views with im/politeness scholars as to what politeness means but also that non-academic views are broader reflecting issues of concern in philosophy, sociology and psychology rather than simply pragmatics.

# “Do you speak English?”: Recontextualizing metalinguistic discourse and online hate speech

Plenary lecture

***Dr. Carmen Lee<sup>1</sup>***

*1. The Chinese University of Hong Kong*

This talk explores the intricate relationship between metalinguistic discourse, linguistic myths, and online hate speech. A growing body of research has analyzed online comments that thematize language, including opinions about others based on the languages they (do not) speak. Some of these comments, despite not containing abusive language, are charged with linguistic misconceptions that can be perceived as covert hate speech and indirect racism. In October 2020, Asian-American reporter Amara Walker posted on social media about her experience of being asked, “Do you speak English?”, a question which she referred to as “racially charged”. This immediately sparked controversy and heated debate on social media. While many expressed support for Walker, others suggested that the yes-no question “is not inherently racist”. This talk extends recent efforts in conceptualizing hate speech as recontextualized discursive practice (Baider, 2020; Lee, 2020a, 2020b). Based on a sample of online comments reacting to perceived linguistic discrimination, I first identify common linguistic myths contained in the implicatures of these comments. I then discuss the recurrent discursive strategies that frame and justify linguistic stereotypes. In particular, I probe into the strategies that normalize the ‘English-first’ ideology and the invisibility of other languages. My aim is to illustrate how pragmatics, coupled with (critical) discourse analysis, can provide researchers with a powerful tool for systematically analyzing hate speech enabled by ‘coded language’ (Wodak, 2007). I conclude the talk by calling for a more explicit recognition of the presuppositions embedded in metalinguistic discourse in society, so as to minimize the potential damage caused by a seemingly harmless yes-no question.

# “Were they not formal before?”: The pragmatics of fiction in translated relational work scenes of Korean TV drama and its uptake in timed comments

Plenary lecture

***Prof. Miriam Locher<sup>1</sup>***

**1.** Universität Basel

This paper first outlines the interface between the pragmatics of fiction and the pragmatics of translation and makes a case for looking at fiction in its own right and as rich in providing inroads for pragmatic theorizing (Locher/Jucker 2021; Locher/Sidiropoulou 2021). Focusing on two classic topics within pragmatics – relational work and participation structure –, the paper then presents two case studies with data from the online streaming platform viki.com. Viki makes Korean TV drama available for international viewing through lay translation and provides the opportunity to comment while watching (building on Locher 2020; Locher/Messerli 2020).

The first study focuses on scenes in the Korean artefact that contain staged negotiations of relational work. These scenes highlight how the characters are dynamically positioned vis-à-vis each other. In addition to the technical restrictions of subtitling (e.g. number of words and duration of display), translators of Korean im/politeness face the challenge that the target language English does not have the morphological and lexical im/politeness nuances of the source text. The study reports how the lay subtitlers creatively become cultural mediators (Bassnett 2021) and manage to raise awareness of the complexity of the Korean im/politeness system in the international and multilingual viewers. The second case study explores how these viewers comment on relational work and culture while watching the drama episodes, and thus reflect on the Korean as well as their own cultural assumptions.

Because subtitlers and commenters add their voices to the artefact in written form, they change the viewing experience of the original artefact for any future audience. We are therefore confronted with a dynamic participation structure that entails blurring of participation roles. To a multicultural and multilingual viewership, streaming platforms as discussed in this paper can function as sites where processes of inclusion can occur in the form of fan community building around a shared, constructed interest in Korean culture.

# Panels

# “Disfluency” as an interactional resource: The use of filler-like items in different turn positions and interactional situations

---

## Panel

---

***Dr. Tomoyo Takagi<sup>1</sup>, Dr. Emi Morita<sup>2</sup>***

***1. University of Tsukuba, 2. National University of Singapore***

Although disfluency in human verbal communication has often been considered an epiphenomenon of cognitive load in speech production, and associated with difficulties in the planning process, many conversation analytic studies have proven that such disfluencies in speech are orderly, and thus available to both the speaker and the recipient as interactional resources (e.g., Schegloff, Jefferson & Sacks, 1977; Goodwin, 1980; Schegloff, 2010). However, one of the most common types of disfluency, i.e., a “filled pause” in which so-called “filler”-like items are used, still awaits systematic investigation from an interactional perspective (some exceptions include Hayashi and Yoon, 2006; and Morita & Takagi, 2018).

The panel aims to analyze the use of so-called “disfluency” markers such as filler-like items or conventionalized sounds from a conversation analytic perspective. A question of particular interest is: When a language makes available to its speakers more than one special form to embody a delay, what influences a speaker to choose one particular form over another before producing the next item due in the unfolding interaction? What kind of “division of labor” is being implemented among these forms, one may ask, and what sorts of interactional tasks can a speaker accomplish by employing a particular form vis-à-vis the other forms? These questions entail that what the use of these forms achieves may not be just limited to a displayed orientation to “preference for progressivity” (Stivers & Robinson, 2006), but critical for the accomplishment of other real-time organizational tasks as well.

This panel thus pursues the above-mentioned line of inquiry in analyzing the use of filler-like items in four languages – Japanese, Chinese, Korean, and French – occurring in natural talk-in-interaction in various situations, from everyday conversation to institutional settings such as medical interviews and classroom presentations. This is an unprecedented attempt to systematically and in parallel analyze, from a conversation analytic perspective, some of the world’s filler-like expressions. The panel contributions include investigations of Japanese filler-like items *nanka* (lit. “something”), *maa* (often translated as “well”), *koo* (lit. “like this”), Mandarin *neige shenme* (lit. “that what”), Korean *way* (lit. “why”), and the multimodal deployment of various “disfluency” markers in French. Examining cross-linguistically how such so-called “filler”-like items are deployed in particular positions in particular interactional environments in a particular language is crucial for a more accurate and deeper understanding of what underlies their use in real-time human interaction across languages.

We hope that this panel will be a first step towards exploring the fascinating world of one of the most human-specific features of social interaction: the actual underlying orderliness of much of what is often seen as “disfluency”. The exploration, we hope, will go beyond capturing participants’ orientation to the problematic nature of the delay in interaction, i.e., “preference for progressivity,” and reveal its more dynamic, context-shaping and context-renewing nature as an interactional resource.

---

# A grammar-pragmatics approach to constructions in Chinese

---

## Panel

---

**Prof. Shaojie Zhang<sup>1</sup>, Dr. Xuhui Hu<sup>2</sup>, Dr. Xiaolong Yang<sup>3</sup>, Dr. Bing Xue<sup>4</sup>**

**1.** Northeast Normal University, **2.** Peking University, **3.** Zhejiang University of Finance and Economics, **4.** Dalian University of Foreign Studies

Research on the grammar-pragmatics interface has been still vigorous and productive in linguistic pragmatics over the past decade. Chinese scholars, in particular, have become more interested in this area in recent days. This is attributed to two aspects: one is that the Chinese language is abundant in grammatical phenomena that need to be adequately accounted for from the grammar-pragmatics approach, and the other goes in line with the shift of focus from the semantics-pragmatics to grammar-pragmatics interface in pragmatics. Therefore, this panel will invite four speakers who are interested and have already contributed to this interface study to join the discussion with a particular focus on different constructions in Chinese.

This panel also welcomes papers of similar interest or concern based on Chinese data or grounded on other languages with the same or similar approach.

Speaker 1 discusses "**The negative meaning of Chinese *shenme* (what) rhetorical question at the grammar-pragmatics interface**", making attempts to theorize the grammar-pragmatics interface based on the analysis of how the *shenme* rhetorical question conveys negative meanings as types of implicature through grammar and pragmatics interactions in context; Speaker 2 focuses on "**Chinese definiteness at the syntax-pragmatics interface**", analyzing how and why the two types of definiteness, anaphoric (familiarity) and uniqueness in the syntax of Chinese nominals, are encoded differently, with the former expressed by a nominal with a demonstrative, and the latter by a bare noun in order to address the debate over the source of the definiteness interpretation. Adopting Distribution Methodology (Halle and Marantz 1993), we propose that the D head in Chinese DPs has an overt anaphoric exponent and a null non-anaphoric exponent which also denotes mass and generic readings, and pragmatics plays a role in distinguishing between the readings of the null exponent. Speaker 3 analyzes "**Chinese *do so* construction at the syntax-pragmatics interface**", providing a parsing-based account of the performance of Chinese *do so* construction within the framework of Dynamic Syntax (Kempson et al. 2001; Cann et al. 2005) and arguing for the context-dependent meaning and the retrieval of semantic content of the construction. Speaker 4 reconsiders "**Chinese *neo-bei* construction at the grammar-pragmatics interface**", analyzing how the canonical Chinese *bei*-passive and *neo-bei* construction as a newly emerged type of non-canonical passive is deviated from canonical Chinese *bei*-passive. It is argued that both conventional pragmatic value ‘affectedness’ and pragmatic inference interact with grammatical passiveness (agent-patient reversal) in the process of *neo-bei* construction interpretation.

This panel discussion will make novel contributions to the current research on the grammar-pragmatics interactions from a multi-perspective analysis.

# A Multi-dimensional Approach to Language Socialization in Parent-Child Interaction

---

## Panel

---

**Ms. Moeko Ozaki<sup>1</sup>, Ms. Mana Kitazawa<sup>1</sup>**

*<sup>1</sup>. Keio University*

This panel aims to address how children acquire culturally appropriate forms of communication and social norms in parent-child interaction from the perspective of language socialization. Language socialization is said to begin from the moment a child has social contact (Schieffelin & Ochs, 1986). Some previous studies have attempted to describe the process based on parent-child interaction such as shared picture-book reading. While these studies recognize the importance of a longitudinal, sample-abundant, and interactional approach to language socialization, they have yet to fully elucidate its discursive process due to a narrow range of age groups and a limited number of samples (Fernald & Morikawa, 1993), in addition to exclusively focusing on parental utterances. This panel, therefore, attempts to overcome these deficiencies by examining parental and children's utterances, sometimes accompanied by embodied actions, primarily from the perspectives of information exchange and mutual stancetaking.

Contributors take various approaches to parent-child conversations in the context of language socialization, but mainly focus on conversational and social function, such as the linguistic forms and content of the parents' and children's utterances and the alignment between parent and child that occurs upon assessment of events. By incorporating these two perspectives, the more explicit exchange of information between parent and child, including literacy development and empathy training, can be tied together with the more implicit form of communication, namely stancetaking. The notion of stance is closely associated with socio-cultural values, and through the assessment performed by caregivers, mothers, and teachers, children learn culturally appropriate displays of positive and negative affective stance toward people, objects, and events in their social world (Cook, 2011; Ochs, 1993).

The data discussed in this panel covers interactions obtained from everyday conversations and specific settings, such as shared book-reading and reality TV shows. The variety of the data and object languages (English, French, Chinese and Japanese) may give us a comprehensive insight into the process of language socialization. Additionally, the investigation of both parent and children's utterances and the sequence will contribute to a better understanding of the complex and dynamic aspect of language socialization of young children through their caregivers.

Cook, H.M. (2011). Language socialization and stance-taking practices. In A. Duranti, E. Ochs and B. Schieffelin (Eds.), *The handbook of language socialization* (pp. 296–321). Malden, MA: Blackwell.

# A pragmatic agenda for healthcare: fostering inclusion and active participation through shared understanding

## Panel

***Dr. Sarah Bigi<sup>1</sup>, Dr. Maria Grazia Rossi<sup>2</sup>***

*<sup>1</sup> Università Cattolica del Sacro Cuore, <sup>2</sup> Universidade Nova de Lisboa*

In many studies on communication in healthcare, asymmetry is identified as one of the primary causes of sub-optimal professional-patient interactions. Rather than seeing asymmetry in itself as a problem, we consider 'knowledge translation' as the biggest challenge for healthcare professionals. When this fails, the implications are serious: burnout and frustration for healthcare professionals, lack of adherence to healthy behaviors and worsened health for patients. The recent Covid-19 pandemic has shown a particularly painful side of the 'medical communication issue', with governments struggling to get correct and complete information to the population in order to contain the infection and to indicate the most appropriate preventive behaviors. Clearly, communication styles that are unable to address the challenges posed by 'knowledge translation' favor non-inclusion and reduced access to care.

In this panel, we claim that in healthcare 'shared understanding' is a precondition for inclusion and active participation. We also assume that the micro-level of dialogues between professionals and patients, and the macro-level of institutional communication are linked and interdependent: on the one hand, a well-informed citizen is more likely to be a well-engaged and responsible patient, who knows how to access healthcare services and make good use of the opportunities the system can offer. On the other hand, patients and healthcare professionals who can develop trusting and constructive relationships with each other are more likely to find creative ways of supporting patients' wellbeing, allowing in return professionals' own satisfaction.

We will further discuss the idea that the achievement of shared understanding through appropriate communication can trigger a virtuous circle leading to more accessible, inclusive, and sustainable healthcare systems. Accepted presentations will address the following questions:

- at the micro-level of analysis:

- which are the greatest challenges in multilingual and multicultural dialogues in the healthcare settings and how can they be overcome?
- which are the dialogical mechanisms that mostly favor or hinder the creation of common ground between participants in a dialogue?
- is it possible to describe indicators of misunderstandings/disagreements in healthcare dialogues?
- how and under which conditions can technological devices favour inclusion and active participation?

- at the macro-level of analysis:

- which are the main challenges for public discourse concerning health in view of achieving shared understanding between institutional actors and the population?
- how should the language of healthcare institutions change in order to foster active citizenship?
- how can pragmatic analyses and findings contribute to the preparation of high-quality teaching materials for medical students?

Finally, is it possible to outline virtuous processes that would allow the micro- and macro-levels of communication in the medical context to support each other towards more inclusive healthcare services?

# Accountability of Discursive Action and the Private-Public Interface

## Panel

**Prof. Anita Fetzer**<sup>1</sup>, **Prof. Elda Weizman**<sup>2</sup>

**1.** University of Augsburg, **2.** Bar-Ilan University

In discourse pragmatics, discursive action is firmly based on the premises of rationality and intentionality, action ascription, and pluralism and indexicality of discursive action. In line with ethnomethodological understanding of accountability of social action, we maintain that participants not only perform social actions but are also able to account for their actions as they know, at some level, what they say and what they mean by their utterances. Accountability may be achieved explicitly, for instance through metacommments and reformulations, or implicitly, through such discourse patterns as naming, small stories, speech acts, etc. By so doing, participants convey what they intend their actions to count as, and what goals they intend to achieve, demonstrating substantive rationality and daily life rationalities. In short, they can account for *why this to me now*.

Accountability of discursive action is a fundamental premise in dialogic interaction and thus is a constitutive part of negotiation-of-meaning and negotiation-of-validity sequences. It utilizes context-dependent practical reasoning making explicit taken-for-granted background information.

This panel examines the theory and practice of accountability of discursive action across different sociocultural contexts and different speech communities (Chinese, English, French, German; Hebrew, Japanese), different media, and different communicative genres, activities and modalities (e.g., online commenting, parliamentary discourse, election campaign). The focus is on the private-public interface in mediated discourse, especially on speakers' conceptualisations and negotiations of (non)accountability indexed by (1) ordinary people utilizing public-domain references, and (2) members of the elite utilizing private-domain references. Private and public domain are not only seen as scalar concepts with fuzzy boundaries but also as interdependent on medium, context, genre and participants and their discursive identities.

Accountability in professional / elite political discourse

- Accountability in argumentation and decision-making
- Accountability and the construction and deconstruction of discursive identities
- Accountability and ironic representation

The research is supported by GIF (Grant I-153-104.3-2017).

## Aging and Elders' Communication

---

Panel

---

**Prof. Lihe Huang<sup>1</sup>, Prof. Yueguo Gu<sup>2</sup>**

**1.** Tongji University, **2.** Beijing Foreign Studies University

With the increasingly severe aging trend in today's world, research into the features and mechanisms of elders' pragmatic communication has both academic and practical values. Due to typical physiological and cognitive aging and/or neurodegenerative diseases, elders present certain pragmatic features or communication disorders in verbal interaction. As a result, geronto-linguistic research that focuses on language degradation of different groups of elders gradually emerges.

We are especially interested in the elders' pragmatic communication. Specific research themes of interest include, but are not limited to:

- linguistic features of elders' speech production and its neurocognitive or social-cultural mechanism
- perception mechanisms of the elder's interaction
- face-saving issues, identity construction, and doctor-patient interaction in elders' life
- analysis of elders' communication within the multimodal pragmatics framework, especially the study of characteristics of non-verbal behavior and emotional communication of the elders with dementia
- comparison of speech production between healthy elders and elders with dementia, especially between the elders speaking different mother tongues
- narratives of aging, diseases, and death from the social pragmatics perspective

This panel encourages discussion on the features and mechanisms of elders' pragmatic communication and social interaction based on various theoretical perspectives and research methods. The perspectives and methods include but are not limited to pragmatic analysis, conversation analysis, ethnographic methods, corpus-based approaches, multimodal analysis, controlled experiments, and lifespan development methods.

After preliminary coordination, the following contributors will present their work in this panel:

- Yueguo Gu, "Investigating Young-Olds' Memory in Everyday Life"
- Lihe Huang, "Social Image and Self-identity of Chinese Elders in Aging Society: from Frailty to Vitality"
- Hongyan Liu, "A Multimodal Study on Chinese Alzheimer's Speakers' Speech Acts in Situated Discourse"
- Yan Jiang, Yueguo Gu, "Exploring Reasoning Patterns of Pragmatics and Decision-Making in Older People's Fraud Cases"
- Deyu Zhou, Lihe Huang, Wei Zhang, "Conversational Structure in the Interaction between Examiners and Elders with Dementia Risk in Chinese Context"
- Xin Cui, Hongwei Ding, "the Phonetic Approach towards Alzheimer's Disease: Language Tasks and Phonetic Parameters"
- Meng Jiang, "Lexical and pre-lexical processing in patients with motor diseases is selectively impaired for Chinese action verbs"

The above panel introduction also serves as a call for papers. If you are interested in language aging (primarily pragmatic aging), you are cordially invited to submit proposals to this panel. Feel free to contact the two panel-organizers if you have any questions. Please submit an abstract of your panel contribution on or before **25 October 2020**.

**Note:**

1. The acceptance of panel contribution entirely depends on its quality.
2. IPrA membership is required for submitting an abstract (with all deadlines in 2020) as well as for presenting during the conference.
3. For other details, please refer to <https://pragmatics.international/page/CfP>

# Building responses in Chinese talk-in-interaction

Panel

**Dr. Xinyang Xie<sup>1</sup>, Dr. Wei Zhang<sup>2</sup>, Dr. Yaqiong Liu<sup>3</sup>, Dr. Xianyin Li<sup>4</sup>**

**1.** *Shanghai University of Finance and Economics*, **2.** *Tongji University*, **3.** *Shanghai Maritime University*, **4.** *Beijing Language and Culture University*

Responses are part and parcel in social interactions across cultures and languages. Research in conversation analysis and interactional linguistics has accumulated a wealth of studies which contributes to, and continues to update, our understanding of responses in interaction (Lee 2013). Research focus has extended from examining responses with reference to preference organization (Pomerantz & Heritage 2013, Schegloff 2007) to the design of responses in relation to different question types and in specific action sequences. A wide range of issues have been explored, e.g., the interactional properties embodied in phrasal and clausal responses to *wh*-questions (Fox & Thompson 2010), the normative structure underlying type-conforming and nonconforming responses to polar questions (Raymond 2003), respondents' independent epistemic authority over, or resistance to, questions as displayed in the formats of responses (Heritage & Sefi 1992, Stivers 2011, Stivers & Hayashi 2010), and grammatical forms of responses in action sequences other than the question-answer sequence (Thompson et al. 2015). Also much researched are the functions of turn-initial responsive tokens (Heritage 1998, Schegloff & Lerner 2009). Common to this line of inquiry is the departure from 'traditional' approaches which views grammar not as internal to language, but as "sequence-specific" and "positionally sensitive" (Schegloff 1996) resources out of which speakers build their actions in, and for, the interaction they are engaged in. Such a view of the relationship between grammar and social interaction has also yielded fruitful insights from studies of responses in languages other than English. However, our understanding of responsive actions in Chinese talk-in-interaction awaits more systematic investigation. Early studies of Chinese grammar have made insightful observations about answers, responses and their relations to questions (Lü 1942, Chao 1968, Hu 1987). However, it is until more recently that studies of responses grounded in naturally-occurring talk-in-interaction begin to emerge (e.g., Wu 2004, Wang et al 2010, Li 2014, Xie 2016). There is still much to be understood about grammar and social interaction in Chinese.

Papers in the panel reports findings from studies of (1) a range of elements in the design of responsive turns, such as turn-initial interjections, stand-alone adverbs, and multiple negatives; (2) responses to polar questions with regard to type conformity and the use of adverbs such as *dangran* 'of course', and responses to polar questions in Chinese sign language, (3) responsive actions in specific sequences, activities and various settings, such as responses in assessment sequences and extended telling, responses to Why-questions as complaining, responses to troubles report in daily conversation and at workplace, doctors responses to patients repeats, and responses in rap battles; (4) Prosodic comparisons of response tokens in Chinese and English.

It is hoped that through examining the design of responsive turns, e.g., turn-initial responsive tokens, lexical choices, grammatical formats, prosodic patterns, and their possible interactional functions in specific sequential contexts, practices for constructing responses in Chinese talk-in-interaction can be uncovered and compared to those in other languages for language-specific or more general properties of responsive actions in social interaction.

# Challenges, opportunities, and particularities of pragmatic and interactional changes in the 20th century

## Panel

***Dr. Ana Belén Llopis Cardona<sup>1</sup>, Dr. Salvador Pons Borderia<sup>1</sup>***

***1. University of Valencia***

This panel focuses on pragmatic and interactional changes occurred throughout the 20th century, understanding this century as a novel diachronic space with specific challenges that deserves new approaches to data and to the current conceptions about constructionalization.

In traditional, diachronic approaches, the 20th century is simply “the end of the road”: the place where all previous linguistic changes are accomplished. In constructionalization studies scattered references to changes in the 20th century can be found, without any special attention to this era as a locus of change. Nevertheless, many pragmatic changes happened entirely in the 20th century: those regarding single items are easily recognizable (vocatives, e.g. Pons&Llopis, 2020), whereas others remain unnoticed and require a more detailed study (Llopis forth.).

The 20<sup>th</sup> century is the birthplace of mass media like radio or TV, and also the century of cinema. The impact of these media in the spread of pragmatic markers and even stereotyped ways of performing speech acts are still to be studied. Also, and unlike previous centuries, methodological problems rise due to an excess of data. This excess is also an extraordinary opportunity to take accurate, fine-grained pictures of the oral contexts of change, hardly difficult to find in previous centuries. In short, the 20<sup>th</sup> century is a place where methodological challenges arise and where specific socio-cultural phenomena can be well documented.

This panel welcomes contributions focusing on the following issues:

- Methodological challenges:

Unlike prior centuries, researchers have access to acoustic and audiovisual records (radio, TV programs): how can these records be processed (historical multimodal corpora, data mining algorithms, etc.)?

Given the amount of data, how can a statistically representative sample be selected from this population?

- Descriptive-theoretical opportunities:

The 20<sup>th</sup> century allows us to zoom into the acquisition and spread of pragmatic changes. How can variational variables (dialects, sociolects, registers, genres, discourse traditions, etc.) be integrated in Historical Pragmatics? Some pragmatic changes remain while others decrease in use or even are lost. Can the study of the 20th century shed light on the factors provoking these preferences?

- Historic and sociocultural phenomena

To what extent do socio-cultural changes correlate with linguistic changes? What is the impact of political movements, World Wars, counter-culture movements (Hobsbaw 1994), inward and outer migrations on language? We invite researchers from different orientations and languages to present their empirical studies to this programmatic panel.

# Children's embodied and linguistic organisation of peer inclusion and exclusion

## Panel

***Prof. Friederike Kern<sup>1</sup>, Dr. Amanda Bateman<sup>2</sup>***

*1. Bielefeld University, 2. The University of Waikato*

Places where children have pragmatic autonomy over the complex co-production of social organisation practices with their peers is often limited due to adults playing a significant role in children's social worlds, where adults shape children's morality (Bateman & Kern 2018) and socialisation (Cekaite & Burdelski, forthcoming). This is in opposition to theory built on empirical studies which present children as competent and capable in co-constructing their own social and cultural worlds away from the watchful eye of adults (Corsaro 2003). When children interact with their peers, they competently use embodied and linguistic resources to include and exclude, shaping their social worlds and participation frameworks in intricate and intelligent choreographies (Tulbert & Goodwin, 2011). Through observing children's peer interactions from an ethnographic perspective, the accomplishments of these temporal movements can reveal young children's competencies of managing their social worlds. Furthermore, research demonstrates children's competence in managing their own social organisation processes in pragmatic ways, which also involves the inclusion and exclusion of peers (Bateman, 2011; Tulbert & Goodwin 2011). Interestingly, equal treatment in interactions among peers that may be understood as a sign of inclusion may entail mutually constructed approval as well as strongly expressed rejection (Heller, Kern & Rohlting 2019).

This panel aims to build on this prior research to offer further insight into child-child interactions in the early years (ca. 3 to 10 years of age) with a specific focus on how peer inclusion and exclusion are co-constructed through situated embodied and linguistic sequential practices and actions. The panel with researcher from all over the world will explore how inclusions and exclusions are managed by children in their everyday interactions with each-other, revealing how different resources are used dynamically in situ in a range of contexts.

# Commenting while watching: Synchronous and pseudo-synchronous text-based engagement with and about audiovisual artefacts

Panel

Mr. Thomas Messerli<sup>1</sup>, Prof. Miriam Locher<sup>1</sup>

<sup>1</sup>. Universität Basel

Our panel explores text-based communication that accompanies video-streams. Affordances that allow such communication exist for users of live-streaming systems such as Youtube Live, Twitch or Periscope, but also on platforms that focus on the delayed distribution of professionally produced fictional films and television series, such as *Bilibili.com* or *Viki.com*.

Text-based commenting tied to video has first started on a separate, second screen (e.g. chatrooms or live-tweeting), and has then also moved to the same screen, where it typically takes place in a separate window (e.g. Youtube Live). There are also chat systems like danmu/danmaku or timed comments on viki.com that synchronise viewer comments not with real time, but with the time of the videotream, thus creating an illusion of a communal experience among spatially and temporally distant viewers.

While there is abundant linguistic pragmatic research on many text-based CMC-practices, studies on digital communication oriented towards television broadcasts and videotstreams have been sporadic so far. The extant literature consists mostly of case studies from different disciplines, which explore such aspects as motivations for contributing comments as well as for viewing socially enriched content; functions of comments for the viewing experience and for the viewing community; consequences of the co-presence of the video as primary and the chat as secondary communication channel, including aesthetic, but also psychological effects; the relationship between the streamed video and the time-aligned written comments. The case studies are typically limited to one particular platform or system (e.g. Twitter, Danmaku, Viki) or in some cases compare several similar sites (e.g. Periscope and Meerkat; Twitch and Youtube Live). What is missing then, is a consolidated effort to look beyond the specifics of individual chat systems and move towards more general insights into text-based videotstream-oriented CMC practices.

With this panel, we want to bring together research about different chat systems, including those that have so far predominantly been in use in an Asian context and thus outside of the Western mainstream. Chat systems like *danmaku/danmu* may for the time being be largely limited to China and Japan, but the ongoing globalization of regional culture of which Japanese anime fan-culture and the Korean Wave are good examples, means that similar practices, e.g. timed comments on *Viki*, have already found new audiences also outside of Asia.

In this vein, our panel explores text based interaction taking place within and orienting towards the multi-modal setting of video streaming. This includes *Danmu/Danmaku* comments, which are examined with a focus on coherence (Leticia-tian Zhang and Daniel Cassany) and mock impoliteness (Shengnan Liu), the interplay of chat systems and live video on Twitch TV and Discord (Sage Graham and Scott Dutt), and interaction in timed comments accompanying Korean television drama streams on *Viki* (Thomas Messerli and Miriam Locher).

---

## Common ground in intercultural interactions

---

Panel

---

***Prof. Istvan Kecske<sup>1</sup>***

1. STATE UNIVERSITY OF NEW YORK, ALBANY, USA

In classic pragmatic models interlocutors can successfully communicate intended meanings by taking common ground into account. This common ground in an interaction is typically taken to be a body of information that is in a sense shared between participants. In recent years the traditional approach to common ground (e.g. Stalnaker 1978, 2002; Clark and Brennan 1991; Clark 1996) has been challenged from different perspectives. Taking into account not only L1 but also intercultural interactions and attempting to bring together the traditional view with the egocentrism-based view of cognitive psychologists (Barr 2004; Barr and Keysar 2005; Colston and Katz 2005), Kecske and Zhang (2009) argued that construction of common ground is a dynamic process. It is the convergence of the mental representation of shared knowledge that we activate, assumed mutual knowledge that we seek, and rapport as well as knowledge that we co-construct in the communicative process.

This dynamic understanding of common ground has been applied in many research projects addressing both L1 and intercultural interactions in recent years. As a result several new elements, aspects and interpretations of common ground have been identified. Some researchers (e.g. Roberts 2012, Garcia-Carpintero 2015) came to view the common ground as one component in a complex contextual information structure. Others analyzing intercultural interactions pointed out dynamism of the interplay of core common ground and emergent common ground (e.g. Macagno 2018; Nolan and Diedrichsen 2019; Ping 2018)

The panel aims to bring together researchers from different angles of pragmatics and communication to examine 1) what adjustments to the notion of common ground based on L1 communication should be made in the light of research in intercultural communication, 2) What the relationship is between context, situation and common ground, and 3) how relevant knowledge and content get selected for inclusion into core and emergent common ground.

# Communicating meanings through multimodal humour on social media

Panel

***Prof. Marta Dynel<sup>1</sup>***

*1. University of Lodz*

## Communicating meanings through multimodal humour on social media

Contrary to the well-entrenched distinction between “seriousness” and “non-seriousness”, the latter being equated with “humour”, ample research has shown that humour can be the bearer of serious meanings. It has been widely attested that humour may communicate people’s *true beliefs* (see Dynel, 2017 and references therein). This holds for the traditional forms of humour, namely conversational humour and canned jokes, both of which may be shared online (e.g. Tsakona, 2015, 2018; Demjén, 2016; Dynel and Poppi, 2018; Rivers and Ross, 2019). The same postulate has been made about multimodal forms of humour – that is humour based on multiple integration of meaning-bearing resources across modes (van Leeuwen, 2004; Kress, 2010) – its online epitome being humorous *memes* (see Shifman, 2013; Yus, 2019; Johann and Bülow, 2019; Wiggins, 2019). Ample research has shown that social media users can voice their opinions through multimodal humour, which can be approached from various theoretical vantage points and with various methodological tools (e.g. Huntington, 2015; Ross and Rivers, 2017, 2018; Piata, 2019; Jiang and Vásquez, 2019; Dynel and Poppi, 2020; Hakoköngäs et al., 2020). Thus, user-generated multimodal humour, whether or not formally qualifying as memes (see Dynel and Poppi, 2019, 2020; Vásquez, 2019), can give insight into current issues and socio-political topics of public discussion, performing an informative function about contemporary problems and ideologies (e.g. Shifman and Lemish, 2010; Milner, 2013, 2016; Dynel, 2020).

This panel is intended to bring together scholars interested in the study of multimodal humour on social media. The overarching aim is to examine novel multimodal data as they serve the communication of (variously conceptualised) meanings on social media. As long as relevant to (broadly understood) pragmatic research on humour, all topics, methods and approaches are welcome. The proposed papers may concern, but are not restricted to, the following:

- Multimodal Critical Discourse Analysis of meme cycles, for instance as bearers of ideologies
- Multimodal humour as a vehicle for political rhetoric
- Meaning production and reception processes on the communication of multimodal humour
- New conceptualisations of meaning conveyed by multimodal humour
- Metapragmatics of multimodal humour
- Core pragmatic concepts (e.g. implicature or presupposition) in humorous multimodal discourse
- Socio-pragmatics of meaning-making in new forms of multimodal humour

# Comparisons of Address Practices in East Asian Languages

## Panel

**Dr. Yoko Yonezawa<sup>1</sup>, Dr. Narah Lee<sup>2</sup>, Dr. Xiangdong Liu<sup>3</sup>**

***1. Victoria University of Wellington, 2. University of Queensland, 3. Western Sydney University***

One of the key themes of studies in human interaction across different linguistic communities has been to explore how people address each other. In addition to simply indicating the referent as an addressee to whom the speaker is speaking, the choice of address terms tells us more about interpersonal relations in a society and its social structure which is deeply rooted in its social history. While aspects of address practices have universal relevance, careful cross-linguistic and cross-cultural studies are crucial for our deeper understandings of the field.

Numerous studies of address terms have focused on European languages since the classic literature of Brown and Gilman (1960), and a number of recent researchers have been exploring languages in other areas such as Southeast Asia (e.g., Enfield 2007; Djenar 2008). Interestingly, however, comparative studies of address terms in languages of Northeast Asia are substantially missing despite independent studies on individual languages not being rare. This panel will contribute to filling this gap by presenting the comparative research on the socio-cultural influences on address practices in Northeast Asian languages.

One of the linguistic characteristics of address practices that Chinese, Japanese, and Korean have in common is to show the speaker's respect towards a superior, which is often based on social hierarchy or the interlocutors' relative age. Cultural and sociolinguistic analyses often explain this tendency as the influence of Confucian cultural values (e.g., Richey 2013). While our panel tackles how this characteristic is realised in the actual use of terms of address in the three languages, at the same time, based on our analysis, we argue that there have been changes in these societies and their values, and these changes are reflected in the address practices.

In this panel, the first three papers will present the results of surveys in Chinese (Xiangdong Liu), Japanese (Yoko Yonezawa), and Korean (Narah Lee), that investigated how speakers of each language address people in different settings and contexts. The papers also include a discourse analysis of spoken corpora to expand on and make visible the actual practices of address terms in the three languages which are outlined in the survey results. The fourth paper focuses on the Korean address form *ce*(Xi Chen & Jungmin Lee), which explores the specific ways that Korean native speakers connect their knowledge of a self-address form *ce* to their understanding of its contextual meanings.

# Complex syntax-for-conversation across languages: Grammar, sequence and multimodality

Panel

***Prof. Yael Maschler<sup>1</sup>, Prof. Jan Lindström<sup>2</sup>, Prof. Simona Pekarek Doepler<sup>3</sup>***

*<sup>1</sup> University of Haifa, <sup>2</sup> University of Helsinki, <sup>3</sup> University of Neuchâtel*

Based on increased concern with language use – and specifically with language use in social interaction – the past two decades have witnessed a sea-change in our understanding of grammar. Grammar is no longer dominantly seen from a “bird’s eye view” (cf. Hopper 2011) as an autonomously structured inventory of items and abstract combination rules, but is increasingly understood as a usage-based, temporal, and ever-adaptive resource for people’s conducting themselves in the social world (e.g., Hopper 1987, 2011; Hakulinen 2001; Thompson 2002; Tomasello 2003; Auer 2009; Bybee 2010; Fox & Thompson 2010). We know from existing research that grammatical patterns are instrumental in the accomplishment of social actions and the management of generic organizational principles of social interaction such as turn-taking or repair; we also know that these very same grammatical resources can serve the purpose of projecting (anticipating what comes next) or back-linking (relating back to what precedes), thereby contributing to warrant progressivity and mutual understanding in social interaction. Yet, existing research on how grammar works as a resource for social interaction has so far, with a few exceptions (see the papers in Laury & Suzuki 2011; Laury, Etelämäki & Couper-Kuhlen 2017, and Maschler, Pekarek Doepler, Lindström & Keevallik 2020), analyzed syntactic patterns below the clause level, and has only recently started to investigate how grammar interfaces with participant’s bodily conduct for local meaning-making in interaction.

The present panel seeks to fill these gaps by exploring the ways in which patterns of complex syntax – that is, syntactic structures beyond a simple clause – relate to the local contingencies of action formation in social interaction, and how they are inextricably intertwined with participants’ nonverbal (prosodic and embodied) conduct. Contributions to the panel investigate Emergent Grammar (Hopper 1987) from two aspects: (1) the on-line emergence of clause-combining patterns (such as ‘main’ & ‘subordinate’ clause patterns) as they are ‘patched together’ on the fly in response to local interactional contingencies (e.g., lack of recipient response); (2) the routinization and sedimentation of clause-combining patterns into new grammatical patterns (e.g., complement taking predicate constructions, relative clause constructions, pseudo-cleft-like constructions, or parts thereof) to serve a range of interactional purposes (e.g., projecting what comes next) in a variety of languages – English, Estonian, French, German, Hebrew, Italian, Japanese, Mandarin, Swedish. Presenting multimodal analyses of complex syntax-for-conversation across a range of languages from different language (sub-)families, the contributions to this panel cumulatively enrich our understanding of how grammars are used and may have evolved in response to local interactional needs within the multimodal ecology of social interaction.

---

# Conflict and language socialization on preschool interactions

---

Panel

---

***Dr. Carolin Demuth***<sup>1</sup>

1. Aalborg University

Conflicts constitute an important part of the teaching-learning process and are a crucial part of educational practices. Children need to learn how to carry out, manage and avoid conflict in negotiating their social worlds with others. Preschools are a learning environment in which many children for the first time encounter conflicts with persons outside of their immediate family – i.e. with peers who may have immediate desires, feelings, and interests that diverge from their own (Moore & Burdelski, 2020) but also with preschool teachers which requires do negotiate own interests within a culturally organized power-asymmetry relationship. Appropriate ways of how to handle conflict need to be understood within a specific cultural-historic context as practice within a community of learners (Rogoff, 1994). Children need to learn to engage in conflict both in situationally and culturally specific ways (Moore & Burdelski, 2020; M. H. Goodwin, 1990).

Studying how children are socialized toward conflict management in every day preschool interactions in diverse cultural contexts promises to be a fruitful avenue to better understand the underlying processes of human development. This symposium aims to bring together international scholars studying conflict socialization practices in preschools in different societies. The individual presentations work within the Language Socialization paradigm (Ochs & Schieffelin, 1984) and draw on ethnomethodologically informed Conversation Analysis/Discursive Psychology with a focus on embodied aspects of interaction and Multi-modal Video Analysis (Goodwin, 2000, 2013). Together, they aim at providing important and novel insights into the interactive processes through which culture is created and maintained in and through socialization practices.

Key-words: preschool; conflict, language socialization, conversation analysis, ethnomethodology, discursive psychology.

# Connectives and Interactional Functions: A Cross-linguistic Analysis

---

Panel

---

**Dr. Minju Kim<sup>1</sup>**

1. Claremont McKenna College

Recent studies have demonstrated that across different languages, connectives that combine clauses have come to perform interactional functions in turn-initial or turn-final position. Many subfields of linguistics have examined this phenomenon under different names (e.g., grammaticalization, (inter)subjectification, and insubordination) since it provides a fascinating locus where the dynamic interplay between usage and grammar can be investigated (Beeching and Detges 2014, Brems et al. 2014, Evans and Watanabe 2016:2). This panel presents four studies that investigate the interactional functions of connectives.

Based on the current literature, we can draw some general conclusions about cross-linguistic similarities and differences in the interactional functions of connectives. First, due to the shared semantics of connectives, their interactional functions can show similarities despite their typological differences. For instance, English *or* (Drake 2015), Swedish *eller* “or” (Lindström 1997), and Korean *tunci* “or” (M. Kim 2018) can all function as a marker of the speaker’s non-imposing stance in turn-final position. (e.g., “Would you like to go to the movies or?”), and turn-final uses of English *but*, Japanese *kedo*, and Korean *nuntey* express a contrastive implication that is “left hanging for the listener to construe” (e.g., “I don’t mind going with you but” Mulder and Thompson 2008:186, Park 1998). Second, due to difference in sentence structures (e.g., SOV vs. SVO), the position of the connectives whose interactional functions are comparable can be different. *And*-prefaced questions in English (Heritage and Sorjonen 1994) and turn-final *ko* ‘and’ questions in Korean (M.S. Kim 2015) carry similar interactional functions. Lastly, the similarities in the interactional functions of connectives are especially prominent in typologically related languages. For instance, Korean *nikka* “because” (Rhee 2012) and Japanese *kara* “because” (Ohori 1995) express logical assertions, translatable as “you know”, and Korean quotative marker *ko* (Sohn 1996) and Japanese *to* (Hayashi 1997) encodes the emphatic meaning of “I’m saying”. In Germanic languages, the complement clause (English *that*, German *daß*, Dutch *dat*, Swedish *att* and Danish *at*) can express the speaker’s disbelief and surprise (e.g., “That I should live to see such ingratitudo!” Evans 2007).

As Mulder and Thompson (2008:200) and others have stressed, more cross-linguistic studies on this topic are needed, especially those that use natural conversation data. Contributing to this line of inquiry, this panel presents four cases studies drawing from three languages, namely Korean, Japanese, and German.

# Constructing Professional Identities in Transitional Contexts in Japanese Society

## Panel

***Prof. Andrew Barke<sup>1</sup>, Prof. Haruko Cook<sup>2</sup>***

*<sup>1</sup>Kansai University, <sup>2</sup>University of Hawaii at Manoa*

This panel empirically explores how linguistic resources are chosen and utilized to construct new professional identities in transitional social contexts in Japanese society.

The topic of “identity construction” has been widely researched in the fields of sociolinguistics, pragmatics, CA, linguistic anthropology, and other related fields. The large body of research has demonstrated that “identities” are socio-cultural and relational phenomena that are situated and emergent (Bucholtz & Hall, 2005; DeFina, Schiffri, & Bamberg 2006), and change over time (Pierce, 1995). Much of the Western scholarship has investigated how professional identities are constructed, negotiated, and/or maintained in institutional and workplace settings, as the construction of appropriate professional identities is crucial in balancing power relations among co-workers in these settings (Angouri & Marra 2011; Baxter 2008; Holmes, Stubbe, & Vine 1999; Holmes 2006; Rees & Monrouxe 2010). These studies have found that professional identities are “dynamically and constantly constructed and negotiated by interlocutors” in interaction (Schnurr & Zayts, 2011:42), with a single individual able to construct a multiplicity of identities, often concurrently.

Studies that have examined Japanese workplace discourse in naturally occurring settings, on the other hand, are still relatively few in number, but they have demonstrated that a variety of linguistic resources are deployed to construct the “right” workplace identities for specific interactional moments (e.g., Cook & Shibamoto-Smith 2018). For example, female professionals in managerial positions use polite directives to construct displays of power (Shibamoto-Smith 1992; Takano 2005), and male employees tend to utilize humor and laughter to display their power (Murata 2018).

In the Japanese sociolinguistic literature to date, however, little research has been carried out that specifically examines the issue of professional identity construction in life-transitional periods. The investigation of professional identities in times of transition is particularly interesting in Japanese society because often the boundaries between different life-phases are quite distinct. For example, unlike in Western societies where the boundaries between formal education and work has become blurred (Roberts 2010), in Japanese society the boundaries are still clearly marked by the change of identity from *gakusei* ‘student’ to *shakajin* ‘mature, contributing adult’ and changing workplaces is not considered as normative.

This panel brings together scholars carrying out empirical research on the construction of new professional identities in transitional contexts in Japanese society and explores factors and processes that result in the construction of new professional identities. Specifically, the panel addresses the following research questions:

- At the time of transitions in life, how are new professional identities (co-)constructed in interaction and/or in narrative?
- What kinds of ideologies influence the process of constructing a new identity?
- What sort of linguistic resources are mobilized to construct a new identity?

# Contrastive corpus approaches to pragmatic markers: variation in use, translation issues and pedagogical applications

Panel

***Prof. Gisle Andersen<sup>1</sup>, Ms. Sara Gesuato<sup>2</sup>, Prof. Maria Teresa Musacchio<sup>2</sup>***

*1. NHH Norwegian School of Economics, 2. University of Padua*

Pragmatic markers (PMs) express interactional or textual, rather than referential, meanings. They signal how utterances are to be understood from an interpersonal or discursive point of view, by indicating, respectively, the speaker's/writer's attitude towards the content being conveyed or its logical connection to the co-text. Being semantically opaque and polysemous, they are hard to describe in lexico-grammatical terms, challenging to capture for non-native speakers and difficult to translate.

In this panel we present findings from studies of PMs conducted from a contrastive and/or corpus-informed perspective in oral and written discourse and across a number of languages. More precisely, we explore the following domains : 1) variation phenomena in PM usage, 2) the role of PMs in conversation; 3) the relevance of PMs to specific kinds of discourse; 4) the degree of equivalence of PMs in multilingual corpora, and 5) the use of PMs by native and non-native speakers.

- 1) We start by considering how PMs are used in language contact situations, that is, among English-Spanish bilingual speech from Gibraltar, by German/Italian-speaking children in South Tyrol, as well as among mono- and bilingual speakers of German in Germany, and heritage speakers of German in the US.
- 2) We next analyse how PMs can serve to handle spoken interaction; in particular, we consider the use of stance markers by EFL learners from different linguistic backgrounds use; the use of the interactional particle “ne” by Japanese learners in spontaneous conversation, and the patterns of use of two topic-introducing PMs: English “speaking of X” and Chinese “huashuo”.
- 3) We further explore the functions of English PMs in these registers: LSP vs LGP; fictional vs spontaneous vs improvised drama dialogue; and in instructors’ vs students’ university discourse.
- 4) We proceed to examine the degree of semantic and textual similarity of PMs occurring in parallel corpora (Dutch vs English, and English vs Italian), including non-verbal ones (in Greek, Russian, Turkish, German and American English).
- 5) We conclude by discussing similarities and differences in the how PMs characterize L1 and L2 oral discourse (in French and Chinese) and written discourse (in English).

Our panel illustrates how PMs may be examined in their co-text, adopting a form-to-function approach, and comparing and contrasting their use across genres, registers, languages and language varieties, in L1 and L2 communication. We also explore pedagogical applications of our research.

# Contrastive Study for Considerate Expressions

## Panel

***Dr. Masaki Yamaoka<sup>1</sup>, Dr. Naomi Koda<sup>2</sup>***

*1. Soka University, 2. Tohoku University*

We have engaged in the research project adopted for the Japanese Kakenhi (Grants-in-Aid for Scientific Research) since 2018. We aim to collect vocabulary and phrase of “considerate expressions” and sentence examples from Japanese corpus, and to construct the database to prepare for future considerate expressions dictionary compilation. We have collected about 150 words and phrases in Japanese now.

We assume that “considerate expressions” is a universal linguistic category, so we can observe it not only in Japanese but also in other languages. Therefore, we are trying to describe the counterparts in English, Chinese, Korean and Arabic. In this panel, we would discuss the aspects of considerate expressions in these languages and would establish the basis of a contrastive study on them.

In current research of Japanese linguistics, our interests in a category called “considerate expressions” are increasing. This topic is closely related to politeness. As is well known, politeness is a context-dependent interpersonal regulative act that is not inherently fixed to a specific linguistic form. In Japanese linguistics, however, it has been pointed out that specific words and phrases seem to perform politeness function as a second or third sense of the word. For example, a degree adverb *chotto* means low degree in an ordinary sentence like (1):

(1)*Kyo wa chotto samui.* (It is a little cold today.)

But this adverb is often used not as a degree adverb but as just a hedge for negative politeness in interpersonal communication. For example, (2) is a refusal against the application of debt:

(2)*Sono kingaku wa chotto muri desu.* (I cannot lend you such a high mount.)

In (2), *chotto* do not have any logical sense, since refusal does not show degree, unlike (1). The speaker is more likely to use *chotto* just to relieve the awkwardness of refusal. In other words, *chotto* plays a role of negative politeness to a typical FTA in this sentence. The usage of *chotto* like this appears repeatedly in similar FTA contexts. And the frequent occurrence of similar contexts causes the conventionalization of politeness function. As a result, the politeness function is recognized a new sense of *chotto*, then, we can find it in the item of *chotto* of the latest version of Japanese dictionary.

Similarly, a well-known phrase when giving a gift “*tsumaranai mono desu ga*” (This item is a low value.) is also one of the considerate expressions which is conventionalized of a kind of negative politeness to avoid condescending.

We can observe such a conventionalization of politeness in other languages. For example, in English the phrase “Can you~?” means originally a question about the hearer’s ability, but it is generally recognized as a request expression. It seems that a conventionalized politeness expression to avoid direct request as an FTA. Similarly, Chinese request expression “Néng bùnéng~?” is also a considerate expression derived from a question about the hearer’s ability. Therefore, it is necessary to describe “considerate expressions” as a universal phenomenon that transcends individual languages.

---

## Conversational Practices of Companions in Healthcare and other Professional Encounters

---

Panel

---

***Prof. Charles Antaki<sup>1</sup>***

***1. Loughborough University***

This proposed Panel will chart how companions support people who have difficulty in communication. When a person with dementia, or intellectual disability, needs to speak with a doctor, welfare worker or teacher, they rely on their wishes being communicated by a companion. That may be a family member, friend, or a professional support worker. But the companion has to gauge what to say, and when, in giving what can be very intimate and personal information. We want to gather together research on the problems they face, and move forward with a systematic understanding of what they do.

We are specifically interested in the very close details of interaction, and we will work only with natural data, video-recorded in routine settings. Initial sets of data have already been collected, but are dispersed among different research groups in different countries, and their analysis has not yet been systematised. We will bring their findings together and find commonalities and differences among the communicative practices that different research groups have identified.

The Panel will be open to others to join, but we already have a core set of intended presenters. We will concentrate on companions' work with four groups: those with dementia; with intellectual disability; those receiving end-of-life care; and school pupils on the autistic spectrum. These are the groups whose companions have been most closely studied in what is still an emerging field.

Panellists use the sophisticated methods of Conversation Analysis (CA), backed up by ethnographic notes of the particular contexts in which the data were collected. We will report on these questions: how and when do companions choose to intervene? What part does the practitioner play in selecting the companion, rather than the service-user, to speak? How does the companion seek confirmation of what they say from the service-user? Are there systematic practices across different domains (is the work of the companion the same when they are family members or professionals? Is helping a person with dementia the same as helping a person with intellectual disability? How do companions manage the dilemma of speaking for someone, yet not imposing their own views? How does the person being accompanied affirm, correct or resist the interventions of their companion?

# Cross-cultural Pragmatics: Multiple Perspectives and Methodologies

## Panel

***Prof. Juliane House<sup>1</sup>, Prof. Daniel Kadar<sup>2</sup>***

*<sup>1</sup>. University of Hamburg, <sup>2</sup>. Dalian University of Foreign Languages*

The aim of this panel is to provide innovative explorations in the field of cross-cultural pragmatics, by involving contributors who approach language and culture in a predominantly bottom-up and corpus-based way. While cross-cultural pragmatics has been a popular area in pragmatic research for a long time, we believe that it is a timely endeavor to reinvigorate the field by bringing together new research that approaches cross-cultural pragmatics from multiple perspectives and by using a variety of methodological approaches, including modern technologically-informed ones. Such a multiperspectival and multimethod take on cross-cultural pragmatics seems for us to be important for various reasons. Firstly, it can help us to move beyond traditional essentialist views of language and culture, and also to identify conventionalised, linguaculturally situated patterns of language use from innovative angles. Secondly, through such an approach, innovative research methodologies can be brought to the contrastive analysis of expressions, speech acts and discursive practices. Thirdly, bringing various strands of research together can contribute to forging synergies between cross-cultural pragmatics and other areas of pragmatic inquiry.

The proposed panel includes various contributors who already confirmed participation – we outline the names of these contributors and the area of research they plan to cover in the talk below this summary of the panel. Note that this is an open call for contributions and we definitely welcome other relevant contributions. We particularly encourage researchers working on areas not covered in the list of topics below to submit an abstract. The panel organisers plan to publish the paper version of the contributions as a special issue in a high-impact journal.

Confirmed contributors in an alphabetical order and themes they plan to cover:

Karin Aijmer Evidentiality and corpus pragmatics

Rong Chen, Lin He, Ming Dong Face and metapragmatics

Anita Fetzer and Elda Weizman Language and politics

Kerstin Fischer and Yoshiko Matsumoto Pragmatics and computers

Michal Hamo and Zohar Kampf Ethics, morality and news analysis

Daniel Z. Kadar and Juliane House The pragmatics of ritual and expressions

Songthama Intachakra The pragmatics of lying

Meredith Marra and Janet Holmes Language and workplace

Shigeko Okamoto Language and gender and translation studies

Christine von Stutterheim Language typology and empirical process-oriented research

Ren Wei L2 pragmatics

# Cross-linguistic approaches to requests for confirmation

Panel

***Dr. Katharina König<sup>1</sup>, Dr. Martin Pfeiffer<sup>2</sup>***

***1. WWU Münster, 2. University of Freiburg***

In recent years, question-response sequences have been studied widely in cross-linguistic interactional research (Enfield et al. 2019; Enfield et al. 2010). While these large-scale studies yield interesting results, e.g. in terms of overall distributional differences of various question and answer types, to date little is known about cross-linguistic similarities and differences in the formatting of particular question-response pairings. Request for confirmation sequences constitute a promising field of study in this endeavor as they play a central role in documenting what speakers assume to be relevant information for the ongoing interaction and in negotiating epistemic rights and access at the same time (Bolden 2010; Seuren & Huiskes 2017; Heritage 2012; Pomerantz 1988; Raymond 2010).

Bringing together contributions on the use of requests for confirmation in different languages, the panel will address the following research questions:

- How do languages differ in the design of request for confirmation sequences? Which linguistic resources are used to mark an utterance as a request for confirmation?
- (How) are RfCs distinguished from other related social actions (such as requests for information, requests for affirmation, requests for clarification or requests for re-confirmation/newmarks) in different languages?
- Are there differences in the distributional patterns of answer possibilities? Which role do multimodal resources play in doing confirmation or disconfirmation?
- Which conversational activities lend themselves to RfCs? In which overall communicative projects are RfCs embedded?
- In which way are RfCs anchored in prior talk or nonverbal actions?

Papers in the panel will include contributions from the scientific network “Interactional Linguistics – Discourse particles from a cross-linguistic perspective” funded by the German Research Foundation as well as individual papers by other invited scholars working in the field.

# Diachronic pragmatics: New perspectives on spoken English from the twentieth century to today

## Panel

***Dr. Elisabeth Reber<sup>1</sup>, Prof. Andreas Jucker<sup>2</sup>***

*1. Ruprecht-Karls-Universität Heidelberg / Julius-Maximilians-Universität Würzburg, 2. UZH Zürich*

Until recently, diachronic pragmatics had to rely on written data to explore changes of usage patterns across time. But in the meantime, new tools have become available to make it possible to trace language change and the development of usage patterns on the basis of actual spoken language at least for the relatively recent past. These tools include archives of audio and video recordings going back to the middle of the twentieth century (parliamentary discourse, audio and video broadcasts of chat shows, presidential press conferences and the like) and various corpora containing transcriptions of actual spoken language going back several decades (e.g., Corpus of Contemporary American English – Spoken, 1990-2019; The TV Corpus, 1950-2018; The Movie Corpus, 1930-2018). All these tools offer new and exciting research perspectives for diachronic pragmatics.

This panel, therefore, presents contributions that combine a diachronic pragmatic perspective with an interest in spoken English and its recent changes, and by doing so explores the potential of these new tools. The research areas include:

- Recent changes in discourse conventions and action formation
- Recent changes in interpersonal interaction (patterns of im/politeness)
- Recent changes in patterns of linguistic structure, and patterns of interaction
- Recent changes in discourse marker usage, interjections and hesitation phenomena

The contributions to this panel offer a careful assessment and critique of the new tools. They explore the extent to which the tools can deliver what they promise and how they can help us to get a better understanding of recent developments of spoken language.

## Digital speech acts in social media

---

Panel

---

***Prof. Zhuo Jing-Schmidt<sup>1</sup>***

*1. University of Oregon*

Language use in social media is an integral part of contemporary digital culture in its various global and local contexts. Research on digital communication in social media is nascent and still limited in scope. Consequently, many questions, both theoretical and empirical, remain unanswered and await in-depth exploration.

This 90 minute interdisciplinary panel aims to explore how language use in social media performs various social acts including but not limited to identity construction, play and self-expression, political activism and advocacy, as well as aggression and violence. Researchers who are interested in and concerned with the discursive, social, technological, political, psychological, behavioral, legal and other aspects of digital speech acts in social media are invited to participate. The panel presentations are intended to address emerging forms and functions of digital communication using verbal, graphical and multimodal devices in various social media platforms across and among languages and cultures in order to shed light on the socio-pragmatic, socio-technological as well as socio-psychological factors that shape the typology of digital speech acts and the real world consequences of these performative acts for individuals and societies. We believe the panel will spurt exciting discussions on creative research topics and innovative research methods and facilitate the exchanges of ideas, data sources, and analytical tools in this budding domain of interdisciplinary inquiries.

The panel will feature brief oral presentations and a Q & A session and group discussion.

---

# Digitalizing social practices

---

## Panel

---

**Ms. Elisabeth Kristiansen<sup>1</sup>, Prof. Gitte Rasmussen<sup>1</sup>**

**1.** University of Southern Denmark

An ever-increasing number of everyday social practices are ‘digitalized’, that is, adapted and transformed to suit online modes of communication. The digitalization processes are spreading even more rapidly as a result of the current pandemic which renders it not only convenient but necessary or even required by law to carry out the above-mentioned activities from our homes.

Increasingly, digital systems structure and regulate many of the things we do, whether in schools, hospitals, workplaces, or as private citizens. They do so in new and non-negotiable ways, pre-determining what actions we can perform and how, and in the process creating a permanent record of everything we do, which can subsequently be used to change the online practice in accordance with the interests of their providers. It is therefore crucially important to take stock of these changes in the semiotic landscape, and to research their impact on contemporary life. The Velux funded research project RESEMINA (The digital (re)semiotization of buying/selling interaction), based at the University of Southern Denmark, investigates this issue in relation to shopping practices online and in physical shops, using multimodal social semiotics (Kress & Van Leeuwen, 2001; Van Leeuwen, 2015) and multimodal ethnomethodological conversation analytic (Hazel, Mortensen, & Rasmussen, 2014; Mondada, 2014) approaches.

To broaden our understanding of digitalization as a phenomenon, the panel investigates how digitalization processes affect social practices in various settings. The panel contributions investigate social practices from a range of different settings that have undergone or are undergoing digitalization, including but not limited to medical, educational and business settings. Each panel contribution investigates in what ways digital social practices are similar to or differ from their face-to-face counterparts and discusses the implications of this for users and participants in terms of access, choice, accountability, etc. The panel contributions use different methods and have different research aims and interests, but they all focus specifically on empirical data and analysis of social practices.

# Discourse Perspectives on Risk and Responsibility

---

Panel

---

**Prof. Jan-Ola Östman<sup>1</sup>, Prof. Catharina Nyström Höög<sup>1</sup>, Prof. Annelie Ädel<sup>1</sup>**

1. Dalarna University

The panel *Discourse perspectives on risk and responsibility* brings together scholars from different fields of research who have investigated risk communication, where aspects of responsibility are an important ingredient. Responsibility is central in risk communication. For example, in relation to evacuation signs, official agencies or collectives are typically responsible for posting relevant warning designs, individuals are most often themselves responsible for following relevant directives, but challenged people will typically need the help of responsible carers. The distinction between moral and legal responsibility, or that between individual and collective responsibility (cf. Östman & Solin 2016), are not always clear, which may have dire consequences in emergency situations.

The panel participants will be working jointly toward achieving a deeper knowledge base for understanding how discourse (including pictures, symbols, colors; cf. Forceville & Kjeldsen 2018) affects people's dispositions to take in and make use of information about risks and security in their everyday lives. The panel furthermore seeks to address the "ontology" of risks and security: Do risks even exist before they are deemed as such (cf. Rasmussen 2013), is (non-)risk distribution as important as wealth distribution in late modern societies (cf. e.g. Boholm 2018), to what extent is our late modern "risk society" a mere theoretical construct (cf. Candlin et al. 2016)?

The panel approaches the communication of risk from a broad perspective, including what policies and attitudes lie behind specific information that guides the public, and how efficient this information is. This entails bringing together researchers working on questions related to (a) risk and security; (b) ideology and responsibility; and (c) multimodality.

Panel presentations approach these questions from a variety of pragmatically oriented approaches and with different methodologies, such as linguistic landscape analyses, multimodal CDA, appraisal analysis, conversation analysis, narrative analysis, cognitive linguistics and metaphor theory, construction grammar, cross-cultural comparison and (psycho)linguistic experimentation. The panel covers different types of data to shed light on the communication of risk, including public signs, focus-group discussions, call-center interactions and video instructions based on machine translation.

# Discourses of discrimination: Language aggression in the construction of otherness

Panel

**Prof. Marianthi Georgalidou<sup>1</sup>, Dr. Angeliki Alvanoudi<sup>2</sup>**

*1. University of the Aegean, Department of Mediterranean Studies, 2. Aristotle University of Thessaloniki*

***Organizers:***

***Marianthi Georgalidou, University of the Aegean, Greece***

***Angeliki Alvanoudi, Aristotle University of Thessaloniki, Greece***

***Discussant: Maria Sifianou, University of Athens, Greece***

The dynamic nature and the multiple facets of identity constructions have become a widely discussed parameter in discourse analysis and social sciences. Identities being interactional constructs are negotiated via discursive choices of speakers/authors who construct self and audience as members of social categories. Identity work involves processes of othering, that is, the portraying of a person or group of people as intrinsically different from and alien to oneself. The construction of *otherness* is a key element of discriminatory discourses that underlies a multitude of institutional and non-institutional genres. Despite the institutional and legal recognition of the inherent dignity and the inalienable rights of all members of society[1], discourses of rejection and hatred addressed to persons based on race, gender, sexual orientation, religious and political affiliation still prevail in different modes of interaction in the Third Millennium. Some recent studies on the topic are Bou-Franch & Garcés-Conejos Blitvich (2014), Culpeper (2011), Georgalidou, Frantzi & Giakoumakis (2020), Hatzidakis (2020), Jane (2017), Karachaliou & Archakis (2015), Musolff (2019) and Sifianou (2019).

In this context, the main goal of the proposed panel is to examine various facets of discriminatory discourses connected to aspects of *otherness* in the identity of the attackees. We are interested in the sociopragmatic analyses of data coming from various genres including political/parliamentary discourse, the press, legal and medical texts as well as digital communities of practice and polylogic conversations. Our research aim is to critically examine direct and indirect verbal discriminatory discourses in the said variety of contexts for their potential to create divisions among speakers/authors, immediate recipients, and audiences. Inspired by this year's theme that invites us to consider a *pragmatics and linguistics of inclusion*, the panel explores how sociocultural diversity is deployed as a negative category/vehicle for legitimizing oppression in spoken and written discourse. The panel brings together scholars working across different frameworks such as ethnography and discourse analysis, critical discourse analysis, conversation analysis and im/politeness theory.

# Doing participation in child talk and interactional synchronicity

Panel

**Dr. Birte Arendt**<sup>1</sup>, **Prof. Ines Bose**<sup>2</sup>, **Prof. Kati Hannken-Illjes**<sup>3</sup>

**1.** Universität Greifswald, **2.** Universität Halle-Wittenberg, **3.** Universität Marburg

Participation is a fundamental concept on the macro level of society as well as for the micro level of interaction. This holds especially true for the current discussion lines on child discourse (Dobrick 2016). The proposed panel focusses on the micro level that is on practices on participating and taking part in child-child and child-adult interactions. However, even with the focus on a micro level, the conceptual as well as analytical perspectives are heterogeneous (Forrester 2017). Our entry point into the debate is, that the multimodal negotiation and accomplishment of synchronicity constitutes a central method to allow for and demonstrate „taking part“. The non-linguistic interactional means include synchronizing of prosodic parameters and bodily action (Kim 2015), the linguistic means of accomplishing participation are among others the co-construction of similar forms on different linguistic level (Breyer et al. 2017).

On the one hand, the interest in aiming for conformity among participants has been long standing in developmental theory (Tomasello 2009), as well as in research informed by conversation analysis by studying rhythm (Breyer et al. 2017), synchronicity (Kim 2015), resonance and repetition (Tannen 1987) in interaction. On the other hand, studies on these practices for child-child and child-adult interaction have been scarce (Keenan 1977, Papoušek 1994). However, the issue has not been entirely unstudied in the recent years; some studies have looked into the establishment of synchronicity in child-child interaction (Arendt/Zadunaisky Ehrlich 2020, Hannken-Illjes/Bose 2019, Bose et al. 2016, Cekaite/Aronsson 2004, Corsaro/Maynard 1996) and child-adult interaction (Rohlfing/Nomikou 2014) on different levels of interaction and language use. By bringing together the interests in synchronicity as related to the establishment of participation we focus on the interactional practices of children. This seems especially relevant, as peers function as crucial instances of socialization (Cekaite et al. 2014).

The papers of this panel analyze the negotiation and achievement of participating through the construction of similarity and synchronicity in child discourse. The methodological backgrounds are foremost in interactional linguistics but are not confined to this stream of study.

The questions we address are:

1. How are context and forms of synchronicity coupled and what functions do they serve?
2. How can similarities through synchronization to establish interactive participation be studied and analyzed?
3. In what way do the concepts of similarity, synchronization, mimesis, mirroring etc. overlap and differentiate?
4. What kind of link between the macro- and micro-notion of child participation can be described by analyzing direct interactions?

# EM/CA and Social Change: Addressing race and racism in EM/CA research and teaching

## Panel

***Dr. Maria Eleonora Sciubba<sup>1</sup>, Dr. Natasha Shrikant<sup>2</sup>***

*<sup>1</sup>. Tilburg University, <sup>2</sup>. University of Colorado, Boulder*

The murder of George Floyd and the uptake of the Black Lives Matter movement worldwide has confronted EM/CA scholars with questions about the ways whiteness is embedded in EM/CA theory, method, and pedagogy. Although Sacks' (1984; 1986) work did highlight ways that EM/CA can study the relevance of race and racism in interaction, only a handful of scholars have used EM/CA approaches to do so (e.g., Rawls & Duck, 2020; Robles, 2015; Shrikant, 2018a, 2018b, 2020a; 2020b; Stokoe & Edwards, 2007; Whitehead, 2017; 2020; Whitehead & Lerner, 2009). These studies highlight the strength of EM/CA theories and methods to analyze how macro processes like "racism", "discrimination", or "resistance" occur in mundane, interactionally specific ways. Despite the fact that EM/CA *can* be used to study these issues, and other forms of *-isms*, these issues are often positioned (through teaching, in data sessions, and by some scholars) as tangential to 'mainstream' EM/CA work. The purpose of this panel is to provide a public platform to a) interrogate the pervasiveness of whiteness in EM/CA and b) to propose ways to enact social change – particularly in regard to race and racism – in EM/CA research and teaching.

To that end, we request three 90 minute sessions:

1. A roundtable inviting panelists and audience to discuss the past, present, and future of EM/CA as it relates to addressing or ignoring questions of race and racism.
2. A research panel inviting papers that extend EM/CA theorizing to address questions of race, ethnicity, and inequality.
3. A research panel inviting empirical papers that illustrate the utility of using EM/CA to study race and racism as it occurs in different cultures and countries.

Potential topics include, but are not limited to:

- Ways in which 'whiteness' is embedded into EM/CA theorizing;
- Ways in which 'whiteness' pervades pedagogy – in the classroom or during data sessions;
- How EM/CA can be used to analyze traditionally conceptualized 'macro' processes, such as resistance, identity, race, or activism;
- How EM/CA theorizing can be extended through centering studies on minoritized groups in different cultures and countries;
- EM/CA studies that document the variety of overt and implicit ways that racial, ethnic, or cultural identities are made relevant in interaction.

# Emancipatory Pragmatics: Reconsidering Context in Terms of the Emergence and Dissolution of Distinct Categories in Communicative Interaction

---

Panel

---

***Dr. Scott Saft<sup>1</sup>, Dr. Sachiko Ide<sup>2</sup>, Prof. Yoko Fujii<sup>2</sup>***

*1. University of Hawaii at Hilo, 2. Japan Women's University*

Emancipatory Pragmatics (EP) is an area of Pragmatics that endeavors to develop inclusive research perspectives based on findings from non-western languages. As part of its program, EP research has proposed an innovative approach to context that is based on *ba*-theory (Hanks et al. 2019). Unlike most western approaches, *ba*-theory does not assume an *a priori* distinction between an individual self and other aspects of context. All aspects of context begin as indistinguishable from one another in what is described as “an ontology of mutual dependence, impermanence and ultimately non-separation” (Hanks et al. 2019: 64). It is only through social interaction that distinctions and categories emerge. Likewise, it is in communication that these same distinctions may dissolve. *Ba*-theory therefore offers an unequivocally dynamic approach to communication that prompts analysts to describe the practices that result in the construction and dissolution of distinctions that are normally taken for granted. Such distinctions include the self and the other but also may be specific relationships such as teacher-student, parent-child, and employer-employee, all of which constantly fluctuate in communicative interaction.

Thus far, EP researchers have made efforts to apply the *ba*-theory approach to context to data from both Japanese and Hawaiian (Hanks et al. 2019; Fujii 2019; Ide 2019; Saft 2019; Ueno 2019). Ueno (2019), for instance, focuses on questions as a communicative practice that not only results in the emergence of the categories of “teacher” and “student” but also leads to the dissolution of a self-other distinction because the participants remain in a merged, interdependent teacher-student relationship. Moreover, the idea of non-separation helps explain why the usage of certain pronoun forms in Hawaiian greetings function to reinforce a state of non-separation between speaker and recipient at the level of social interaction (Saft 2019). In addition, EP work has applied the *ba*-theory framework to interaction involving speakers of English, demonstrating how individual selves emerge and at the same time how those selves dissolve into a mutually interdependent familial relationship (Hanks et al. 2019).

This panel will continue considering language practices in Japanese, Hawaiian, and English, but one of the major goals of the panel is to extend application of this approach to context by concentrating research on languages that include Korean, Thai, Mandarin, Libyan Arabic, and Persian. The presentations will probe diverse linguistic situations that examine language practices situated in context with a focus on descriptions of how various distinct categories emerge and dissolve in social interaction. Doing so will enable the panel to work toward the ultimate EP goal of understanding how people throughout the world employ language to construct and manipulate the categories that constitute our social world.

---

# Emotion in Institutional Encounters

---

## Panel

---

**Dr. Bethan Benwell<sup>1</sup>, Dr. Jack Joyce<sup>2</sup>, Dr. Catrin Rhys<sup>2</sup>**

1. University of Stirling, 2. Ulster University

This panel brings together scholars investigating how emotion and institutional concerns are interwoven in talk-in-interaction. It assembles interactional studies which address: (1) how we understand emotion in institutional encounters (2) how emotional concerns and institutional concerns are navigated, and (3) members' orientations to personal experience as it is interactionally accomplished.

Studies of emotion in interaction treat emotion as a discursive phenomenon that is rhetorically deployed and used to construct the nature and causes of events (Edwards, 1999). Crucially, the focus is on how actions reflect peoples' emotional states, stances, and attitudes towards an issue or event (see Couper-Kuhlen, 2012), and how these are organised in interaction (see Kaukomaa et al., 2013). Investigations into common markers of emotion include (but are not limited to): certain words (Edwards, 2005), facial expressions (Kaukomaa et al., 2013), descriptions (Rae, 2008), and reaction tokens (Wilkinson & Kitzinger, 2006). We excavate how these displays are manifest in institutional interactions where service users are complaining, requesting, demanding etc., to uncover how affect can be a resource for achieving an action, but may also act as a hindrance to fulfilling the institutional remit. Service providers are expected to balance these often-competing demands, and it is this balancing which is of interest to this panel.

This panel assembles papers from scholars examining emotion in institutional encounters, specifically those which deal with action, sequence, and interactional activities across a variety of institutional contexts. The papers explore embodied displays of emotion and orientations to affect in a range of contexts including: institutional complaints, support groups, service calls, treatment recommendations, legal consultations and organisational training and appraisals. The panellists reflect on junctures where institutional concerns interact with displays of emotion, and how interlocutors balance these to act appropriately. Thus, the intended outcome of the panel is to further understand institutional encounters where sensitive concerns are manifest, and thus in conflict or agreement with, the concerns of the institution.

# Encounters between Strangers in Public Space

---

## Panel

---

**Prof. Elwys De Stefani**<sup>1</sup>, **Prof. Lorenza Mondada**<sup>2</sup>

1. KU Leuven, 2. University of Basel

Research on encounters in public space is largely indebted to Goffman's (1963, 1971) pioneering observations, which led him to coin the nowadays well-established notions of (*un*)focused interaction, civil inattention, etc. However, despite these early insights, half a century later empirical analyses of interactions between unacquainted persons are still scarce. Specifically, video-based studies of how incidentally co-present individuals start to engage in a common activity, thereby turning into co-participants, are lacking (but see Kendon & Ferber 1973; De Stefani & Mondada 2018). The contributions to this panel examine the very first moments of such encounters by focusing on i) the bodily reorientation of the participants-to-be that characterises the 'pre-beginning' (Schegloff 1979) or 'pre-opening' (Mondada 2010) of the encounter, ii) the categorisation work on which individuals base the identification and selection of the imminent co-participant, iii) the first words spoken (possibly produced as greetings; Duranti 1992, 1997; Pillet-Shore 2012), and iv) the language choices they make (in environments in which multilingualism is plausible; Heller 1982; Mondada 2018).

The speakers joining up for this panel explore these questions from the perspective of multimodal conversation analysis and interactional linguistics, thereby expanding on a classical object of investigation in these fields—i.e., openings. Although initially examined on the basis of phone calls (Schegloff 1967, 1968, 1986), early research has shown that issues of identification and recognition are fundamental in initial phases of any kind of interaction (Zimmermann 1992). In unplanned, incidental face-to-face encounters, identification and recognition work is embodied in unilateral or reciprocal sighting, bodily reorientation, the mutual approach or avoidance. Based on these situated and embodied practices, interactants-to-be categorise their prospective co-participant(s). In urban, multilingual settings, they select the possibly appropriate language(s) for the encounter at hand. It is in openings that languages and their varieties are negotiated and that the mode of the encounter (e.g., monolingual vs. multilingual) is established for the time being. Thus, the initial moments of the encounter constitute an ideal locus for examining multilingualism at work (Gumperz 1982; Heller 1982; Auer 1998; Torras & Gafaranga 2002), a phenomenon that has been addressed only marginally from the vantage point of conversation analysis. The data analysed in this panel address gatherings in public space, the organisation of mobility and multiple courses of action in diverse settings of interaction—either involving co-present individuals occupied with a 'same' activity (e.g., sitting on a bench, waiting for the bus, walking the dog), or implicating individuals approaching others with a specific intent (e.g., requesting information, selling subscriptions, handing out flyers). By focusing on the first moments of such encounters in public space, this panel addresses the foundations of co-sociality and the conditions under which pro-social encounters between strangers take place.

# Examining the inclusivity of Indigenous languages in education

Panel

***Dr. Yumiko Ohara<sup>1</sup>***

***1. University of Hawaii at Hilo***

Inclusivity remains a question within all of the major public domains of society, including education, politics, religion, media, and business. Education, for instance, is recognized as one of the most powerful social agents responsible for instilling fundamental skills, historical knowledge, identity, and language, but, at the same time, many express skepticism about who educational institutions actually serve. In the case of language, it is therefore not surprising that education is sometimes viewed as the one of the most effective tools for excluding the rights and knowledge of Indigenous communities by suppressing their languages. Examples of this language suppression abound throughout the world, including Native American languages in the United States, Sami in northern Europe, Māori in Oceania, Ainu in Hokkaido, Jejueo in Korea, and Formosan languages in Taiwan. As Wilson and Kamanā (2006:153) assert in the case of the Hawaiian language, “Those who overthrew the Hawaiian monarchy understood that banning Hawaiian as the language of public and private schooling would exterminate the language.”

Although the UNESCO declared 2019 as the year and 2022-2032 as the decade of the Indigenous languages, linguists still point to the dire situation throughout the world as half of the world’s languages are predicted to be lost within this century. In light of these declarations and predictions, this panel will examine the inclusivity of indigenous languages in the area of education. Some research findings indicate positive effects of an educational focus on the learning of Indigenous languages in terms of academic achievement (Wilson and Kamanā 2001), identity development (Nystad et al. 2017), and overall wellbeing (Taff et al. 2018), but there are numerous language situations yet to be addressed. This panel will bring together researchers and activists focusing on indigenous languages that including Hawaiian, Ainu, Jejueo, Sami, and Ryukyuan in order to consider leading questions such as: how are indigenous languages incorporated in various levels of the educational system? Are indigenous languages a part of school curriculum? If so, to what extent is it employed as a language of instruction? What is the role of the government in terms of promoting the revitalization of an indigenous language in education? To what degree is mother tongue education seen as a part of linguistic human rights? Examination of these questions will lead to a better understanding of not only the degree to which Indigenous languages are included in education but also the necessity of ensuring their inclusion.

# Expanding the scope of ethnolinguistic research on poeticity

## Panel

***Dr. Kuniyoshi Kataoka<sup>1</sup>, Dr. Makiko Takekuro<sup>2</sup>***

*1. Aichi University, 2. Waseda University*

Poetic language has been part and parcel of anthropological and ethnolinguistic investigations from the inception of the field (e.g. Sapir 1921). It was later developed most intensively by Roman Jakobson in his theory of poetics (1960, 1966, 1971), and subsequent lines of work have been advanced under the rubric of “ethnopoetics” (Hymes 1981, 1996; Kroskryt and Webster 2015), “poetry of prose” (Silverstein 1985, 2004; Lempert 2018), and recently, in significant affinity with “resonance” (Du Bois 2007, 2014) and “catchment” (McNeill 2003, 2005). So far, we have addressed the phenomena of poetics from a “plurimodal” perspective, which is geared toward revealing the interplay among several modes (or media) of communication through performance and artifacts. Building on these findings, the purpose of the present panel is to explore the potential of poetic investigation by extending the scope to other relevant issues such as creativity and evolutionary perspectives on poeticity.

In this panel, we will examine questions such as:

1. What social consequences ensue due to culture-specific notions of poetry and poetic performance? How do such differences affect people in respective social milieus? What needs to be done to remedy the inequality arising from the differences?
2. Poetry and poetics have often been discussed in terms of (broadly defined) creativity, whether it is norm-conforming or norm-breaking. How is creativity differentially conceptualized across cultures, and how can it be defined to incorporate seemingly diverse/contradictory conceptions?
3. Humans learn to imitate others in situated contexts, in which “poetic” structures are used as cues to make inferences about their mental states. Then what phylogenetic and ontological motivations support such an evolutionary-pragmatic perspective?

With these questions in mind, we will reconsider poetic performance—including conceptual, somatic, and physical phenomena—from ethnographic (cf. Bauman & Briggs 1990, Hanks 1989), interactional (Sawyer 1997, Silverstein 2004, Du Bois 2007), and evolutionary (Dunbar 2004, Levinson 2019) perspectives, revealing that poetics and performance are mutually constituted through discursive recursivity.

This panel aims to examine and reveal the sources and consequences of poetic performance, ranging from highly ritualized, sacred performances, to casual verbal exchanges and encounters. Specifically, we will focus on poetic practice in the media, educational institutions, public domains, and rituals in diverse communities, as well as on poetic impacts in human evolution.

Discussant: William Beeman (University of Minnesota)

# Food-in-the-making, Materiality and Sensoriality in Social Interaction

## Panel

***Dr. Sally Wiggins<sup>1</sup>, Prof. Lorenza Mondada<sup>2</sup>***

*1. Linköping university, 2. University of Basel*

How do people engage with food in social interaction? How do they not only talk about food but bodily engage with it, manipulating it, touching it, as well as eating and tasting it? What does this tell us about the sociality of food activities?

Activities dealing with food are fundamental for bio-social life, going from survival to gastronomy, from foraging to shopping in markets, from cooking at home to going to high-end restaurants — among humans but also animals. Although food has recently been attracting considerable attention in social sciences (Mintz, & Du Bois, 2002, Sutton 2010), including linguistics (Lavric, & Konzett, 2009; Gerhardt, Frobenius, & Ley, S. 2013; Szatrowski, 2014), research on interactional activities with food is still relatively scarce. While dinner talk has been abundantly studied as an exemplary form of conversation, talk and bodies at dinner, and in other activities involving food, have been much less considered.

Within the perspective of conversation analysis, on the basis of video-recorded data, and within a multimodal perspective (Goodwin, 2017; Heath 2013, Keevallik 2018, Mondada 2016), this panel deals with *engagements with food in social interaction*. It will devote a special focus on *embodied activities involving food and its materiality*. These culinary activities are explored in their diversity – such as foraging (Keisanen & Rauniomaa, 2019), buying food (Mondada 2019a, De Stefani 2011), creating dishes, cooking (Crabtree et al. 2013; Galatolo & Traverso 2005, 2006; Mondada, 2014, Mondada et al. in press), eating and tasting (Liberman 2013, Mondada, 2018), commenting on and assessing food (Wiggins 2002, 2013). All deal with corporeal engagements with the materiality of food, be in the form of manipulations and transformations of aliments, ingredients and dishes, and/or in the form of intersubjective sensorial accesses to food qualities and taste.

In this way, the panel elaborates on –beyond food itself– important topics in contemporary multimodal conversation analysis, such as embodied actions and their fine-tuned sequential organization, interactions with objects (Nevile et al. 2015), and the intersubjective dimension of sensoriality in interaction (Mondada, 2019b). These dimensions are still rarely discussed in relation to food: in this sense, the panel aims at developing a multimodal interactional praxeological approach to food, contributing to the growing interdisciplinary literature on this topic.

## Fraseología y humor en corpus multimodales

---

Panel

---

***Dr. María Belén Alvarado Ortega<sup>1</sup>***

**1. UNIVERSITY OF ALICANTE**

Desde una perspectiva pragmática planteamos el estudio de algunos de los hechos pragmáticos más importantes en la actualidad, la fraseología y el humor en corpus multimodales. El estudio de estos hecho a través de textos multimodales, es decir, a partir de formas en las que existe más de un código semiótico, ya sea, texto, imagen, gesto, o sonido, enriquece su análisis, ya que el interlocutor debe asumir las presunción óptima de relevancia y resolver las incongruencias existentes, todavía supone un reto mayor en la interpretación del modo irónico-humorístico.

El humor como fenómeno pragmático, que se apoya en marcas o indicadores, ha sido el objeto de estudio de numerosos investigadores (Padilla y Ruiz Gurillo (eds.) 2009) y del grupo GRIALE, al que pertenecen M. Belén Alvarado y Laura Aliaga. En el grupo de investigación GRIALE hemos desarrollado un método teórico que aplicamos a los enunciados con humor en diferentes géneros textuales, a partir de la Teoría General del Humor Verbal (Attardo, 2001). Así pues, lo que pretendemos es aplicar esas herramientas al estudio de corpus multimodales. Por eso planteamos en este panel la contribución de Belén Alvarado y Laura Aliaga, que analizan estos fenómenos en la comedia de situación y en las redes sociales.

Además, consideramos fundamental contar con la presencia de una experta en multimodalidad y significados figurados, Marta Agüero, que realizó su tesis doctoral sobre este tema en 2013. También destacamos la participación de Jorge Soto y Adrián Fuentes en el panel, que darán otro enfoque para el estudio de estos fenómenos pragmáticos en corpus multimodales.

En definitiva, consideramos que este panel tiene una gran importancia en la pragmática, ya que creemos que puede ayudar a esclarecer diferentes hechos relacionados entre sí y ver su funcionamiento en corpus multimodales.

# From Intersubjective to Textual Meaning: Motivation for the Rise of Discourse Markers/Pragmatic Elements

## Panel

***Dr. Noriko Onodera<sup>1</sup>***

**1.** Aoyama Gakuin University

This panel explores a recently-noticed conspicuous directional tendency in semantic change (1), which is now drawing much research attention (Shinzato 2002, Narrog 2012, Onodera 2019a, 2019b).

(1) intersubjective > textual

In the last four decades of studies on semantic change, unidirectionality such as ‘from Function (Meaning) A to Function B’ has been a focus of analyses. Among numbers of hypothesized tendencies/clines, the following has been acknowledged as one robust tendency which has guided works on semantic change, especially accompanying grammaticalization.

(2) propositional > ((textual) > (expressive)) (Traugott 1982, 1989)

The last function in (2), ‘expressive’, has been later replaced by ‘(inter)subjective’ functions (cf. Traugott and Dasher 2002: 94). Tendency (2) can then be depicted as

(3) propositional > textual > (inter)subjective.

If we follow the tendency (3) in our analyses as most of us have all done, the suggested (1) marks a counterexample to (2) and (3). Is the direction “from intersubjective to textual” really a counterexample to the sturdily supported directions for decades, (2) and (3)? Our review has found that (1) “from intersubjective to textual” is not a counterexample, but was indeed proposed in an early work of semantic change (Traugott 1989). In Traugott (*ibid.*), (2) was revised as the following set of tendencies (4) because “the ordering [of (2)] appeared to be too strong” (Traugott and Dasher 2002: 94):

(4) Tendency I: Meanings based in the external described situation > meanings based in the internal (evaluative/perceptual/cognitive) described situation.      Tendency II: Meanings based in the external or internal described situation > meanings based in the textual and metalinguistic situation.

Tendency III: Meanings tend to become increasingly based in the speaker’s subjective belief state/attitude toward the proposition.

(Traugott 1989: 34-35)

Tendency III seems to depict subjectification in a more recent term. Now, if we closely look at Tendency II, it proposes the tendency from ‘internal (inter)subjective meanings’ to ‘textual’ meanings. Thus, the change “from intersubjective to textual” meaning is not a counterexample to (2), the long-supported predictable direction, but was proposed back in the late 1980s.

However, the revision as the set of tendencies (4) might have left “the problem of ordering” (Traugott and Dasher 2002: 94) pending. Therefore, our panel will address this problem by demonstrating that the change, “intersubjective > textual”, is not an exception but another facet of the plausible cline.

In this panel, there will be seven papers that illustrate the examples in English, Chinese, Italian, Japanese, Russian, Korean, and Ainu languages, all supporting the direction, “from intersubjective to textual”.

The intersubjective meanings seem to arise in nothing but dynamic human interaction such as everyday conversations. Plausible candidates that might undergo the shift “intersubjective > textual” would be discourse markers and other pragmatic elements.

# Gendered crises?: Bringing in the voices of women in the workforce in the times of health, social, economic and other global crises

## Panel

**Dr. Mariana Lazzaro-Salazar<sup>1</sup>, Dr. Olga Zayts<sup>2</sup>**

*1. Universidad Católica del Maule, 2. The University of Hong Kong*

The ongoing COVID-19 pandemic has exposed many vulnerabilities and inequalities in the social, economic and political domains, and has brought to light a long-standing truth: women are among the most affected demographic groups in times of crises simply by the virtue of their sex (United Nations, 2020). Despite all the efforts (scholarly and otherwise) to address gender equality pre-crises, times like the current pandemic appear to rapidly deprive women of the opportunities only recently gained and threaten to deepen the gender gap even further. The focus of this panel is on *women in the workforce* in times of crises and the various impacts of health, social economic and other global crises on these women's professional and personal lives. Layoffs and furloughs, pay-cuts, changed 'work orders' (e.g. virtual work), increased family care responsibilities, including home schooling children while maintaining a full-time work schedule are only some of the challenges that the women have been reported to face during COVID-19. Anecdotal evidence from social media and grey literature suggests that that impact on women is far greater than on men, to the extent that the current pandemic is claimed to be a 'gendered crisis' (see UNESCO, 2020).

In this panel we take a broader view of the impact of crises on working women and acknowledge that at least for some women crisis times present opportunities to cross social and ideological structural barriers and to play a central role leading changes and decision-making across social domains. Women, for example, have been shown to be more likely to rise to positions of leadership in times of crisis, arguably due to their interpersonal skills and successful management of uncertainty, which has been referred to as the 'glass cliff phenomenon' (e.g. Sabharwal, 2015).

The overarching aim of the panel is to examine, through the lenses of language and communication, the role that women in the workforce play in dealing with the challenges and the opportunities of global crises. The panel showcases the multiple realities of women in the workforce drawing on empirical data from a diversity of cultural contexts, women in different professions and occupations, job roles and sectors, across age range and gender orientations. Employing a range of pragmatic approaches (e.g. narrative inquiry, discourse analysis, conversation analysis, corpus analysis), the papers in the panel examine the issues of decision-making, leadership, uncertainty, crises communication, (hegemonic) femininity, negotiation of identities, roles and responsibilities in times of crises, female power and solidarity, among others. The panel foregrounds the importance of bringing in the 'female voices' not just to rectify the gender inequalities, but to find more effective solutions and responses, and to build a more resilient world in times of crises.

# Going Viral, Activism and Change: New Studies on Iconic Communication in a Shared World

## Panel

***Dr. Monica Cantero-Exojo<sup>1</sup>, Prof. Eduardo Urios-Aparisi<sup>2</sup>***

*1. Drew University, 2. University of Connecticut*

This panel continues the investigative approach that began in a similar fashion at the 15th International Pragmatics Conference, Belfast 2017. Within this framework of study, this panel explores how knowledge and political/social call to action is perceived, shared and used by the individual and/or social groups with diverse backgrounds across separated geographies. We believe that the term iconic communication proposed by Barker and Yazdani (2000) defines the types of communications that occur mainly in social media. The main feature of these relationships is that individuals may not share the same socio-cultural background or geographical space, but still they share experiences embedded in the verbal-visual discourse. The panel welcomes presentations on the study of iconic communication from a diversity of theoretical perspectives including Systemic Functional Perspectives (O'Halloran 2004), Semiotic Approaches (Kress and Van Leeuwen 2001) and Conceptual Metaphor theory (Lakoff 1980, 1984; Kövecses, 2010, 2020). This panel is open to research taking any perspective, but it should focus on one of the following points:

- the interaction between images and words or other modes of communication in social media.
- the present impact of social media and iconic communication in politics and especially in the enacting of social change.
- the relationship of iconic communication to the increase of online communication through different platforms in the context of the CoVid-19 pandemic and social movements: MeToo, Black Lives Matter, Global Warming and Climate Change.
- How cinema, television and the visual arts reflect on and/or disseminate discourses of social change.

In sum, this panel welcomes studies that consider the dynamics of discourse in the adaptable and multimodal context of those social media, studies that focus on the processes that lead those interactions such as framing or reframing (cf. Lakoff 2009 and Semino et al. 2018) communicative structures and intentionalities.

# Grammar, Pragmatics and Evidentiality: a developmental perspective

Panel

***Dr. Pedro Guijarro-Fuentes<sup>1</sup>, Dr. Aoife Ahern<sup>2</sup>, Dr. Jose Amenos-Pons<sup>2</sup>***

*<sup>1</sup> Universidad de las Islas Baleares, <sup>2</sup> Universidad Complutense de Madrid*

The development of the capacity to produce and interpret utterances is closely connected to the learner's ability to consider thoughts about the linguistically encoded objects, relations, and events. Expressions of evidential meaning encode, or lead to the derivation, based on encoded meaning and inference, of the information source to which propositional content is attributed; the understanding of this kind of meaning also contributes to the ability to identify the degree of speaker certainty, and thereby, speaker commitment. The question of how evidentiality is acquired offers potential answers about the precise relationship between linguistic and cognitive development with two clear divided camps. For some, the way L1 learners use (or fail to use) language may uncover whether a L1 learner has gripped or failed to grip the underlying concepts, in this case, the links between information sources, speaker certainty and commitment. For others, it has been claimed that what L1 learners say or do not say is governed not only by what they can and cannot think about but also by the internal mechanics of language acquisition that makes the discovery of the meanings for certain expressions easier than for others. The understanding and use of evidential has been shown to develop slowly, once children have acquired linguistic expressions of false belief and uncertainty, often considered to be the main components of theory of mind (Papafragou et al., 2007). Thus, acquisition data can shed light on the cognitive architecture involved in information-source tracking in the expression and understanding of evidential meaning, theory of mind and of the linguistic means for attributing mental states.

This panel will provide a forum in which to share research on pragmatic perspectives on the acquisition and expression of evidential meaning in cross-linguistically different evidential systems, especially in language pairings where at least one of the two languages does not encode evidentiality in specialised grammatical morphology. The interest of cross-linguistic studies lies in the fact that in some languages, evidentiality is encoded in specialised morphemes, whilst others resort to processes of pragmatic enrichment to express evidentiality. Even though little is known about how evidential systems are acquired, existing research suggests that the acquisition of evidentiality poses significant challenges for learners; it can be assumed that knowledge about first, second or bilingual acquisition, due to the varying configurations of evidential meaning, will have implications on the understanding of the language faculty and its relationship to cognition. This panel offers opportunities to clarify which language internal or external factors (e.g., specific structural features, language dominance, language proximity and input) constrain the results of language learning processes.

We aim to narrow gaps in our knowledge and form connections among researchers working with different languages and learner populations. These breaches include theoretical or methodological gaps in our empirical linguistic or empirical knowledge, or areas of research, language combinations and populations that have not been fully explored. Methodologically oriented papers that adopt any particular pragmatic and linguistic framework for research on the acquisition of evidentiality in any language combination will be welcome.

# Historical Perspectives on Aggression and Rapport in English Speech Acts

## Panel

***Dr. Theresa Neumaier<sup>1</sup>, Dr. Sofia Rüdiger<sup>2</sup>***

***1. TU Dortmund University, 2. University of Bayreuth***

Starting with Austin's seminal work (1962), the idea that using language primarily means acting, i.e. 'doing something', has become generally accepted in linguistic research. Pragmatic researchers have typically investigated 'acting through speaking' on the basis of face-to-face conversation (Levinson 2017:202). However, while this is relatively unproblematic when looking at Modern English, analyses of speech acts in other periods of English are faced with a lack of comparable data. In order to solve this problem, historical pragmatics has produced a significant body of research drawing on text types considered 'speech-like', 'speech-based', or 'speech-purposed' (Culpeper & Kytö 2010:17): letters (e.g. Fludernik 2007), plays (e.g. Culpeper & Archer 2008), dialogue in other fictional texts (e.g. Fitzmaurice 2007), and court proceedings (e.g. Claridge & Kytö 2014). Still, despite this great interest, many questions remain unanswered in the field of historical pragmatics, particularly at the "level of politeness and impoliteness" (Jucker 2020:3). This panel seeks to redress this situation by placing emphasis on speech acts which are either used to create rapport or which can be considered a form of aggression.

As there is generally no one-to-one correspondence between form and function, the illocutionary forces of speech acts typically remain vague or ambiguous (see Jucker & Taavitsainen 2000:69). This problem is reinforced substantially in their historical analysis, where the determination of the perlocutionary force (the effect/reaction) is complicated by the fact that researchers have "no direct access to the speakers and original contexts of production [and reception]" (Taavitsainen & Fitzmaurice 2007:11). Nevertheless, "[w]hile historical context may not be completely recoverable, it may be approximated and reconstructed" (Arnovick 1999:12) and thus enables us to study speech acts historically.

This panel will involve a series of presenters whose work addresses the interrelational aspects of speech acts from a historical perspective and with a particular focus on aggression and rapport. We are looking for studies based on different (historical) genres, e.g. courtroom discourse, pamphlets, literary texts, sermons, etc. and which deal with speech acts which are either predominantly associated with their perlocutionary effect (i.e. as being particularly (un)pleasant for the hearer) or which are typically perceived as particularly (un)pleasant for the speaker themselves. We are especially interested in speech acts and speech act types which have been neglected in previous studies of historical pragmatics, for example, threats, refusals, or complaints (direct and indirect). The focus will be on empirical studies of speech acts and their role in the management of interpersonal dynamics and hierarchies as well as on diachronic processes related to them (such as aspects of pragmaticalization (cf. Claridge & Arnovick 2010) or attenuation (Jucker 2019)). The aim of this panel is to open up the discussion of conceptualizing aggression and rapport in a historical framework and relate this to the notion of diachronic speech act research. The panel will conclude with a discussion section led by Claudia Claridge.

# How can interpreting in mental health settings contribute to inclusion? Accuracy, neutrality, and flexibility as important professional standards

## Panel

**Prof. Leona Van Vaerenbergh**<sup>1</sup>, **Prof. Betty Gogukian**<sup>2</sup>, **Prof. Yvan Leanza**<sup>3</sup>

1. University of Antwerp, 2. University of Geneva, 3. Université Laval, Ecole de psychologie (Québec City)

Within the framework of the conference topic “The pragmatics of inclusion”, this panel aims to draw attention to the variety of settings within the area of mental health care and to investigate how interpreting and interpreters can contribute to the societal and psychomedical inclusion of patients with linguistic and cultural barriers leading to a sense of discrimination and exclusion.

Up to now little research has been conducted on interpreting specifically in the area of mental health (see e.g. Blumenthal 2016: 22-23; Tribe & Raval 2002). Nevertheless, mental health care is a field in its own right with a large variety of settings. This variety is created by the nature and severity of the disorders, the type of consultations: diagnostic consultations by means of diagnostic and psychometric tests, psychological assessment, counseling, etc., and by the participants in the consultation: the specialism of the health care provider (psychiatrist, psychologist, psychotherapist) and the age of the patient (child, adolescent, adult, elderly people) (Leanza 2015). Furthermore, the setting is determined by the institutional context: the process of a consultation in the hospital may differ from that in a private practice (Gogukian, Pereira & Fierro 2018).

For the interpreter, this variety involves a high degree of variability of contexts, situations, and interactions, and a clear definition of role frontiers with health care providers is needed. In order to contribute to inclusion, a highly professional attitude of the interpreter is required. Three important standards request particular attention and further research, i.e. accuracy, neutrality, and flexibility. The required *accuracy* relates to different levels: the linguistic interpretation, the cultural interpretation, and last but not least the interpretation of nonverbal communication features (e.g. Mudarikiri 2002: 185-186; Blumenthal 2016: 114 ff; Van Vaerenbergh 2020: 312-314). *Neutrality* is often misunderstood and confused with disengagement and detachment (Gogukian Ratcliff, 2010). Therefore, different authors (René de Cotret, Ošlejšková, Tamouro & Leanza 2017; Leanza 2017) suggest to use the term ‘multipartiality’. *Flexibility* is an important standard when interpreting is considered as a practice profession. Practice profession means that “technical skills are always applied in a dynamic, interactive social context” (Dean & Pollard 2011: 156). Flexibility is the competence of the interpreter to tailor his/her strategy in a professional way to varying contexts.

The aim of this panel is to discuss results of different research approaches, i.e. theoretical studies, survey studies and field research and to represent different disciplines with their own approach to accuracy, neutrality, and flexibility, but also to the role, the possibilities and difficulties of interpreting in the area of mental health care. We invite researchers of different disciplines to submit paper propositions on topics such as:

- Professionalism of the interpreter and ethics
- Interpreting and transcultural mental health
- Interpreting and lingua franca in mental health settings
- Interpreting nonverbal communication in mental health care
- Consecutive and simultaneous interpreting in mental health settings
- Interpreting in the context of diagnostic and psychometric testing
- The role of the institutional context
- Training of interpreters for mental health settings.

# How pandemics affect embodied interaction: covid19 and new forms of sociality

---

Panel

---

***Prof. Lorenza Mondada<sup>1</sup>***

**1.** University of Basel

The crisis provoked by Covid-19 and its consequences have wider impacts not only on health but also on human sociality. They raise fascinating issues about how social practices change in pandemic situations, and how they adapt and/or resist to it. This panel is interested in exploring a diversity of questions related to how pandemics affect embodied social interactions in their ordinary details.

This concerns not only how the public understands health issues related to mechanisms of contagion, and how official preventive measures are responded to by/within actual conducts. This concerns more fundamentally how interpersonal and institutional interactions, as well as ordinary relations and routine activities, can change, adapt to the situation, adopt new formats, and adjust their accountability, both in the sense of intelligibility and moral-normative legitimacy.

The panel presents the findings of the project *Human Sociality in the Age of Covid-19*. Based on a rich corpus of video-recordings of naturalistic social gatherings collected during the covid19 crisis, the papers aim at understanding both the foundations of embodied social interaction as revealed by the pandemic and the specific embodied conducts the pandemics has generated. They address how social, interpersonal, as well as formal relationships between persons coming and acting together in everyday life and work suddenly began to change. The panel will discuss the way we can draw a relation between the official instructions and injunctions of health authorities and the actual conducts of the citizens in their ordinary life. State messages were not only reproduced and circulated by other institutions but also personified by various figures of authority, and were adopted (or not) by citizens in their embodied conducts. The panel will also discuss how changed conducts raised (or not) issues of intersubjectivity and affected the intelligibility and morality of interpersonal and institutional relationships. Finally, it will discuss how change became visible in new ordinary practices – such as greeting, passing objects, coordinating actions, etc. – and how this affected the intelligibility of social relationships and the accountability of actions.

Participants to the panel (3 talks, 1h30 slot)

Mizuki Koda & Lorenza Mondada

Philipp Hänggi, Hanna Svensson, Julia Bänninger

Sofian Bouaouina, Guillaume Gauthier, Burak Tekin

# How vague and ambiguous are vagueness and ambiguity?

## Panel

**Dr. Ilaria Fiorentini<sup>1</sup>, Dr. Chiara Zanchi<sup>1</sup>**

*1. University of Pavia*

This panel explores the relationship between *ambiguity* and *vagueness*. Along with *fuzziness/indeterminacy* and *generality* (Zhang 1998), both concepts convey incomplete knowledge (Denison 2017: 293) and have been distinguished as follows: Ambiguous expressions carve up *multiple* discrete regions in the conceptual space, whereas vague ones select a *single* region with *blended boundaries* (Wasow 2015: 32). Furthermore, ambiguity is understood to pertain to different linguistic levels, while vagueness only affects the lexicon. Finally, vagueness purportedly correlates with inherent indeterminacy that can be mitigated or intensified, whereas ambiguity has been considered responsible for misunderstandings that need to be resolved (Piantadosi et al. 2011 propose an opposite view; for a discussion, see Magni 2016).

Nonetheless, the relationship between ambiguity and vagueness is more complex than it initially appears. First, there is little terminological consensus on imprecise/unspecified language. Second, although ambiguity is usually regarded as a *trigger* of language change, it can also be considered a *result* of change, whereas vagueness enables unconscious language change (Denison 2017). Third, polysemy has been variably described as a case of ambiguity, of vagueness, and as the place where the two concepts are mostly confused (Tuggy 1993). Fourth, both ambiguity and vagueness can occur accidentally or intentionally, and may be exploited or avoided through purposeful communicative choices. Finally, when deliberately chosen, ambiguous and vague expressions are productive in specific textual genres (Cutting 2007).

The contributions will discuss the relationship between ambiguity and vagueness (i) as a terminological/theoretical issue, (ii) in diachrony, and (iii) in relation to language use and users. The following topics will be addressed:

- Can we differentiate between ambiguity and vagueness, and if so, how? Is their distinction merely terminological?
- On which linguistic levels do ambiguity and vagueness operate?
- What role does ambiguity and vagueness play in language change?
- What role does context play in ambiguity and vagueness strategies?
- What are the effects of ambiguity and vagueness on communication outcomes? When are ambiguity and vagueness efficient and/or tolerable?
- What is the addressee's role in interpreting ambiguous/vague message?
- When ambiguity and vagueness are intentional, how are they used in manipulative discourses? Are they particularly exploited in specific textual genres?
- What are the possibilities offered by corpora for the study of ambiguity and vagueness?

## Humour in interaction

---

### Panel

---

***Prof. Leonor Ruiz Gurillo<sup>1</sup>***

1. UNIVERSITY OF ALICANTE

Humour is a multifaceted phenomenon that relies on human attributes such as perception, cognition and emotions. It is an everyday reality and occurs in all sorts of contexts and, for this reason, humour is a subject that has awakened the interest of scholars from a wide variety of disciplines, and, consequently, studies on humour have been carried out in different fields of science such as linguistics, sociology, psychology, education or medicine, to name a few.

In particular, there is a burgeoning interest in humorous discourse from a linguistic and interactive perspective and research on this issue has brought fascinating results (see Norrick & Chiaro, 2009; Chovanec & Tsakona, 2018; Yus, 2018; Attardo, 2019; Ruiz Gurillo, 2019). In this vein, this panel deals with the role of humour in different interactive settings. Contributions to this panel will take a pragmatic angle when analysing different interactive humour genres and they will show that humour is an intrinsically human phenomenon based on ambiguity that crosses many lines and boundaries, including gender, age or ethnicity.

In this panel, we welcome linguistic (and especially pragmatic) approaches to humour, which consider any of the aspects listed below, or other aspects not mentioned:

- Gender and identity construction through humour in interaction
- The development of children's verbal humour
- Humour and linguistic disorders
- Communicative strategies in interactional humour
- Humour in social networking sites (Facebook, Twitter, Instagram...).
- Humour in comments (to social networking site entries, to videos, to pieces of news...).
- Humour in instant messaging conversations.

Scholars we encourage to participate:

- Larissa Timofeeva Timofeev: Timofeeva@ua.es
- Belén Alvarado Ortega: belen.alvarado@ua.es
- Salvatore Attardo: Salvatore.Attardo@tamuc.edu
- Neal Norrick: neal@norrick.de
- Delia Chiaro: delia.chiaro@unibo.it
- Ana Mancera Rueda: anamancera@us.es
- Helga Kotthoff: helga.kotthoff@germanistik.uni-freiburg.de - Esther Linares Bernabéu: Esther.Linares@ua.es

# Ideology and language in health discourses and health care interactions

Panel

***Dr. Jana Declercq<sup>1</sup>, Dr. Gilles Merminod<sup>2</sup>***

***1. University of Groningen, 2. University of Lausanne***

This panel addresses how ideology comes into play in health care interactions and/or in discourses about health. We define ideology as assumptions, expectations and frames that allow individuals to make sense of what is going on beyond the sole here-and-now of a single event, beliefs which contribute to the realisation and interpretation of individuals' actions (Hanks 2005). We focus on two kinds of ideologies in the context of health discourses. First, we examine language ideologies, e.g. of what interaction in health care should look like. For instance, the asymmetry in communication between doctor and patient is often problematized, in favour of a more equal, patient-centred approach, in communication training in health programmes. However, there may be "good organizational reasons for what appears to be medical dominance" (Pilnick and Dingwall 2011: 1378), because of the topic and tasks of medical interactions, and that patients co-construct the relationship as asymmetrical. Likewise, number of health campaigns opt for communication strategies based on a virtually acontextual vision of decision-making (Merminod 2020), echoing the "view of communication as the public 'airing' of ideas that started out as privately conceived and individually owned" (Duranti 2005: 411).

Secondly, health discourses are shaped and shape ideologies of health and illness (Jones 2013). Being healthy or ill is more than the biomechanical reality of viruses or traceable tissue injury (Briggs and Hallin 2018; Declercq 2018). It also entails our shared understandings and evaluations of what constitutes as health and illness; of particular illnesses; and of how treatment should be approached. These understandings and assumptions can be an important site of friction in health discourses and interactions. Health and illness are sometimes understood differently in the public sphere than in the medical world; illnesses, treatments and patients (groups) can come with stigma or taboo. As these understandings and evaluations are essentially discursive, a linguistic/language perspective is crucial here too.

Gaining an understanding of how ideologies shape health discourses and health care interactions, as created, regimented by and sustained in communities of patients, health care professionals and other relevant professionals, and academics, thus is important, and can contribute to solving some critical issues in health care.

# Im/politeness norms in online affinity spaces

---

Panel

---

***Prof. Pilar Garces-Conejos Blitvich<sup>1</sup>, Prof. Marta Dynel<sup>2</sup>***

*1. University of North Carolina at Charlotte, 2. University of Lodz*

Social media support the emergence of different kinds of relationships, associations, and online communities based, among others, on shared interests, identities, and a sense of belonging different from traditional groups like family, friends, and geographically based communities; social media also foster global communicative connectivity and blur the lines between different types of media an on/offline engagement. Against this backdrop, notions of what constitutes an online community and, fundamentally, doing normativity therein, for instance regarding what constitutes behavioral in/appropriateness (conceptualized as im/politeness), are of crucial interest to digital media studies. To advance the field, it has been suggested that digitally native conceptualizations such as *affinity spaces* (Gee, 2005) need to be applied. Gee defined affinity spaces as semiotically mediated social spaces characterized by users' common endeavor, a shared space where people affiliate with others based on their shared activities, interests, and common goals, as well as a place where informal learning happens.

To add to this line of research, the focus of the proposed panel is the pragmatics and metapragmatics of im/politeness norms in online affinity spaces. Among others, attention is paid to norm negotiation within and across online affinity spaces, where first-order evaluations and jointly negotiated norms (see e.g. Eelen 2001; Locher & Watts 2008) play a crucial role. As Bousfield (2010) rightly observes, norms are a matter of social conventionalisation. The norms which determine the perception and reception of im/politeness may be local, situational, personal, and cultural (Culpeper 2008). However, in online affinity spaces, the distinctions between these categories become blurry. The different norms affect one another and guide users' norm negotiation and evaluation both within and across communities engaging in different types of practices, sometimes becoming the foci of metapragmatic discussions (see e.g. Dynel & Poppi 2019; Garcés -Conejos Blitvich & Lorenzo-Dus, 2010; Graham & Dutt 2019).

Of special interest to the panel is the negotiation of emerging norms in online affinity spaces and the role im/politeness plays in creating and maintaining them, for example how aggressive communicative behaviours are used to challenge and restore norms (Spring et al., 2018). The fleeting nature of many online communities, the different constraints on interactional behavior afforded by the digital medium, and context collapse (Marwick & boyd, 2011), among others, are reflected in normativities that are in flux and are sometimes developed ad hoc. As regards established online communities, we are also interested in how norms and abiding by them are associated with the identity of a (core/peripheral) group member, and how norms are related to moral judgements of the ingroup versus the outgroup (Angouri, 2016). These issues become even more relevant from a *global* (Li & Jung, 2018) perspective when the discursive struggle about norms of in/appropriateness (im/politeness) is viewed through a multicultural, translanguaging, polylinguaging angle (Androutsopoulos, 2015; Sultana et al., 2015).

---

# Impoliteness in Intercultural Encounters

---

Panel

---

**Dr. Vahid Parvaresh<sup>1</sup>, Prof. Daniel Kadar<sup>2</sup>**

***1. Anglia Ruskin University, 2. Dalian University of Foreign Languages & Hungarian Academy of Sciences***

While impoliteness has long been a major topic of interest in the field of pragmatics, in our view further research is due to investigate its operation in intercultural encounters. There are various reasons why such an endeavour is timely, including the following:

- As an academic concept, ‘culture’ has recently undergone some significant developments, and it is fundamental to revisit intercultural impoliteness in light of such developments. For instance, it has been recently argued that culture encompasses “practices mediated by symbolic systems of various kinds across various social and historical contexts” (Kramsch & Zhu, 2020, p. 1).
- With the increasing dominance of social media and the drastic changes that this dominance has introduced, we have been witnessing a dramatic increase in “incompatibility, conflict, aggression and even harassment” (Parvaresh, 2019, p. 79). It is particularly intriguing to consider the ways in which such changes influence perceptions of impoliteness.
- The rise in people’s movement across borders has not necessarily always resulted in more harmony but rather in an increase in some forms of derogatory and discriminatory language (see Musolff, 2019).

It is therefore vitally important to devote more attention to the investigation of the intersection between the notion of culture, or culturally-informed understandings, and impoliteness evaluations.

The contributions to this panel address, in one way or another, instances, or rather perceptions, of impoliteness and offence in intercultural settings, either in face-to-face encounters or in more virtual and Internet-based forms of communication. The panel as a whole serves to offer an insight into both culturally informed ‘practices’ as well as culturally informed ‘perspectives’. While the former are “the visible or directly observable components of culture”, the latter “are hidden and need to be inferred” (Spencer-Oatey & Kádár, 2016, p. 85).

# Inclusion and Communicative Competences across Contexts

## Panel

**Dr. Antonia Krummheuer<sup>1</sup>, Dr. Niklas Norén<sup>2</sup>, Dr. Mike Clarke<sup>3</sup>, Prof. Friederike Kern<sup>4</sup>**

**1.** Aalborg University, **2.** Uppsala University, **3.** University College London, **4.** Bielefeld University

Young people living with communicative disabilities, their family members and support networks often report frustration at the fact that young people's communicative competence can be diminished or lost when they transfer between contexts involving different communication partners (e.g. transitioning from home to school). This change can fundamentally challenge their participation and inclusion in new contexts.

In the last decades, a growing body of interactional research has examined *atypical interactions* which refers to social interactions "where one or more participants have a communicative impairment and where that impairment is evident in consequential ways within the interaction." (Wilkinson, 2019, p. 281). A central concept explicitly and implicitly taken up in these studies is the notion of *communicative competence*. The studies emphasize the need for a more situated, multimodal and practice-oriented concept of communicative competence that recognizes competence as an interactional achievement rather than a set of skills that belong to individuals (Clarke & Wilkinson, 2013; Goodwin, 2004; Maynard & Turowetz, 2017). This perspective enables insights into what competence may mean in communication involving people with limited communication means, and promises a deeper understanding of *inclusive practices* (as a pedagogical or participatory concept) and how they can be fostered within and across activities and settings.

In this panel, we will revisit the concept of communicative competence, especially in the field of atypical interaction, from the perspective of inclusion. We will discuss whether and how a situated, multimodal and practice-oriented approach can help to understand and inform inclusive practices.

- How can interactional studies inform concepts of communicative competence?
- How can a multimodal and interactional understanding of communicative competence be informed by or applied to practice?
- How can a multimodal and interactional understanding of communication competence inform the use or design of communication technologies?
- And, especially, how can this concept be used to understand and foster communicative competences and inclusion of people with limited communication means across contexts?

The panel is organized in 2 x 90 minutes session

# Inclusion and Exclusion in the Discourse on Covid-19

---

## Panel

---

***Dr. Bettina M. Bock<sup>1</sup>, Dr. Kristin Kuck<sup>2</sup>***

***1. Universität zu Köln, 2. Magdeburg University***

The rapid spread of the previously unknown coronavirus SARS-CoV-2 has led to political decisions in many countries which have had a profound impact on the lives of all people in societies. In the public discourse on the Covid-19 pandemic these political decisions and their consequences for certain social groups are vividly discussed. The panel aims at investigating and (critically) discussing facets of inclusion and exclusion in the public discourse by the means of discourse linguistic analysis. The discourse on Covid-19 is taken as exemplary object of investigation, because this global discourse seems to allow general insights into the social standing of groups and linguistic practices of positioning and of speaking about social groups (that may differ from society to society).

The analysis of linguistic means in discourse can provide insight into unexpressed, stereotypical knowledge, which is presupposed as shared and commonly accepted knowledge and therefore does not need to be verbalised. Discourse is understood to be the discussion of a topic by larger social groups, which is reflected in texts of various kinds, not only reflecting the attitudes of those involved in the discourse, but at the same time guiding the future handling of the topic.

Subjects of talks in the panel may address but are not limited to the following research questions:

- In which way do social groups that are otherwise often marginalized in media discourse, gain visibility in the Covid-19 discourse (for example people with disabilities, elderly people)?
- How is the differentiation between groups of people who need to be protected to a greater extent than others (so-called “risk groups”/people at higher risk for severe illness) linguistically represented, and which social groups are made a subject of discussion?
- Which discourse topics are in which way linked to aspects of gender, age, ethnicity or social origin, and which stereotypes emerge if applicable?
- What similarities/differences between Covid-19 discourses in different languages and countries can be identified by contrastive discourse analyses?
- In which way do the protests around Covid-19 reflect inclusion or exclusion of certain groups? How do protesters linguistically construct their social position?
- Which lexical features and metaphors shape the discourse, and how do they reflect inclusion or exclusion?
- Which topoi are used in arguments regarding Covid-19 measures, especially concerning lockdown and curfew rules in general and for certain social groups?
- What insights does the discourse on freedom vs. health protection provide regarding the inclusion or exclusion of groups in societies?

We invite scholars working on one or more of the above-mentioned aspects to participate in our panel.

As there is lively pragmatic research activity related to Covid-19 (corpus collections in several languages, popular scientific information series on neologisms in this discourse, an ongoing essay-project of the scientific journal *Aptum*, edited by Kersten S. Roth and Martin Wengeler) we look forward to reaching a broad international community of possible contributors.

*Invited speakers:*

Hanna Acke, Turku

Charlotta Seiler Brylla, Stockholm  
Kersten Sven Roth, Magdeburg

# Inclusive communication at University and Tertiary Education Level

## Panel

**Prof. Christiane Hohenstein**<sup>1</sup>, **Prof. Magdalene Lévy-Tödter**<sup>2</sup>, **Ms. Petra Stemmer**<sup>3</sup>

**1.** Zurich University of Applied Sciences, **2.** FOM – University of Applied Sciences Hamburg, **3.** KDA in cooperation with University of Cologne

The panel addresses ‘inclusive communication’, its linguistic and institutional (pre)conditions, as a part of pragmatics. By ‘inclusive communication’ we understand an approach uniting hitherto different fields, e.g. efforts in barrier-free communication, Universal Design, gender-equal language, easy-to-read language, and aspects of intercultural communication in an interdisciplinary and transformative way, that includes communicative requirements of persons with impairments and/or special needs.

Structures for the improvement of ‘Diversity’ and ‘Inclusion’ have been established at universities and institutions of tertiary education since the late 1990s. Nowadays, they form part of a ‘Third Space’ sector of activities in educational administrations which is continually growing. This means that institutionalization is advanced, while equal opportunities are yet to be realized in curricula in terms of inclusive environments for teaching, learning, and interacting for students and staff.

Many empirical studies have been carried out in the fields of social sciences, sociology, educational science, and organizational pedagogy, in order to promote equal opportunities at universities. While these approaches facilitate a holistic view of organizational issues such as an inclusive corporate culture, the focus of research rarely has been on *communicative support*, activities, and programs. It may be surprising, too, that hardly any analyses of relevant aspects regarding students with disabilities have been carried out in collaboration with linguists or sociolinguists. Topics of linguistic interest include e.g. emotional work associated with non-visible, speech and hearing impairments, ‘coming out’ as a speech act, language attitudes, easy-to-read and plain language, technological facilitation, the discourses of inclusion, narratives of self-perception, and perception by peers, and (linguistic) resources of students with visual and hearing impairments (e.g. multilingualism, heightened capacities).

The instruments of pragmatics and sociolinguistics are offering a basis for analyzing internal and external barriers to communication in university and tertiary education. Research into institutional communication and academic talk, discourse and conversation analyses, applied and clinical linguistics may highlight pathways to inclusive communication. In turn, this may improve the situation for all students.

Contributions to the panel will address resource-based linguistic approaches to the agency of persons with visual and hearing impairments in universities and tertiary education, analyses of academic discourse, multimodal communication, and easy-to-read language. The discussion will be open to further aspects.

---

# Indexing Exclusion through Style

---

## Panel

---

**Ms. Cornelia Bock<sup>1</sup>, Dr. Florian Busch<sup>2</sup>, Dr. Naomi Truan<sup>3</sup>**

**1.** Universität Hamburg, **2.** Universität Halle-Wittenberg, **3.** Universität Leipzig

There is no inclusion without exclusion. Our panel tackles the dynamics of inclusionary and exclusionary practices from a sociolinguistic perspective, i.e. one that investigates stylistic choices in interaction, understood as the shaping of utterances from a pool of socially meaningful semiotic resources (Eckert 2000; Coupland 2007; Selting 2008). Twenty years after the first thematic issue of the *Journal of Sociolinguistics* on new research on sociolinguistic style and stylization (Rampton 1999), we propose to reexamine stylistic practices through the lens of exclusion.

The distinctiveness of performable signs is the foundation of social identities. Social actors either align with social values and categories (a process that can be summed up as ‘adequation’), or they highlight differences and non-belonging through style (known as ‘distinction’) (Bucholtz & Hall 2005). As social actors index exclusion, they perform activities of social dis-alignment in micro-level interactions on the one hand, and distance themselves from social stereotypes at macro-level of discourses on the other (De Fina 2013; Spitzmüller 2013). Sociolinguistic style is thus inevitably an ideological matter, as it presupposes “an interpretation of the social world and of the meanings of elements within it, as well as a positioning of the stylizer with respect to that world” (Eckert 2008: 456). Style, finally, reveals how these positions are made valid in a given community of practice—in other words, the metapragmatic ideologies attached to them—, either through contextualizing effects of stylistic features in use or through explicit meta-discourse shaping stylistic awareness and social enregisterment (Silverstein 2003; Agha 2007).

Our panel focuses on two aspects regarding the exclusionary dimension of stylistic practices: First, what semiotic means do social actors use to presuppose and/or entail exclusion through style and stylization? Second, on which ideological assumptions are these choices perceived, rationalized, justified and/or contested as exclusionary?

The aim of the panel is to bring together scholars from different fields working on social style and interaction, in order to uncover general and specific patterns of exclusionary styles in a wide range of sociocultural lives. The papers presented here range from Interactional Sociolinguistics, Conversation Analysis, Interactional Stylistics, and Metapragmatics dealing with these questions on all structural levels of language.

We are happy to have Scott F. Kiesling as a discussant.

# Individual differences in pragmatics

---

## Panel

---

***Prof. Diana Mazzarella<sup>1</sup>, Prof. Sandrine Zufferey<sup>2</sup>***

*1. University of Neuchâtel, 2. University of Bern*

Speakers vary in their ability to use and interpret language in social contexts. However, the existence of individual differences represents “an inconvenient truth” (Kidd, Donnelly & Christiansen, 2018) for experimental approaches to the study of pragmatic competence. While individual variability is undeniable, its systematic investigation is far from being attained. This panel explores the question of individual differences in pragmatics and its theoretical and methodological implications.

Research on individual differences plays a crucial role in identifying the *social* and *cognitive* skills underpinning pragmatics. Much research has focused on the role of cognitive skills - e.g., structural language, Theory of Mind, executive functions - but the contribution of social factors, such as education or socioeconomic background, is still underexplored (but see Di Paola et al., 2016; Taguchi, 2012; Zufferey & Gygax, 2020).

Furthermore, research on variation in the mechanisms of pragmatic processing raises foundational issues on the very nature of pragmatics, including the question of whether pragmatics is a unitary system. For instance, to interpret the variation in findings with ASD population, Andrés-Roqueta and Katsos (2017) put forward a distinction between ‘linguistic-pragmatics’ and ‘social-pragmatics’. While the former would rely on structural language and competence with pragmatic norms, the latter would also require Theory of Mind abilities.

Finally, the study of individual differences opens up important methodological challenges. Crucially, it highlights the need to devise tests of pragmatic and related skills that are suitable for correlational research, yielding sufficient variance while tapping specific abilities (for a discussion, see Matthews, Biney & Abbott-Smith, 2018). The panel aims to bring together linguists and psychologists whose work on the socio-cognitive foundations of pragmatic skills can shed new light on the interplay between these theoretical and methodological issues.

We encourage submissions addressing the topic of individual differences of pragmatic competence in children, learners and adults.

# Influencers & ‘fans’: The pragmatics of affect & hate in the construction of social media celebrities

Panel

***Prof. Alexandra Georgakopoulou<sup>1</sup>, Prof. Pilar Garces-Conejos Blitvich<sup>2</sup>***

*<sup>1</sup> King’s College, <sup>2</sup> University of North Carolina at Charlotte*

According to Freberg et al. (2011), social media influencers (SMIs) constitute independent third-party endorsers or opinion leaders who can shape audience attitudes using blogs, tweets, and other social media. Communication strategies are paramount in the phenomenon of SMIs who often engage in self-presentation and self-branding through the creation of rich multimodal narratives of their personal, everyday lives so as to increase their visibility and numbers of followers (Khamis et al., 2016). The relation between their self-brand and followers is essential to extending their influence (Dhanesh & Duthler, 2019). Currently, many companies recognize the numerous opportunities to promote their brand or organization that forging alliances with SMIs can create (Neilsen, 2013). Influencers are, therefore, increasingly being approached by brands to promote products: a practice commonly called influencer marketing. Similarly, the platforms themselves incentivize use and retention of the influencers’ (and their fans’) attention economy, by granting them privileges akin to those of MVPs (Most Valuable Players).

Due to SMIs’ importance in the social media landscape, their online practices have received much attention from a variety of disciplines, including studies of marketing, public relations, psychology, etc. From a sociological and cultural studies perspective, the analysis of influencers has mainly focused on: structures of social media & the cultural logic of (micro)-celebrity; self-branding practices; questions of gender, immaterial, affective labor & the monetization of the everyday (e.g. see, Abidin 2018; Gamson 2011; Hearn 2017; Jerslev 2016; Keller 2015; Marwick, 2016). Perceptions & practices of creating authenticity, accessibility, relatability and connectedness with followers/fans’ have also received special consideration, as SMI–brand collaborations may result in tensions for SMIs’ authenticity management (see Audrezen et al., 2018).

Despite the key-role that language (along with other semiotic modes) plays in the construction of the identity of SMIs & the strategies they mobilise in marketing their products and themselves, scant scholarship has looked at the phenomenon from a (multimodal) discourse analytic/pragmatic perspective (see Brian et al., 2012; Georgakopoulou forthcoming; Parhankangas & Renko, 2016; de Aquino Carlson, 2017; Riikonen, 2020).

This panel seeks to fill in this gap by bringing together discourse-focused & pragmatics work, from different methodological and analytical perspectives, that scrutinizes the broad theme of multimodal resources deployed by SMIs for self-presentation & their role in signalling relations both of affect/fandom and of the increasingly prevalent phenomena of backlash, hate, flaming and cancelling directed at them. More specific topics that we would expect to be addressed include but are not limited to:

- The role of audience & participation in the creation of affect and/or hate & cancel culture
- Linguistic & pragmatic markers, strategies, & norms of ‘relational work’ between SMIs and networked audiences
- Specific (remediated or emergent) SMIs’ genres, conventionally associated with affect or hate.
- Rhetorical strategies & persuasion in connection with (self)-branding & marketing
- The role of experiential, evaluative, morality-based & affective language
- Markers and resources for doing authenticity, credibility, and relatability

# Interactional dynamics in remote dialogue interpreting

---

## Panel

---

**Dr. Esther de Boe**<sup>1</sup>, **Dr. Jelena Vranjes**<sup>2</sup>

**1.** University of Antwerp, **2.** UGent

In a short time, technology has profoundly changed the ways in which we communicate. Especially since the outbreak of the Covid-19 crisis, remote communication has seen a massive increase in all contexts. In dialogue interpreting settings, the use of remote interpreting (RI) by telephone and video link increases accessibility of public services to non-native speakers. Assessing its efficiency is therefore essential to ensure inclusion of all citizens.

When communication is mediated by an interpreter by means of RI, this adds up to the already complex character of the communicative event. Since the interpreter takes a turn at talk after each primary participant's turn, interactional issues, such as overlapping speech, are likely to have an even stronger disruptive effect on the communication than is the case in monolingual events. Evidence-based research on RI indicates that such disruptions are primarily related to the reduced possibility for synchronization of interaction (Wadensjö, 1999). Recent research focusing specifically on interaction management (Davitti, 2018; De Boe, 2020; Vranjes & Brône, 2020) suggests that in remote dialogue interpreting, smoothness of interaction is affected. This is mostly due to reduced visual access, which impinges on the use of nonverbal resources (such as gaze and gesture) to manage the conversational flow. These outcomes call for a more granular, micro-analytical investigation of the ways in which interaction management is accomplished in RI. Since smoothness is a decisive factor in participants' satisfaction with communication, it is of vital importance to further investigate which factors contribute to realising fluent interaction management, as well as the role of visual access in these dynamics.

This panel brings together evidence-based research contributions aimed at examining interaction management (turn transitions, negotiation of meaning, repair, backchannelling behaviour, a.o.) in RI by telephone and video link. All papers use micro-analytical approaches, based on data derived from authentic as well as experimental settings (including simulations and eye-tracking experiments), in various contexts of spoken language remote dialogue interpreting. In sum, the empirically grounded insights from these studies will make a contribution to the burgeoning research on the complex conversational dynamics of remote dialogue interpreting.

# Interactional Frames and Language Resource Development

---

## Panel

---

**Prof. Kyoko Ohara<sup>1</sup>, Dr. Miriam R. L. Petrucci<sup>2</sup>**

**1.** Keio University, **2.** International Computer Science Institute

*A second and equally important kind of framing is the framing of the actual communication situation... We have both cognitive frames and **interactional frames**, the latter having to do with how we conceptualize what is going on between the speaker and the hearer, or the author and the reader.* (Fillmore 1982: 117)

Motivated by Fillmore's characterization of interactional frames (1982:117), the goal of this panel is to bring together theoretical linguists working in pragmatics with frame semanticists, creators of FrameNet-inspired lexica (Ruppenhofer et al., 2016, Boas 2009) and constructicons (Lyngfelt et al., 2018), as well as developers of real world applications. The panel will provide a forum to discuss the importance of the role of interactional frames in human language understanding as well as the challenges and consequences of representing Fillmore's *interactional frames* in resources based on Frame Semantics and Construction Grammar.

Participants on the panel include theoretical linguists and, importantly, developers of both FrameNet-type lexical and grammatical resources, i.e., constructicons. Their combined scholarship in pragmatics, as well as their contributions to Frame Semantics and real world application development (e.g., Fischer et al., 2020), set the stage for a vigorous discussion of the role of interactional frames in the development of FrameNet-type resources. Adopting a very broad view of pragmatics, Östman's paper takes a discourse-pragmatic perspective on interactional frames. The other papers in the panel address aspects of interactional frames in different genres and languages or for different linguistic and computational purposes. Ohara and Petrucci's presentation considers the interactional frame as mediating between author and reader in the opening of *The Little Prince* in English, Japanese, and Hebrew. In another contrastive work, this one about German particles and their corresponding constructions in Brazilian Portuguese, Czulo and his colleagues propose the *pragmatic frame* as a superordinate category that includes the interactional frame. Boas and Gemmell discuss the implementation of the interactional frame in an online frame-based lexicon for German. Langedijk and Fischer study human-robot interaction for toasting and discuss the interdependence between situational elements, interactional knowledge, and cultural phenomena.

After the presentation of all the papers, the organizers will jump-start a broad discussion about whether pragmatic frames should be distinguished from interactional frames and how to implement interactional frames in language resources to pursue the insight in Fillmore (1982).

# Interactions in the process of instructing and learning Geido: Multimodal analysis of Japanese traditional and martial arts

## Panel

***Dr. Seiji Nashio<sup>1</sup>, Dr. Ikuyo Morimoto<sup>2</sup>, Dr. Yasuharu Den<sup>3</sup>***

***1. Hiroshima University, 2. Kwansei Gakuin University, 3. Chiba University***

This panel aims to explore a new research field in interaction studies, namely, “interaction in *Geido*. ” The purpose is to understand how language and bodily conduct are intertwined to organize instructions in *Geido* and, more specifically, how the cultural aspects of *Geido* are observable in this organization.

*Geido* is a generic term encompassing Japanese martial arts (*Judo*, *Kendo*, *Taido*, etc.), musical arts (*Shamisen*, *Koto*, etc.), and other arts derived from Japanese culture (*Sado*, *Kado*, etc.). These have been inherited and schematized from generations, based on Japanese ideologies and sensibilities. The central idea of *Geido* states that its purpose is not only to practice techniques but also to cultivate a way of life. Thus, an analysis of *Geido* practices helps us in understanding how language and body transform through social knowledge within social interaction, and in finding a philosophy penetrating into the Japanese social manner of action. From these perspectives, this panel tries to explore how *Geido*’s philosophy is manifest in its practice, particularly by focusing on the process of instructing and learning it.

The recent rise of multimodal analyses in pragmatics, conversation analysis, gesture studies, etc. (e.g., Streeck, Goodwin, & LeBaron 2011, Haddington, Mondada, & Nevile 2013) provided us with novel insight into the organization of language and body in our daily activities. The organizers also conducted a panel in the previous conference, titled “Interaction in *Budo*,” where they contributed to research on interactions through multimodal analysis of the interactive instructions in Japanese martial arts. However, new concerns emerged that were not addressed in the previous panel. One such concern was that instructions in *Budo* comprised clips from actual performances of the art, and learners often copied the move of the instructor. Such clips were presented repeatedly as a reference by the instructor and copied repeatedly by all participants, constituting a kind of *format*. Similarly, when we shift our attention to other traditional arts such as *Sado* and *Shamisen*, we observe similar practices.

Thus, we can presume that the methods of instructing and learning via such formats are Japanese-specific and common to Japanese martial and traditional arts. This widens our focus on traditional arts apart in general, *Geido*, to investigate how particular formats comprise multimodal instructions in each *Geido* style.

The presenters in this panel have analyzed video data capturing practices of instructing *Geido* such as *Nōgaku* (classical music dramas), *Taido* (striking martial art), *Jiu-jitsu* (grappling martial art), *Shamisen* (three-stringed musical instrument), *Nihon buyo* (classical dance performances), and *Sado* (tea ceremony). Based on detailed micro-analyses of language and bodily conduct used in these activities, they have elucidated several aspects of organization in *Geido* practices at both micro and macro levels. These include: i) how practitioners coordinate their movements in space and time based on shared expectancies and understanding of the sequence of movements; and ii) how each style reflects a unique Japanese philosophy through such coordination.

# Interpreter-mediated communication in clinical settings: societal needs, communicative challenges, therapeutic potentials

Panel

**Prof. Charlotta Plejert<sup>1</sup>, Dr. Peter Muntigl<sup>2</sup>, Prof. Claudio Scarvaglieri<sup>2</sup>**

***1. Linköping university, 2. Ghent University***

Due to rapidly rising mobility and migration, many countries face the challenge of dealing with increasing ethnic, cultural and linguistic diversity (i.e., *societal superdiversity*) and are called upon to find new and innovative ways to facilitate communication between different language groups and, at the institutional level, to provide adequate social services to individuals. Essential services such as professional health care interpreting have considerable beneficial effects for migrants, such as reducing patient compliance and the risk of medical errors and improving comprehension and clinical outcomes (Karliner et al. 2007, Weber et al. 2016). A growing amount of research has shown that interpreters do not merely act as language conduits (Wadensjö, 1998), but as participants of interaction who may change the course of the interaction by introducing new actions that may lead the conversation down a different path (Bolden 2018; Bot 2005; Raymond 2014a,b; Davitti 2019). Thus, interpreters may influence the communication process and affect aspects as important as the power dynamic between the participants (often supporting the role of the medical expert - Hsieh 2010, Davitti 2019) and participants' agency (Majlesi & Plejert 2018: 147). A few studies have begun to explore interpreters' use of verbal and non-verbal resources in interpreter-mediated psychotherapy (Bot 2005, Storck & Brakemeier 2017, Ticca 2018, Vranjes et al. 2019), and in dementia assessments (Plejert, et al., 2015; Majlesi & Plejert, 2018), but we still lack a clear picture of its effects on the communicative process (how does interpretation affect interactive practices and the sequential organization of the clinical activity at hand?) or its outcome (how is interpretation an asset, how is it problematic?).

This panel showcases new interaction-focused work on IMC by bringing together experts from an international community. The papers explore a range of different clinical contexts such as neuropsychological assessments (tests of cognitive performance of a patient) doctor-patient consultations and psychotherapeutic treatments. These papers draw from discursive methods that focus on micro-processes of social interaction (such as conversation analysis, discourse analysis, multimodal interaction analysis or discursive psychology) to examine a range of important issues such as: how epistemic brokering in IMC may influence interactional trajectories or the assessment process as well as the validity of the outcome of testing procedures; how threats to the patient's face and aspects of stigma are dealt with; how IMC with migrants changes over time, in different institutional settings and how these findings can have important implications for interpreter training. Anna Claudia Ticca and Jelena Vranjes will contribute papers. Galina Bolden agreed to act as discussants for this panel.

# Investigating participation and engagement in learning contexts: Tracing evidence of inclusive practices from a micro-analytical perspective

Panel

***Dr. Clelia König<sup>1</sup>, Mr. Revert Klattenberg<sup>2</sup>***

***1. Universität Koblenz-Landau, 2. Universität Hildesheim***

There is a growing consensus that learning opportunities, generated through participation in meaningful interactions, are a central component of educational success (e.g., Gardner, 2019). The need for such learning opportunities, in turn, affects discourse in that participants have to be able to “use interaction as a tool for mediating and assisting learning” (Walsh, 2011, p. 21). Interaction itself, however, can be severely hampered by learners’ lack of engagement and the limited extent of their participation. Against the background of increasingly diverse learning environments, there is then a growing need for investigations into practices which enable active participation and encourage greater discourse involvement.

The panel aims to contribute to developing an understanding of ‘inclusion’ from a data-driven, micro-level perspective – that is, as a mutually accomplished and situated phenomenon surfacing in participants’ interactional practices. The focus is, then, on talk-in-interaction in educational settings, and especially on tracing the evidence of participants’ ‘inclusive practices’. These practices are defined as language use and other multimodal resources (e.g., prosody, body positioning, gestures, gaze, etc.) enabling and encouraging participation.

Contributions address for instance (I) the definition of inclusive practice within learning context, particularly how such contexts can be defined when they seem to be very heterogeneous, (II) the empirical observability of teachers’ practices and how they relate to other interactional competences, especially how they impact participation opportunities, (III) the changes in learners’ participation and agency, with a special focus on the learners’ interactional resources (Sert, 2015).

# Language & risk. Communicating risks, danger and safety in a late modern world

---

Panel

---

***Prof. Hermine Penz<sup>1</sup>, Prof. Georg Marko<sup>1</sup>***

*<sup>1</sup>. University of Graz*

Risk, danger and safety are prominent topics in today's society, some theorists even claim that they are the predominant principles according to which social life is organized, cf. Ulrich Beck's theory of the risk society. As a consequence, risk communication, i.e. any text informing a wider audience about potential hazards in life and/or instructing them how to deal with them, constitutes a central form of language use today. While the main intention of research into risk communication is to enhance its efficiency, we will take a broader perspective in this panel, looking at how discourses represent aspects of life associated with risk, thereby foregrounding or backgrounding them, maximizing or minimizing them, and making them seem identifiable and manageable or unidentifiable and unmanageable. These aspects include calculated probabilities and subjective un/certainties, the people creating risk, taking it or being affected by it, the actions and events interpreted as dangers or opportunities, the emotion evoked, and the world in which risk and safety play a central role. Currently, there is of course also the question of the relationship between conceptions of risk and conceptions of crises and to what extent and how they are different.

The panel covers discourses in different social domains, with a special emphasis on medicine, ecology and the private sphere. The contributions approach this topic from various methodological and disciplinary angles, ranging from micropragmatics (e.g. form-based studies of epistemics) to macropragmatics (e.g. critical discourse analyses of risk constructions in specific types of texts).

---

# Language and gender: permanence and changes

---

Panel

---

***Dr. Silvia Ramirez<sup>1</sup>, Dr. Carlos Gelormini-Lezama<sup>1</sup>***

*1. Universidad de San Andrés*

Silvia Ramirez Gelbes & Carlos Gelormini Lezama

Scholars invited: Bianca Di Virgilio, Delfina Pedriel, Emilia Uzcudún, Ana Zarwanitzer

Panel: Language and gender: permanence and changes

Scholars' works that connect language and gender date back many decades. The first ones analyzed the differential features of the way women on the one hand and men on the other spoke, illustrating the existence of the corresponding stereotypes (Eckert 1989, Lakoff 1975, Trudgill 1996). As it may be inferred, the constitution of these stereotypes contributed to the reproduction of inequality associated with genders, with the primacy of the masculine and the submission of the feminine, both immersed in a patriarchal order that defined two distinctive territories: the public sphere for men and the private one for women (Arneil 2001, Bengoechea 2009 and 2010, Lakoff 2008, Siltanen & Stanworth 1984, Talbot 2003). However, the emergence of women in public areas forced a reorientation of this issue. Proof of this was the publishing, in the last two decades, of manuals and institutional guides for the avoidance of sexist language, for instance, in Spanish (García Meseguer 1998, Gobierno de Chile 2016, Guerrero Salazar et al. 2010, Instituto para la Mujer 2006 and 2008, Murillo Ávila et al. 2014). Currently, the emphatic demand for rights by not only female groups, but also those of non-binary minorities (Butler 1993, 1997, 2006; Petchesky 2009) is introduced as a phenomenon that challenges a growing number of speakers and invites them to create or accept neological forms that are conceived as inclusive (Jimenez Rodrigo et al. 2011, Ramirez Gelbes & Gelormini Lezama 2019 and 2020, Sczesny 2015). This panel's presentations –either in English or in Spanish– will focus on the following topics: the effects of Spanish gender-inclusive language on sentence processing, a text mining approach on discourse in IMDb reviews about 1917 and Little Women, linguistic gender equality in open access articles, gender inequality in predictive text on mobile devices, gender identities and discursive dissidence, gender construction and heteronormative masculinity in U.S. Latin-American radio, gender in the parliamentary abortion debate in Argentina.

# Language of inclusion and exclusion: a multilevel and multicultural approach

Panel

**Ms. Yan Zhou<sup>1</sup>, Prof. Hongyin Tao<sup>2</sup>, Ms. Liz Carter<sup>3</sup>**

**1.** 1. UCLA, **2.** UC, **3.** UCLA

## Language of inclusion and exclusion: a multilevel and multicultural approach

This panel takes a multilevel approach to explore the semiotic practices of inclusion/exclusion in different interactional contexts: at the micro-level, how inclusion/exclusion are encoded in linguistic systems in interaction; at the macro-level, how inclusion/exclusion in speech communities are reflected in speakers' choices of language codes; in ordinary conversation, how speakers display and negotiate their identities in the discourses of inclusion/exclusion; and what implications there may be for inclusive discourse in practical/professional settings. Previous studies (e.g., Filimonova 2005) have touched on "clusivity" features at the micro-level, for instance, first-person pronouns are often cited as a common way to index inclusion/exclusion (e.g., La Polla 2005, Bull and Fetzer 2006). Beyond pronominal systems, non-verbal behaviors, especially shifting gaze direction, are also shown to index membership in social interaction (Goodwin 1979, Tao 1999). At the macro-level, sociolinguists have extensively examined language codes chosen and perceived by speakers from different speech communities based on distinctions such as race (*linguistic profiling*, Baugh 2003), gender (Coates 1986), social class (Labov 1986), ethnicity (e.g., Bond and Cheung 1984) and other in-group/out-group memberships.

In this panel, we will explore a number of critical issues in the discourse of inclusion/exclusion in two sessions: In the first session, we address the issue of identity in both intracultural and multicultural settings. Ariel Chan will discuss how Cantonese-English bilinguals from three different communities position and negotiate their cultural identities through code-switching. Kaarina Hippi and Liisa-Maria Lehto contribute to the discussion by analyzing multicultural speakers' linguistic identities and the evaluations of their language use. Yi Ren will discuss how Mandarin speakers negotiate group membership through linguistic devices such as contrasting person references in board game interactions. In the second session, we examine the discourse of inclusion and exclusion in institutional settings. Liz Carter will investigate the functions of first-person pronouns (e.g. *wo* and *zan*) in indexing the language ideology in Chinese mass-media broadcasts. Yan Zhou will examine how expressions of epistemic asymmetries are used for the purpose of inclusion and exclusion in the interaction between laypeople/citizen-government officials. Xinrong Goh et al. will present their findings on the inclusion and exclusion of the patient in multi-party medical consultations in clinics in Singapore.

With the multilevel aspect (micro-level linguistic devices, macro-level choices of codes and identity, and the dimension of knowledge) and conversational data from different interactional settings, we seek to expand our understanding of inclusion/exclusion and contribute to the current discussion on this important theme.

# Language practices in police investigative interviews

---

## Panel

---

**Dr. Paweł Urbanik<sup>1</sup>, Prof. Jan Svennevig<sup>1</sup>, Prof. Aneta Pavlenko<sup>1</sup>**

***1. University of Oslo***

In the past few decades, rising demands for transparency of public institutions have allowed researchers to study authentic recordings of police interrogations. Several studies have examined the language of investigative interviewing techniques, demonstrating how police investigators linguistically manipulate suspects, coerce confessions and enact institutional power asymmetries (Antaki & Stokoe 2017; Berk-Seligson 2009; Heydon 2005; Leo 2008; Shuy, 2017; among others) and how suspects respond to such practices (Cerović 2016; Stokoe et al. 2016). A number of studies have also shown that the language used by the police when informing suspects about their rights is complicated and unclear even to well-educated people (Kurzon 1996; Rogers et al. 2011, 2013). The problems are even greater among vulnerable populations, including people with mental health problems, juveniles, and immigrants with limited proficiency in the majority language (Cooper & Zapf 2008; Eades 2008; Pavlenko 2008; Pavlenko et al. 2019).

However, most of the research on police interviews has focused on investigative practices and the comprehension of cautions in the UK, Australia and the USA by native speakers of English. We still know very little about police interviews outside English-speaking societies, particularly about communication of rights and the procedural constraints on interaction in this context. In particular, very little attention has been paid to comprehension problems in various stages of police interviews, especially when L2 suspects are being questioned. More knowledge is also needed about police interviews in different work settings and with different groups of interviewees.

To begin filling these gaps, our panel brings together scholars from Norway, Spain, the UK and the USA who have examined language practices in police interviews. We present 5 studies that deal with authentic recordings of police interviews and provide insight into different aspects of investigative work in these countries. In particular, the panelists focus on local orientations to age, masculinity, citizenship, suspects' opportunities to exercise their rights as well as their linguistic proficiency and potential comprehension challenges. The researchers have investigated interactions between police officers and different groups of interviewees, including male suspects, 17- and 18-year old suspects, second language suspects, and civilians crossing intra-Schengen borders.

# Language practices of cyberhate

---

## Panel

---

**Prof. Luiz Andre Neves de Brito**<sup>1</sup>, **Prof. Inês Signorini**<sup>2</sup>

**1.** Universidade Federal de São Carlos, **2.** UNICAMP (Universidade Estadual de Campinas)

Since the rise of ‘social media’ in the late 2010s, communities based on affects and affinities have rapidly spread and reached an audience never imagined before. A well known phenomenon associated with these communities is the circulation of false information or fake news. Due to these misinformation cascades (Easley & Kleinberg, 2010), we have seen how individuals abandon their own point of view and convictions to follow a community point of view, although it sounds completely untrue or nonsensical. The usage of a hashtag points to this cascade behavior as it promotes a sense of belonging, of being a part of a community. This identity between individual and community may be faced as a shared practice of inclusion, but, while fake news is usually associated with the rise of populism and extremism, we have noticed how gender, religion, political, ethnic, and racial diversity has been frequently avoided, silenced, and excluded. In addition to exclusion, new forms of cyberbullying, more specifically new forms of verbal and semiotic violence, or cyberhate, emerge. As a matter of fact, the Internet has become a privileged tool to disseminate hatred, based on racism, xenophobia, bigotry, and all sorts of bias and prejudice.

This panel focuses on contemporary language practices that are aimed at producing online hate speech and incitement in different forms of cyberhate, generally defined as “any digital act of violence, hostility, and intimidation, directed towards people because of their identity or perceived difference” (KhosraviNik & Esposito, 2018).

Interested on the topic of discourse analysis (Blommaert, 2005) and ethics of discourse (Graham, 2018) on social media communication, this panel proposes some fundamental questions to be discussed among the accepted presentations: How do people get engaged linguistically and semiotically in processes of othering? How do people make investment in resources to support their online hate? How language works in this context of cyberhate? Under what circumstances the discursive practice of cyberhate is not only produced, but also consumed and diffused?

# Language use in human-animal communities: towards interspecies pragmatics

## Panel

**Dr. Rea Peltola<sup>1</sup>, Dr. Mika Simonen<sup>2</sup>**

**1.** Université de Caen Normandie, **2.** University of Helsinki

This panel investigates the interactional and conceptual organization of interspecies communities from a linguistic perspective. Urgent concerns about the state of our environment and the position of non-human beings within contemporary societies have made manifest the need for reflecting on ethical, cultural and social issues related to human-animal relationships. These considerations go alongside growing biological knowledge about the cognitive, communicative and emotional capacities of different species. Various interdisciplinary approaches in the humanities and the social sciences (Human-Animal Studies, Posthumanism, Ecocriticism, Biosemiotics) have shown that the faculty of speech and language has been used as one of the most important grounds for separating humans from other living beings and that power relations based on this dualism are sustained by language use (e.g., Stibbe 2012). By undoing conceptual hierarchies and boundaries between humans and other living creatures, animal philosophies have revealed the possible existence of local interspecies communities with shared interests and meanings.

In this wider context of reconsidering the human-animal relationships and the status of language within them, the aim of this panel is to explore language use in everyday interaction and cohabitation between humans and other living beings. The panel includes contributions from different theoretical and methodological approaches that focus on:

- The linguistic strategies adopted by human speakers when addressing a member of another species: Are there expressions or ways of speaking reserved for non-human addressees? What kind of an interface separates the “human-to-human language” from the “human-to-non-human language” (Mitchell 2001)?
- The social actions accomplished by participants in interspecies interaction: How do human and non-human participants display their orientation to the sequential environment and to each other as participants (Goode 2006, Roberts 2004)? To what extent do humans engage in “mind-reading” (Levinson 2006) when producing responses to actions in interspecies interaction?
- The ways in which the plurality of perceptual universes (von Uexküll 1982) and semiotic webs (Kohn 2013) is linguistically construed: How can language structures serve as a support when human speakers seek to understand and describe non-human actions and states? What can we say about “human” and “non-human” categories and conceptualizations when looking at grammatical constructions in actual language use (Goatly 1996, Sealey 2018)?
- The connections and the tensions between private and public animal talk: What kind of cultural, political and ideological factors shape the ways in which humans talk about other species?

References are available on request.

# Laughter and interactive stancetaking in English, Japanese, and German food conversations

## Panel

***Dr. Polly Szatrowski<sup>1</sup>***

*1. University of Minnesota*

In this panel we investigate how laughter is used when participants create, monitor, and accept/resist stances in English, EFL (English as a Lingua Franca), Japanese, and German conversations about food. The practice of eating together involves speakers positioning themselves vis-à-vis the food and other participants while taking stances through evaluations of food. Including others in commensality may be a universal way to increase closeness.

This panel builds on previous research related to positioning (Davies & Harré 1990) and stancetaking (Englebretson 2007), including Du Bois' (2007) dialogic and intersubjective approach to stance that focuses on evaluation through which participants position themselves and create alignments vis-à-vis one another and the object(s) of evaluation. Also relevant is conversation analytic research on assessment that views evaluation (assessment) as not merely lodged in the private internal experience of the speaker, but as a dynamic embodied multimodal performance that is continually monitored and adjusted moment-by-moment in the conversational interaction (C. Goodwin 1981, 1986, 2018; Pomerantz 1984; C. Goodwin and M. Goodwin 1987, 1992, M. Goodwin 1990, 1997, 2006; M. Goodwin and C. Goodwin 2000, 2001).

In the temporal unfolding of interactive stance sequences, laughter is an important device used to negotiate agreement, disagreement, and ambivalence. Applying research on laughter (Jefferson 1979, Jefferson 1984, Jefferson, Sacks & Schegloff 1987, Chafe 2007, Ervin-Tripp and Lampert 2009, Holt 2010, Warner-Garcia 2014, Clift 2016, Brunner, Diemer & Schmidt 2017 and others), footing, contextualization cues, and frame (Goffman 1981, Gumperz 1982, Tannen 1993), and face threatening acts and negative and positive politeness (Brown and Levinson 1987), the papers in this panel focus on where laughter is used in stance sequences, the function of the laughter in the interaction, and the temporal development in the interactional achievement of stances.

The papers in this panel investigate laughter and face maintenance in assessments of snack bars and chips in English focus groups, stance-taking and laughter in negotiations of food-related cultural identities in ELF Skype conversations, the relation between laughter and gaze in disagreements during English hummus taste-testing, functions of laughter in stancetaking at a German Taster Lunch, the multimodal co-construction of stances towards high-calorie foods using laughter in Japanese Dairy Taster Brunches, and the relation between laughter and 'proper' behavior in restaurant conversations. These papers show that participants use laughter to project positive or negative assessment, mark alignment, position the speaker, mitigate problematic issues or opposing opinions, frame and reframe the situation, reduce imposition and potential face-threats, create rapport and common ground, and pursue or resist affiliation.

By exploring a diversity of languages, societies, and practices of social interaction, this panel deepens our understanding of shared practices and knowledge in conversations about food. It reveals the complex practices of stancetaking in food conversations related to identity, assessments, and politeness, and suggests ways that laughter can be used to include others while acknowledging differences. This panel contributes to research on contextualized social and cognitive activity, and the growing body of research on the linguistics of food (Gerhardt, Frobenius, & Ley 2013, Szatrowski 2014, and others).

# Linguistic recycling: How and why do we reuse the same linguistic resources?

Panel

***Dr. Lauri Haapanen<sup>1</sup>, Dr. Daniel Pfurtscheller<sup>2</sup>***

*<sup>1</sup> University of Jyväskylä, <sup>2</sup> University of Vienna*

“She said that he said that they said...” – this is a recursive process that can be termed ‘quoting’ when focusing on discursive practices of using utterances again and ‘recontextualization’ when focusing on the material and operational aspects of it. If termed ‘linguistic recycling’, resource aspects of this process of reusing language are foregrounded. In this panel, we invite scholars to discuss such linguistic recycling. Contributions are meant to shed light on how and why language users – both as individuals and as communities – save resources and create value by quoting and recontextualizing other’s utterances.

In the world of material goods, the term recycling describes the process of extracting entire products or their parts at the end of the products’ life cycle and reusing them to start the life cycle of new products. The value production chains of material goods are (to a certain extent) comparable with those of semiotic goods. In everyday talk as well as in professional communication and public discourse, individuals and communities engage in practices of recycling utterances. And similarly to material goods, practices of down-, cross-, and upcycling utterances have been developed to increase or maintain linguistic capital: Selling a news piece with what used to be casual utterance as its headline is what we consider upcycling. Reusing the utterance in more or less the same shape within text bodies of social and mass media news is comparable to, for example, the crosscycling of a PET bottle. By contrast, using the utterance as a text dummy in a layout sketch can be considered a case of downcycling.

Yet there are ontological differences. In the physical world, the same set of particles has been recycled since the big bang. In the semiotic world, however, recurrence, in general, and recycling, in particular, refer to the type, not the token. The utterance itself, as a physical event, is unique, inseparably intertwined with its context and therefore volatile. But this holds true in analogue communication only. Digital instances of language use such as tweets and GIFs can be recycled as exact copies, replicating themselves in social networks like viruses. So, it could be argued that digital linguistic recycling combines two types of recycling: the token-based recycling as known from the material world and the type-based recycling as known from the semiotic world. This combination results in an intriguing synthesis: In our digitalized world, we recycle semiotic and linguistic tokens (and not only types) – and we do it by saving the original token!

We are convinced that systematically scrutinizing motivations and consequences related to linguistic resources can result in exciting and, perhaps, inconvenient insights. Therefore, our panel asks, reflects, wonders and also answers, how can we theorize linguistic recycling, what methodological tools and concepts we need in studying it and how is linguistic recycling practiced in various domains, today and tomorrow?

# Making language for specific purposes comprehensible for a broader public: Evaluating and improving expert-lay communication in different domains

Panel

***Mr. Gianni De Nardi<sup>1</sup>, Dr. Karin Madlener-Charpentier<sup>1</sup>, Prof. Felix Steiner<sup>1</sup>***

*<sup>1</sup>. ZHAW School of Applied Linguistics*

Communication of expert knowledge for a broader public is a growing societal concern (Antos 2020; Brettschneider et al. 2012; Lugger 2020; Lutz 2019). This is because domain-specific knowledge is a crucial precondition of self-determined access to the knowledge society in general and of participation in specific social domains such as education, public administration, politics, healthcare, and the law. Making research processes, findings, their interpretation, implications, and applications comprehensible and accessible for a lay public is thus a challenge for experts in all knowledge domains. From a linguistic point of view, a core question is the comprehensibility of *languages for specific purposes* (LSP) for laypersons with different levels of language competence, reading ability, and prior knowledge as well as different cultural backgrounds (e.g., Ballod 2020; Busch 2015; Göpferich 2002; Kastberg 2019).

A highly relevant current illustration of this challenge is provided by the substantial extent of public misunderstanding of scientific principles, research findings, and research uncertainty during the corona pandemic. A less visible, yet internationally widely documented and ethically crucial example concerns research subjects' (lack of) comprehension of informed consent (IC) documents (e.g., Baum 2006; De Nardi et al. 2018; Fernandes Moreira et al. 2016; Stunkel et al. 2010).

This panel addresses the question of LSP comprehensibility from the perspectives of pragmatics, text/discourse linguistics, and psycholinguistics, spanning LSP domains such as the life sciences, the technical, medical/health, legal, political, and economic domains:

- Which factors mediate LSP comprehensibility for (different groups of) laypersons?  
For instance, which linguistic features make an IC form, a press release, an economic or a legal text comprehensible for a broader public? Which features – related to content, speech acts, vocabulary, (morpho-)syntax, text structure, explicitness etc. (e.g., De Nardi et al. 2018; Hansen-Schirra et al. 2009; Wolfer 2017) – lead to higher/lesser degrees of comprehension?
- How can comprehensibility of oral and written formats of LSP be evaluated (e.g., Ballstaedt 2019; Bührig/Meyer 2007; Burgess et al. 2019; Kercher 2013; Wöllstein 2017)? Which (psycho-) linguistic measures and models of comprehension can be applied or adapted for such evaluations?
- How can LSP comprehensibility be improved (e.g., Bleiberg et al. 2019)? What is the potential contribution of so-called “light” or “plain language” (e.g., Luttermann 2017; Maaß/Rink 2017; NIH 2013)? How can visualizations contribute to LSP comprehensibility? (How) Does digitalization impact LSP comprehensibility (e.g., Marx 2019; Turnbull 2014)?
- How is comprehension negotiated in communicative exchanges between experts and laypersons, e.g., medical doctors and patients (e.g., Groß 2018; Stukenbrock 2008)? What are potential implications for linguistic professionalization, e.g., in medical, health, and care professions?

The goal of the panel is to (1) share challenges, findings, and options regarding the evaluation and improvement of LSP comprehensibility and (2) to discuss implications and applications across research domains and disciplines.

# Managing trouble in talk-in-interaction: Repair and other remediation practices

## Panel

***Prof. Alexa Hepburn<sup>1</sup>, Dr. Galina Bolden<sup>1</sup>, Dr. Jenny Mandelbaum<sup>1</sup>***

***1. Rutgers University***

Conversation analysts argue that talk in interaction provides the fundamental infrastructure through which social life is organized and enacted. Practices of recipient design generally ensure that talk is designed to maintain intersubjectivity and progressivity. When trouble arises, the organization of *repair* (Schegloff, Jefferson, & Sacks, 1977) provides speakers with many well-documented resources for fixing such problems (e.g., Hayashi, Raymond, & Sidnell, 2013). CA research has amply demonstrated that practices for managing interactional troubles (such as problems of hearing, speaking, and understanding) provide a window into participants' orientations to a range of social phenomena that are otherwise difficult to capture, including management of their professional (e.g., Kitzinger & Mandelbaum, 2008), cultural (Bolden, 2014), relational (Mandelbaum, 2016), gender (Stokoe, 2011), sexual (Land & Kitzinger, 2005), racial (Whitehead & Lerner, 2009), etc. identities and associated rights and responsibilities. Cross-linguistic work on repair has shown both the universality (e.g., Dingemanse, Torreira, & Enfield, 2013) and linguistic specificity (e.g., Fox, Hayashi, & Jasperson, 1996) of methods deployed to fix interactional problems. In spite of the wealth of research in this area, as Schegloff (2006) notes, the solution to many important organizational problems of talk in interaction are as yet neither known nor understood. This panel is designed to showcase new investigations into repair and other boundary practices for managing interactional troubles and into how these practices might be deployed in the service of diverse interactional projects. We invite papers that advance our understanding of repair and other remedial practices across contexts and languages.

Confirmed panel participants:

- Virginia Gill
- Makoto Hayashi
- Chase Raymond
- Geoff Raymond
- Jeffrey Robinson
- Kevin Whitehead
- Rutgers University CA team:
  - Faculty: Galina Bolden, Alexa Hepburn, Jenny Mandelbaum, Lisa Mikesell, and Jonathan Potter
  - Students: Hee Chung Chun, Dana Licciardello, Song Hee Park, Aleksandr Shirokov, Wan Wei, and Kaicheng Zhan

# Manufacturing Dissent: Manipulation and Counter-Manipulation in Times of Crisis

Panel

***Prof. Cornelia Ilie<sup>1</sup>***

***1. Stömstad Academy***

Over the first two decades of the twenty-first century we have witnessed unprecedented worldwide crises affecting political, financial, environmental and public health sectors. These crises, culminating with the ongoing COVID-19 pandemic, have been accompanied by equally challenging ‘infodemics’, which feed on people’s basic anxieties, spreading false information, conspiracy theories and misleading narratives. The response actions taken at national and transnational levels often range from crisis management to crisis manipulation, while communication strategies are sometimes framed in a way that obscures inconvenient and disquieting facts, so as to influence individual behaviours and public perceptions for political gain.

Research on the strategies and impact of manipulation has recently witnessed dramatic expansion, resulting in a diversity of theoretical perspectives, where manipulation is described by philosophers as an inherently social practice (Coons and Weber 2014) inducing false beliefs and expectations (Scanlon 1998), by discourse analysts as a form of social power abuse, cognitive mind control and discursive interaction (Van Dijk 2006), and by argumentation theorists as a consequence of unethical argumentation (Meyer 1987).

While several studies have addressed major aspects related to the notion, forms and goals of manipulation, less attention has been devoted to the dynamic interplay of discursive, meta-discursive and inter-discursive strategies that underpin the interaction between manipulator(s) and manipulation target(s) in terms of (mis)trust, (un)truthfulness and (dis)empowerment. To bridge this gap, the panel proposes to redirect the research focus towards integrated, multi-level, transdisciplinary approaches for a systematic scrutiny of the crisis-driven manipulative practices performed in particular socio-political and culture-specific contexts by virtue of the power relations between manipulator(s) and the manipulation target(s), the potential manipulability of the manipulation target(s), and the impact of counter-manipulative and challenging responses.

The aim is to bring together scholars from relevant disciplinary areas to explore strategies of propagating and of counteracting manipulation practices, including deception, disinformation, misinformation, conspiracy theories, lying and fake news, in various environments during periods of social, economic, political and/or health crisis. The investigations may cover offline and online discourse genres, including, but not limited to official notifications, news reports, tweets, press conferences, mainstream vs. independent media, parliamentary debates, election campaigns, institutional question-and-answer sessions with citizens. Some of the questions to be explored are: In what ways can manipulation be distinguished from persuasion? How are manipulative practices used to promote self-legitimization and other-delegitimization in particular socio-cultural contexts and communities of practice? What cognitive, evaluative and emotional aspects of communication are involved in manipulative messages?

The following scholars have confirmed their participation in the panel: Didier Maillat & Steve Oswald; Cristina da Silva Marinho & Michael Billig; Massimiliano Demata; Maria Stopfner; Monika Kirner-Ludwig; Martina Berrocal; Karin Bischof & Karin Stögner; Roberta Martina Zagarella & Marco Annoni; Li Xin; Cornelia Ilie.

The discussant will be John Wilson (Northern Ireland).

The panel welcomes papers related to its proposed theme.

# Meaning Generation in Chinese Official Media Discourse

---

## Panel

---

**Prof. Lutgard Lams<sup>1</sup>, Dr. Rui Zhang<sup>2</sup>**

***1. KU Leuven Campus Brussels, 2. Dalian University of Technology***

Media discourse operates in a public sphere with struggles over meaning, which is ‘communicatively, interactively and intersubjectively generated’ (Verschueren 2016: 143). It is consequently an ideological site where journalists and other interactants may skillfully manipulate meaning to influence the viewpoints of the general public, but it is equally a site where ideological meaning is generated on the basis of common sense assumptions without any intentionality on the part of the message producer.

When applied to the Chinese media context, one can investigate meaning generation in the official media that answer to and reflect party discourse or one can focus on bottom-up discourses, either aligning with or contesting state narratives. This panel chooses to examine the way voices in the Chinese vernacular and English-language state media are negotiated when addressing the domestic and foreign communities. Intent on reaching a fuller inclusion into the global media discourse networks, these official media also ensure that the ‘China story’ is being told ‘properly’ to the outside world and seek alignment from the Chinese citizenry to the state’s dominant tune (Kadar, Liu and House 2020).

The panel offers a platform for an exchange of ideas about explorations into various phenomena concerning the pragmatics of meaning generation in Chinese official media discourse. Including primarily empirically-grounded contributions, the panel is divided into three thematic sessions. The first one concentrates on meaning generation in media narratives about conflict and dispute. Several presentations adopt a comparative approach, comparing Chinese and Taiwanese news accounts or Chinese and Western news magazines. While two papers zoom in on meaning making about trade disputes (either by conducting a critical discourse analysis or by analyzing the mechanisms of presuppositions), a third study looks at metaphors in narratives about political conflicts.

The second session comprises studies on Chinese political discourse articulated during press conferences by the Chinese Premier, or press releases by Hong Kong officials who echo the vocabulary and phrasing of that of the Chinese government. An additional presentation will take a retrospective and prospective view on how Chinese media discourse has been studied within the framework of linguistic adaptability.

The last session focuses on media narratives of public health emergencies. The first two studies investigate the genre of official government announcements of COVID-19 in China, Japan and the US, and on ‘Ren Zhongping’, as a subgenre of *Renminribao* commentary articles on the pandemic. The other two presentations examine the issue of translation in Chinese official media discourse in this crisis context, and implied meaning triggered by metaphor use in the *Renminribao* over a longer period of time. All contributions take linguistic analysis as the point of departure and approach it from a variety of analytical lenses, either with a culture-specific perspective or a cross-cultural one.

# Meaning in Interaction

---

## Panel

---

Prof. Arnulf Deppermann<sup>1</sup>, Prof. Elwys De Stefani<sup>2</sup>, Dr. Henrike Helmer<sup>1</sup>

1. Institut für Deutsche Sprache, 2. KU Leuven

This panel brings together researchers who are interested in how the meaning of words and expressions in talk is established in social interaction. Whereas over the last decades action formation, sequence organization, as well as the role of grammar, prosody and multimodal conduct have become flourishing topics of Conversation Analysis and Interactional Linguistics, issues of lexis and semantics in interaction have remained largely unexplored (but see Clark/Wilkes-Gibbs 1986, Deppermann/Spranz-Fogasy eds. 2002, Hakulinen/Selting eds. 2005, Deppermann ed. 2011, Bilmes 2015). Yet, as already Garfinkel's "Studies in ethnomethodology" (1967) have shown, there is a ubiquitous need for the situated interpretation of expressions because of the irremediable indexicality of all language use. Even for content-words that are not deictic expressions, meaning is always indexical to a certain degree. It cannot be retrieved just from a (mental) lexicon, but has to be elaborated in the local context and must be collaboratively grounded (Clark/Bangerter 2008). This becomes especially clear in misunderstandings, or when the meaning of an expression changes in the course of an interaction (Liberman 2012).

This panel focuses on practices by which participants clarify the local meaning of the expressions they are using in the current context of the interaction. Such practices include definitions (Greco/Traverso 2016; Deppermann/De Stefani 2019), explications of intended meanings (Helmer/Zinken 2019), contrasts (Deppermann 2005, Bilmes 2015), various forms of repair (Clark/Wilkes-Gibbs 1986), the construction of taxonomies (Bilmes 2011, 2015), exemplifications, e.g., in narratives, and in the deployment of other practices that are still to be discovered. Multimodal practices, such as enactments and demonstrations (e.g., Deppermann 2016, Kääntä/Kasper/Piirainen-Marsh 2018), are an additional important resource for the clarification of meaning. The contributors to this panel approach meaning both from an interactional and from a linguistic perspective. Concerning the interactional organization of meaning, we are interested in activity types and sequential environments in which clarifications of meaning become an issue for participants. Pedagogy, misunderstandings and conflict are environments that are particularly prone to negotiations of meaning; each of them makes relevant various degrees of granularity of meaning, different referential and conceptual facets, and varying practical uses and constraints for expressions and their meaning (Deppermann 2020).

Concerning the linguistic constitution of meaning, we are interested in routine formats that are used to implement practices of meaning clarification in different languages. Examples are formats for explicating meaning (e.g., German *x heißt y* ('X means Y', Helmer 2020), *das heißt* ('that means'), *du meinst* ('you mean', Helmer/Zinken 2019)), definitional formats (e.g., the negative format 'X is not Y, but Z'; Deppermann/De Stefani 2019) or formats for clarifying the locally intended meaning (Italian *nel senso che* ('in the sense that'), De Stefani 2020).

## Media as procedures

---

### Panel

---

Prof. Martin Luginbühl<sup>1</sup>, Prof. Jan Schneider<sup>2</sup>

<sup>1</sup>. University of Basel, <sup>2</sup>. University of Koblenz-Landau (Campus Landau)

While we probably all agree that media and communication are interdependent, i.e. that media shape communication and communication shapes media, there still is a debate going how media have to be understood best in order to capture their role in communication. In some media theories, the term *medium* is still used to refer to only the matter used to “transport” meanings, information or signals from a sender to a receiver. Especially in German media discourse, but also internationally, this technical conception of *media* is still dominant in linguistics (cf. Marx/Weidacher 2014: 54; Schmitz 2015: 8) and some media studies works (e.g. Hartley’s widely read introduction to *Communication, Cultural and Media Studies*(2020: 200): “Media of communication are therefore any means by which messages may be transmitted”).

In this panel, we aim to challenge this narrow understanding of *media* especially within media linguistics. We propose to understand *media* not (only) as technical infrastructures, but above all as socially constituted semiotic procedures (Schneider 2008). In this understanding, *mediality* means a specific way of not only processing, but also constituting signs. Therefore, all communication (even oral face-to-face communication) has its specific *mediality* and is medial communication. The technical aspect of media then not only refers to hardware, but also – in the Greek sense of *techné* – practical skills or *procedures*.

This panel proposes a multi-faceted look at the way how *media* in the sense mentioned above shape communication and how media affordances (Gibson 1977, Costa 2018, Zipoli 2014) emerge. Instead of asking what a *medium* is or is not, we focus on questions like:

- What are the specific medialities (or medial properties) of medial procedures (or communication forms) like face-to-face communication, mobile communication via smartphone, mass media conversations, Youtube blogs, meetings with video communication tools etc.
- What do we learn about social life in ‘digitalised societies’ when we compare these different medialities with each other?
- What effects do different medial procedures have on the concrete interaction?
- In which ways influence emerging communication practices in turn medial procedures?
- How are established medial procedures transferred and transformed to new medial environments?

## Metapragmatics in Chinese

---

### Panel

---

**Prof. Xinren Chen**<sup>1</sup>, **Prof. Rong Chen**<sup>2</sup>

*1. Nanjing University, 2. University of California at San Bernadino*

This panel aims to complement and enrich existing metapragmatic research by presenting a series of metapragmatic studies on face-to-face or computer-mediated communication in the context of China. The topics under examination will cover various interactional practices ranging from speech act performance (e.g. complimenting, invitations and offers), (im)politeness, identity (de)construction and marking, to conversational management in a variety of communicative contexts, such as Weibo blooging, Reality TV mediation shows, and police mediation. Theoretical frameworks such as metapragmatics (Bublitz & Hübner 2007; Caffi 1984, 1994; X. Chen 2020; Culpeper & Haugh 2014; Mey 2001; Verschueren 1995, 2000), rapport management model (Spencer-Oatey 2000, 2005, 2008), self-politeness theory (R. Chen 2001), pragmatic identity theory (X. Chen 2013, 2014, 2018), and cultural pragmatics (G. He 2016) will be adopted to account for a variety of metapragmatic phenomena in Chinese communication. All the studies concerned will be empirical by nature, using naturally occurring data. They may be qualitative or quantitative in their respective methodological orientation. We hope that our panel, which offers culturally situated and linguistically-bound studies in Chinese, may offer new perspectives, dimensions and insights to the newly emerged field of metapragmatics.

# Multilingual Pragmatics: Examining classroom discourse in multilingual settings

Panel

***Prof. Pilar Safont<sup>1</sup>, Dr. Laura Portolés<sup>1</sup>***

***1. Universitat Jaume I***

For the last thirty years, a considerable amount of research has examined pragmatic production and awareness in classroom discourse (Taguchi, 2019). These studies have adopted an SLA perspective, and the umbrella term employed for this line of research is Second Language or Interlanguage Pragmatics. Several individual variables have been identified (Taguchi, 2012), pragmatic instruction has been widely examined (Alcón, 2018), and the intercultural nature of pragmatic behavior has been considered (Kecske, 2017; McConachy, 2019). Although several scholars have raised the need to adopt multilingual perspectives in examining language learning contexts (Aronin, 2019; Cenoz and Gorter, 2020), the multilingual background of language learners has not received much attention neither in SLA nor in IL pragmatics studies. Yet, findings to date point to the peculiarities of multilingual pragmatic production and development. Studies in this respect have tackled the effect of instruction, adolescent written and online discourse (Martín-Laguna, 2020) and early pragmatic development (Portolés, 2015; Portolés and Safont, 2018).

In order to contribute to this line of research, we would like to encourage discussion and present recent research conducted in multilingual learning environments that takes into account all learners' languages and focuses on their pragmatic competence. In this sense, we suggest three subtopics that this panel may cover in examining multilingual classroom pragmatics, namely those of i) the role of teachers and students' pragmatic awareness, (ii) the use of translanguaging to achieve pragmatic goals, and iii) the effect of specific multilingual learning environments (CLIL, L3 and online contexts) on the learners' pragmatic development. In addition to that, we also welcome proposals tackling classroom multilingual pragmatics from other enriching perspectives.

# Multimodal im/politeness in spoken, sign and written language

Panel

***Dr. Iris Hübscher<sup>1</sup>, Prof. Andreas Jucker<sup>2</sup>, Dr. Lucien Brown<sup>3</sup>***

***1. URPP Langue and Space; UZH Zurich, 2. UZH Zürich, 3. Monash University***

While im/politeness for many years focussed on verbal strategies, recent years have seen the emergence of a vibrant interest in multimodal components of im/politeness in oral and sign languages, such as prosody/ non-manual features, gesture, sign and other bodily signals in face-to-face interaction and emojis and other cues in written language channels. For example, on the side of oral languages, research has found that different prosodic features such as pitch, speech rate, intensity and breathiness play an important role in the encoding of im/politeness (Brown, Winter, Idemaru, & Grawunder, 2014; Winter & Grawunder, 2012). Similarly, nonverbal cues such as manual gestures, head nods and other bodily cues can be shaped by im/politeness factors (Brown & Winter, 2018; Kita & Essegbe, 2001). Also, it has been demonstrated that gesture and prosody interact closely in the perception of im/politeness (McKinnon & Prieto, 2014; Nadeu & Prieto, 2011). Furthermore, multimodal cues have been shown to play a crucial role in the development of the perception and production of politeness in first language acquisition (Hübscher, Garufi, & Prieto, 2019; Hübscher, Wagner, & Prieto, 2020). Regarding sign languages, research has, for instance, investigated taboo signs (Loos, Cramer, & Napoli, 2020) and also how the head and other non-manual features are used to communicate politeness (Mapson, 2014). Finally, research has shown that in written languages, including computer mediated communication, interactants use different cues such as emojis and special use of punctuation to mitigate a potential face threat or more generally to signal their im/polite intention (Haugh et al., 2015).

This panel would like to bring together researchers whose work focuses on one or several of the above-mentioned multimodal aspects of im/politeness in either oral, sign or written languages. This panel aims to discuss the role of different multimodal signals from both a perception and production point of view, looking at the phenomena across languages and cultures and at different stages of language development. Ultimately, the aim is to contribute to a better understanding of how multimodal im/politeness should figure in our description of the pragmatics of im/politeness more widely.

## Narrative Practices and Dimensions

---

Panel

---

***Prof. Neal Norrick<sup>1</sup>***

**1.** Saarland University

In recent years the spotlight in narrative pragmatics has often shifted from stories themselves to narrative practices and dimensions. Narrative dimensions or parameters have been defined in relation to tellers, recipients and contexts in place of traditional categories like genres and classifications like fictional versus non-fictional or narratives of personal versus vicarious experience. Research has revealed gradient dimensions and hybrid genres. At the same time, recognition of a wider variety of telling contexts, moving beyond traditional content-based canonical stories, has led to recognition of the analytical need for a range of narrative practices in place of “large stories” versus “small stories.” Researchers began to explore narrative practices not just within the story (text) but also within the overall narrative performance including elicitation of stories, justification for telling, obtaining the floor, recipient design, and recipient responses, even as these responses turn into parallel and conflicting narratives. Storytelling in interaction was also analyzed in relation to embodied action, e.g., gestures, diverse forms of re-enactments, and “showing” objects, persons or features of the material environment. Various strategies of “recipient design” result in narrative practices tailored to the current participants and interactional goals of the immediate local performance. The affordances of computer mediated communication influence narrative dimensions and shape narrative practices of their own, particularly in the social media. Tellability, initially based on story content, has come to be understood as often grounded on interactional criteria such as relationships between tellers and recipients, who has the right to tell whom, who should know the story and why. This panel brings together an international group of scholars interested in narrative discourse and narrative performance, seeking to identify and illuminate narrative practices and dimensions across story genres, telling contexts, social groups and cultures, to relate, compare and perhaps reconcile approaches based in narrative dimensions and narrative practices.

# Navigating verbal hypocrisy in face-to-face and mediated contexts: Towards a pragmatic model

Panel

***Prof. Tuija Virtanen<sup>1</sup>, Prof. Sandrine Sorlin<sup>2</sup>***

***1. Åbo Akademi University, 2. Université Paul Valéry – Montpellier 3***

## Navigating verbal hypocrisy in face-to-face and mediated contexts: Towards a pragmatic model

Hypocrisy is widely conceptualised in negative terms as a mismatch between people's insincere claims and their actual deeds which is not intended to be detected. The notion has rarely been theorized across disciplines: if its ubiquity has been noticed in philosophical political thought (Runciman 2008), sociology has shown a "lack of systematic attention to the origins, patterns, and implications of hypocrisy" (Wieting 2015: 2). Linguists of various orientations have paid little, if any, theoretical attention to this notion. Rather, it is used, in passing, in its everyday sense. Still, hypocrisy is arguably a pragmatic phenomenon. Despite good candidates for conceptual affinity such as (im)politeness and (in/post)civility, irony and sarcasm, as well as faking, lying, and deception at large, hypocrisy appears in everyday use of language as a multifaceted conceptualisation in its own right. For all its negative flavour, some extent of hypocrisy seems to be a *sine qua non* of public discourse: for Machiavelli, political aims cannot be met honestly, so condemning hypocrisy amounts to condemning politics altogether (see Grant 1997). But even beyond politics, Feinberg (2002: 59) shows that "Life without dissimulation is impossible in what we call civilized society. The question is not whether everyone is a hypocrite. Everyone is. The only variant is the degree of hypocrisy practiced by every person." The goal of this panel is to investigate the phenomenon across contexts in order to devise a pragmatic model of verbal hypocrisy.

The panel offers micro-pragmatic and macro-pragmatic analyses of verbal hypocrisy including prosody. We address questions such as: Why and when is hypocrisy used, what linguistic resources are employed, and what kinds of tacit norms are assumed? How do people negotiate, detect, and characterise hypocrisy? Might the 'dark' and possible 'brighter' sides of hypocrisy constitute a continuum, and if so, how do each function in pragmatic terms? Some of the studies focus on recent political issues, changing academic practices, as well as uses of hypocrisy to generate humour. Others are concerned with the metapragmatics of hypocrisy in ordinary and professional contexts. The wide variety of data allow pragmatic analyses of particular speech acts in the service of hypocrisy, its contributions to the dynamics of power, persuasion and manipulation, as well as the relations of shared understandings of hypocrisy to the ideals of sincerity, authenticity, trust and communicative cooperation. All in all, the two sessions of the panel advance the study of verbal hypocrisy as a phenomenon *per se*, serving to disclose its fuzzy boundaries and suggesting avenues towards a comprehensive pragmatic model. Each paper will be followed by a brief discussion, and the second session will be extended by a quarter of an hour to incorporate the discussant's note and a final general discussion.

# Negotiating masculinities across media: communities, contexts, and discourses

Panel

***Dr. Daria Dayter<sup>1</sup>, Dr. Mark McGlashan<sup>2</sup>, Ms. Alexandra Krendel<sup>3</sup>, Dr. Robert Lawson<sup>2</sup>***

*<sup>1</sup>. University of Basel, <sup>2</sup>. Birmingham City University, <sup>3</sup>. Lancaster University*

Understandings and (re)negotiations of masculinity have increasingly become part of the conversation in contemporary language, gender and sexuality research, partly in reaction to ongoing public debates around toxic masculinity, online male identities such as incels and pick-up artists, misogyny, and institutionalised sexism. Dominant discourses of masculinity place a number of cultural constraints on men, including, for example, the ideals of stoicism, risk-taking, competitiveness, the need to “man up”, and the value of sexual promiscuity. In the research fuelled by the controversy about toxic masculinity, however, the positive connotations of masculinity are often neglected in favour of foregrounding in-group and out-group boundaries. The masculine qualities that speakers can claim for themselves through language also include loyalty, agency, independence, self-reliance, and so on.

This panel considers how discourse (as social practice) operates in media, media platforms, and communities designed for and marketed to men. The panel considers how these discourses relate to and enable (re)negotiations of identity and community membership - as well as representations and metadiscourse about these identities and communities - within and across contexts. The panel contributes to the conference theme of pragmatics of inclusion by asking questions about discursive gatekeeping, facework in negotiating masculinity, and forms of inclusion in speech communities.

We invite contributions that address the following themes from the perspective of linguistic pragmatics, discourse analysis, and conversation analysis, as well as contributions from non-linguistic disciplines.

- Masculinity and ideology (toxic masculinity, misogyny, positive masculinity)
- Masculinity and intersectionality (gender and sexuality, ethnicity, class, age, disability)
- Masculinity and community (homosociality, male solidarity)

# New technologies in studying multimodal reference and joint attention in social interaction

---

Panel

---

***Prof. Anja Stukenbrock<sup>1</sup>***

*1. University of Lausanne*

This panel brings together researchers who use new technologies to investigate how participants establish reference and joint attention to phenomena in shared spaces, including visible, imagined, technically mediated, and virtual reality spaces. These are not given, but have to be created by the participants in order to jointly attend to a referent.

Reference and joint attention have long been studied in different research domains. While researchers in psychology, child development, cognitive sciences, etc. have used modern technologies (remote and mobile eye tracking, motion tracking, etc.) as part of laboratory experiments for decades, studies on multimodal reference in Conversation Analysis and Interactional Linguistics use video data collected in naturally occurring social interaction (Hindmarsh & Heath 2000; Goodwin 2003; Eriksson 2009; De Stefani 2010, 2018; Mondada 2014; Stukenbrock 2009, 2015). As these studies show, verbal (summoning devices, deictics, response cries, etc.) and embodied resources (pointing, bodily orientation, object manipulation, etc.) are mobilized concurrently and deployed in context-sensitive ways with respect to the ongoing activities, the participants' position in space, their attentional focus and interactional availability.

While verbal, embodied, and technical resources may all contribute to the interactional construction of space and the localization of referents, technologies may, moreover, support the detailed investigation of referential practices and attention-sharing in physically shared and mediated spaces. Mobile eye tracking is beginning to gain grounds in studying the details of gaze in CA and IL studies on turn-taking (Kendrick & Holler 2017; Auer 2018, forthc.; Weiß 2018; Zima et al. 2018), multimodal constructions (Ningelgen & Auer 2017), and multimodal reference (Stukenbrock 2018, 2019, 2020; Stukenbrock & Dao 2019). The proposed panel is interested in both types of technological usages: new technologies as part of participants' ethno-practices of sharing referents in various kinds of spaces (Hindmarsh et al. 2006; Keating 2015, 2017; Jucker et al. 2019), and new technologies as part of researchers' methodology of examining referential practices in those spaces.

---

## Nonlexical vocalizations and the sensing body

---

### Panel

---

***Dr. Emily Hofstetter<sup>1</sup>, Prof. Leelo Keevallik<sup>1</sup>***

***1. Linköping university***

Language and the body have increasingly been demonstrated to be intertwined, from body movements being integrated in syntax (Keevallik, 2018) to the coordination of multiple communicative modalities into action gestalts (Mondada, 2019). The renewed interest in sensoriality (Mondada, 2018) opens the possibility of investigating how bodily sensations are managed in interaction, extending our focus beyond the verbal-visual traces of the body (Streeck, 2003) and moving towards a full appreciation of the body's role in linguistic encounters. In this panel, we provide a forum for discussing how sensory phenomena are managed using nonlexical vocalizations. We define nonlexical vocalizations, or liminal signs (Dingemanse 2020) inclusively: across the papers in this panel, we will see not only response cries such as 'whoops' or 'ow', but also sighing, moaning, and other tokens that defy lexical/nonlexical classification.

Several nonlexical vocalizations have historically been linked to bodily experience 'flooding out' into public display. As tokens, many of them regularly are interpreted as if revealing mental and bodily phenomena for co-participants (Keevallik & Ogden, 2020). While cognitive and physiological studies of nonlexical vocalizations have treated this relationship as self-evident, we are yet to address the social accountability involved in producing such sounds in naturalistic activities.

Moreover, little attention has been given to nonlexical vocalizations' constraints and affordances, from phonological options to syntactic placement, and to how they relate to embodied actions occurring at the time of production. Although the vocalizations individually are not typically conventional tokens, as a whole they offer a set of related affordances, such as easy modification of form (prolongation, reduplication, vowel quality) to suit situated action while still being recognizable as an instance of 'a strain grunt', 'a sensation of pleasurable taste', or 'a pain cry'. Thus, nonlexical vocalizations are a site for especially creative solutions to achieving situated action, yet they have not received significant attention.

This panel will develop both interactional research into the display and organization of sensation (smell, kinesthesia, pain...) in everyday interaction as well as linguistic research into the boundaries of language. The papers aim to advance an integrated, embodied, and multisensory understanding of language that inclusively accounts for liminal signs.

# Offensive language on social media

---

Panel

---

**Dr. Tahmineh Tayebi<sup>1</sup>, Dr. Marton Petyko<sup>1</sup>**

**1.** Aston University

Online social media, including Facebook, Twitter, Instagram, YouTube, Snapchat, Reddit, blogs and forums, has become a key venue for exchanging ideas and communicating with others. Whilst social media platforms can enable constructive and insightful conversations, offensive language, including verbal aggression and abuse, harassment, cyberbullying, online misogyny, trolling and hate speech, is a widespread phenomenon in online settings, which may have damaging effects on social media users (Rösner & Krämer, 2016).

Although recent years have seen a growing academic interest in offensive language on social media (Kienpointner, 2018), which is commonly defined as hurtful, derogatory, or obscene comments made by one person to another person (O'Driscoll, 2020), most papers tend to focus on English online discussions while it is relatively little known about what is considered offensive in other languages and cultures (Alakrot et al., 2018).

The aim of this panel is therefore to address the cross-lingual and intercultural dimensions of offensive language online by bringing together researchers who are interested in how offensive language and its various manifestations, including verbal aggression and abuse, harassment, cyberbullying, online trolling and hate speech, are constructed, utilised, perceived and tackled on various social media platforms across languages, cultures and domains.

The panel features twelve papers which focus on various linguistic and social aspects of offensive language across languages, cultures, social media platforms and online communities. The contributions draw on data from multiple languages, including Danish, English, French, German, Hungarian, Japanese, Korean, Polish, Ecuadorian Spanish and Turkish. In addition, the papers analyse the manifestation of offensive language on a number of social media platforms, including Facebook, Instagram, Twitter, YouTube and 4chan as well as various blogs and news sites.

The talks address the following topics: the cycle of causing and taking offence on social media (Tahmineh Tayebi), offensive language in Facebook comments on climate change (Audra Bacon), the role of grammatical gender shifts in hate speech (Magda Stroinska), gendered hate discourse towards Syrian refugee women in Turkey (Yasemin Erdogan-Ozturk & Hale Isik-Guler), “otherness” and “reality” in French online anti-migrant comments (Nadia Makouar & Laura Ascone), cross-modal and cross-linguistic effects in hate speech perception (Jana Neitsch & Oliver Niebuhr), the metapragmatic negotiation of critical comments on YouTube product reviews (Michael Wentker), mock politeness in Japanese online comments (Vera Hanaoka), impoliteness and the moral order in Korean online interactions (Ariel Kim), ethnic slurs in exchanges with Ecuadorian indigenous politicians on Twitter (Maria Placencia), “greentext” and “shitposting” as discursive violence on 4chan (Dillon Ludemann), and the argumentative strategies associated with trolling on political blogs (Marton Petyko).

## Orientations to ‘knowing how’ in interaction

---

Panel

---

***Prof. Ilkka Arminen<sup>1</sup>, Prof. Tom Koole<sup>2</sup>***

***1. University of Helsinki, 2. University of Groningen***

Orientations to ‘knowing how’ in interaction In Conversation Analysis there has been considerable analytic attention for the interactional import of epistemics: participants’ orientations to the knowledge they share or not (e.g. Heritage 2012; Heritage & Raymond 2012) and to rights and responsibilities with respect to the domains of knowledge (e.g. Stivers et al. 2011). In these investigations of epistemics the focus has been primarily on ‘knowing that’ or ‘propositional’ knowledge. Analyses of the interactional import of ‘knowing how’ (e.g. Ryle 1946) have been much more scarce, and have not often traveled under the flag of epistemics. Curl & Drew (2008) for requests and Craven & Potter (2010) for directives have, for example, observed a design orientation to the ability of an addressee to perform the recruited action and have used the notion of ‘contingency’ to characterize these orientations, in which aspects of these contingencies lie in the competencies or ‘knowing how’ of these addressees. Also the concept of ‘expertise’ has been proposed to characterize interactional orientations, in particular, to professional skills of doing assessments (Heritage 2013), medical reasoning (Harms et al. forthcoming) or seeing (Goodwin 1994). In this panel we aim at bringing together research on participants’ orientations to such forms of ‘knowing how’ to explore (i) the design of these orientations, (ii) their interactional import in various contexts and procedural relevance for actions, and (iii) their relation to epistemics. We encourage participation of EM/CA-researchers who work on participant orientations to each other’s knowledge of, and skills in (institutional) procedures, reasoning and actions.

# Political Discourse in the era of COVID 19: Gender, power, and ideology

## Panel

***Dr. Diana Boxer<sup>1</sup>, Dr. Lilian Atanga<sup>2</sup>***

***1. University of Florida, 2. Bamenda University***

Political discourse in the era of COVID-19: Gender, Power and Ideology

Diana Boxer, University of Florida

Lilian Atanga, Bamenda University, Cameroon

The discursive construction of COVID-19 has largely hinged on power relations and political ideology. This panel seeks to examine how political ideologies have contributed to shaping gender and power discourses on COVID-19, how they serve to include or exclude, and how they are sustained, challenged, or subverted. Painter and Qiu (2020) note that the discourse of social distancing, vital to mitigate the spread of the novel coronavirus, is also hinged on political beliefs. Moreover, the discourse of compliance has become politically motivated, with perceptions of risk along the lines of political ideologies (Barrios and Hochberg 2020). COVID-19 has taken the world by storm, with no one government having anticipated its effects. The political discourse surrounding COVID-19 has been diverse, ranging from labeling the virus to shifting blame (Yeung 2020). In the US, some adherence to CDC and WHO directives has hinged along party lines (Barrios and Hochberg 2020). Indeed, across the globe COVID-19-related behavior has been highly politicized.

The papers included in this panel cover a range of political discourse surrounding the pandemic: (social) media discourse, gendered discourses about COVID by different state leaders across the world, and discourses resulting in fragmenting previous political ideologies and subverting relations of power with political leadership. A group of international scholars will form part of the panel, including the conveners, Diana Boxer (US) and Lilian Atanga (Cameroon). Papers will be presented by both conveners: 1) Atanga on The Politics of COVID in African Contexts; and 2) Boxer and Judith Lejeck on Trump's blame shifting. Recruited participants are 1) Taiwo Oloruntoba-Oju (Nigeria) on the construction (and deconstruction) of gender asymmetries in conversations between women and men in the wake of COVID in the Nigerian setting; 2) Stefanie Schnurr, Sophie Riessner-Rubicek and Carolyn Debray (UK), analyzing the (purportedly positive) media coverage of women head of states world-wide for their handling of the Covid19 pandemic.

Also participating are: Aurora Donzelli, (Bologna) presenting on truth and Trump's epistemic tactics in a plague year; Najma Al Zidjaly (Oman) discussing Covid 19 and "divine" hate speech against women on Arabic Twitter; and Cristina Gadaleta (Huddleston) presenting on politeness strategies in power discourse curing the pandemic: The case of the Pope and the Queen.

Cornelia Ilie (Sweden), will serve as discussant.

# Practices of inclusion in multi-challenging communication

Panel

Dr. Simone Girard<sup>1</sup>, Dr. Anne Parpan-Blaser<sup>1</sup>, Prof. Gabriela Antener<sup>1</sup>, Mrs. Annette Lichtenauer<sup>1</sup>

1. FHNW School for Social Work Olten

## Practices of inclusion in multiple challenging communication

Inclusion is promoted to a great extent by thinking and addressing people as “persons” in communication processes, e.g., as newspaper readers in the media system, as clients in a service provision, as study participants in a research (cf. Wansing, 2007). Only in this way can they participate in these communication systems and thus in society. The current efforts towards barrier-free communication make a contribution precisely in this area. However, as a single communication event or offer has multiple and complex goals and challenges, it is usually not enough to simply redesign the communication to make it more accessible, e.g., by addressing a specific sensory impairment or providing it in easy-to-understand language.

In this panel, we focus on multiple challenging communication situations. We explore the question of which communicative and linguistic practices are used to shape these situations so that the participation of members of communication-vulnerable groups is improved or made possible at all (e.g., people with speech, language, hearing, visual and cognitive impairments; people with cultural or ethnic differences that are not understood or accepted by the service providers; cf. Blackstone & Pressman, 2016: 70). By multiple challenging communication situations, we mean situations where participants have to deal with multiple barriers on different levels at the same time. Three levels will be emphasized, all of which are relevant in pragmatic theory and research:

1. Relational level. Challenges that affect the existent or emerging relationship between the participants, as well as their respective attitudes towards each other.
2. Form or resource level. Challenges regarding appropriate selection of verbal, non-verbal and paraverbal resources (word choice, syntax, gesture, layout, etc.) for an addressee-oriented communication.
3. Content level. Challenges regarding the content to be communicated (e.g., due to complexity or sensitivity of the content).

The panel sets out to explore these barriers by addressing for example the following questions:

- How do communicators (writers, speakers, text designers) and addressees deal with the multiple challenges? What practices and tools have emerged?
- At what level do especially communicators make trade-offs when not all barriers can be addressed?
- According to which criteria are certain barriers or levels neglected? Based on what criteria are one or another level given higher priority than others?
- What are the consequences for communication and for the achievement of the communication goals?

This panel brings together researchers working on written or oral communication in health care or health prevention, in social services and in public authorities. The individual contributions explore the challenges and linguistic or communicative practices that communicators and addressees use to tackle the multiple challenges of addressing communication-vulnerable people.

## Practices of inclusion in workplace interaction

---

### Panel

---

**Dr. Mirka Rauniomaa<sup>1</sup>, Ms. Mari Holmström<sup>1</sup>, Dr. Marika Helisten<sup>1</sup>**

*<sup>1</sup>. University of Oulu*

In line with the special theme of the conference, the panel sets out to identify and examine everyday interactional practices that promote – or possibly hinder – social and knowledge-based inclusion at the workplace. Practices of inclusion are understood to be closely tied with opportunities for participation in the activities of the work community as well as with orientation by community members to social solidarity, collegiality and professional roles and relationships.

The panel brings together empirically-based, conversation-analytic research that investigates how practices of inclusion manifest themselves in the rich details of social interaction, especially as is evident through language and bodily conduct. The examined settings range from more formal and/or task-oriented to more informal and casual, and from face-to-face to technology-mediated ones. Practices of inclusion are examined as part of the situated, multimodal activities of work communities, including explicit as well as the more subtle, implicit instances of inclusion. Such practices may be related to or take form as, for example, displays of affiliation and rapport; addressing or seeking information about other participants as is relevant for an ongoing or impending activity; (re)distributing, negotiating and constructing work-related knowledge and expertise; and raising potentially delicate, socially problematic or otherwise challenging issues for joint discussion.

Further, the panel explores whether, and to what extent, practices of inclusion are space- and time-bound, and how they might transform when opportunities for participation change in different ways. For example, participants may be faced with challenges related to finding their place within a work community, ratifying their membership or, indeed, maintaining their sense of community under unusual or unfamiliar circumstances.

Finally, the panel invites discussion on possible practical applications and societal impact of the investigations: how both social and knowledge-based inclusion could best be cultivated and facilitated in work communities, and how the micro-level practices of inclusion – or perhaps the lack of such practices – may be connected to macro-level issues such as work-related well-being, job satisfaction and the overall organizational climate.

# Pragmatic attunement in the process of inclusion in cross-cultural communication

## Panel

***Dr. Kazuko Tanabe<sup>1</sup>***

***1. Japan Women's University***

This panel will bring together scholars of cross-cultural communication who are interested in pragmatic attunement in the process of inclusion. The prospective contributors will present their empirical research on this subject discussed in terms of contrastive pragmatics. Contrastive pragmatics deals with pragmatics or language use in different languages (Aijimer ed., 2011). The definition of inclusion in this panel covers not only the political and social integration of various races and people but also the concern of language use to implement efficient interactive communication in cross-cultural settings. Under this situation, people try to make efforts to communicate according to the listener's culture. This panel focuses on the various forms of pragmatic attunement depending on the cross-cultural situations so as to illustrate how pragmatic attunement bridges the gaps between the speaker's and listener's cultures.

The following are some examples of what we describe as pragmatic attunement in the process of inclusion.

### 1. Simplification of honorific language in this global age

Indication of the simplification of honorific language has been noticed in Japanese language use these days. It has been found that the use of honorific expressions has diminished among young people, and is being transformed to create new polite styles 'Verb-desu' instead of 'Verb-masu' which has been used for more than 200 years (Inoue & Tanabe, 2019). People have begun to put more emphasis on the clearness and simplicity of communication rather than the social deixis dependent on status. This change is assumed to occur because a culturally wide range of people have begun to use Japanese and tried to pursue the efficiency and correctness of communication to avoid misunderstandings.

### 2. Communication styles created by immigrants

The Japanese government has implemented policies in order to increase foreign workers. Those who are to work in elderly homes are highly expected to come. A new communication style between foreign workers and the elderly should be developed. For example, deciding how to address the elderly is a crucial factor for foreign workers in order to build preferable human relationships.

### 3. Attitudes to learning a second language

In every situation of learning a second language, learners are always urged to adjust the pragmatic background of their first language to that of the target language. Learning the pragmatic aspects is much harder than acquiring the grammatical rules, especially in the case of foreign languages to learners. Based on the above, this panel discusses that pragmatic strategies, such as overlapping, repetition, reactive tokens, and tag-questions, make conversations more smooth. Besides, they are very important devices to pragmatic attunement in the process of inclusion, though they are apt to be regarded as the last stage to master a second language.

Other factors to achieve pragmatic attunement in cross-cultural communication besides the three above will be welcomed.

# Pragmatic inference: The role of inferences and inferencing in pragmatic models of communication

## Panel

***Dr. Chi-He Elder<sup>1</sup>, Prof. Michael Haugh<sup>2</sup>***

***1. University of East Anglia, 2. University of Queensland***

This panel investigates the role that inference plays in pragmatic models of communication. Following Grice, pragmatic inference traditionally refers to the hearer's understanding of the speaker's intended meaning. Any inferences that a hearer draws that were not intended by the speaker thus remain outside of the Gricean account. Scholars have since identified different kinds of inferences that can or should be included in a pragmatic model of communication, for example including weak inferences alongside strong ones depending on the strength of the corresponding speaker's intention (Sperber & Wilson 1995), inferences that a speaker did not intend but would be happy to endorse (Ariel 2016), or even inferences that lie beyond what a speaker plausibly intended (Terkourafi 2014).

Such taxonomies beg the question of the kinds of input a hearer's inference can take. Rather than recovering speakers' intentions via mental representations, commitment-based accounts of communication argue that hearers draw inferences according to the social commitments that speakers incur through their utterances (Geurts 2019); while work in talk-in-interaction takes evidence for hearers' inferences from their on-record responses to prior utterances. One may then question whether it is inferences as private mental states and/or as publicly available displays that should take precedence in a model of communication (Elder & Haugh 2018).

Inference as a product differs from inference as a process, so the same process can lead to different products, or the same product can be derived via different processes (Terkourafi forthcoming). The study of inferential processes can include types of inferential reasoning that speakers engage in (e.g. deductive, inductive, abductive) alongside the kinds of perceptual inputs that enter the reasoning process. There are also questions about the nature of inferential processes: are they conscious or subconscious, automatic or effortful, and how do these features cross-cut one another (Recanati 2002, Sperber 1995, Mazzarella 2014)? Or perhaps pragmatic processes are not inferential at all: for Mazzone (2009), hearers derive speaker meaning associatively by recognising patterns in working memory.

Once we move away from inference as a product of intentional meaning, analogous issues arise such as how non-intentional communication can lead to inferences about people's identities, values and beliefs (Green 2019). Finally, it has to be recognised that not all language ideologies promote the human capacity for inferring speaker meaning (Robins & Rumsey 2008), with intention-based accounts of communication being criticised as Western-centric (Ameka & Terkourafi 2019).

We anticipate a rich discussion on issues including but not limited to:

- types of inference in pragmatic modelling
- the role of inferential processes in the derivation of utterance meaning
- the utility of the concept of inference in models of communication
- inferences arising from intentional versus non-intentional communication
- inference as a cognitive and/or cross-cultural universal

# Pragmatic perspectives on disagreement in argumentative contexts

Panel

***Ms. Jennifer Schumann<sup>1</sup>, Dr. Steve Oswald<sup>2</sup>***

***1. University of Bern, 2. University of Fribourg***

In argumentative settings - eristic ones in particular -, people exchange arguments in support of their opposing standpoints. Sometimes these disagreements are rooted in misunderstandings, other times in genuinely laid-out and understood opposing points of view. As argumentative exchanges may have far-reaching consequences (from belief change to the implementation of policies), and because these may end up being brought about through a misrepresentation of disagreements and of their causes, the study of disagreements is an important area of research that stands to gain from the input of pragmatic research.

When arguers disagree, they have a variety of choices to convey that there is a difference of opinion with the opponent. Sometimes these choices are signaled through linguistic markers that explicitly indicate that the speaker refutes the opponent's position (e.g. "No", "Yes, but...", "I strongly disagree...", "On the contrary", ...). But in argumentative reality, disagreements are not always as obvious. In fact, in many cases they are much subtler. In occurrences where part of an utterance is left implicit, one has to engage in pragmatic processing to work out unarticulated components of meaning, such as implicatures, presuppositions, etc. to fully retrieve the original speaker meaning. This also leaves room for inaccurate and uncharitable interpretations, retractions of commitments and even fallacious arguments (e.g. *ad hominem* or straw man attacks) that can further deepen such disagreements and make them prevail over more consensual outcomes that could be reached once the causes of a disagreement are made explicit.

This panel investigates how disagreements manifest themselves through the lens of language use in argumentative situations and how arguers manage them when they arise. The aim of this panel is to give the floor to different pragmatic approaches that may illuminate the notion of disagreement and to create room for diverse and fruitful discussions that arise from its pragmatic study.

# Pragmatics of Writing: From the Development and Teaching to Automated Assessment of Pragmatic Competence

---

Panel

---

***Prof. Liana Konstantinidou<sup>1</sup>, Prof. Daniel Perrin<sup>1</sup>***

*<sup>1</sup>. Zurich University of Applied Sciences*

“What do people want to do when they write – and what do they actually do?” (Perrin 2003, 825). This question in the introduction to an issue of the Journal of Pragmatics has contributed to shifting the focus of writing research from cognitive to social and pragmatic aspects of text production, foregrounding the relevance of writers’ pragmatic competence.

Text processes and production are influenced by writers’ cultural and biographical background, (professional) role in the respective communicative setting, the concrete communicative situation, as well as the communicative patterns of the community of practice (Wenger, 1998). At the same time, text evaluation and text impact depend on readers’ perception and involvement. These processes, driving and driven by language use in sociocultural contexts, trigger the topics and foci of research in pragmatics (Verschueren 2001). Research so far in this field has provided evidence of pragmatic competence as a key sub-competence of writing and writers (Konstantinidou, Hoefele & Kruse, 2016).

In our panel, we focus on pragmatic aspects of writing in specific sociocultural context, social settings, and situations of language use. We investigate both the development and teaching of pragmatic competence in multilingual and professional settings. By doing so, we reflect on the relation of pragmatic competence with the quality of both writing processes and text products and discuss the challenges of measuring pragmatic competence using automated assessment methods.

# Professional practices and contexts – Perspectives of practitioners and scholars

## Panel

***Mr. Henrik Rahm<sup>1</sup>, Mrs. Marlies Whitehouse<sup>2</sup>, Ms. Severine Wozniak<sup>3</sup>***

***1. Lund University, 2. Zurich University of Applied Sciences, 3. Université Grenoble Alpes***

The relation and collaboration between scholars and practitioners in order to understand practices in the professions has long been discussed within and across applied sciences and theoretical disciplines. However, research approaches claiming to combine theoretical and practical needs and expectations sometimes lack either solid grounding in empirical data or thorough reflection from theoretical perspectives.

Given that an increased interest in research settings can be observed with linguists investigating e.g. literacy practices in the workplace, companies' annual general meetings, or health literacy with methods such as participant observation, linguistic ethnography and discourse analysis, this symposium aims to take the discussion further by rethinking studies of professions, professional communication and professional settings from theoretical and practical angles. The symposium invites contributions both from cooperation with other disciplines as well as with practitioners, and scholars from different disciplines who investigate professional settings where language plays a key role. We especially encourage contributions with a public outreach in the form of cooperations between academia and practitioners. The focus can be e.g. on the discourse of the field investigated, the challenges for the professionals, customers, patients, citizens, next of kin, or other stakeholders as well as languages for specific purposes or plain languages. Contributions could also highlight the specific role of language brokers in multilingual professional settings.

From theoretical angles, the contributions may explain how and why studies of professional communication contribute to further developing empirically grounded theories of language use in context in an increasingly digitized and glocalized professional world. From practical angles, the contributions could elaborate on potential pitfalls and benefits practitioners can expect from collaborating with researchers from various disciplines. For example, how practitioners can engage in – and benefit from – research projects by co-creating knowledge together with academic researchers. Phases of such activity include identifying wicked problems, formulating pertinent research questions, developing shared languages, engaging in ongoing dialogue, finding results and conclusions based on mutual learning, as well as developing and implementing tools that foster sustainable solutions.

# Remedies against the pandemic: How politicians communicate their crisis management

## Panel

***Prof. Daniel Weiss<sup>1</sup>, Prof. Andreas Musolff<sup>2</sup>***

*<sup>1</sup>. University of Zurich, <sup>2</sup>. University of East Anglia*

The ongoing pandemic offers a multifarious picture of reactions across different nations. The following parameters seem to have an impact on the strategies and how they are communicated: the political style of the leaders (liberal vs. authoritarian), their general orientation (right wing vs. centrist/left wing), the degree of affectedness of their countries (heavy – light). The measures propagated reach from very restrictive to none, and they involve a range of communicative strategies. Analyses will include the following perspectives:

- Do the leaders recognize or deny the threat? What stances towards the pandemic do they take: ignoring, ridiculing, belittling, taking serious, boosting the threat? How do they refer to the disease (just another flu, an unknown type of pneumonia, a lethal threat, a psychosis)?
- What authorities do they align/disalign with (scientific experts, WHO, other countries, folk medicine, religion)?
- What are their overall verbal strategies when addressing the broad public: calming, comforting, warning, encouraging, demanding, boasting with own achievements, denouncing failures? What typical speech acts (notably performatives) do state leaders utter? What reactions does all this trigger on social platforms, e.g. Reddit?
- What type of epistemic predicates expressing (un)certainty prevails? What nonverbal or prosodic cues mark the oral delivery?
- How do government and opposition shape the debate in and outside parliament?
- How do leaders publicly articulate conflicts with other political instances such as the health minister or regional authorities (governors, mayors)?
- How do they show social empathy and/or personal involvement based on own experience (e.g. B. Johnson, N. Peskov, M. Mishustin)?
- What role do populist language and/or xenophobic attacks (e.g. anti-immigrant fake news) play when legitimizing the own strategy?
- What purpose are implicit strategies intended to serve (presuppositions, conversational implicatures, irony, metaphors and metonymies, similes, quotations)? Who uses aggressive or relief humor?
- How do leaders cope with the interference of other key issues on the current political agenda, and what argumentative weight is assigned to the presumptive economic impact of the planned/realized measures?

It goes without saying that most of these parameters vary in time depending on the development of the pandemic in the given country. Moreover, the same politician may employ different styles in the “old” media and in social media when discussing the same subjects. The panel involves the following disciplines: neo-Gricean / Relevance theory based pragmatics, Critical Discourse Analysis, cognitive metaphor theory, corpus linguistics (e.g. quantitative analysis of key words), multimodality studies (e.g. humorous hashtags), argumentation theory, computer-mediated communication studies (newspaper online comments on governmental discourse and users’ responses). It encompasses numerous contrastive studies, e.g. authoritarian vs. “liberal” approaches to the crisis, government’s and opposition’s stances towards the confinement strategies, divergent policies of different nations comparable in other respects, different concepts of leadership, the relative weight of health care and economy in argumentation, etc. The contrastive contributions cover data from 21 different countries, most of them located in West and North Europe (10) and East Europe (6), but the list also comprises Israel, Uganda and three Latin American countries.

# Revisiting FACE – ontological, epistemological and methodological ‘faces’ of a socio-pragmatic concept

Panel

***Prof. Gudrun Held<sup>1</sup>, Dr. Johanna Warm<sup>2</sup>***

***1. Universität Salzburg, 2. Wirtschaftsuniversität Wien***

As a figurative and hardly graspable concept of self-awareness that comes into play in social encounters, *face* inspires a variety of theoretical frameworks that have been developing over more than 40 years, giving rise to a wide and still ongoing debate on both its validity as a scholarly concept and its utility as an explanatory tool. The main issue of the different positions – be they theoretically constrained or empirically approved - is to create a plausible bridge from the abstract conceptualization as an inner value to its concrete appearance as an outer phenomenon. As the latter was assumed to be mainly conveyed with language, *face* became a widely studied subject in linguistics and its ramification in different socio-linguistic and pragma-linguistic strands. Whilst Goffman puts the exteriorization of *face* into the vague concept of *facework*, Brown & Levinson (1978/87) presumed its verbal performance in politeness. It was the predictable clarity of their norm-oriented model that was responsible for linking *face* firmly to *politeness*, and thus constituting the widely spanned area of research where both *face* and *politeness* were constantly treated together until, in the following waves of the politeness paradigm, being critically measured against each other. With the increase of cross-cultural investigations and the widening of relation-oriented as well as genre- and frame-based positions *face* was more and more disentangled from *politeness* until the two concepts were considered as research-objects “of their own right” (cf. Haugh 2013).

Therefore, alternatives to the politeness angle have been created (cf. O'Driscoll 2007, Bargiela/Haugh 2009). On the one hand, under socio-psychological conditions, there was a recourse to Goffman's general conception of *face* and the concept of *facework* regained fundamental relevance. On the other hand, with the turn to intercultural and interpersonal pragmatics the view was enlarged from micro- to macro-contexts thus regarding procedures of *face*-management according to culture-specific identity concerns and to socially acquired face claims (e.g. Ting Toomey 1994, Hopkins 2015). Further on, the interactional approach – developed in Arundale's (2006, 2013) *Face Constituting Theory* – defined *face* not only as relational but simultaneously as interactional. The classical but static dualism of positive vs. negative *face* has thus been released into the more active distinction between associative and dissociative (inter)actions constituting situations of approach and withdrawal, of connectedness and separateness (cf. O'Driscoll 2017).

In spite of the variety of opinions given in the sociopragmatic research of the last 50 years, many problems concerning *face* and *facework* have been left unresolved, and new problems are still emerging when widening the perspectives to complementary visions, other disciplines, and different linguacultures. This is where the panel wants to engage the discussion concentrating on contributions that, on the one hand, treat the notion of *face* in the (meta-)linguistic lens and in the epistemic discourse, on the other, analyze the empirical realization of *facework* in all kinds of sociocultural contexts and communicative situations.

---

## Rules in Social Interaction

---

### Panel

---

***Dr. Jörg Zinken<sup>1</sup>, Dr. Uwe-Alexander Küttner<sup>2</sup>, Dr. Giovanni Rossi<sup>3</sup>, Prof. Marja-Leena Sorjonen<sup>4</sup>, Dr. Matylda Weidner<sup>5</sup>***

*1. Leibniz-Institute for the German Language, 2. University of Potsdam, 3. University of California, Los Angeles, 4. University of Helsinki, 5. University of Bydgoszcz*

Rules have been a central concept for researchers interested in human meaning and action since about the second half of the 20th century (Erickson et al., 2013, chapter 1). Across the social and human sciences, rules came to be seen as that which provides for order and meaning. A different perspective on the nature of rules and “rule-following” goes back to influential arguments in the works of Harold Garfinkel and Ludwig Wittgenstein (Garfinkel, 1967; Wittgenstein, 1953). Work in this tradition emphasizes a person’s agency in treating a situation as requiring the application of a particular rule. Following a rule involves ‘ad hoc’ methods of interpreting the rule in the context of events, and participants mobilize rules and norms to provide for the accountability of their actions. Similar conceptualizations of norms and rules figure prominently in Conversation Analysis, especially in research into the orderly properties of interaction: the turn-taking rules (Sacks, Schegloff, & Jefferson, 1974) or (sequential) relevance rules (Robinson, 2016; Schegloff, 2007), for example.

This panel brings together current ethnomethodological, conversation analytic and interactional linguistic work on (the role of) rules in social interaction. The accepted contributions offer insights into how participants in various settings and across a range of languages orient to, manage and enforce rules, how they deal with rule violations or breaches, and how these practices relate to the interactional negotiation of accountability. The panel will address three major themes and is organized as follows:

1. Rules and rule violations in the context of games (Discussant: Emily Hofstetter)
2. Practices of managing rules in informal interaction across languages
3. Rules and (public) accountability (Discussant: Jeffrey Robinson)

**Duration:** Three 90-minute sessions

# Self- and other-reference in social role construction in different genres and social contexts

## Panel

***Prof. Minna Nevala<sup>1</sup>, Prof. Minna Palander-Collin<sup>1</sup>***

***1. University of Helsinki***

First-person is an important locus of interpersonal and indexical work and it often establishes the starting point of the interaction (e.g. Agha 2007: 280, Mühlhäusler and Harré 1990). Several empirical studies show how first-person expressions establish the interlocutor's stance and position them vis-à-vis the recipient but also in relation to the broader social and societal context, its norms and hierarchies, as well as the expectations of the audience and practices of the genre (e.g. Palander-Collin 2009, Palander-Collin & Nevala 2011, Palander-Collin & Liukkonen 2017). The communicative functions of self-reference may also vary depending on the context (Hyland 2003). Moreover, in addition to the first-person pronouns the self can be positioned through the use of various other linguistic means, as well as by means of reference to others, such as stance markers and address terms.

This panel focuses, firstly, on self-reference, i.e. the ways in which the writer or speaker can position themselves in different genres and social contexts and what kind of social roles are then created and which linguistic means are used. Secondly, the panel comprises studies of other-reference, particularly as a tool for identification in multicultural interaction. Papers in the panel relate to different genres and languages from Catalan parliamentary debates, Finnish, Hungarian and French YouTubers' vlogs to British newspapers. The methodologies used range from macro to micro perspectives, including combinations of qualitative and quantitative methods, and synchronic and diachronic perspectives. Research questions address a vast array of issues, such as the use of discursive strategies in newsmakers' role construction, social media users' epistemic stance markers, and adolescents' ways of identification in ELF settings.

---

## Signs of care: Communicating sympathy in African contexts

---

### Panel

---

**Dr. Alice Mitchell**<sup>1</sup>

*1. Universität zu Köln*

This panel sets out to explore how people express sympathy in African settings. The goal is to bring together fine-grained analyses of sympathy displays with work that investigates broader sociocultural dynamics shaping the expression of sympathy. From an interactional perspective, displays of sympathy constitute affiliative responses to talk about troubles (Jefferson 1988) or to witnessed events causing pain or distress. In their analyses of sympathy, papers in this panel take into account a range of semiotic resources, including voice quality, prosody, lexicon and grammar, gaze behaviour, gesture, and touch, in languages ranging from Iraqw (Tanzania) to Ngemba (Cameroon). Several of the papers take conventionalized linguistic expressions of sympathy as their starting point, investigating the meaning and use of interjections in particular languages. Other papers focus on social contexts in which displays of sympathy typically occur, such as condolence-giving, and identify the norms and forms of behaviour associated with these affective displays.

Understanding sympathy as an inclusive interpersonal stance that attends to another person's emotional status, this panel will offer linguistic perspectives on anthropological discussions relating to ethics and care. Papers will show how people in a range of African communities care for and comfort one another through their communicative practices, thus highlighting the role of language in the ethical treatment of others. Papers will also attempt to position specific linguistic interactions within broader sociocultural frameworks. When is sympathy appropriate, and when is it unnecessary or even inappropriate? Who can show sympathy to whom, and how? How are sympathy displays calibrated to the perceived severity of the situation? And to what extent are expressions of sympathy gendered or otherwise socially indexed? With its focus on Africa, the panel aims to explore possible commonalities and differences in forms of sociality and ethical conduct across the continent.

The African focus addresses the conference theme of "inclusion" at a disciplinary level by working towards better representation of African languages, perspectives, and scholarship at IPrA.

## Silence and silencing

---

### Panel

---

***Prof. Dennis Kurzon<sup>1</sup>***

*1. University of Haifa*

Research on silence as a topic in pragmatics has widened since it appeared first in the 1980s. In the early stages the number of works, whether they are books or articles, could be counted on the fingers of no more than two hands. Early work on silence focused on the phenomenon in conversation, such as pauses discussed by Sacks et al. (1974) in their seminal work. This was followed by the Tannen and Saville Troike volume of articles in 1985, and by Jaworski (1993). Jaworski, two years later, produced a volume of articles on silence, with extensions of silence in other fields, too, such as in sociolinguistics and ethnography, in the arts, often with a metaphorical meaning of “silence”. Research on silence in relation to the right of silence in legal proceedings in criminal law also began to appear (Boer 1990, Kurzon 1995, Cotterill 2005, Heydon 2006).

Since then, there have been a number of books on silence from a linguistic/pragmatic perspective (e.g. Kurzon 1998, Nakane 2007, Schroeter 2017), special issues of journals on silence (e.g. *Multilingua* Vol. 24:1-2, 2005; *Journal of Pragmatics* Vol. 43, 2011), extending the domain of the topic, as well as single articles. It has become a well-established subfield in pragmatics.

The aim of the panel is to offer an opportunity to scholars who are working in the field of silence to present new work on the topic. On the panel are scholars from Australia, Austria, Israel, Malaysia, Poland, the United Kingdom, and the United States, who will present papers not only on silence in conversation analysis, on the right of silence in legal discourse, on silence in political discourse, but also on silence in intercultural situations, on silence in parent/children and psychotherapeutic encounters, on silence within the context of politeness, on silence in graphic novels, and on the phenomenon of silencing in spoken, in written and in digital discourse.

---

# Social Interaction in High Stakes Crisis Communication

---

## Panel

---

**Mr. Pentti Haddington<sup>1</sup>, Prof. Elizabeth Stokoe<sup>2</sup>**

***1. University of Oulu, 2. Loughborough University***

This panel brings together empirical papers that investigate *low frequency* but *high stakes* communication between crisis negotiators, emergency services, and related professionals – and sometimes with members of the public who are service users – using conversation analysis. By *low frequency*, we refer to the fact that our datasets comprise recurrent (for the professionals involved) but low-occurrence events (e.g., from the perspective of service users who call a suicide helpline) relative to, say, police interviews with arrested suspects, or as a subset of all calls to emergency services. By *high stakes crisis*, we refer to the matters being dealt with by interacting parties, which involve threat to life, to social order or, potentially, death. The institutional settings investigated constitute hard-to-access sites involving extensive negotiation with relevant stakeholders, often leading to the co-production of knowledge with those professionals whose job is to communicate with people in crisis of various kinds – and even the training of those professionals.

The panel includes studies from live crisis situations (police negotiations with suicidal persons, suicide helplines, police-lay people interactions, call/dispatch centres), training simulations (mass casualty exercises, crisis management training in UN military observation), and telephone calls to complex multimodal events. We examine a range of topics, from preparing and training for crisis before it has happened to ongoing live crisis; and from how decision-making happens in time-limited environments which are also uncertain or ambiguous in nature. The studies show how professionals deal with unpredictable external challenges (e.g., technology failure) and how the management of extraordinary events may nevertheless be routinized.

The panel will apply the theoretical background and methodological rigour of EMCA to interaction in settings that are largely unstudied or understudied. From its very beginnings, EMCA research has examined institutional and organizational settings. However, this work has not typically focused on moments of crisis where there is an *immediate threat* to life for at least one of the parties to that interaction. This is in part because such encounters are hard to access, requiring lengthy negotiations with the partner organizations whose work is under empirical scrutiny. The papers augment an emerging body of EMCA work on acute crisis, which is proving impactful on the organizations themselves (e.g., via research-based training) as well on our fundamental understanding of the organization of talk. As early work (e.g. Stokoe et al. 2019) shows, interaction in crisis and conflict settings has begun to interrogate established understandings of core concepts in CA. Each of the papers in the panel will make visible core aspects of the social organization of crisis communication, contributing not just to what we know about those settings, but also the fundamentals of our discipline (Kevoe-Feldman, 2019). Contributors to the panel include Pentti Haddington (University of Oulu), Clara Iversen (Uppsala University), Antti Kamunen (University of Oulu), Heidi Kevoe-Feldman (Northeastern University), Maximilian Krug (University of Duisberg-Essen), Samu Pehkonen (University of Tampere), Karola Pitsch (University of Duisberg-Essen), Iira Rautiainen (University of Oulu), Rein Sikveland (Norwegian University of Science and Technology, Trondheim, and Elizabeth Stokoe (Loughborough University).

# Solitude speech: cross-linguistic approaches to monologue

## Panel

**Dr. Mitsuko Izutsu<sup>1</sup>, Dr. Katsunobu Izutsu<sup>2</sup>**

**1.** Fuji Women's University, **2.** Hokkaido University of Education

In the growing popularity of conversation analysis and interactional linguistics, a central concern of pragmatic and functional approaches to language has long been with conversations between more than one participant. This panel, on the other hand, focuses upon the use of language with no intention of communication. We investigate how monologic speech is linguistically different from dialogic communication, especially from cross-linguistic perspectives. The term “monologue” used here represents language uses that are not directed to anyone else, also referred to as “soliloquy” (Hasegawa 2010a) or “private expression” (Hirose 1995, 2000). The term does not refer to a public speech made by a single person without any turn-takings.

Monologue and its internalized speech (“inner speech” (Vygotsky 1934/1986), “private speech” (Flavell 1966), “egocentric speech” (Piaget 1923/1959)) have attracted much attention in education and developmental psychology. Their importance has also been demonstrated in other fields, for examples, studies of “self-talk” in sports and social psychology (e.g., Van Raalte and Vincent 2017) and those of “inner speech” in brain science (e.g., Fernyhough 2017). The literary exploration into “interior monologue” dates way back to the modernism era (the late 19th to mid-20th century).

However, although monologue is directly a matter of language, linguistic research still lags behind. In Japanese, where monologic research is relatively advanced owing especially to a series of Hasegawa’s works (Hasegawa 2005, 2006, 2010a, 2010b), a few studies revealed some language-specific features of monologue (e.g., sentence-ending forms *-(ka)na*, *-kke*, *-tto* in Hasegawa 2010a, Nitta 1991) or linguistic devices of monologization (Izutsu and Izutsu 2019). In other languages, however, little has been known about such linguistic features of monologue.

Moreover, there has been a long-standing view that monologue presupposes dialogue or communication (e.g., Bakhtin 1934/1981, Searle 1972, Benveniste 1974, Du Bois 2009) with a noteworthy exception of Chomsky (1975). This appears closely related to the fact that an act of producing monologue is phrased using an expression that includes another self in some languages (e.g., Eng. *talk to oneself*). However, such self-reference is not necessary in other languages (e.g., Jap. *hitorigoto-o iu* ‘utter solitude speech’). It thus remains an open question whether the conception of monologue differs across languages or whether monologue is a universal or cross-linguistic phenomenon explainable on similar experiential bases.

This panel aims to explore how linguistic research can advance understanding of monologue. In particular, we want to discuss:

- Whether monologic speech (or language for thought) presupposes or reflects the presence of addressees (or others) (e.g., “inner dialogue” (Voloshinov 1930/1973), “creatures of social situations” (Goffman 1978)),
- What kinds of linguistic features are observed in literary representation of inner speech (i.e., interior monologue),
- How the spontaneous display of emotion/feeling (“response cries” (Goffman 1978)) varies across languages,
- How the absence of communicative intention is displayed (or disguised) as a form of monologue in society,
- Whether it is possible to establish a classification/taxonomy of monologue usable for linguistic research,
- How monologue (or language for thought) is represented in linguistic forms, and more generally,
- How language for thought is different from language for communication.

---

# Speech Acts and Politeness in Chinese

---

## Panel

---

***Prof. Daniel Kadar<sup>1</sup>, Prof. Fengguang Liu<sup>1</sup>***

***1. Dalian University of Foreign Languages***

Organised by Daniel Z. Kadar and Fengguang Liu

Discussant: Julianne House

This panel aims to exploit speech act theory to investigate aspects of politeness phenomena in Chinese. While speech act theory has had a significant impact on the research of Chinese politeness, Chinese data has often been used to invent ‘exotic’ speech acts, hence unnecessarily proliferating speech act categories. Also, little attempt has been made to use Chinese politeness data to enrich speech act theory.

The proposed panel aims to reinvigorate research on Chinese politeness from a speech act theoretical point of view. The organisers aim to achieve this goal through the following steps:

- We aim to investigate how conventional speech act categories can be systematically applied to approach linguistic politeness across Chinese datatypes. The panel organisers will encourage the presenters to systematically apply established speech act typologies.
- The panel aims to enrich pragmatic research by analysing types of Chinese data that are difficult to access for academics who do not specialise in Chinese. As part of this endeavor, the organisers will encourage the presenters to use naturally occurring data in which politeness behaviour is salient, and to devote special attention to how speech acts can be identified in such data.
- The organisers also aim to encourage the presenters to attempt to enrich previous speech acts coding scheme. While coding, just like speech act categories, should not be unnecessarily proliferated, we believe it is important to revisit previous coding schemes and explore whether they are fully applicable to Chinese data.
- The panel aims to prompt research on ritual speech act sequences, which is arguably one of the most understudied aspects of Chinese politeness. Since the Chinese linguaculture has an intriguing albeit understudied system of ritual speech act sequences, and such ritual sequences play an important role in the realisation of politeness in Chinese, we intend to devote special attention to them.
- The panel also aims to provide a forum for bringing together speech act theory with discourse analysis, with a special focus on linguistic politeness.

This is an open call and we are definitely willing to consider more papers. Thus far, following colleagues have confirmed interest in joining the panel (in alphabetical order):

Han Dan & Fengguang Liu Opine in state media

Lilin Fan & Yongping Ran Complain in medical encounters

Xu Huang Requests and their componential analysis

Xiaoxia Jiang Directives in tourist texts

Ke Li and Wenyu Liu Directives in media

Fengguang Liu & Daniel Kadar Ritual speech act sequence theory

Hongyan Liu Speech acts and multimodality in clinical encounters

Junli Liu Speech act sequences in ritual offers

Puyu Ning Meta-analysis of apologies

Jia Qiu & Xinren Chen Complimenting in CMC

Wenrui Shi Opine in political media

Xiao Tian Compliments and compliment response sequences in

CMC

Yanxue Ting Requests and their research in large corpora

Wang Zepeng and Yansheng Mao Complimenting and emotions

Ling Zhou Invites and invite responses in social media

# Taking actions to enhance inclusivity of persons with dementia: Pragmatics of active social inclusion

## Panel

***Prof. Yoshiko Matsumoto<sup>1</sup>, Prof. Heidi Hamilton<sup>2</sup>***

*1. Stanford University, 2. Georgetown University*

The aim of this panel is to explore how the theory and practice of pragmatics can contribute to transforming society into a place where individuals with dementia are integrated with other members of the community or, to put it differently, into a place where people without dementia proactively include themselves in the lives of people with dementia. To this end, we have brought together prominent researchers from around the world who investigate verbal and nonverbal interactions of people with dementia in a wide variety of settings. The number of people diagnosed with dementia is rapidly growing throughout the world and is projected to reach 82 million in 2030 (WHO 2019). While this number represents a minority of the world population, we argue that the disregard for or exclusion of this group is just as problematic as prejudices against other social minorities and individuals with disabilities.

Persons with dementia (PWDs) face myriad impediments to active social inclusion; contributing factors include these individuals' communicative and cognitive challenges (Wray 2020); actions taken (or not taken) by their interactional partners (Hamilton 1994, 2019); and dominant discourses (Sabat 2003) that (even if unintentionally) shape exclusionary public policy and related societal circumstances.

Over the past twenty years or so scholars and professionals representing a range of disciplines (Pinkert et al. 2019; Innes et al. 2004) have examined the complex phenomenon of social inclusion/exclusion on the micro-level (the subjective experience of the PWD), the meso- level (the intermediate interactional environment) and the macro-level (the broader socio-cultural context) (Forbes et al. 2011). Much of this interest – no matter what level – has been sparked by the seminal work on “personhood” (Kitwood 1997) that aims to highlight the “person within – the reflexive, immaterial communicable essence of a person that is located deep within the body, but that is sometimes veiled by symptoms.”

With this background, our focus here is to examine aspects of social inclusion/exclusion in a variety of verbal and nonverbal settings and to consider the pragmatic implications of the vital interrelation between the personhood of PWDs and others in a society. We address this question in a multi-session panel that explores topics including everyday family interactions, institutional interactions (e.g. nursing homes, physician encounters), interactions in multilingual situations, and implications to pragmatics research in general.

Based on the insights of our multi-faceted research presentations from Denmark, Germany, Ireland, Japan, Sweden, UK, USA and Taiwan, we hope to illuminate ways to enhance the inclusion of people with diverse conditions and differing communicative practices and to suggest a future direction of pragmatics to advance the goal of inclusion.

## Talk about talk: on formulating actions in interaction

---

### Panel

---

**Dr. Rebecca Clift**<sup>1</sup>, **Dr. Liz Holt**<sup>2</sup>, **Dr. Marco Pino**<sup>3</sup>

**1.** University of Essex, **2.** University of Huddersfield, **3.** Loughborough University

It is a truism in Conversation Analysis that “next turn” is where a speaker displays their understanding of what is being done in “prior turn” (Schegloff, 1992) by responding in a sequentially relevant way; thus, one orients to the prior turn as a question by providing an answer, a greeting by responding with a greeting, and so on. It is standardly NOT the case that we formulate explicitly what has just been done in prior turn. The purpose of this panel, however, is to examine precisely those occasions when participants have cause to formulate explicitly what they or others are doing, or have done, on a previous occasion, so embodying the micro-politics of social action (Drew, forthcoming) and the essential reflexivity of interaction. Our panel focuses on the various selective practices deployed by speakers in their formulations and the sequential implications of such practices. These include (i) how participants recognise and explicitly ascribe actions to prior talk, e.g. declarative statements, such as ‘I am X-ing’ or ‘You are X-ing’ or characterisations, such as ‘She starts yelling at me’; and (ii) how speakers display sensitivity to the ways in which their actions can accountably be analysed by co-interactants. For example, speakers may comment on what they have just done or about to do (e.g. “I don’t want to sound really ungrateful”, Burdett, et.al, 2019) as a way of orienting their recipients to what they are doing in their talk. Our panel extends these lines of enquiry by investigating the various ways in which speakers manage accountability through formulations of their own and others’ actions (including co-present and absent parties) in mundane and institutional settings.

# Talking to and about children: Studies of child-centered interaction across contexts

## Panel

***Dr. Kaoru Hayano<sup>1</sup>***

***1. Japan Women's University***

This panel brings together scholars who document interactional practices that adults use when they talk *to* or *about* a child in a variety of social settings—ranging from parent-child interaction at home to institutionalized interaction between parents and various types of professionals. In the field of conversation analysis, there is a growing body of literature that investigates interaction centered around children. The topics that have been discussed include participants' orientations to epistemics (Heritage & Raymond 2015), the management of children's affect (Goodwin and Cekaite 2018), and rights and responsibilities associated with parents (Pillet-Shore 2015). Despite the diversity in the topic as well as the nature of interaction examined in these studies, their findings all point toward one general conclusion: the adult participants' social identities vis-à-vis children are constructed and/or maintained through their turn-by-turn talk, whether they are talking to or talking about the children. This warrants further, systematic investigations of child-centered interaction. The goal of this panel is to contribute to this line of research by exploring the range of possible situational and interactional contingencies that trigger the use of specific practices.

The papers in this panel aim to address the following questions:

- What verbal and bodily practices are available for the adults (the parents or professionals) to employ while addressing or referring to children?
- How do the identified practices handle social issues such as the adult's rights to and responsibilities for the child, the child's agency, and institutional requirements?
- How do adults position themselves vis-à-vis the children in different situations? As an adult? As a parent? As a professional? As a co-member of a family?
- How is the adults' behavior affected by factors such as social setting; the action they are conducting, the presence or absence of the child in question, the age of the child and/or the child's capacity or eligibility to participate in interaction in a given situation?

# Technologically-mediated interaction in workplaces

---

## Panel

---

**Dr. Elina Salomaa<sup>1</sup>, Prof. Esa Lehtinen<sup>1</sup>**

***1. University of Jyväskylä***

In the 21st century, digital technologies have permeated the everyday practices in workplaces (Orlikowski & Scott 2016). People use technologies to interact with their co-workers, to deliver and process information, and to deal with other tasks related to their work. Thus, we are interacting not only with other people but also increasingly with digital technology. These technologies include communication platforms but also technologies that facilitate co-operation or automate particular work tasks.

Studies of digital interaction in workplaces have already provided important insights into the ways technology can change ways of working. For example, due to the lack of nonverbal cues, participants cannot monitor turns in progress in the same way as face-to-face, and thus they need to maintain coherence in virtual meetings by using specific discursive strategies (e.g. Markman 2009). Conversational norms often differ from ordinary conversation, too, as Skovholt and Svennevig (2013) show in their article about responding and not responding in workplace emails. In addition, the more open access to the interaction, especially on social media platforms, is shown to blur traditional distinctions e.g. between organizations and their stakeholders (Girginova 2015). On another trend, workplace studies have focused on more complex work situations, where people work in technology-saturated environments to achieve both co-located and distributed collaboration (Luff & Heath 2019), or where the interaction takes place between users and technology (Arminen & Poikus 2009). However, we need more research on how digital practices are embedded in the everyday practices of organizations. Also, research needs to keep up with how digitalization in workplaces is connected to societal changes, such as those caused by the Covid-19 pandemic.

This panel brings together the most recent research addressing linguistic and discursive practices in technologically-mediated organizational contexts. The presentations shed light on how technologies support or reshape working practices, how people interact in mediated settings, and how technologies are interwoven with broader workplace processes. They describe various contexts from medical settings to business interaction, and address digital platforms and technologies such as email and video-mediated technologies. In addition, the multimodal and multimedial character of organizational interaction is emphasized in the papers.

# Technology use in social interaction: enabling vs. constraining participation

Panel

Prof. Florence Oloff<sup>1</sup>, Ms. Iuliia Avgustis<sup>1</sup>, Dr. Samira Ibnelkaid<sup>1</sup>, Dr. Joonas Råman<sup>1</sup>

*1. University of Oulu*

While notions such as artificial intelligence and social robotics are making the headlines and predict new ways of living and communicating, our daily lives are already closely entwined with mundane technologies in less spectacular and often unnoticed ways. This panel aims at investigating how ordinary technologies such as laptops, smartphones, tablets, smart speakers and other touch- or voice-based interfaces are used in social interaction, either as a means for enhancing joint, multimodal action or as a tool that possibly hampers participation. Within socio-linguistic and discursive approaches, research on new communication technologies has a long-standing focus on remote interactions and new forms of texts, images or their combinations (e.g. online communication, identities or discourses) but has scarcely acknowledged the role of mundane technologies with respect to multimodal, embodied social practices in co-presence. More recently however, a growing interest has been recorded within qualitative and interactionally oriented research approaches regarding the topic of humans interacting with and via computers/machines, especially so with respect to ubiquitous communication technologies used in everyday social encounters. This research has shown that - while technology-related activities in face-to-face settings can impact on the participants' availability for others (e.g. Mantere/Raudaskoski 2017) - participants nonetheless skillfully and accountably manage their dual involvement with co-present and remote interlocutors or with on- and offscreen activities (e.g. Aarsand & Melander Bowden 2019, Brown et al. 2015, Porcheron et al. 2016). Micro-analytic approaches reveal the interactional work participants engage in for establishing these new forms of co-presence and joint involvement (e.g. while using smartphones, İkizoğlu 2019, Raclaw et al. 2016, or voice interfaces, Porcheron et al. 2018, in video calls, Gan et al. 2020, Licoppe/Morel 2012, or while video gaming, Piirainen-Marsh 2012, Tekin/Reeves 2017).

This panel aims at uniting researchers from an interdisciplinary field (e.g. Conversation Analysis, Multimodal Analysis, Phenomenology, Ethnography, Human-Computer-Interaction, Information and Communication Sciences, etc.) who study technology use through video recordings of naturally occurring, non-experimental settings and who are interested in the way everyday technologies and screens are integrated in linguistic and social practices in - online and offline - face-to-face encounters. More specifically, the panel will consider how technology use is linked to participation (Goffman 1981, Goodwin, 1981, 2000), i.e. how the presence and use of technology can *constrain* or *enable* participation in social interaction, and how this possibly relates to different levels of technological and digital skills. Contributions to this panel either take into account specific groups of participants (e.g. younger people, elderly citizens, patients and healthcare professionals, gamers, etc.) or specific tasks and activities within a given mundane, institutional or professional setting (e.g. playing, co-creating, socializing, livestreaming, instructing, teaching, etc.). Through fine-grained analyses of sociality with and around everyday technologies in various settings, the research presented in this panel will also advance our understanding of digital literacy, or more accurately, of "technobodily literacy", as a multisensorial and situated practice.

# The complex ecology of L2 interactional competence: language, body and the material world

Panel

***Prof. Simona Pekarek Doehler<sup>1</sup>, Prof. Søren Wind Eskildsen<sup>2</sup>, Prof. Steven Thorne<sup>3</sup>***

*<sup>1</sup> University of Neuchâtel, <sup>2</sup> University of Southern Denmark, <sup>3</sup> Portland State University*

As video data is becoming the empirical norm in many lines of research on language use and development, bodily conduct and material artefacts are receiving increased attention. This panel spearheads “the multimodal turn” in second language acquisition (SLA) research (Majlesi & Eskildsen, 2019) to understand how embodied conduct – such as gesture, posture and gaze – as well as artefacts and local configurations of space intertwine with second language (L2) speakers’ emergent abilities to engage in L2 social interactions, i.e. their interactional competence.

Embodiment, uses of artefacts and development of L2 interactional competence have largely been investigated separately in the past. The role of gestures in L2 learning has been scrutinized in experimental settings as a window onto thinking processes (Stam, 2010; Gullberg, 2011) and microanalysis of participants’ visible orientations (i.e., their constant displays of their current ecologically mediated thinking through verbal and bodily actions) in naturally occurring interactions has revealed how learning-related processes such as understanding, noticing, or repairing are accomplished in ways that are embodied and fundamentally co-constructed (e.g., Pekarek Doehler & Fasel-Lauzon, 2013; Eskildsen & Wagner, 2015; Burch & Kasper, 2016; Hellermann et al. 2017; Eskildsen & Markee, 2018). Yet, we know little about how such embodied conduct interfaces with L2 development over time; research concerned with the developmental trajectories of L2 interactional competence has so far near-to exclusively focused on participants’ verbal conduct (Hellermann, 2011, Pekarek Doehler & Berger 2011, 2018). Today, it is time to widen the scope of investigations into L2 interactional competence by scrutinizing how L2 development materializes in and emerges from embodied, ecologically and materially situated, co-constructed practices (Greer, 2018).

This panel brings together a set of empirical investigations exploring, across a variety of languages and settings, how language, bodily conduct and material artefacts interface in the development of L2 interactional competence. Furthering our understanding of the complex local ecology of L2 use and learning, the panel empirically substantiates an understanding of L2 interactional development as situated in people’s acting within the multi-semiotic social world.

---

# The discourse grammar of communicative distance

---

## Panel

---

**Prof. Bert Cornillie<sup>1</sup>, Ms. Giulia Mazzola<sup>1</sup>, Prof. Lola Pons<sup>2</sup>, Dr. Álvaro Octavio de Toledo y Huerta<sup>3</sup>**

*1. KU Leuven, 2. Universidad de Sevilla, 3. Universidad Autónoma de Madrid*

Over the last decades the continuum between communicative immediacy and communicative distance has been a much debated topic in Romance linguistics (Koch & Oesterreicher 1990; Kabatek 2005; López Serena fthc.). Moreover, research on the various discourse traditions along this continuum has led to a more refined description of the anchoring of linguistic subsystems in certain communicative and sociolinguistic contexts. Whereas the bulk of pragmatic-linguistic research has focussed on discourse settings of the communicative immediacy, accounts of the grammar and pragmatics of communicative distance are scarcer. The role of normative models emerging in the communicative distance should not be underestimated, in that they often yield lasting innovations in the linguistic system. Therefore, the proposed thematic panel will discuss the grammar and pragmatics of linguistic variants typical of the communicative distance from several perspectives: language change, historical sociolinguistics and scripturalness.

**Language change.** Recently, research has shown that the poles of communicative immediacy and distance both foster language change. As for the former, linguistic changes have often been addressed in terms of inference-invited semantic change (Traugott & Dasher 2007, Traugott 2018). However, change from distance settings turns out to be common too (Cornillie & Octavio de Toledo 2015; Cornillie 2019; Pons 2020). Several aspects are still unresolved:

- What are the most common models of inspiration for the grammar of distance?
- In the case of new expressions based on prestigious languages (e.g. Latin, French, English), via which discourse traditions do they typically actualize?
- How does a grammar of distance emerge? Which processes of selection and innovation characterize this domain?

**Historical sociolinguistics and audience design.** Usage patterns may also vary depending on the intended audience of texts (Bell 2001; Octavio de Toledo 2011) and social (a)symmetries between writer and audience lead to the selection of marked variants (cf. Mazzola, Cornillie & Rosemeyer 2021). Yet, the limits of variation within the communicative distance is a matter of discussion. The following issues need to be addressed:

- How can a typology of intended audiences of texts be determined?
- How does the writer-addressee relationship shape style-shifting within the texts of communicative distance?
- What types of morpho-syntactic and pragmatic markers are used to signal audience-induced style-shifting?

**Scripturalness as language elaboration.** The enduring prestige of linguistic forms usually depends on their relation to the written language. Many vernacular expressions that appear both in the immediacy and the distance originated in spoken interaction and shifted to the written communication, acquiring a higher degree of scripturalness. Various questions require further investigation:

- What are the mechanisms behind advanced written language elaboration? Is it due to competition between layering forms?
- What role do canonized writers play in previous stages of a language? Is there a methodologically sound way of measuring their impact on the language of the past?

- Does the reverse process also occur? Do linguistic forms that used to be restricted to the communicative distance shift to the language of immediacy? What can we learn from the (mutual) diachronic exchange between the two poles?

# The Discourse Pragmatics of Low Transitivity Predicates Across Languages

Panel

**Prof. Marja-Liisa Helasvuo<sup>1</sup>, Prof. Ritva Laury<sup>2</sup>, Prof. Hongyin Tao<sup>3</sup>**

**1. University of Turku, 2. University of Helsinki, 3. University of California, Los Angeles**

While high transitivity constructions have been the focus of much syntactic research, usage-based studies have drawn attention to the prominence of low transitivity (LT) structures in language use, especially in conversation. For example, Thompson/Hopper (2001), point out that conversation is very low in transitivity, part of the evidence being that about 37% of the one-participant clauses in their English database are copular clauses. They attribute this to the pragmatics of everyday interaction, stating that “our talk is mostly about ‘how things are from our perspective’” rather than simply reporting events; what speakers routinely do, according to them, is “describing states, revealing our attitudes, ascribing properties to people and situations, and giving our assessments of situations and behavior.” Similar findings have been reported by Ewing (2005) for Javanese, Helasvuo (2001) for Finnish, Sadler (2007) for Japanese, and Tao (1996) for Mandarin, among others. However, there is much more to be learned about LT constructions in language use and the status and utility of such constructions crosslinguistically. Thus, this panel, with contributions by Michael Ewing, Maria Frick, Marja-Liisa Helasvuo, Ritva Laury, Ivana Leinonen, Niina Lilja, Patricia Mayes, Tsuyoshi Ono, Emeline Pierre, Ryoko Suzuki, Hongyin Tao, and Sandra Thompson, explores a range of typologically different languages, including English, Finnish, French, Indonesian, Japanese, Mandarin Chinese, and Spanish, on the following topics.

- 1) What types of LT predicates are commonly observed in actual language use crosslinguistically? While high/low transitivity has been shown to be a useful continuum (Hopper/Thompson 1980), LT structures can vary greatly – from intransitive and stative to copular and verbless (e.g. NP) predicates. How are they used differently if a language allows multiple forms, and what role does genre/situation play (Mayes 2003)? Also, while much evidence has been gathered especially from English (Thompson/Hopper 2001, Scheibman 2002), more empirical, crosslinguistic evidence would enrich our understanding of such phenomena.
- 2) Are there LT structures that emerge from, or figure prominently, in conversational interaction? Preliminary evidence shows, for example, that the subject of copular constructions in some languages may prefer pronominal forms or unarticulated but somewhat accessible referential entities. Why is it so?
- 3) What interactional functions or actions are different types of LT constructions deployed to accomplish, especially in connection with the more or less fixed constructions they form? For example, are different LT constructions used in different sequential positions for different conversational moves (e.g. initiating new actions or evaluating a previously established discourse entity)? Are copulas used more for categorizing, identifying, or assessing than their typically conceived syntactic functions?
- 4) How can a usage-based discourse pragmatic approach help deepen our understanding of the relevant theoretical constructs that have been widely held in linguistics? For example, if much of everyday conversation can be characterized as low in transitivity, shouldn’t grammar for interaction be centered around LT constructions? Should the functions of LT structures such as verbless constructions be re-evaluated crosslinguistically? And finally, what does all this mean for the dynamic organization of language and the emergence of language structure from discourse?

---

# The expression of customer dissatisfaction online

---

Panel

---

**Dr. Nicolas Ruytenbeek<sup>1</sup>, Prof. Sofie Decock<sup>1</sup>**

**1. Ghent University**

In the current era of digitalization, customers are able to express their dissatisfaction in the form of complaints and negative reviews on a variety of online social media platforms, and they increasingly make use of this possibility. Such forms of negative online word-of-mouth have been found to strongly influence other consumers' purchase decisions (Ludwig et al. 2013; Yin et al. 2014; Vermeulen & Seegers 2009). Online complaints and negative reviews have been approached from the perspective of discourse pragmatics and conversation analysis, with attention to their linguistic realizations and their interactional dynamics (e.g., Vásquez, 2011; Dayter and Rüdiger, 2014). In addition, online complaints have recently been experimentally investigated by Ruytenbeek et al. (to appear). The aim of this panel is to further expand our knowledge on the discourse-pragmatic strategies used by dissatisfied customers online and on how these different strategies influence the readers' perceptions. We welcome abstracts on the following questions (the list is not exhaustive):

- What are the discourse-pragmatic strategies that customers use to voice their dissatisfaction online? What paralinguistic features do they resort to?
- How does the expression of customer dissatisfaction differ across different online public platforms?
- What are the differences between customer dissatisfaction in F2F vs. online written communication?
- How do other customers respond to customer dissatisfaction?
- How do other customers emotionally react to the expression of customer dissatisfaction? Do their objective emotional reactions correlate with their subjective assessments?
- What is the influence of discourse genre, e.g., complaint, claim, negative review, on the expression and the perception of customer dissatisfaction?
- Which theoretical approaches are most useful to address customers' negative evaluations online?
- Does customer dissatisfaction vary inter-individually and/or cross-culturally? If so, in what respect?
- How can interdisciplinary approaches shed light on the pragmatics of customers' negative evaluations online?

# The Impact of COVID-19 on Communication: Immigration, Media Representation, and globalization

Panel

**Dr. Akira Satoh<sup>1</sup>, Prof. Hata Kaori<sup>1</sup>**

**1.** Osaka University

The world-wide pandemic of COVID-19 has changed our practices in all social milieux, including the political, medical, economic, educational, work, and private. As researchers of discourse, one of our crucial roles is to create knowledge that can make sense of what is going on, especially in such an uneasy condition. This panel will address the impact of COVID-19 with a particular focus on how it is made relevant to identities, power relations, and ideologies, all of which can lead to further inequality, discrimination or segregation.

Some of the panelists' presentations will consider manifestations of such problems in the context of Japan. One study tries to illustrate the identities of Japanese women living in London under the new circumstances of COVID-19. Since the beginning of 2020, the potential discrimination against Asian people has come up to the surface resulting in various hate crimes. In the narratives of participants, two conflicted two identities have emerged, that is the awareness of the victims of discriminations as well as a Japanese identity which is differentiated from the other Asian countries in order to escape from hate crimes. This will be a case study that people adjust their identity when they face social change in order to survive under the conditions of the new environment.

Another study investigates how foreign media treated the Japanese government's management of the COVID-19 pandemic on the cruise ship. In February, there were severe criticisms by the US and British media of Japan's epidemic prevention measures of the ship quarantine. However, in March Czech media dismissed the condemnation, saying that the US-owned company, which is registered in a British island, and the relevant countries, namely, the UK and the US, should "accept responsibility for the fiasco". Then in May, US media started criticizing the cruise-ship operators. This study shows that different ideologies are reflected in the various views on the same incident.

Still another study focuses on one novel code-mixed expression in Japanese, "With *korona*", from the perspective of enregisterment (Agha, 2005). The use of the phrase is assumed to have been pioneered by business elites and entrepreneurs, and is now circulating in social space particularly through the online media related to business and economy. Such a way of dissemination appears to involve voicing contrast, allowing those who use it to invoke and thereby perform a certain kind of identity. On the basis of this line of analysis, the study will point to the emergence of a new shibboleth, which seems to be part of a larger process where COVID-19 gets associated with meritocracy and neoliberalism.

As shown here, methods and approaches from narrative analysis, sociolinguistics, CDS, and linguistic anthropology can be mobilized in order to figure out ongoing impacts of COVID-19 on the ways people communicate in/about the COVID-19 situation. By investigating above, the interplay between COVID-19 and the issues of immigration, media representation, and globalization will be better illuminated.

# The language and discourses of football – Pragmatic perspectives

Panel

***Prof. Eva-Maria Graf<sup>1</sup>, Prof. Marcus Callies<sup>2</sup>, Ms. Melanie Fleischhacker<sup>1</sup>***

*<sup>1</sup> University of Klagenfurt, <sup>2</sup> University of Bremen*

In recent decades, football, the major spectator sports in Europe and South America, has seen an increasing commercialization and globalization, accompanied by an ever-growing popularity and intensive coverage in various kinds of media and modalities. This increased popularization and public attention has also led to more research on the language and discourse(s) of football, which is, however, scattered over a diversity of outlets with only few thematically focused collections existing to date (see, e.g. Adelmann et al. 2003; Settekorn 2007; Lavric et al. 2008; Taborek et al. 2012; *Aptum* 2018).

Football-related linguistic research has for a long time focused on structural-linguistic aspects in various reporting genres such as post-match reports and live commentary on radio and TV, in particular with a view to phraseology, including specialised terminology and jargon. Only few studies to date have examined specific pragmalinguistic resources such as the discourse-pragmatic functions of selected syntactic constructions in live sports reporting (e.g. Ferguson 1983; Jürgens 1999; Callies & Levin 2019b) or pragmatic borrowings (e.g. Balteiro 2018). Generally speaking, research has become more diverse and interdisciplinary in the last fifteen years or so with an increasing number of studies looking at football language from a wider discourse perspective in several under-researched contexts (see Caldwell et al. 2016). For example, recent studies have examined wordplay and humour (Chovance 2017; File & Schnurr 2018), talk in football audiences (Gerhardt 2014; Tolson 2016; Hauser & Meier 2018), and post-match interviews (e.g. Wilton 2016; File 2017, 2018). At the same time, the emergence of new genres of sports reporting in the age of online computer-mediated communication has opened up many new and innovative ways of studying football language and discourse and its accompanying audio-visual modes of communication from a multimodal perspective (see e.g. Chovanec 2018 or several papers in Callies & Levin 2019a). Concurrently, recent years have also witnessed a growing discourse-oriented research in football as gendered social practice (Jeans & Kay 2007; Jeans 2012; Graf & Fleischhacker in prep.) and gender aspects in televised football (Johnson & Finlay 1997; Kennedy 2004).

This panel features eight contributions that adopt a pragmatic, usage-based perspective and make use of a broad range of data and methodologies to examine the pragmatics of the language, communication and discourses of football in and by a variety of genres, participants and stakeholders on and off the pitch and in all kinds of contexts of use. The contributions add to current efforts of extending the scope of (applied) linguistic research on football language and discourse by exploring, e.g., naming practices and terminology, media discourse and production, identity construction on social media, gender (in) equity, fan communication and communication on the pitch.

# The language of inclusion and exclusion: discourses on minorities in digital media

## Panel

***Prof. Igor Trost<sup>1</sup>, Mrs. Annamaria Fabian<sup>2</sup>, Dr. Stefanie Ullmann<sup>3</sup>***

*1. University of Passau, 2. University of Bamberg, 3. University of Cambridge*

Practices in the inclusion and exclusion of minorities have been studied extensively in the social sciences, and discourse analysis is beginning to catch up. In recent years, linguistic studies have focused on discourses of refugees and migrants (e.g. Viola & Musolff, 2019), of people of color (e.g. McEnery et al., 2015), of people on grounds of gender (e.g. Fabian, 2020; Gnau & Wyss, 2020; Paknahad Jaborooty & Baker, 2017; Hardaker & McGlashan, 2016; McPherson, 2014), disability (Grue, 2014; Sties, 2013), rare diseases (Brookes, 2020; Harvey & Brookes, 2019, Semino et al., 2017), mental health issues (e.g. Harvey, 2012), homo- and transsexuality (Bachmann, 2011), etc. in various countries and contexts. Many of these studies make use of data from digital media, itself an increasingly popular object of study in linguistics (e.g. Abel et al., 2020; Marx et al., 2020; Wright, 2020; Bubenhofer, 2017; McKeever, 2019; Wang & Taylor, 2019; De Decker & Vandekerckhove, 2017; Marx & Weidacher, 2014; Zappavigna, 2012; Crystal, 2006). These important studies have raised awareness for the analysis of minority issues from the point of view of linguistics but aiming inclusion in digital media by inclusive language use has not been focused so far.

Given these partly disparate trends, the panel seeks to further the study of the inclusion and exclusion of minorities (potentially including minorities not mentioned above) in online discourses from a crosslinguistic perspective. Its remit includes references to minorities by both members and non-members of the minorities themselves, and the linguistic and discursive aspects of any activities and policies fostering the inclusion and/or countering the exclusion of minorities. Contributions will be invited discussing one or more of the following issues:

1. the lexicogrammar and phraseology used in the linguistic construction of minorities with respect to inclusion and exclusion in digital media;
2. salient linguistic strategies for the promotion or denial of inclusion and minority rights in different languages and different cultural/societal contexts, and experiences in employing them;
3. the affordances of (a combination of) corpus linguistic, cultural-linguistic, and other methodologies for the study of online discourses on minorities.

In order to cover as much ground as possible, the panel will include nine 20-minute papers (plus 5 minutes of discussion). We intend to put out a call for papers. In addition, the following speakers will be approached:

- Prof. Dr. Marina Bondi (University of Modena and Reggio Emilia/English Language and Translation)
- Annamaria Fabian, M.A., (University of Bamberg/German and Hungarian Linguistics) and Prof. Dr. Sibylle Sauerwein (Université Paris Nanterre/German and Romance Linguistics),
- Prof. Dr. Uta Helfrich (University of Göttingen/Romance Linguistics)
- Dr. Susanne Kabatnik (University of Greifswald/German Linguistics)
- Prof. Dr. Andreas Musolff (University of East Anglia/Intercultural Communication)
- Prof. Dr. Igor Trost (University of Passau/German Linguistics),
- Dr. Stefanie Ullmann (Cambridge/English Linguistics and Computerlinguistics)

- Dr. Lorella Viola (University of Luxembourg/Contrastive Linguistics: English and Italian and Digital Humanities)
- Dr. Janina Wildfeuer (University of Groningen/German and English Linguistics)

# The Linguistic and Nonlinguistic Practices of Gay Roles, Gay Characters, and Gay Men: A Multimodal Perspective

## Panel

**Prof. Chie Yoshinaga<sup>1</sup>, Dr. Li-Chi Chen<sup>2</sup>, Mr. Eryk Hajndrych<sup>2</sup>**

**1.** Sanyo Gakuen University, **2.** Kazimierz Wielki University

The proposed panel aims at critically discussing whether there is *gayspeak* by scrutinizing how the linguistic and nonlinguistic practices of gay roles (e.g., in stage dramas, on television series, etc.) and gay characters (e.g., in comic books, in animations, etc.) are different from or similar to those of openly gay men in real life. As pointed out by Seyfeddinipur and Gullberg (2014: 1): “Language is fundamentally multimodal.” While speech interacts with gestures, *text* and *image* also multiply each other in constructing various meanings (Bateman 2014). The proposed panel is, in particular, interested in how multimodal analysis facilitates the examination of the created, performed, and naturally-produced *gayspeak* in various genres. In the following, each contributor’s findings are summarized:

**Eryk Hajndrych** and **Li-Chi Chen**’s contribution illustrates how Pai Hsien-Yung’s *Crystal Boy* was adapted in stage drama, focusing on how the literary narrative was visually and audibly presented through the actors’ dance, combined with stage music and lighting. While the linguistic and nonlinguistic practices observed in most of the gay roles in the stage drama did not show much difference from those of their straight counterparts, Little Jade’s feminine traits were highlighted in many of his dances, further showing *gayspeak*.

**Mie Hiramoto**’s contribution demonstrates the representations of unconventional speech styles and semiotics by examining mediatization strategies of queer male characters in popular *shōnen* action animations. As observed, queer male characters frequently serve as sidekicks and have been mediated and mediatized with creepiness, unwanted attachments, maniac nature, and hypermasculine ruthlessness, which are associated with traditional masculine ideologies through naturalized semiotic processes.

**Chie Yamane-Yoshinaga**’s contribution analyzes how Japanese gay men were presented in both the comicbook and television series versions of *Kinoo nani tabeta* ‘What did you eat yesterday?’. While Shiro was found to use male-exclusive linguistic expressions, Kenji was found to use female-exclusive linguistic expressions. In the comicbooks, moreover, visual metaphors were frequently used, especially by Kenji to show his various emotions. The two gay characters also varied in their looks and clothes, further suggesting that gay male characters were presented differently to show their different personalities and styles.

**Li-Chi Chen**’s contribution analyzes how gay Taiwanese YouTubers used multimodal resources as social semiotics in their self-disclosure about homophobic bullying. His findings are in favor of *gayspeak*, as the observed gay Taiwanese YouTubers frequently touched their interlocutors and imitated a feminine tone of voice, which was intended sarcastically in response to those who had despised male feminine traits.

Finally, **Heiko Motschenbacher**’s contribution describes the linguistic landscape of Wilton Manors, Florida, a community with the largest LGBT populations in the US. His findings suggest that homonormativity plays a central role in this context. While same-sex sexualities are discursively constructed as the local norm, gay male experiences predominate; heterosexualities, lesbian and other sexualities are marginalized or even silenced. There exists privileged gay masculinity on Wilton Drive: one that can be described as white, middle-class, and focused on domesticity and consumption.

# The making of an (in)credible witness and suspect: historical and contemporary perspectives on the discursive-pragmatic characteristics of testimonial accounts

Panel

***Prof. Mieke Vandenbroucke<sup>1</sup>, Prof. Rik Vosters<sup>2</sup>***

*<sup>1</sup> University of Antwerp, <sup>2</sup> Vrije Universiteit Brussel*

Both historical and contemporary legal procedures rely on statements by witnesses and suspects given both in-court and in previous police investigations as evidence in case decision-making. Such testimonies and depositions are typically shaped by complex co-construction by the interlocutors, while written accounts used in court are the outcome of transformative entextualisation processes (Andrus 2006; Grund 2007; Park & Bucholtz 2009). In this panel, we investigate such contemporary and historical accounts in trial proceedings, witness depositions and interrogation reports, using the present to explain the past (cf. Labov 1975), while simultaneously exploring what historical accounts can contribute to our understanding of present-day meaning making processes in testimonies.

Contemporary studies have documented how oral witness and suspect accounts come into existence through spoken question-answer sequences between interlocutors, and are shaped by a variety of questioning and answering techniques in direct and cross-examination, where meaning and evidence are negotiated through interaction (Komter 2006; Seung-Lee 2013). These encounters are power-differentiated and often highly conflictual interactions, fraught with skilful manipulation of pragma-linguistic resources (e.g. visual evidentials, marked pronominal constructions) to elicit relevant evidence and influence the court's perception of the speaker's identity and reliability of their testimony (Mattoesian 2001).

Moreover, contemporary research has documented how the drafting process of the written account by the interrogator introduces changes to what the witness orally stated, for instance removing turn-taking through first-person accounts (Komter 2006), or filtering out hesitations and unintelligible utterances (Gallez & Maryns 2014; Rock 2001).

Historically, there is clear evidence that courtroom scribes similarly represented speech events by defendants in an unreliable fashion, making such evidence unsuited for correlational sociolinguistic analyses (Grund 2007), but opening up the possibility for historical pragmatic analyses of how entextualisation processes varied by context and evolved over time. Such discursive steering and transformative processes in turn heavily influence both how information is uncovered as evidence (Archer 2002), and how witnesses' and suspects' identities and credibility is construed to the court (Vartiainen 2017): elements such as the use of direct speech, for instance, are presented as markers of credibility and authenticity, even though witness testimonies are notoriously unreliable in representing the spoken word (Giordano 2012; Kytö & Walker 2003).

In this panel, we welcome papers which engage with testimonies in witness depositions, interrogation reports, or other similar courtroom or legal data, either from a contemporary or a historical perspective. We particularly welcome work focusing on the various pragmatic and textual features which shape the credibility of courtroom actors such as witnesses, suspects or experts, in either the oral account or written representation. We aim to achieve a mix of invited and submitted papers by senior and novice researchers working with historical and present-day data, and explicitly invite all participants to reflect on how we can use contemporary pragmatic research to further our understanding of historical pragmatic analyses of witness accounts by uncovering parallel linguistic and pragmatic behaviour and practices.

---

# The poetic function and social meaning in language

---

## Panel

---

**Dr. Scott Kiesling<sup>1</sup>**

**1. University of Pittsburgh**

Discussions of social meaning in language are most commonly pursued through the indexicality of a single form, including the phonetics, intonation, morphology, and lexis of an utterance. But relatively little work in sociolinguistics to date has been focused on the relationship between the linguistic poetic function and social meaning. One example of such work is Lempert's (2008) article that shows that Tibetan monks use interspeaker poetic patterns to create stances in competitive speech events. There are also older works that appeal to poetic forms, such as the classic studies of figures of speech in Tannen's (1989) book *Talking Voices*, the most well-known of which is the chapter that argues for the importance of different forms of repetition in interaction. This panel will host papers that show how Jakobson's (1960) poetic function is used to create social meanings in linguistic form in interaction.

The poetic function is most famously articulated by Jakobson (1960:358) as the function that "projects the principle of equivalence from the axis of selection into the axis of combination." For practical analytic purposes, the important issue is that meaning is not attached to a single token of a form that is taken to be of a particular type (the axis of selection), but that the form is a pattern across a stretch of speech, including across different speakers (the axis of combination).

Papers in this panel connect poetics and social meaning in a wide range of ways and forms, but can be separated into two main themes, around which the two sessions of the panel are organized: 1) The reflexive connection between the poet and their poetry; and 2) poetic language as it is used 'in the world,' that is, in 'non-poetic' genres. In the first session, there are three papers that relate the relationship of the poet/author to poetic practice. These papers focus on poets as diverse as hip-hop artists (Brown); how speechwriters and ad writers represent their work as poetic (Mapes and Thurlow), and how poetry historically helped Iranian poets create an "impersonal axis of experience" comparable to modern psychiatry (Manoukian). In the second session, the papers focus on the poetic aspects of activities not formally poetic. Poetic functions such as parallelism, affective alignment, and multimodal poetics are explored in domains such as psychoanalysis (Fuentes-Calle), yoga (Riner), and TikTok cooking videos (Tovares). Emerging from these papers is a deeper understanding of the poetic function, and an appreciation of its ubiquity in pragmatics.

identities like gender, class, race, nationality, etc., but also forms such as stance and affect, and especially the link between the two.

# The pragmatics for co-constructing healthcare in the global and diverse societies: crossing, or transforming, boundaries in healthcare communication

Panel

***Dr. Keiko Tsuchiya<sup>1</sup>, Dr. Sarah Atkins<sup>2</sup>***

***1. Yokohama City University, 2. Aston University***

The global pandemic we have been facing could be the most significant collective experience we have shared since the world wars, highlighting how the contemporary world, and its economy, politics and culture, are interconnected (Appadurai, 1996). Such circumstances demand that healthcare professionals (HCPs) across multiple disciplines, patients, and lay-persons communicate and collaborate effectively for the health of global and diverse societies *a fortiori*. How people act together and collaborate has been a fundamental question in discourse-pragmatic research (cf. Austin and Searle), and explored extensively (cf. *action ascription* in Levinson and *joint action* in Clark, to name a few). The practice and process of mutual understanding and cooperation in healthcare become even more intricate and interdiscursive when it comes to interactions among people with diverse sociocultural backgrounds and/or different health beliefs and health conditions. The related fields of discourse-pragmatics, interactional linguistics and conversation analysis have been central methodologies in addressing how mutual understanding and cooperation are achieved at the micro-level of the interaction. Studies across these fields have demonstrated the value of micro-analytic and discourse-based approaches for shedding light on effective healthcare communication. Drawing on the notion of Goffman's *frame*, Tannen and Wallat (1983) provide a discourse analytic perspective on the different participation structures in three distinctive contexts in which HCPs are engaged in primary care consultations: a paediatric examination, a social work session and a staff meeting. This seminal work highlights multi-layered discourses and interdisciplinary communities HCPs are involved. Sarangi (2016) raises the notion of "distributed expertise" in team collaboration in healthcare: "the division of labour at the interactional level must be distributed and coordinated along the lines of role-responsibilities" (p.3). Employing Peirce's *semiosis*, Goodwin (2018) multimodally describes interactions with an active speaker with a "three-word vocabulary" due to a brain damage, who efficiently uses multimodal resources (e.g., prosody and gestures) and incorporates another's talk for building meaning. However, how individuals with different health conditions communicate each other efficiently still remains largely uncovered. This panel continues the discussion of co-constructing interactions/discourses in the field of healthcare/health-related practices which call for collaborations beyond boundaries of diverse individuals, professional/institutional disciplines, and different ethnic groups/sociocultural communities. The panelists present studies in a range of healthcare contexts: a comparative study of topic selections between Japanese and British adults with ASD (autism spectrum disorder) (Kyoko Aizaki), ethnometodology research of doctors and patients' identity categorization in intercultural medical encounters (Valentina Fantasia, Cristina Zuccher-maglio, Marilena Fatigante, Francesca Alby), a case study of simulated medical consultations in English as a Lingua Franca in Japan which focuses on cognitive empathy (Yukako Nozawa), an analysis of intertextuality in a cross-ethnic narrative therapy with the issue of racism in the US (Shoko Yohena), and team members' multimodal strategies to prompt the leader's requesting in emergency care simulations in the UK and Japan (Keiko Tsuchiya, Małgorzata Chalupnik, Sarah Atkins). This panel contributes to a better understanding of collaborative practices between interactants with socio-culturally diverse backgrounds in healthcare settings.

# The Pragmatics of Danger: Cross-Linguistic Perspectives on the Discourse of Global Crisis

## Panel

***Dr. Carsten Levisen<sup>1</sup>, Dr. Zhengdao Ye<sup>2</sup>***

***1. Roskilde University, 2. Australian National University***

Language plays a crucial role in times of social change, as both a driver and a measure of it. In times of global upheaval and multiple exigencies – medical, migratory, environmental, and economic – many new words, as well as new meanings attached to old words, emerge in public spheres. Words from technical (etic) domains migrate into popular (emic) domains, and old words are reinvigorated for the rhetorical keying of meanings and messages. The rise and fall of words and discourse rituals speak of changes in pragmatic orders, and offers insights into shifts in priorities, understandings, and views of the world.

This panel provides a cross-linguistic exploration of the changing pragmatic orders in times of global crisis. The aim of this panel is to explore keywords and scripts of "danger talk", with an emphasis on "keywords of the moment", of transient discourse formations, and changes in cultural scripts. The key questions that the panel explores are: how do different linguacultures conceptualize and understand situations of perceived danger? How are discourse rituals changed, modified, annulled, and expanded, in times of crisis? What kind of metapragmatic landscapes are formed in response to "danger talk"?

To answer these questions, four related themes will be explored:

- People and place: discourses of belonging, socialities, and popular geopolitics in times of crisis.
- Events and actions: discourses of 'what happens' and 'what to do' in times of crisis.
- Emotions and affect: discourses of 'feelings', i.e. the changing scripts for emotionalities and expressivities in times of crisis.
- Values and cosmologies: discourses of good and bad, life and death, and the scripts for ethics and beliefs in times of crises.

Contributors to the panel are scholars in cultural pragmatics – broadly defined. This includes researchers in the fields of ethnopragmatics, intercultural pragmatics, cultural discourse analysis, linguistic anthropology, and adjacent disciplines.

# The Pragmatics of Hope: Investigating alternatives to despair in contemporary political arrangements and communicative practices

Panel

***Dr. Daniel Silva<sup>1</sup>***

**1.** Universidade Federal de Santa Catarina

In *Radical Hope*, Jonathan Lear (2006) delineates how the Crow people, a nomad indigenous group in the Midwest of the United States, resisted the cultural devastation predicated in their confinement to a reservation by the U.S. government in the end of the 19<sup>th</sup> century. Lear focuses on the authoritative account of Plenty Coups, a Crow leader, and describes that this indigenous group refused to give in to despair by imagining a “radical hope”. Through the realization of loss and the working out of pragmatic resources such as collective interpretation of dreams, writing with literate collaborators, and imaginations of alternative futures, Plenty Coups managed to transform the “destruction of a telos into a teleological suspension of the ethical” (p. 146). Instead of short-circuiting reality in his dream visions, Plenty Coups engaged with reality in practical ways. Lear points that the Crow, in their collaborative work to survive cultural devastation, rephrased the questions about hope that Kant addresses in *Critique of Pure Reason*. Kant asks: “What can I know? and What I ought to do?” For Lear, “these questions are better transposed to the first-person plural” (p. 103).

Hope is an affect that engages temporality in creative ways. It is also a principle of explanation (Bloch, 1986) that has received growing attention in linguistics and the social sciences (see Crapanzano, 2003; Miyazaki, 2004; Heller & McElhinny, 2017; Borba, 2019). As the Crow case highlights, hope is fundamentally a pragmatic and metapragmatic resource in which people oppose despair, inequality, and violence by reimagining past harms, current disjunctions, and alternative futures.

Given that the contemporary world has been affected by a major health pandemic, which adds to a growing economic crisis and to political instabilities of all sorts, this panel gathers scholars in pragmatics interested in reflecting on language practices and forms of practical reason that are aimed at producing hope.

As scholars interested in language, some fundamental questions that we ask ourselves and our empirical data are: How do people in debilitating scenarios engage with practical reason in order to avoid despair? How do they imagine the access and distribution to linguistic and semiotic resources in this moment of crisis? How do subjects reimagine temporality to prospect alternative futures while redressing past harm?

# The pragmatics of inclusion and exclusion in (team) sports

---

## Panel

---

**Dr. Kieran File<sup>1</sup>, Dr. Stephanie Schnurr<sup>1</sup>**

*<sup>1</sup>. University of Warwick*

This panel aims to explore the pragmatics of inclusion and exclusion in (team) sports. Sport and sports teams present an important social context for the study of inclusivity and exclusion, as sociolinguists and pragmatics scholars are beginning to discover (Chovanec, 2009; Chovanec, 2016; File, 2018; File & Schnurr, 2019; Wolfers et al., 2017). On the one hand, sport is a context where team spirit and values of collaboration and togetherness are celebrated, but on the other hand, competitiveness and competition are also integral aspects of (team) sports. Issues of inclusion and exclusion in the sports domain are also reflected in recent media headlines which often portray high-performance sports as a context where racism and sexism thrive, where heteronormativity and hegemonic masculinity reign, and where sharply stratified social structures give rise to bullying practices by those in power (BBC Sport, 2016; Grierson, 2016; Hope, 2019; Roan, 2017; Roan & Nathanson, 2017).

In this panel, we bring together scholars who are unpacking the pragmatic processes of inclusion and exclusion in sports teams. Focusing on a variety of different team sports, the contributions to the panel provide accounts of how different forms of inclusion or exclusion are being constructed, negotiated, and sometimes even rejected by different interlocutors. Working with authentic data collected in a range of different socio-cultural contexts, including the UK, New Zealand, Australia, Germany, the Czech Republic and the USA, contributors identify and describe the pragmatics of inclusion on the micro-level of an interaction while at the same time linking these observations to (often problematic) issues of inclusion and exclusion in team sports. They thereby address the following questions:

- What communicative practices in sports team contexts threaten or help to accomplish team cohesion?
- How do intercultural teams, mixed gender and other diverse team memberships manage this diversity in the promotion of inclusivity in team communication?
- Where and when is inclusivity particularly relevant in the everyday practices of sports teams and in what circumstances does exclusivity appear?
- How are issues of exclusion in sports teams reported in the media?
- How are issues of exclusion negotiated among the members of a team?
- What are the benefits of a pragmatic approach to understanding inclusion?
- How can we translate our pragmatic findings for sports practitioners?

In spite of their focus on different sports teams in different socio-cultural contexts, the contributions to this panel showcase some of the benefits of approaching issues of inclusion and exclusion from a pragmatic angle, and demonstrate how the tools of pragmatics can help making the processes of inclusion and exclusion more visible, thereby increasing our understanding of these complex and multifaceted concepts.

# The semiotics of contagion: Magical thinking and the management of danger

Panel

***Dr. Judith Pine<sup>1</sup>, Dr. Colleen Cotter<sup>2</sup>***

*1. Western Washington University, 2. Queen Mary University of London*

The representational economies within which messages about COVID-19 circulate require complex indexical operations in order to function. The semiotic ideologies in play function to create essential categories of people and behavior, iconizing indexical relationships between, for example, mask wearing and political stance, between toilet paper and preparedness, between awareness and infection, between virological data and language. These semiotic operations make sense of what may otherwise appear to be foolhardy, antisocial, underexamined, and counterproductive practices at many scales, from the local to the national and to the global. Efforts to develop metacognitive awareness of what might be thought of as toxic semiotic structures encounter a phenomenon which we refer to as “magical thinking”.

Magical thinking is conceived of here as a semiotic and sociopragmatic operation which involves the deliberate, although perhaps not fully intentional, effort to maintain hegemonic ideologies which obscure or erase alternative notions of facts-on-the-ground while presenting participants in the discourse with a seductive illusion of safety and control, an inhabitable stance from which to view a pandemic or other dangerous circumstances with relative equanimity. This shaping of meaning in response to danger involves a consistent development of direct indexes associating recognition of danger with undesirable characteristics, which can play out temporally in discourse interactions.

The puzzle which this panel seeks to explore is the durability and “contagiousness” of COVID-related magical thinking which has resulted in such social phenomena as viral videos promoting and rejecting public health practices, the first-lockdown stockpiling of toilet paper and hand sanitizer, resistance to public health recommendations, anti-vax rhetoric, and competing interpretations of emerging public health data. As Taylor-Neu (2020) points out in the context of climate change denial, “it is not the value of capital-S-Science that is at issue but, rather, *what counts as scientific*” (21); thus, efforts to cement an iconic relationship between public health advice and politically neutral science cannot rely on the notion that other positions are inhabited by anti-science, or even anti-common-sense actors.

The papers in this panel take different approaches to explore cases across community or national contexts which consider the conditions under which magical thinking can be effective or problematic, the factors involved in successful disruption of toxic magical thinking, the potential role of magical thinking in cases where COVID-19’s spread has been disrupted, and the sociopolitical drivers behind meaning-making in managing crisis.

# The sociopragmatics of emotion

---

Panel

---

**Prof. Laura Alba-Juez**<sup>1</sup>, **Prof. Michael Haugh**<sup>2</sup>

**1.** UNED (National Distance Education University), **2.** University of Queensland

Displaying and responding to emotions is a critical part of human communication and relational work. Research on affect and emotions at the turn and first two decades of the 21th century shows that humans are not epitomes of reason, as previously believed (e.g. Ochs & Schieffelin 1989; Ekman 2003; Bednarek 2008; Scherer 2009; Wilce 2009; Kahneman 2011; Foolen et al. 2012; Damasio 2003, 2018; Wetherell 2012; Spencer-Oatey 2013; Culpeper et al. 2014; Dewaele 2015; Alba-Juez 2018; Mackenzie & Alba-Juez 2019). Emotion permeates every human activity, and scholars have thus come to realize that to study the human condition without including the emotive variable does not allow us to see it in its whole complexity. It is now well established that the study of emotion is crucial not only for the comprehension of the mechanisms of the human psyche, but also for the study of language, communication and social interaction. Indeed, the fact that humans express emotions by means of speech acts, drawing on different affective practices, is one of the most salient characteristics distinguishing them from other animals, which thus makes the phenomenon worthy of investigation.

This panel focuses on emotion from a sociopragmatic perspective (Alba-Juez 2021; Langlotz and Locher 2017; cf. Caffi and Janney 1994), that is, social, interactional, and normative dimensions of language use (Haugh, Kadar & Terkourafi 2021), building on the original focus of sociopragmatics on social dimensions of language use (Leech 1983) . Thus we take into account aspects of emotion communication such as the users' perceptions of the attitudinal context, the sociocultural norms involved, the interpretation of emotive acts as (in)appropriate, the constitutive role of emotions in relational work, among many others. We argue in favor of the need to broaden the scope of research towards a sociopragmatic, multidisciplinary and multidimensional analysis of emotion in discourse and interaction.

The presentations include various methodological perspectives, including discourse analysis, conversation analysis, corpus pragmatics and experimental pragmatics, all applied to the study of the sociopragmatic aspects of emotion, concerning topics such as:

- Gender and emotion
  - Hate speech
  - Power and emotion
  - Fake news and emotion: lying and bullshitting
  - Persuasion as a means for the manipulation of emotions
  - Emotional intelligence and (im)politeness/ Relational work
  - Taboo language and emotion
  - Irony, humor and emotion
  - Online emotions/Cyberemotion
  - Emotion and alterity
  - Intercultural emotional communication
  - Cultural emotion and its sociopragmatic inferences
  - Trauma, shock and emotions in times of disaster/global crisis (e.g. Coronavirus and social distance)
  - Collective emotions: relational emotions, emotional contagion, emotion and the formation of social identities
  - Interdisciplinary studies on emotion
  - Metapragmatics of emotion
-

- Emotion as a means for persuasion and manipulation

**The following authors are participating in the panel:**

Tim Wharton, Marina Terkourafi, Roxanne Casiez, Carmen Sancho Guinda, Ad Foolen, Afrooz Rafiee, Daniel Kadar, Juliane House, Isolda Carranza, Carmen Maíz, Francisco Yus, Yasuko Obana, Nikos Vergis, Chris Rühlemann, Carolina Figueras, Wei-Lin Chang, Miguel Ángel Benítez, Encarnación Hidalgo-Tenorio, Francesco de Toni, Carmen Santamaría, Małgorzata Sokół, Carla Almeida, Michael Haugh and Laura Alba-Juez

# Touching and being touched in the local organization of gestural trajectories in interaction

## Panel

***Prof. Marc Relieu<sup>1</sup>, Dr. Alain Bovet<sup>2</sup>, Dr. Sara Keel<sup>3</sup>***

***1. Telecom Paris, 2. University of Lausanne, 3. Haute Ecole de Santé Vaud***

Drawing on a number of recent studies on touch in interaction (Nishizaka, 2007, Goodwin, 2017, Routarinne, Tainio and Burdelski (eds) 2020, Cekaite and Mondada (eds) 2020; Edmonds and Greiffenhagen, 2020), this panel focuses on activities in which the co-participants produce gestural trajectories that involve touching (hapticity) and being touched (tactility). These contacts may constitute either the main involvement (Goffman, 1963), and, as such, be sustained for all or most of the activity, or be an optional or provisory involvement, occasioned by interactional contingencies. An example of the former is the practice of mundane massage, in which two co-participants have managed a spatial arrangement suitable for a massage through which a localized muscular tension is attenuated by repeatedly lifting and squeezing the muscles between fingers and thumb. An example of the latter is when dancers get in bodily contact with one another in the course of an improvised dance trajectory. By focusing on such situations, we want to address what hapticity and tactility do to interactions, notably in terms of structuration and organization. How are these haptic and tactile moments anticipated, initiated, negotiated, interrupted, resumed, or closed? How are hapticity and tactility articulated to or co-elaborated by other communicative means such as talk or gaze? Is there a specificity of tactile and haptic engagements and how do co-participants accountably orient to it? Once the activity has begun, how do previous haptic and tactile trajectories (Sudnow, 2002) orient and organize a relevant field (Merleau-Ponty, 1945) that can both constrain and be enriched by subsequent moves, pressures, tapping, delineations, etc.?

We suggest apprehending hapticity and tactility through recordings of naturally occurring activities, to remain as sensitive as possible to what happens throughout and around haptic and tactile moments (see Greco et al., 2019).

# Tracing racism in anti-racism: Critical approaches to the European public discourse on the migrant and refugee crisis

Panel

Prof. Argiris Archakis<sup>1</sup>, Dr. Villy Tsakona<sup>2</sup>

*1. University of Patras, 2. National and Kapodistrian University of Athens*

The ongoing migrant and refugee crisis in European countries (2015 – to date) has led to the rise of different stances and practices on behalf of European states, ranging from solidarity to xenophobia. In this context, the main goal of the panel is to bring together studies investigating various semiotic strategies through which racist views infiltrate discourse intended as anti-racist. Our focus is on the anti-racist discourse of the European public sphere, which refers to the current migration and refugee crisis. We explore how racist views are not cultivated only through hate speech, which overtly stigmatizes and demonizes migrant and refugee populations (see Assimakopoulos et al. 2017). Racist views can also circulate through seemingly anti-racist discourse, which aims at denouncing racist practices, but ends up disguising, reproducing, and sedimenting inequalities.

The panel includes sociopragmatic analyses of data coming from various genres including advertising campaigns, news articles, TV shows, cartoons, parliamentary proceedings, and other political texts. Our research aim is to detect anti-racist texts indirectly and implicitly perpetuating social and/or sociolinguistic inequalities and eventually racism (see e.g. Archakis et al 2018, Archakis & Tsakona 2019). Such texts could be perceived and scrutinized as instances of *liquid racism*. According to Weaver (2016: 63-64), liquid racism “does not produce a monolithic reading as racism but is experienced as racism in particular circumstances [...]. It has a structure that is constructed with far more potential for ambivalence. [...] [L]iquid racism should not be seen as a weakened or challenged residue of racism but rather as an ambiguous form that is encouraged nowadays and one that weakens various defenses against claims of racism”.

In order to identify instances of liquid racism in ‘racist’ anti-racist texts, we draw on the broader framework of Critical Discourse Analysis. Given that one of the most important principles of CDA pertains to the relation between the macro-level (involving hegemonic discourses) and the micro-level (involving texts produced by individuals) (see van Dijk 2008), our focus is on:

- the multiple linguistic and multimodal strategies used by text producers at the micro-level to convey latent racist meanings despite their declared anti-racist stance; and
- the macro-level hegemonic racist discourses which are thus reproduced.

So, we employ an array of methodological tools used to investigate racist discourse and useful for tracing liquid racism, including but not limited to the following:

- The analytical tools of Reisigl & Wodak’s (2001) *discourse-historical approach* for media and institutional texts
- *Critical Metaphor Analysis* (Charteris-Black 2004) for news articles, TV shows, advertising campaigns, political texts, etc.
- van Leeuwen’s (2008) *model of representation and viewer network* for the analysis of multimedia texts such as advertising campaigns, advertisements, cartoons, newspaper images, etc.
- Bamberg’s (1997) *model of narrative positioning* for the analysis of (small) stories, news articles, etc.

# Translation, Interpreting and English as a Lingua Franca

---

## Panel

---

***Prof. Michaela Albl-Mikasa<sup>1</sup>, Prof. Juliane House<sup>2</sup>***

***1. ZHAW School of Applied Linguistics, 2. University of Hamburg***

The global spread of the use of English as a lingua franca (ELF) has obvious repercussions on the practices of translation and interpreting. ELF can be defined as the use of English by a multitude of speakers of different mother tongues. While international interactions in the 20<sup>th</sup> century were predominantly facilitated by means of translation and interpreting, the 21<sup>st</sup> century is marked by an overwhelming use of ELF in ever more such interactions. The main challenge is not that interpreters and translators will soon be made redundant, but rather that the number of source texts and source speeches produced in ELF is growing exponentially with the consequences to date largely unknown. While ELF use has been widely discussed in applied linguistics and pragmatics generally, its impact on translation and interpreting has not received the same attention. Nor has the effect of translating and interpreting processes on the nature of ELF use received much attention. In the proposed panel we will therefore investigate this bidirectional influence.

With respect to how the global spread of ELF impacts on the profession of translation and interpreting practice as a whole and on individual practitioners' attitudes towards and competence in ELF, we focus on research using document study, physiological and behavioral tasks as well as questionnaires and/or interviews with translators and interpreters operating in manifold professional contexts ranging from the EU as one of the biggest employers in the field, to international conferences, press agencies, academic publishing, and refugee and asylum seeking contexts. With respect to how translation and interpreting impacts on ELF we focus on the difficulties of finding pragmatic equivalents in the target language for unconventional meanings of phrases found in ELF discourse that can often be traced to functionally divergent uses in speakers' native languages. We are also interested in comprehension and production problems occasioned by the way pragmatic markers are (mis)translated into ELF from speaker's L1s. We also deal with many other aspects of how the intrinsically multilingual nature of ELF- more often than not due to direct translation from various L1s - creates hitherto unknown problems for the translator and interpreter.

Invited participants:

Michaela Albl-Mikasa (Winterthur), Juliane House (Hamburg, Athens) (co-convenors)

Daniel Kadar (Dalian, Budapest), Simo Mättä (Helsinki), Karin Reithofer (Wien), Maureen Ehrensberger-Dow (Winterthur)

# When Talk Becomes a Challenge. Disability and Social Inclusion

## Panel

***Prof. Melissa Moyer<sup>1</sup>, Dr. Ignasi Clemente<sup>2</sup>***

***1. Universitat Autònoma de Barcelona, 2. Hunter College, CUNY***

Talk is one of the key ways available to express meanings, exercise agency and negotiate identity, but with certain kinds of disabilities communication becomes an extra effort. Alternative modalities of communication are often developed which range from the embodiment through gestures or other physical body alignments, the use of augmentative technology or the recruitment of a caretaker or family member.

The contributions to the present panel take up the communication challenges faced by individuals with acquired traumatic brain injury, autism, and locked-in syndrome from various qualitative, theoretical, and methodological perspectives. The issues addressed by participants on this panel include (a) a critical analysis of the manner in which disability is investigated by abled researchers; (b) a detailed look at embodiment and the sorts of conversation managing strategies used to organize communication; (c) an exploration of the multimodal means to communicate meanings; and finally, (d) a critical examination of identities in disability and how agency can be taken up to resist, or contest self- and other imposed categorizations. These different perspectives serve as a discussion platform to gain a deeper understanding of the role communication plays to avoid social exclusion.

# Panel Contributions

# “And then you have this murdered woman” - L1 and L2 speakers’ linguistic and interactional resources in evaluative talk about art

Panel contribution

**Dr. Eveliina Tolvanen<sup>1</sup>, Ms. Sara Rönnqvist<sup>1</sup>**

***1. University of Helsinki***

In this cross-sectional study, we investigate how first language (L1) and second language (L2) speakers of Swedish deploy certain linguistic resources in talk-in-interaction in a similar setting, i.e. group discussions about visual art. As previous studies of L2 talk-in-interaction (see e.g. Pekarek Doehler & Pochon-Berger 2015, Eskildsen & Markee 2018) have shown, speakers who learn to interact in a second language orient to the language that they speak in terms of action in context. To further increase our understanding of L2 interactional competence, it is of great interest to compare L2 interaction with L1 interaction in a similar context. Our aim is to accomplish this by examining how L1 and L2 speakers interact with their co-participants in the same context-specific situation, by focusing on how the co-participants interactionally orient to language as action.

For this purpose, we draw on highly comparable data that consists of task-based, unmoderated conversations (9 conversations, 8 hours and 40 minutes in total), where groups of university students, who are L1 or L2 speakers of Swedish, discuss pictures representing pieces of visual art. In this data, the co-participants typically contribute to the discussion by producing descriptions, observations, interpretations, explanations, and evaluations of what they see, while also building on previous contributions. The co-participants also continuously draw on the material context of the situation, where the pictures of the pieces of art are central artefacts, available as resources for the co-participants to orient to by e.g. pointing.

To illustrate potential similarities and differences between L1 and L2 interaction, we investigate some linguistic resources that have a central role in the speakers’ contributions. These are certain stance markers (I+cognitive verb, with focus on *jag tänker* ‘I think’ and *jag tycker* ‘I find’), and additive discourse markers such as *å sen* (‘and then’). We will both account for the frequency and distribution of these markers in the L1 and L2 data and investigate how the L1 and L2 speakers employ them for their joint accomplishment of actions. By examining the markers in their sequential and interactional surroundings, we show how they are utilized in the speakers’ online production of the evaluative talk.

Our preliminary findings point to differences in the distribution of the markers, e.g. that some stance markers are not as common in the L2 data (particularly *jag tänker* ‘I think’), while the additive marker *å sen*, for example, is frequently employed by the L2 speakers, in comparison to other additives. Based on these findings, we seek to discuss similarities and differences between L1 and L2 interaction.

# “Be strong, be kind”: A portrait of a leader during times of crisis

Panel contribution

***Dr. Bernadette Vine<sup>1</sup>***

**1.** Victoria University of Wellington

Female political leaders from around the world have been widely praised for their efforts in managing the COVID-19 pandemic. Hassan and O’Grady (2020) note that women leaders “have attracted praise for effective messaging and decisive action”; Garikipati and Kambhampati (2020) comment on the “the decisive and clear communication styles adopted by several female leaders”, this contributing to “the systematically and significantly better COVID-outcomes” in the early stages of the pandemic in countries led by women.

One of these female political leaders is Jacinda Ardern, who during her first three years as Prime Minister of New Zealand has dealt with three major crises: the COVID-19 pandemic in 2020, as well as a terrorist attack and a volcanic eruption, both in 2019. Ardern was already Prime Minister before these crises occurred but her communication during these times has been commended as an example from which others can learn valuable lessons about communicating during times of crisis (e.g., Parungao 2020, Wilson 2020). Her approach to leadership throughout has emphasised “unity” and “kindness”, and has also undoubtedly contributed to her party winning the recent election (October 2020) with the largest majority for a Labour government in at least 50 years.

The current study examines the discursive features of Ardern’s “effective messaging” and “clear communication style”, with a particular focus on her speeches to the public during the Covid-19 pandemic in 2020. This includes analysis of her language during prepared speeches, as well as how she interacts with members of the media during the question time which typically follows these speeches. An Interactional Sociolinguistics approach is taken to analysing the discourse, with consideration of the effects of its wider socio-cultural context on the discourse. I will also draw on a range of publicly available background information sources to support my analysis.

# “Call it Wuhan Chinese bat shit flu from China”: place references, discrimination and liquid racism in Covid-19 representations on twitter.

Panel contribution

***Dr. Sofia Lampropoulou<sup>1</sup>, Dr. Paul Cooper<sup>1</sup>, Ms. Megan Griffiths<sup>2</sup>, Ms. Elizabeth Pye<sup>1</sup>***

*1. University of Liverpool, 2. University of Liverpool*

The aim of this paper is to explore how Covid-19 crisis is represented on Twitter through examining the indexicality and enregisterment of aggressive terms used to describe the virus and the discriminatory discourses that are promoted. Since its outbreak in January 2020, talk about Covid-19 has dominated the political, economic and social world. Digital media have been the main means of information and access to the news throughout lockdown periods and, thus, communication through digital media became even more prominent than before. This study follows the line of research that views media as a platform that integrates with and actively shapes peoples' socio-cultural practices (Androutsopoulos, 2014; Agha, 2011). We particularly focus on Twitter and the ways in which users make sense of the Covid-19 crisis by attributing blame and responsibility to China, the place where it originated. We analyse two sets of tweets collected using the RTweet package (R Core Team 2017). The first comprises 61,159 tweets from 3-12 May 2020, roughly coinciding with the peak in Covid cases in the UK. The second is 55,096 tweets from 20-28 August 2020, around the time Covid cases were peaking in the US. We investigate tweets which include terms such as ‘Coronavirus’ and ‘Covid’ in both the content of the tweets as well as in hashtags and observe that the terms ‘Coronavirus’ and ‘Covid’ were consistently the most frequent. We then focus on place references such as ‘Chinese virus’, ‘Wuhan flu’ and ‘Kung flu’ and go on to analyse them qualitatively in their local contexts of occurrence. ‘Chinese virus’ is similarly frequent and consistent relative to ‘Coronavirus’ and ‘Covid’, as it occurs in 16,996 tweets in May and then 15,146 in August. In principle, the ways these terms are used create indexical links with the place it originates. But further investigation of their uses suggests additional social values are indexed where terms are used to attribute blame and responsibility to China. These aggressive uses are closely related to a discourse of hygiene where Chinese food is represented as unclean and contaminated. Via the above strategies, China and Chinese are ‘othered’ as the perpetrators of the virus and, thus, blamed for its existence. Othering of those of Asian heritage is also achieved via and us vs. them divide. It follows that uses of place references such as ‘Chinese virus’ on Twitter become enregistered as discriminatory; this practice helps users make sense of the crisis by creating a safety net that places the threatening virus at distance i.e. a foreign land that mishandled the crisis. Enregisterment of such terms helps promote discourses of superiority of a Western culture and, thus, perpetuates a *liquid racism* (Weaver, 2016; Tsakona *et al.* 2020) often encouraged in media language.

# “Crash, boom, bang!” Responsive animations in English interaction

Panel contribution

***Dr. Marina Cantarutti***<sup>1</sup>

*1. The Open University*

In the development of everyday social activities, participants deploy different embodied resources to convey to one another what it is like to experience certain phenomena. Greater levels of granularity often mobilise greater forms of affiliation (Heritage, 2011), which is why often participants *animate* (understood here as voicing or depicting; see Goffman, 1981; Goodwin, 2007; Clark & Gerrig, 1990; Cantarutti, 2020) figures or behaviours in activities like complaint stories or troubles tellings, where validation and empathy are often made relevant as responses.

However, in these social activities sometimes A-participants do not animate, but rather, *describe or evaluate* a set of affairs involving a phenomenon of a sensory kind (visual, auditory, tactile, kinesthetic) making a response relevant. In responsive position, B can be the one initiating an animation by providing a selective embodied (re)enactment/voicing of one aspect of the descriptive/evaluative content of A. These Other-initiated animations involve an embodied version of a (sensory) phenomenon that has been described as experienced (in reality or hypothetically) by some other person, who is being voiced. In other words, B brings to the here-and-now a version of the verbal material, associated “sound effects”, and/or gestural activity of the behaviour described in A’s turn, as in this excerpt:

(RCEHOUSEMATESII, “Spat”; GAT-2 transcription conventions)

08 KER ↑I ‘SPAT; =

09 =all over my com’PUTer (with that) ↑‘YESterday; =

10 BEN =+pbr+ff ([pB:y::]) (0.5) ↑ wIth MILK- °uhh (0.8)

ben +lifts shoulders

+moves neck forward

+covers mouth

These animated responses are designed as multimodal gestalts (Mondada, 2014) of i) fully enactive lexical plus non-verbal material, ii) non-verbal enactments followed by non-animated recipient responses, or iii) non-lexical vocalisations (Goffman 1978, Keevalik & Ogden, 2020; Dingemanse, 2020) often with iconic gestures.

These forms of responsive animation show how speakers can turn to their own bodies to selectively represent -in consequentially implicative and often interactionally “risky” ways- bodily experiences that others have described (often as their own). They offer an insight into empathetic responses that allow co-participants not just to voice their own demonstration of understanding and epistemic access, but also to engage in complicit and often playful ways of speaking on behalf of each other for relational purposes.

A comparative analysis of cases from a collection of 40 responsive animations in English videorecorded data featuring these configurations will be presented, with a particular focus on the cases involving non-lexical vocalisations. The design of these practices will be described in terms of their prosodic and gestural parameters and the way in which these resources temporally interact with each other and are integrated in the syntax of turns (Keevalik, 2018). The study will discuss the actions that the situated deployment of the practice entails in the sequential positions in which it occurs.

The study adopts a multimodal perspective to the theoretical and methodological approaches of conversation analysis and interactional linguistics (Couper-Kuhlen & Selting, 2001), combined with an impressionistic plus instrumental study of phonetic detail (Local & Walker, 2005) and the annotation of gesture based on phases and gesture types (McNeill, 1992, Kendon, 2005).

# “Do you know the nature of an Oath?” - The credibility of child witnesses in the Old Bailey Corpus

Panel contribution

***Dr. Susan Blackwell<sup>1</sup>***

***1. Universiteit Utrecht***

Common-law legal systems have traditionally regarded children as unreliable witnesses, prone to fantasy and suggestibility. Accordingly, rules of evidence which apply to child witnesses often include features such as a competency test, corroboration of evidence and a caution from the judge to the jury. These features have only recently been discarded in the legal system of England and Wales.

This paper reports a systematic corpus-based study of the judicial treatment of child witnesses at the Old Bailey, London's central criminal court. The Old Bailey dealt with the most serious offences, known as felonies, which could incur the death sentence. Its proceedings were published from 1674 onwards, based on the short-hand notes of scribes. The earliest Proceedings were aimed at a popular rather than a legal audience, and not surprisingly focused on the most dramatic cases and the most salacious details thereof; nonetheless, other contemporaneous reports generally confirm their authenticity (Hitchcock & Shoemaker (2007)).

While the proceedings of the Old Bailey from 1674-1913 have been digitised and made available online ([www.oldbaileyonline.org](http://www.oldbaileyonline.org)), they are not ideal for linguistic analysis. Huber and his colleagues therefore created the Old Bailey Corpus (OBC) (Huber 2007:1), identifying and tagging the direct speech in the Proceedings and adding sociolinguistic mark-up based on sociobiographical speaker data such as age, sex and occupation. This study makes use of both the digitised Proceedings and the OBC, in order to identify as many child witnesses as possible from the earliest possible period and to examine the discourse of their interaction with other courtroom participants.

The records reveal numerous instances of quite young children giving evidence as defendants, victims and witnesses in serious cases, covering offences ranging from highway robbery to rape, where the possible penalties included death or deportation. However, young witnesses were not always permitted to testify. The judges seem to have gone to some lengths to establish the age of any child who appeared before them and to satisfy themselves that the witness understood “the nature of an oath”, which was typically confirmed in the religious language of the time. Although the reports cannot be taken as verbatim, the Old Bailey records suggest that those children who were allowed to testify were rightly regarded by the Court as credible witnesses, often able to stand their ground under rigorous or even aggressive cross-examination about traumatic events. The records also reveal a gradually evolving judicial stance towards the child witnesses who appeared in court over the period of time covered by the Proceedings.

# “It seems we have lost the compass that has been with us from the nation’s foundation until now”: Contextualizing the pandemic – a case study of Israel president’s speech and the public’s comments

Panel contribution

***Prof. Elda Weizman***<sup>1</sup>

1. Bar-Ilan University

In October 2020 Israel parliament, the Knesset, has reconvened to mark the opening of its winter session. Speeches were delivered by President Reuven Rivlin, PM Benjamin Netanyahu and opposition leader Yair Lapid. The ceremonial opening took place against the background of ongoing Covid-19 health threats, tight lockdown, economic crisis, political deadlock over the passing of a new state budget, and nationwide demonstrations against Netanyahu. This presentation will focus on President Rivlin ‘s speech and commenters’ responses to it. Specifically, it addresses the recontextualization of Rivlin’s speech by the commenters.

Despite its monologic format, the speech in question is dialogic, in as much as the “active responsiveness” (Bakhtin 1981) as well as expected follow-ups (Weizman & Fetzer 2015) shape the speaker’s discursive choices. It considers a multiplicity of audiences (Reisigl 2010), including politicians addressed explicitly (“honorable leaders of Israel”) as well as the broad public, addressed more implicitly. The speaker addresses the various aspects of the crisis, connects them explicitly and implicitly to the pandemic (“the corona pandemic made me think of the dead”, “we understand the need to fight the plague but find it hard to put up with the loss of personal freedom”) and contextualizes it as a major historical event. He self-positions as part of a collective identity (“as a people, we must return to our compass”), and constructs impartiality (“every evening policemen beat protesters, protesters throw stones at policemen”), but he then breaks the symmetry while making explicit demands on political leaders. He does so predominantly by shifting from the epideictic (e.g. allusions to a mourning ritual) to the deliberative (Aristotle), and through the accentuated use of non-hedged directives, terms of address and self and other reference, specifically the first person plural pronoun.

I argue that from a perlocutionary viewpoint, the appeal to the broad public is unsuccessful. Commenters on social media severely challenge (Weizman 2008) the president and refuse to align with the reconciling “we”. It will be shown that most of them re-contextualize the Covid-19 health crisis as resulting from Netanyahu’s political opportunism, and frame the speech as an unethical, if not immoral attempt at an unjustified neutralism. They do so through a rich array of meta-comments which refer to the speaker’s discursive patterns, mostly to the first person plural as a strategy of unjustly sharing responsibility, as well as through ironic comments which establish a gap between the speaker’s stance and their own.

# “I’ll discuss it with myself, I’m the only boy” – Using speech, body and artefacts to perform inclusion and exclusion in peer discussions.

Panel contribution

**Dr. Daniel Müller-Feldmeth<sup>1</sup>, Ms. Chantal Wanderon<sup>1</sup>, Ms. Tamara Koch<sup>1</sup>, Prof. Martin Luginbühl<sup>1</sup>**

*<sup>1</sup>. University of Basel*

During discussions among peers, the sequential unfolding of argumentative structure is often tightly intertwined with a simultaneous negotiation of identities (Hample/Irions 2015; Morek 2015). We present a case study of a peer discussion (collaborative reasoning) of four children (8yo), where children extensively mobilize verbal, nonverbal and paraverbal resources to include and exclude themselves and others. In this conversation, the continuous process of in- and exclusion and thus the relational level (Kyrtzis 2004) often comes to the fore compared to the level of the argumentation, and sometimes decides about the negotiation of acceptability of an argument.

The data is part of a larger corpus from the current project “Argumentative discourse skill levels of school children” (funded by the Swiss national science foundation), entailing 180 filmed and transcribed conversations, each among four children (grade 2, 4 or 6, aged between 7 and 14) from schools in German-speaking Switzerland (see Hauser/Luginbühl 2017). In this project as well as in our study, we deploy conversational analysis as a qualitative approach as well as quantitative methods and visualization tools to gain deeper insights into the sequential organization of talk and oral argumentation among children, and we will discuss how these approaches can mutually inform each other.

In the case study the children had to fulfill a schoolbook task and had to select three out of 12 objects to take on a desert island. The entire conversation is characterized by a dynamical process of inclusion and exclusion, both initialized by the only boy itself, but also by the other participants. The participants mobilize various linguistic and embodied resources: Children exploit physical surroundings, space and body in very explicit ways (leaving the table, hiding, closing the gap after the boy leaves), thus leaving, reentering and reconfiguring the interactional space (Kendon 2009; Goodwin 2007). More subtle practices include putting up the leg between oneself and the opponent, posture and gaze (Andersen/Gannon/Kalchik 2013), and thereby dynamically constitute temporary group identities. In addition, an artefact (the worksheet) is regularly used to signal retreat (taking the sheet with oneself) and reentering (placing the sheet on the table) (Schmitt/Deppermann 2007). Gaze serves as an important means of asking for ratification, and, used selectively, to initiate coalitions. Group identities are also constituted in interactional styles: While the girls mark suggestions as negotiable by using modalized forms (Heller 2018), the boy regularly states his contributions as (non-negotiable) facts, accompanied by an aggressive attitude, expressed on paraverbal and embodied levels, which in turn boosts practices of solidarization among the others (e.g., asking all but the boy for their opinion).

We qualitatively analyze the various levels of linguistic and embodied sequential practices of in- and exclusion. We show how multimodal practices are interdependent with verbal interaction and exemplify their substantial role in argumentation (Bose/Hannken-Illjes 2020). We also demonstrate how visualizations of the sequential structure of the conversation can substantially aid in tracking how the dynamics of in- and exclusion shape the unfolding structure of the co-constructed argumentative content.

# “Smooth” video-interpreting: paralinguistic, interactional and embodied features.

Panel contribution

***Prof. July De Wilde<sup>1</sup>***

**1. Ghent University**

This presentation reports on research conducted in the context of interpreters’ assessment during interactions between a public service provider and a migrant client in search of guidance for affordable housing in Flanders, the officially Dutch-speaking and in large parts autonomous northern region of the federal state of Belgium. The assessment is part of a research project which explores the efficiency of a short-term training programme for non-certified interpreters (Rillof et al. 2020). Based on discourse-analytical approaches to video-recorded interactions, the project’s aim is to determine whether, and under what circumstances, briefly trained interpreters can constitute a valid additional form of language mediation and thereby meet several of the challenges currently faced by the Flemish public service interpreting sector, i.e., supply/demand mismatch, a shortage of interpreters for the rarer languages and budget constraints.

In particular, this presentation will theoretically reflect on the concept of “smoothness”, a concept that is frequently used in the academic literature (Hale, 2007: 153; Pöchhacker 2004: 123) in the context of participants’ perceptions of the quality of interpreted interaction. On the basis of micro-analysis of authentic video-interpreted interactions, we aim to identify the variables involved in assessing a video-interpreted intervention as either *very, regularly or less smoothly performed*. We specifically focus on the interplay between **paralinguistic categories** (i.e. articulation problems, hesitations, word-level repetition, false starts, self-repairs, rendition speed), **interaction-related categories** (turn-taking problems such as overlapping speech, extended silences at lexical/syntactic clues for transition/relevance places) and **embodied categories** (gaze, eye contact, upper body movements, in particular face and shoulders and their interaction with note-taking, as inferred from posture). In our conclusions we present a tentative categorization and thereby aim to contribute to empirically grounded definitions of *smoothness* when discussing interaction management in interpreter-mediated remote communication by video link.

# “So dishonest, unreliable and untrustworthy .... would you be a troll?” A descriptive analysis of ordinary speakers’ criteria affecting the identification of trolling

Panel contribution

***Ms. Diane Liberatore<sup>1</sup>***

**1.** University of Neuchâtel

As noted by Plantin in 1996, by Doury (2003, 2008), but also by Boogaart, Jansen and van Leeuwen (2020), ordinary speakers have a good intuitive grasp of argumentation. Through accusatory speeches, they often identify and explain the argumentative criteria that are constitutive, as they believe, of certain forms of discourse. On Internet forums, the accusation of trolling seems to have the implicit aim of immediately closing the argument in order not to “pollute” the forum, or not to give too much credit to the troll’s speech (“Don’t feed the troll”). The notion of “troll” seems to be closely related to manipulation, hypocrisy, and therefore to “bad faith” (Hardaker, 2013), since trolls regularly use bad faith in their speeches. Bad faith allows the de-commitment (de Saussure & Oswald, 2008, 2009) from previously implicit content, and tends to reopen the debate by means of a meta-argumentative stage. Generally, when someone is accused of uttering something in bad faith, interlocutors try to seek an agreement on the real meaning of the ambiguous statement. However, when speakers identify bad faith in connection with trolling, their accusation of trolling encourages skipping the search for the real meaning of the statement and proceeding directly to a settlement (van Eemeren & al., 2014) of the dispute, without agreeing to argue further on the fake deep disagreement (Fogelin, 1985) intentionally generated by the troll.

What are the criteria that influence the choice of settling the exchange and that precipitate the decision to abandon agreement on the implicit meaning of a tendentious statement? Examining a corpus of accusations of trolling in an Internet forum held by “the sceptics of Quebec”, I compare ordinary speakers’ definitions and criteria of trolling and bad faith speeches in order to understand why the closure is precipitated in some cases.

# “You bring up a good point”: Teacher Formulations for Transforming Participation

Panel contribution

***Ms. Yeji Lee<sup>1</sup>***

**1.** University of Basel

A central concern in the field of language pedagogy, both in theory and practice, is the extent to which student participation can be maximized in the classroom. The concern arises from the widely held assumption that students' participation is a prerequisite to language learning and that learning itself can be described as a process of increasing participation in a community of practice (Lave & Wenger, 1991). Previous literature has generally measured and so defined students' participation in reference to the amount of talk that students produce, albeit with differences in the specific aspects of speech that are observed (e.g., number of words, communication strategies). While this undertaking highlights students' participation-as-speaker, it may overlook the other side of the coin: their participation-as-recipient.

In the classroom, students not only participate as speakers but, possibly more so, as recipients. Recipiency, however, does not automatically refer to the remaining state when students are not speaking. Instead, it needs to be worked out and established as a form of participation in its own right through the ongoing course of an activity (Goodwin & Goodwin, 2004). A case in point is when the larger class needs to be re-attended to as recipients after the teacher engages with a single student in a question-answer sequence. A decisive moment in this situation is when the teacher offers a comment in the third turn (Mehan, 1979). Characteristic of teacher's third turns is that they not only respond to the student's prior turn but also tend to a myriad of contingencies (Lee, 2007), one of which can be to project a teaching/learning moment for the entire student cohort.

The aim of the current study is to describe how the teacher's third turn comes to address the larger class, hence transforming recipiency from the single student. This is a practical problem for the teacher who has to engage with the entire student cohort without having to explicitly summon them or topicalize a change in participation, hence halting the ongoing progressivity of talk. Within the analytic principles of Ethnomethodology and Conversation Analysis, the study demonstrates the processes by which transformation in recipiency is achieved and how it renders a one-on-one question-answer activity into a one-to-multiple teaching moment. The data consists of video-recordings of online and face-to-face English Language Teaching (ELT) classrooms in Switzerland and South Korea, respectively.

Preliminary analyses highlight the role of the teacher's formulations in the third turn as a device that promotes a transition in recipiency. Such formulations not only demonstrate the teacher's understanding of the student's answer but also of the relevance of the student's answer for the larger class (e.g., “you bring up a good point”). These formulations are routinely accompanied by an array of multimodal resources: the teacher shifts their body posture while mobilizing materials that have a shared sense of belonging to the larger collectivity (e.g., whiteboard, presentation screen). Findings come together to point to how the progressivity of activities in the classroom is hinged on the timely transformation of students' participation.

# “You missed two zeros, oh my!”: Impoliteness and the Moral Order in Korean Online Interactions

Panel contribution

***Dr. Ariel Kim<sup>1</sup>***

***1. McMaster University***

This study investigates impoliteness and the moral order in Korean online interactions. While an increasing number of studies have examined the relationship between impoliteness and the moral order, research to date has not focused on the Korean language, despite that moral judgement of what is impolite or offensive is culturally bound. This work will contribute to a better understanding of impoliteness and moral order across different linguistics contexts. To satisfy the aims of the research, data comprised of the offensive comments posted on a Korean actor’s official Instagram page and the meta-comments concerning these offensive comments are examined. Preliminary analysis shows that the socio-material conditions of the online environment play a vital role in the ways in which the offensive language is used and evaluated in Korean online interactions. More specifically, perceived anonymity is a significant feature affecting the commenters’ communicative behaviours. The data indicates that anonymous computer-mediated environments provide commenters with a sense of (emboldened) freedom to speak their minds (i.e., both making offensive comments and evaluating these offensive comments) freely. This is an especially interesting feature of the communicative environment as knowing social status (i.e., age and rank) relative to others as well as the degree of closeness is of paramount importance to Korean speakers when determining how to behave verbally and nonverbally. Furthermore, alongside technological conditions, the relevant situational events and group and societal norms are closely linked in determining how offensive communicative behaviour is perceived and evaluated.

# #InclusioneSociale: Discourses of inclusion on Twitter from 2010 to 2020

Panel contribution

***Dr. Lorella Viola***<sup>1</sup>

**1.** Centre for Contemporary and Digital History (C2DH) - University of Luxembourg

What emerges from the few studies that have examined the linguistic and communicative strategies in online inclusive discourse (e.g., Brookes 2019; Lin, Yang, and Zhang 2018; Dickins et al. 2016; Ewart and Snowden 2012) is that a common, official definition of social inclusion adopted by both researchers and policy-makers is missing (Ewart and Snowden 2012). This, in turn, is believed to generate confusion about the social categories the concept of social inclusion refers to. In this study, I analyse the Italian public discourse of social inclusion on Twitter to explore how this reputed elusive concept is recognised by various actors. The Italian case is interesting because from the Italian policy makers' point of view, social inclusion is clearly understood and communicated as an issue concerned with employment and accessibility to the labour market whereas at the European Union level, social inclusion is associated with disability. Guided by a critical discourse approach, I use a combination of digital humanities methods such as bi-grams and topic modelling to analyse 16,878 Italian tweets that include the hashtags #*Inclusione* ('inclusion') and #*InclusioneSociale* ('social inclusion') from 2010 to the first half of 2020. The results show that if on the one hand there is an increase of awareness towards the topic of social inclusion - evidenced by the sharp rise in the number of relevant tweets over time (2 in 2010 vs 3,198 in 2019) - on the other, this type of discourse is on the whole predominantly associated with disability only. However, the analysis of the distribution of both the bi-grams and the topics over time evidences a clear division into two macro-themes, employment and disability, which in turn include numerous other topics. This mirrors the conceptualisations of social inclusion adopted by the two major institutions in Italy, i.e., the national government and the European Union but it also shows how this has over time created a convolution of sub-concepts in the way the public has internalised social inclusion. As discourses are formed through shared ideas, the analysis also shows that understanding how the meaning of social inclusion is shared also crucially reveals the emerging linguistic patterns which have over time generated and shaped this type of discourse.

# 'Eco-anxiety': From affect to action – a cultural pragmatics study

Panel contribution

***Dr. Helen Bromhead<sup>1</sup>***

*1. Griffith University*

Global heating is wreaking unparalleled damage on the earth and its people. The threat of further disaster from human-induced climate change looms. We know we are in danger; we know our behaviour poses danger. This awareness is mirrored in the language we use. In many languages, climate change-related words and expressions are being coined and popularised, including in the realm of feeling. In English, the word *anxiety* has proved productive in the formation of *eco-anxiety*, *environmental anxiety*, *climate anxiety* and *climate change anxiety*.

Once only spoken of in niche environmental psychology circles, *eco-anxiety* has entered the English-speaking public sphere, and was a contender for a number of dictionaries' 2019 'Word of the Year' (e.g., Macquarie Dictionary 2019; Oxford Languages 2019). This apparently new negative feeling, 'eco-anxiety', has been met with scripts for how to deal with it through actions.

For example, an Australian private health insurance newsletter counsels parents to manage their children's 'eco-anxiety' by activities like tree planting (*HCF Health Agenda* 2020). A 'slow living' podcast recommends taming 'eco-anxiety' via meditation and gradually reducing one's plastics consumption (*The Slow Home Podcast* 2017). There is also an English-language discourse script of an individual young person channelling their 'eco-anxiety' into collective climate action (e.g., ABC *Big Ideas* 2020) – the so-called 'Greta effect' after Swedish climate activist and Schoolstrike founder Greta Thunberg.

This study aims to unpack the meaning of the English *eco-anxiety* and elucidate its attendant scripts through semantically-enhanced discourse analysis (Author forthcoming), a method coming out of the Natural Semantic Metalanguage (NSM) approach to cultural semantics and pragmatics (Goddard and Wierzbicka 2014). The primary data is a purpose-built collection of English-language podcast episodes from different genres on the topic of 'eco-anxiety' recorded in Australia (e.g., ABC *Big Ideas* 2020; *Culture Club* 2020; *The Slow Home Podcast* 2017). The study is also informed by recent linguistic work on climate change-related language (e.g., Fløttum 2017; Penz 2018).

# ‘getting personal with you’: Affective frames in confessional monologues of YouTube lifestyle and beauty influencers

Panel contribution

***Dr. Tereza Spilioti<sup>1</sup>, Ms. Olivia Droz-dit-Busset<sup>2</sup>***

*1. Cardiff University, 2. University of Bern*

Submission to panel: **Influencers & ‘fans’: The pragmatics of affect & hate in the construction of social media celebrities**

Since the Middle Ages, confession has been made one of the ‘most highly valued techniques for producing truth’ (Foucault 1978: 58-59). The production of truth through sharing emotions and intimate details about one’s life with priests, doctors, or counselors has been thought to improve physical and mental well-being, enabling people to communicate with their inner and authentic self and, thus, achieve moral worthiness. While such acts of self-disclosure had been normally associated with one-to-one interaction in non-public spaces, ‘new’ media formats and, particularly, reality TV capitalised on the public broadcast of confessional monologues in seemingly private spaces: for example, viewers could witness the key players reflecting on their actions and feelings, while being isolated from other participants in the Big Brother diary room.

This paper aims to investigate how confessional monologues are being remediated in social media where the boundaries between public and private are also becoming increasingly blurred. Our research focuses specifically on the role that confessional videos play in the construction of authenticities among lifestyle and beauty influencers. While it is not easy to define the “beauty community”, as content creators dabble in several YouTube genres, lifestyle and beauty SMIs are arguably characterised by an orientation to: communication that centres on peer-to-peer recommendation (Kelly-Holmes 2016) and reviews of cosmetic products; sharing of application techniques of those products (especially makeup techniques); an affinity for colloquial speech styles (Tolson, 2010); and an avoidance of negativity or controversial topics such as politics and religion. This consumption-focused content is interwoven with more personal “life updates” which give the influencer the opportunity to seem more relatable and closer to their audiences.

Our study examines a series of confessional monologues, i.e. ‘single speech situations in which a person revisits his/her moral worthiness vis-a-vis his/her actions, thoughts, emotions and relationships with others’ (Lorenzo-Dus 2009: 88). While previous research has paid attention to micro-linguistic markers of authenticity (e.g. intensifiers, superlatives, slang) in such situations on reality TV formats, our analysis adopts a multimodal approach to the confessional videos shared by the lifestyle and beauty influencers. By focusing on the intros of the videos, we investigate the interplay of verbal and visual resources in the construction of particular affective and story frames (Giaxoglou & Spilioti 2020). We pay attention to the use of pronouns and the ways in which they interact with gaze, camera angle and filming location in establishing particular participation formats and positions that the YouTubers take in storying the “self” in interaction with their fans. Our analysis also explores how the media and social affordances of YouTube interaction between influencers and fans shape agency and control in such performances of the self that vary from other confessional formats in the media, such as reality TV. We conclude by discussing the implications that this production of discourses of truth and affect has for processes of self-commodification and the wider political economies of social media.

# ‘Wenn ich ehrlich bin’ (‘if I am honest/ to be honest’): Uses of projective and retrospective conditional honestly-constructions in German palliative care consultations

Panel contribution

***Prof. Susanne Günthner***<sup>1</sup>

1. University of Muenster

Based on concepts of Interactional Linguistics, this presentation will focus on ‘wenn ich ehrlich bin’ (‘if I am honest’)-constructions used in German palliative care interactions. It aims at contributing to our understanding of how grammar is used and may have evolved in response to local interactional needs within social interaction.

As various analyses have convincingly shown, temporality (i.e. the unfolding of spoken language in the process of interaction) is an essential feature of every social action (Hopper 1987, Auer 2000; Deppermann/Günthner 2015). Instead of studying syntactical construction from an atemporal ‘bird’s eye view’ (Hopper), this presentation analyzes ‘Wenn ich ehrlich bin’ (‘if I am honest’)-constructions as communicative practices in ongoing interactions.

On the basis of palliative care consultations, I will illustrate how doctors make use of *if*-clauses referring to speakers’ truthfulness as a usage-based, dialogically oriented and sedimented resource for stance-taking and positioning in highly sensitive institutional contexts. In particular, I will investigate the way these routinized ‘honestly’-*if*-clauses are ‘patched together’ with following and preceding clauses – in response to local interactional contingencies: Why should doctors feel the need to assure their patients that the following or preceding statement is to be treated as ‘honest’?

As the data show, physicians deploy these subordinate clauses as positionally sensitive units: (i) They mobilize ‘wenn ich ehrlich bin’-clauses as projecting constructions (Günthner/Hopper 2010; Günthner 2011) to frame the following talk. (ii) In addition, they also use them as syntactically post-positioned ‘clausal glue-ons’ (Couper-Kuhlen/Ono 2007) to retrospectively convey a particular stance towards their preceding statement.

In addition, ‘honestly’-*if* clauses can be realized (i) with reference to the speaker’s subjective position “ich” (*I*) (‘wenn ich ehrlich bin’; ‘if I am honest’) as well as (ii) with reference to a depersonalized subject using the indefinite pronoun “man” (*one*) (‘wenn man ehrlich ist; if one is honest’).

Due to their potential in projecting and contextualizing ‘what to expect’, as well as their potential in retrospectively calibrating preceding actions, ‘honesty’-*wenn*-constructions form a syntactic pattern mobilized for the management of warranting temporality, alignment and sensitive disclosures in social interaction.

# 'You don't wanna take such a risk': A scenario-based focus group study on attitudes toward returning or migrating in the aftermath of radionuclide decontamination

Panel contribution

**Dr. Joel Rasmussen<sup>1</sup>**

**1.** Örebro University

The present analysis of focus group discussions follows up on a survey study that showed clear demographic differences regarding the public's attitudes to various measures after a possible nuclear accident with radioactive fallout in residential areas. Against the background of these attitudinal differences found along demographics, this focus group study recruited respondents who would likely differ in their chosen approach to risks and measures, but with the aim of studying how they choose to articulate attitudes in the discussions. What they all were asked to relate to was a scenario where radioactive fallout has prompted evacuation and decontamination, and later the possibility of continuing to live in their home but with certain rules of conduct because all the surrounding areas are not decontaminated and safe - a very likely outcome in the case of a radionuclide accident. Using concepts from appraisal analysis, the conversations from 12 focus groups were studied. With the exception of some elderly men, who articulate lower risk and greater acceptance of and attachment to the decontaminated home area, the results show that the respondents create a negative alignment with the scenario of living in a decontaminated neighborhood, and thus present more positive attitudes to moving permanently. The respondents acknowledge that the authorities make an effort in such a situation, but then raise critical questions, thus often using so-called concession/counter pairs to endorse balanced opinions. Overall, the objections, consisting of evaluative categorization and adjectives and modal choices in the upper scale of intensification, signal discomfort and worry on a number of themes including (1) the severity and magnitude of the risk across time and space, (2) the uncertainty of knowledge, (3) restrictions on the use of environments, and (4) children's vulnerability and proneness to testing boundaries (including spatial restrictions, see point 3). These results demonstrate that the predominant, international government measures presented as *restoration* (with evacuation, decontamination, and the supposed return to normal life) are articulated and evaluated very differently and critically by most focus group participants. Thus, the study lastly discusses how risk governance in the area of radionuclide risk could be developed in order to incorporate, instead of counteracting, citizens' understanding of risk and safety.

# (Hetero)Normative Orientations in Discourses of Obsessive-Compulsive Disorder: an Ethnographic Informed Corpus-Assisted Discourse Analysis

Panel contribution

***Mr. Elvis Coimbra Gomes<sup>1</sup>***

*1. Queen Mary University of London*

People suffering from obsessive-Compulsive Disorder (OCD) experience repeating unwanted thoughts that pathologically generate unsettling doubts. The content of intrusive thoughts can range over a variety of topics infused with social meaning: e.g., fears of germs, of committing blasphemy, of harming oneself/others, of not being truly in love with one's partner, or of morphing into a different kind of sexual or gender identity. Some psychological quantitative studies looked at sociocultural factors influencing the manifestation of OCD by correlating OCD sub-types with specific cultural aspects of certain countries. For instance, the prevalence of harming obsessions among Brazilian OCD sufferers was connected to the high rise of criminality in the country; or the prevalence of cleanliness obsessions in Arabic cultures was correlated with the Islamic cleaning rituals. However, these studies presuppose the connection of sociocultural factors with OCD sub-types without knowing if the connection is relevant for sufferers. To my knowledge, no study has explored how sufferers negotiate these cultural notions. Instead of imposing cultural assumptions onto OCD manifestations, I propose to look at sufferers' discourse and examine how sociocultural factors interact with the OCD at a practice level. More specifically, I suggest that a look at how sufferers discursively orient to specific normativities reflects sociocultural factors.

To illustrate this, I focused on sexual and gender identity related OCD. An online forum was built to collect interactional and ethnographic data over the span of a year, forming a specialized corpus of roughly 268,200 words by 49 heterosexual participants and 74,700 words by 21 LGBTQA+ participants. Due to the amount of data, I triangulated ethnography with corpus-assisted discourse analysis to trace normative orientations present in the "discourse prosody" of specific collocations. The assumption being that patterns in lexical associations reveal certain ideological assumptions, or "Discourses" in the Foucauldian sense (as social practices that constitute shared ways of being, doing and thinking). Based on ethnographic insights, the five most dispersed words related to the discursive topics of OCD symptoms, therapy, sexuality and gendered actors were selected and subject to the collocation analysis. I specifically looked at the top 30 collocates of each word, which provided windows into normative orientations that were identified through a qualitative look of multiple concordance lines.

The analysis revealed that participants try to protect their identity at all costs, by orienting towards (or distancing from) ideologies that (dis)confirm their identity. As such, they oriented towards institutionalized Discourses of cognitive-behavior therapy to the detriment of psychoanalytic (or gay-affirmative) therapy; and oriented towards extreme and strict forms of heteronormativity to various degrees (e.g., straight men can only act masculine, only sexually desire women and must avoid homosocial relations with other men; or vice versa for gay men who additionally embrace homophobic slurs from strangers because the latter confirm their gayness).

# (Im)politeness Metalanguage and Speech Acts in Shakespeare's Plays

Panel contribution

***Mr. Samuel Oliver<sup>1</sup>***

**1.** Lancaster University

Since the 1990's, there have been arguments in (im)politeness research for more attention on 'first-order' (im)politeness. That is, understandings of (im)politeness that come from speakers themselves, as opposed to an analyst's interpretation of what is (im)polite (Eelen, 2001; Watts et al., 1992). Without understanding how users of language understand, negotiate, and evoke issues of (im)politeness, how can we hope to understand it, or how it affects language use? Some research has addressed this by looking at (im)politeness metalanguage: terms such as 'polite', 'impolite', 'rude', and so on (Culpeper, 2011; Jucker et al., 2012). However, considering the great volume of research on (im)politeness, only around 6% of it has actually looked at (im)politeness metalanguage (Jucker & Staley, 2017: 422). Additionally, while some of this work looks at uses of (im)politeness metalanguage in, for example, cross-cultural settings, there remains very little research on historical data. Finally, though there has been a variety of research that looks at (im)politeness through the angle of different speech acts, e.g. thanks, compliments, requests, etc., there is a lack of research which links up the focus on (im)politeness metalanguage with regards to different speech acts.

This paper addresses these three deficiencies by comprehensively looking at (im)politeness metalanguage in a corpus of Shakespeare's plays, and addressing how this language links to different speech acts. In which speech acts are (im)politeness metalanguage labels used? To which speech acts do they respond? Which are they followed with? Through use of the new Enhanced Shakespeare Corpus produced via the *Encyclopedia of Shakespeare's LanguageProject* at Lancaster University, this paper will be able to offer answers to these questions that are comprehensive, driven by statistical information, and can reveal links to gender and social status as well. Metalanguage labels were identified using the Historical Thesaurus, and then manual elimination of those not used in (im)politeness senses. Based on use and meaning, these terms are then divided into five fuzzy semantic groups: GENEROSITY-INJURY, GENTLENESS-ROUGHNESS, KINDNESS-UNKINDNESS, GOOD NATURED-BAD NATURED, and CIVIL-INCIVIL. I will look at how the (im)politeness metalanguage in Shakespeare's plays, and the five semantic groups, correlate to speech acts. For instance, scenes where there are many insults also appear to contain many (im)politeness metalanguage labels.

# (Re)interpreting testimony: The place of language competence in the construction of witness (in)credibility

Panel contribution

***Dr. Jenelle Thomas<sup>1</sup>***

***1. University of Oxford***

This paper investigates how language competence is constructed as a proxy for truthfulness within the historical trial. There is a long tradition of foreign-language speakers taking part in trials through interpreters, but this is not uncontroversial; interpretation has been shown to affect lawyer questioning, juror perception, and the form and content of testimony (Berk-Seligson 2012). In this paper, I discuss a case where the reliability of defendants and witnesses was explicitly connected to their mastery of the language of the courtroom.

In 1791, a group of enslaved people suspected of conspiracy were interrogated in Pointe Coupée, Louisiana. Although the interrogation was likely conducted in (Creole) French, the transcript is in the administrative language, Spanish. The case was sent to trial in New Orleans in 1792, where it became clear that there had been procedural irregularities in the initial interrogation, including the interpretation and transcription. The Commander of Pointe Coupée had assumed the triple role of interrogator, interpreter, and scribe, “[putting] down whatever he pleased” (Hall 1992: 328) while falsely documenting the presence of official witnesses and interpreters. The content and veracity of the testimony was called into question by this improper practice, in particular the flouting of Spanish interpretation norms for defendants who had varying levels of fluency in French and Spanish.

In New Orleans, the defendants and those listed as witnesses and interpreters in the initial interrogation were subjected to a test of their French (1), then questioned about the veracity of their earlier testimony.

(1) explicandose en el frances criollo para verificar si el dho Fran.co las entiende y contesta se reconocio que entendia y contestaba regularmente

*speaking in creole French to verify if the aforementioned Francisco understands and answers [the questions] it was recognized that he understood and answered normally*

In this way, the reliability of the testimony and the defendants and witnesses themselves, is tied to language competence. I show firstly that this association is constructed through the meta-discourse around language competence in the transcript, specifically the adverbs of speech, such as (*muy*) *regularmente* ‘(quite) normally’ or *perfectamente* ‘perfectly’ (used with both positive and negative polarity). Secondly, I argue that this discourse around comprehension and production is co-constructed and co-opted by both witnesses and accusers to question the credibility of previous testimony and claim innocence or guilt. This has consequences both for the trial verdict and our understanding of historical events as we question the effect being able to speak in one’s own defense has on interpretations of credibility and guilt. While most trials do not explicitly interrogate language competence, I argue that this association between linguistic ability and truthfulness is embedded in both historical and contemporary trials.

# 1st person in Catalan parliamentary debate (1932-38 and 1980-2020): Its main pragmatic uses and evolution

Panel contribution

***Dr. Neus Nogué<sup>1</sup>***

*1. University of Barcelona*

The aim of this contribution is to present a research on the main pragmatic functions of the 1st person and other strategies to refer to the addresser (the *principal* in Goffman (1981)'s terms) in Catalan parliamentary debate. More specifically, a corpus of debates that took place in the Parliament of Catalonia in the period 1932-38 (during the Second Spanish Republic) and in the present day, since the recovery of the Catalan democratic institutions in 1980, is analysed. The seminal work on deixis by Levinson (1983), together with the studies on participation frameworks by Goffman (1981) and on person by Siewierska (2004), and the research on these subjects with regard to Catalan (Cuenca 2004 and 2014; Nogué 2005, 2011 and 2015, and others) constitute the basis of the study's theoretical framework. Other contributions by Mühlhäuser and Harré, Agha, De Cock, and Beeching, Ghezzi and Molinelli, among others, are also taken into account.

Data from a corpus including the transcription of a number of debates drawn from the *Diari de Sessions* of the Parliament of Catalonia (1932-38, 1980, 1993, 2005, 2013 and 2020) are classified and analysed. The whole corpus contains more than 550,000 words.

The analysis combines both qualitative and quantitative methods and focuses on the following aspects: 1. the distribution of the 1<sup>st</sup> person singular and the 1<sup>st</sup> person plural; 2. the distribution of inclusive and exclusive 1<sup>st</sup> person plural; 3. the pragmatic function of non-prototypical uses of the 1<sup>st</sup> person plural; and 4. the use of demonstratives for self-reference. All aspects are dealt with from both a synchronic and a diachronic point of view; when an evolution is identified, special attention is paid to its possible causes.

The results of the research, still in progress, suggest that members of Parliament increasingly prefer to include themselves in a group rather than to speak only on their own behalf; that some uses of the 1<sup>st</sup> person plural are due to ideological features of a particular political party; and that the use of demonstratives for self-reference in parliamentary debate conveys mainly an idea of distance, is less frequent today than in the past, and may also be related to idiolectal preferences.

# 20th century diachrony of Catalan discourse markers: The case of some contrastive connectives.

Panel contribution

***Prof. Maria Josep Cuenca***<sup>1</sup>

**1. Universitat de València**

Contrastive discourse markers are a very rich group of markers which includes several forms, either conjunctions or parenthetical connectives, expressing different nuances of contrast. Departing from the general description of contrastive DMs in Catalan included in Cuenca (2006) and in Cuenca, Postolea & Visconti (2019) and following the general approach proposed in Pons (2014), this presentation aims at analyzing the 20<sup>th</sup> century diachrony of some of the contrastive parenthetical connectives that have experienced significant changes during this period, either because they have changed their meaning and expand their use, such as *tanmateix* ‘however’, or have decreased in use, such as *nogensmenys* ‘nonetheless’.

As grammaticalized units, DMs experience semantic change (see, e.g., Heine 2013). In the case of Catalan, a recently standardized language (the process starting during the first third of the 20<sup>th</sup> century and consolidating by the last third of the century), changes related to the standardization process and the influence of Spanish, the dominant language in the country and during decades almost exclusively used in writing, are key elements to be considered. Thus the description and prescription included in reference grammars and normative documents have special importance in order to analyze the data.

The analysis is based on the Catalan language reference corpus, *Corpus Textual Informatitzat de la Llengua Catalana* (CTILC), including literary and non-literary texts from the 19th century but mainly constituted by texts of the 20th century (ca. 57 million words in this period) and will follow the recent diachronic history of contrastive connectives that have experienced changes. For instance, *nogensmenys* has a significant amount of occurrences between 1964 and 1983 but shows a decrease ever since and especially since 1999. On the contrary, *tanmateix* increases its use, especially since 1989. Attention will be devoted to their use in translated texts, since translation is often important in the extension of a marker, especially in bilingual contexts.

The basic research question is to what extent linguistic (both paradigmatic and syntagmatic) and socio-cultural factors have an influence on linguistic change in the field of connectives.

The analysis shows different diachronic histories, that can be compared to those identified in formation of connectives in Old Catalan (e.g. Cuenca 1992-93, Martínez 2018, 2019), and highlights to the influence of standardization processes and bilingual context on the evolution of connectives.

# A Case-Study of Covert Aggression in Film: Multimodal Construal and Reception of Pragmatic Meaning Across Cultures

Panel contribution

***Dr. Louisa Desilla***<sup>1</sup>

*1. Aristotle University of Thessaloniki, School of English*

Hollywood characters are often described in film studies as “symptomatic”, namely “they are symptoms of some broader type of human predicament or behaviour pattern which they represent” (Phillips, 2000: 62). Although such a view may reduce these characters to “stock types” allegedly lacking the intricacies and depth found in literature or art-house cinema (*ibid*), it can be particularly useful when embarking on the analysis of the way a character behaves and the emotions s/he experiences in a single, isolated scene. Based on this “symptomatic” premise, the present paper establishes Scene 12 of *Ocean’s 11* (Soderbergh, 2001) as a textbook example of covertly aggressive discourse, where Frank Catton assumes the role of the sly manipulator with Billy Tim Denham being the ignorant target who goes through both physical and emotional distress. In particular, the way in which covert aggression is construed through implicit verbal attacks and non-verbal cinematic signifiers (e.g., kinesics, gaze, timbre etc.) will be demonstrated drawing on insights from psychology, multimodality and pragmatics (Brown and Levinson, 1978/1987; Culpeper, 1996/2011). Indeed, Frank uses a carefully prepared concoction of both politeness and impoliteness strategies to confuse Billy Tim, thus ultimately breaking his resistance. Importantly, the exchange between the two perfectly illustrates the way language is interlinked with important aspects of characterisation, such as race, gender and power; as Strong (2013: 75) explains, “the [white] car dealer, Billy Tim, is coded by name and Southern accent as a type likely to be rendered ill-at-ease by closeness and conversational intimacy with a black man, especially when coupled with the suggestion of physical force”. Furthermore, the paper will report on the findings of a case-study designed to test the comprehension of (im)politeness, as well as its impact on characterisation, by a sample of Greek viewers, and gauge their preferences regarding the subtitling of this scene. Interestingly enough, the participants accessed implicatures which, albeit sometimes unintended by the filmmakers, pertain to certain racial and gender stereotypes and bring into sharp relief the prevalence of the latter as well as the subjectivity of audience response (cf. Desilla, 2014).

# A contrastive analysis of the speech act of political condemnation in Chinese and American political language use

Panel contribution

***Ms. Wenrui Shi<sup>1</sup>, Prof. Fengguang Liu<sup>2</sup>, Prof. Juliane House<sup>3</sup>***

***1. DaLian, 2. Dalian University of Foreign Languages, 3. Universität Hamburg***

Political condemnations involve a moral, critical gesture by one political actor towards another (Kampf & Katriel, 2017). It refers to a set of behavioral and attitudinal dispositions that have their source in certain right-obligation domain. These discursive rituals center on a particular pivotal speech act, which is essential to identifying what the discourse “opines” (House & Kadar, forthcoming). Normally, it has the aim to persuade the condemned party to make changes by explaining reasons of his/her wrongdoing, even by making a request or giving a suggestion. Previous studies of the speech act of condemnation have overwhelmingly focused on the linguistic realizations, categorizations, and strategies of condemnation in daily language use, while the linguistic practices in the realm of political discourses, as well as the different linguistic features in different lingua-clutures are relatively yet understudied. The present research deploys a quantitative contrast of ritual frame indicating expressions (RFIE) and pragmatic upgraders of Chinese and American speech acts of political condemnation based on the self-constructed corpora by collecting the authentic data. Moreover, the research expounds the pragmatic causes behind the phenomenon by applying a qualitative analysis.

# A convergence of language between child and mother: Semantic analysis based on Formal Concept Analysis

Panel contribution

***Mr. Takuto Nakayama<sup>1</sup>***

*1. Keio University*

This paper has two purposes: (i) to show a mother and her child have a common tendency in their semantic uses of a certain word, and (ii) to illustrate such a tendency is peculiar to themselves. This study examines the utterances of mothers and their children by the UCRE Semantic Analysis System through Formal Concept Analysis.

The UCREL Semantic Analysis System (USAS) is a system by Lancaster University that automatically labels semantic tags on each word of a text. It categorizes words into 21 major discourse fields and their subfields. Formal Concept Analysis (FCA) is a mathematical method originally based on Applied Mathematics that examines characteristics of the set of research targets by the encompassment of their attributes. The founder of this method, Rudolf Wille, describes that “the aim and meaning of Formal Concept Analysis as mathematical theory of concepts and concept hierarchies is to support the rational communication of humans by mathematically developing appropriate conceptual structures which can be logically activated” (Wille, 2005: 2).

The pilot study focuses on the word “play” because it is expected that both children and mothers use and it is used frequently. It is going to be updated into a more detailed study with an examination of other words and descriptions of a Hasse diagram by more utterances. From the CHILDES corpus, sentences that include “play” are extracted from the conversations by three pairs. Children are Adam, Sarah and Laura (Brown, 1973; Braunwald, 1997), whose age was from 2 to 4. Each word in the sentences is semantically tagged with the USAS. For this, it can be surveyed about what kind of meanings collocates with “play”. From the set of sentences, 30 examples (10 examples from each age) are randomly extracted from each child’s utterances and their mother’s. Using Concept Explorer, a tool that can implement FCA, the sentences are described in a Hasse diagram.

As a result of the pilot study, the Hasse diagrams of all three children have similar forms to those of their mothers. On the other hand, the distribution of attributes in each diagram is not identical. The result indicated that each speaker has unique ways of semantic use of the word, “play”. However, between speakers who frequently speak to each other, they have a similar distribution of the usage. As another result, each parent has a different form from each other. This implies the presumption that between speakers without frequent interactions, they tend to have a distinct distribution.

# A corpus approach to examine the functions of pragmatic maker “you know” in spoken discourse

Panel contribution

***Dr. Amos Yung<sup>1</sup>***

***1. The Hong Kong Polytechnic University***

The pragmatic marker “you know” is widely used in English spoken discourse even though it is not taught in formal language classes. Both NES and NNES learned the usage of “you know” in daily social interaction. This paper examines the pragmatic marker “you know” in the *Hong Kong Corpus of Spoken English*(HKCSE) (Cheng, Greaves & Warren, 2005, 2008) to identify the functions and usage of “you know” in the four spoken discourses, which are academic discourse, business discourse, public speeches and daily conversations by the native and non-native English speakers.

This study compiled the functions identified by previous researchers (Müller, 2005; Huang, 2011) and examined the vagueness of information that co-occurs with “you know” in HKCSE. The researcher found 3,337 instances of the pragmatic marker “you know” in HKCSE (314 instances in academic sub-corpus, 1,484 instances in conversation sub-corpus, 1,215 instances in business sub-corpus and 324 instances in public sub-corpus.)

The vagueness of the information co-occurred indicates that the pragmatic marker “you know” is mostly used as a signal to request the hearer to interpret the intended meanings embedded with the information given by the speaker. The pragmatic marker “you know” is not needed when the information does not require interpretation by the hearer. The usage of the pragmatic marker “you know” was independent of the gender or the nativeness of the speakers, but its usage depends on the context in the spoken discourse.

# A corpus-based analysis of exclusionary discourses in ‘masculine’ team sports as reported in the Australian media

Panel contribution

***Ms. Melissa Kemble<sup>1</sup>***

***1. The University of Sydney***

This research explores issues of exclusion/inclusion related to gender bias and sexism in the professional sporting domain as reflected in the Australian media. Existing research into media coverage of sports has revealed enduring discourses that promote hegemonic masculinity, thereby constructing the sporting spaces as ideally and preferably male. However, many of these studies fail to address how the discussion of gender and sport intersects with other issues relating to inclusivity, such as sexuality, race, and ethnicity which thereby construct the sporting domain as not only masculine, but also as heterosexual and White (Bruce 2016).

In Australia, media coverage has provided evidence that exclusionary discourses still prevail in the domain of team sports, with reporting on: derogatory and sexist comments towards female athletes and sports, such as those made in response to an in-game action photo of AFLW newcomer Tayla Harris; continued allegations of sexual abuse and violence by men’s rugby league players; and racism towards men’s ‘Aussie Rules’ (AFL) Indigenous athletes including targeted public abuse towards renowned player Adam Goodes. This research aims to investigate how far media coverage serves to counter instances of exclusion in sport and/or to perpetuate traditional forms of hegemonic power.

This study, therefore, takes a pragmatic approach to investigate salient linguistic patterns that provide insight into how different forms of exclusion/inclusion in team sports are constructed and negotiated within the Australian print media. It focuses on the language used to report on professional men’s and women’s Australian Rules Football (AFL) and National Rugby League (NRL). Data was collected from the five most widely read newspapers across Australia for the period December 2017–2019 and compiled into the ‘OzFooty’ corpus, with sub-corpora for each sporting league. Corpus-based discourse analysis is used to identify salient lexical patterns related to the construction of in-groups and out-groups with respect to gender, which are then further explored in the individual texts, bringing in ‘micro-level’ analysis of how such pragmatic processes work in these texts. Specifically, I will explore discourses around gender discrimination, heteronormativity, and binary constructs of femininity/masculinity, and how they contribute to an inclusive or exclusive sporting space in the media. I also consider, where evident in the data, how racism and cultural stereotyping may intersect with issues of gender and/or sexuality. These identified discourses are then discussed in relation to existing issues of exclusion/inclusion in Australian team sport.

# A corpus-based contrastive study of topic-introducing discourse markers: English speaking of X and Chinese huashuo

## Panel contribution

*Ms. Yinchun Bai* <sup>1</sup>

## **1. University of Freiburg, University of Antwerp**

Discourse markers are known to be context-dependent and polyfunctional on a language-specific basis. Even between cognates, it is rare to find cross-linguistic correspondence that matches both on the semantic level and the functional level (e.g. Aijmer & Simon-Vandenbergen 2006; Simon-Vandenbergen & Willems 2011; Auer & Maschler 2016), let alone between expressions from linguistically more distant languages. In an attempt to explore the different facets of cross-linguistic comparison and generalization of discourse markers, this paper compares the English discourse marker *speaking of X* with the Chinese discourse marker *huashuo*. These expressions share the semantic root of “speak” and function typically as topic-introducing devices that attend to discourse coherence and interlocutor relations, as exemplified in (1) and (2).

(1) WILLIE GEIST: *What did you think you're doing?*

ELLIE KEMPER: *It was an acting exercise? I don't know.*

AL ROKER: Speaking of acting exercises, is this true that you took an improv class and your teacher was Jon Hamm?

(2015, SPOK, NBC)

(2) W: 这回我在市里, 〇〇〇〇〇〇〇

'I'm in town this time. If (you) have any problem, call me.'

话说你得买个德国手机卡口

‘Speaking of which, you need to buy a German SIM card.’

(Chat History between K and W 2013-08-11.txt, 2013, Chat)

By examining these semantically and functionally comparable discourse markers from linguistically heterogeneous languages, this study thus enriches the cross-linguistic investigations of discourse markers and helps to develop a better understanding of cross-linguistic generalizations at large. This contrastive study is corpus-based. The analysis of *speaking of X* is based on the spoken data extracted from COCA from 1990 to 2015, which contain 127 million words of transcripts of conversations from more than 150 different TV and radio programs. The analysis of *huashuo* is based on a self-compiled small-sized corpus of computer-mediated conversations – the Chat corpus, which consists of 3 million words of chats via instant messaging applications such as MSN, WeChat and WhatsApp from 2004 to 2019. The findings not only provide a detailed account of the discourse meaning and usage of each of the expressions, but also reveal their commonalities and differences in respect of the formal-semantic properties, pragmatic functions, usage patterns, and frequency distributions, which concern different planes of the discourse (e.g. textual, interpersonal, etc.) and different functional domains (e.g. coherence, politeness, etc.).

**Key words:** discourse marker, Chinese, topic introduction, corpus-based, contrastive

# A corpus-based study of a selection of stance markers in spoken EFL learner language

Panel contribution

***Prof. Erik Castello<sup>1</sup>***

**1.** University of Padua

Stance markers express the speaker's stance or attitude towards a proposition or a particular speech function. Such markers are not closely tied to the grammar of mood and can optionally occur in initial, medial or final position in the clause (Halliday 2004; Carter/McCarthy 2006). Recent research on their acquisition by L2 learners has shown that not only does their use depend on L2 proficiency, but also on task type and individual speaker style (Gablasova et al. 2015), and that teaching and learning how to use them appropriately can be challenging (Jones 2016). Perez-Paredes/Bueno (2019) explored the use of the certainty markers *obviously*, *really* and *actually* in the Chinese, Spanish and German components of LINDSEI (Gilquin et al. 2010) and in comparable NS data. They found that the three groups of learners often use them in different positions in the clause to make different pragmatic meanings.

The present paper investigates the Italian and the Swedish components of LINDSEI, and compares them to each other and to the language produced by the learners' NS examiners/interviewers. These two components were chosen because of the differences in the two groups of learners' likely exposure to the media and their (in-)formal contact with the English language. Although the situation of informal English language learning in Europe and beyond is evolving rapidly mainly thanks to the new media and to Web 2.0 applications (Pavesi/Ghia 2020), in Italy foreign TV programmes and films are dubbed, while in Sweden subtitling is the norm. Furthermore, only a minority of the LINDSEI Italian students interviewed had spent a long time in an English speaking country, while all the Swedish interviewees had the opportunity to study abroad (Gilquin et al. 2010). This latter group was, therefore, likely to be closer to a native-like level of proficiency, although this might not be necessarily the case (Aijmer 2011). The dataset totals about 190,000 words and is analysed with the software AntConc (Anthony 2019). The paper first provides an overview of the use of a selection of markers suggested by the literature and attested in the data. It then focuses on a small set of them, including *in fact*, *indeed* and *maybe*. *In fact* can be problematic for Italian learners, as there is an area of functional non-equivalence between it and Italian *infatti* (Bruti 1999), and the uncertainty marker *maybe* is frequently used by Italians in examination settings, especially as a backchannel (Castello/Gesuato 2019). The analysis has revealed the NS tendency to place the adverbs in initial and final position, which also the Swedish learners do, albeit to a lesser extent. The Italians, on the other hand, favour the medial and only partly the initial position. Other differences regard the use of specific markers, with the Italians overusing *in fact* and *maybe*, mainly in initial position, and underusing *actually* and *indeed*. A more fine-grained pragmatic analysis has then brought to light that the Italians often use *in fact* inappropriately and employ *maybe* differently from the Swedes and their NS examiners.

# A critical examination of homo-negative language use and the pragmatics of inclusion and exclusion of gay rugby players

Panel contribution

***Prof. Richard Pringle<sup>1</sup>, Mr. Erik Denison<sup>1</sup>***

***1. Monash University***

Since the late 1980s, critical sport scholars have typically emphasised how a dominant form of masculinity is performed and reproduced within male sporting contexts that broadly privilege males over females, and, orthodox masculinities over males who are judged as effeminate, unmanly, epicene or as homosexual. Although recent evidence suggests that contemporary male rugby players are more accepting of diverse sexualities, one area of contention relates to the ongoing use of homophobic language. Evidence illustrates that the use of phrases such as “so gay”, “fag” or “no homo” are still relatively common within rugby union clubs. Yet this finding suggests a disconnect between use of homophobic language and the players’ proclaimed acceptance of sexual diversities. Regardless of language intent, the use of homonegative phrases has been associated with increased rates of sport withdrawal from players who identify as gay (Greenspan, Griffith, & Watson, 2019) and, more broadly, with higher rates of self-harm and suicide amongst LGB people (Chang et al., 2020; DeFoor, Stepleman, & Mann, 2018).

In this paper, we draw on results from eight focus group interviews with gay and straight rugby players from Australia and Britain in order to explore the intent and impact of the ongoing use of homophobic language. Our results illustrate that the majority of ‘straight’ rugby players stated they would welcome gay players into their teams yet they still used, or did not actively problematise, the use of phrases such as ‘so gay’ and ‘fag’. Moreover, although these players acknowledged that these phrases have clear lineages to homophobic insults, they argued that the meanings of these words have changed, as they are no longer used with derogatory intent. Gay rugby players, in contrast, detailed the struggles of identifying as gay and how homophobic language, regardless of intent, reaffirmed a sense of non-acceptance or abnormality. We discuss the complexities of these results and offer ways forward for sport teams to encourage greater inclusion of sexually diverse players.

# A cross-cultural study on Thai-English (im)politeness produced and perceived by Thai EFL learners

Panel contribution

***Dr. Rungpat Roengpitya<sup>1</sup>***

***1. Faculty of Liberal Arts, Mahidol University***

Language and culture are interconnected. In many societies, the native enculturation occurs at a very young age, along with the first language acquisition. Prior to the puberty period, learners start their additional (L2/ FL) language and culture at home or at school. It is very interesting to see how native and foreign cultures are, cross-culturally, produced and perceived by learners through their L1 and L2. This paper is aimed at studying how Thai EFL learners would produce and perceive Thai (L1) – English (L2/ FL) politeness and impoliteness through the two languages. In the literature, politeness can be found in human languages and cultures (Leech, 2014: 3) such as in Japanese (Ide, 1982), French (Brown and Gilman, 1960), and Thai (Bilmes, 2001). Politeness is applied to maintain camaraderie (Lakoff, 1973, 1977) and can yield positive or negative results in conversations (Angkapanichkit, 2014; Terkourafi, 2012).

In this study, 34 Thai EFL learners at a tertiary level (31 females and 3 males) with the age ranging from 20-23 years and the mean age of 21.02 years participated. Multi methods were applied. The data collection was divided into two sections: the production and the perception. The production section had 20 items (10 Thai and 10 English) with different interlocutors and scenarios in short turn-taking conversations. Prior to the lecture on politeness, participants, as Speaker B, were asked to create and write down a sentence to respond to what Speaker A said and to rate each answer in a 5-point scale, ranging from very impolite-impolite-neutral-polite-very polite, based on Culpeper (2019). In the perception section with 40 items (20 items X 2 times) collected before and after the lecture, participants were asked to rate, in a 5-point scale, another 20 scenarios (10 Thai and 10 English) in a randomized order with the provided answers designed to have different ranges of politeness. This was to see how Thai EFL learners would perceive the (im) politeness from the Thai-English conversations. There were a total of 2,040 items (34 participants x 60 items).

From the preliminary results, Thai EFL learners produced and rated Thai (T) and English (E) answers, in average, at Level 3 (T = 70%; E = 63%); and at Level 4 (T = 77%; E = 65%). Perceptually, the participants rated the provided Thai-English answers, in average, at Level 1 (T = N/A; E = 63%); Level 2 (T = 57%; E = 54%); Level 3 (T = 57%; E = 69%); Level 4 (T = 65%; E = 57%); and Level 5 (T = 73%; E = 85%). The non-reciprocal and unequal power of interlocutors in Thai and English played a major role in the production and perception of Thai EFL learners on politeness with other cues e.g., pronouns, address terms, and verb forms. For Thai scenarios, particles were as another cue for Thai politeness. This research on politeness, which reflects the minds of youths, is hoped to be extended to the future national scale to help cultivate, maintain, and strengthen the glocal culture.

# A Cross-Linguistic Study on Evidentiality, Source Monitoring and Theory of Mind: Comparing Turkish and English-speaking children

Panel contribution

**Dr. Birsu Kandemirci<sup>1</sup>, Prof. Anna Theakston<sup>2</sup>, Dr. Ditte Boeg Thomsen<sup>3</sup>, Dr. Silke Brandt<sup>4</sup>**

**1.** Kingston University London, **2.** The University of Manchester, **3.** University of Copenhagen, **4.** Lancaster University

Some languages provide support for keeping track of one's knowledge or even force the speaker to mention the source of their knowledge. Turkish is one of these languages that distinctly marks the source of the speakers' knowledge by obliging them to specify their source when talking about past events by the help of evidential markers. English, on the other hand, does not enforce such an obligation on the speakers and the linguistic specification of the source of information is optional. Learning a language with obligatory evidential markers can also have an impact on children's social-cognitive development. For example, Turkish 3- to 4-year-olds have been found to be at an advantage in terms of their false-belief understanding compared to their English- and Chinese-speaking peers (Lucas et al., 2013). The aim of the current study was to investigate the contribution of evidential marker proficiency to children's false-belief understanding and source monitoring abilities while controlling for receptive vocabulary and short-term memory skills. We compared Turkish-speaking ( $N = 50$ ,  $M_{age} = 50.1$  months) and English-speaking ( $N = 50$ ,  $M_{age} = 50.6$  months) 42- to 59-month-olds' performance in three false-belief tasks. As factors that might impact children's performance, we measured their Source Monitoring ability, using the Mode of Knowledge Access Task (Gopnik & Graf, 1988), evidential-marker competency, using the Direct Experience and Changed State of Objects tasks (Ögel, 2007; Aksu-Koç et al., 2009), receptive vocabulary, short-term memory, and demographic factors, looking at their gender and age.

Age, receptive vocabulary, and short-term memory significantly correlated with false-belief performance in both language groups (all  $p$ 's  $<.05$ ). Additionally, source monitoring performance significantly correlated with false-belief performance for Turkish-speaking children,  $r_s(48) = .53$ ,  $p < .001$ . Turkish-speaking and English-speaking children's performances were analysed together, using a generalised linear mixed effects model and by following the principle of backwards selection. The final model suggests that the language children speak, their short-term memory, and source monitoring abilities significantly predicted their false-belief understanding. In line with Lucas et al. (2013), acquiring Turkish put children in an advantageous position in terms of their false-belief understanding. These combined results, together with the results from language-specific models will be discussed in detail and the implications of these findings will be outlined. We will discuss whether this advantage was due to the mastery of evidential markers in Turkish, and to what extent a comparison of two languages with different grammatical structures might be informative.

# A French-German contrastive discourse analysis on disability in comments of digital newspapers

---

Panel contribution

---

***Mrs. Annamaria Fabian<sup>1</sup>, Prof. Sibylle Sauerwein<sup>2</sup>***

*1. University of Bamberg, 2. Université Paris Nanterre*

This presentation will examine French and German comments in online media discourses on disability in comparison (Cultural Linguistics). In order to explore the borders of language usage as well as border crossings in disability discourses by undertaking a Cognitive Discourse Analysis, we will use a corpus of online newspapers and related comments. The corpus consists of undeleted as well as those deleted by community moderators – in public unvisible – due to violence of community rules or legal infringements. For this comparison of deleted and accepted comments in both languages – French and German – we have contacted some newspapers who are ready to contribute to our project by forwarding all comments to us belonging to specific media contributions on disability chosen by us.

This comparison of deleted as well as available comments enables a corpus-based research on norms of social conventions related to disability, and furthermore, to inclusive and exclusive language usage towards minorities (so called ‘sayability/Sagbarkeit’ and ‘acceptability/Akzeptanz’) in French and in German digital discourses.

# A historical perspective on threatening speech acts

Panel contribution

***Dr. Theresa Neumaier***<sup>1</sup>

**1.** TU Dortmund University

While ‘positive’ promises have been investigated quite thoroughly, “evil promises” (Christensen 2019: 119), i.e. threats, have often been neglected. In fact, threats are notoriously hard to investigate: They cannot be elicited nor can they be collected easily, since there are “very few contexts in which threats are used frequently and predictably” (Harris 1984: 247). Furthermore, it is by no means clear which type of speech acts threats actually constitute – they could be classified as commissives, directives, or expressives. Hence, in-depth studies of threats are scarce and mostly concerned with modern data. This is certainly surprising, as other aggressive speech acts have already been examined diachronically.

The paper at hand aims to close this research gap. Using courtroom data from the *Proceedings of the Old Bailey* (1674-1913), I compiled a corpus of speech acts which were perceived as potentially threatening by contemporaries – otherwise they would not have made it past the magistrate and into the courtroom. I manually analysed 80 trial recordings of ‘threatening behaviour’ which either involved alleged written threats (typically in form of anonymous letters) or verbal threats (e.g. in order to extort money). In doing so, I focused on the following research questions:

- What are the defining attributes of the speech acts in question?
- Which of those attributes are prototypical, which peripheral? Does this change over time?
- What are the underlying felicity conditions for an utterance to be perceived as a threat? Do they correspond to what has been established by studies based on modern data or introspection?
- Are some manifestations of a threat more typical than others?

The results reveal a correlation between the mode in which the threat was uttered and the intention of the speaker: While in letters the threat typically fulfils the conditions for commissives, predicting a future action in consequence of something which already happened, spoken threats mostly correspond to directives and are used as a form of coercion. This also shows in the linguistic manifestations of the threats – conditional *if*-clauses, for instance, are more frequent in the spoken dataset. Moreover, while analyses of modern courtroom data found the vast majority of threats to be indirect (e.g. Christensen 2019), the utterances analysed in this study overwhelmingly contain direct threats. These findings not only show that the analysis of speech acts in general and historical speech acts in particular needs to be based on an ethnographic approach, they also provide a first glimpse into the historical development of a yet under-researched speech act type.

# A longitudinal study of resistance: Action and practice in a physics lab

Panel contribution

***Mr. Adam Jones<sup>1</sup>***

***1. University of Neuchâtel***

This in progress paper presents results on *resisting actions* employed by one novice researcher and L2 speaker of English in an English as a *lingua franca* environment. While there is an extensive body of research on recruitment-related actions (Drew and Couper-Kuhlen 2014) such as directives, requests and the like, less attention has been paid to how participants systematically postpone or altogether reject the recruitment-related actions of another. When working within research laboratories where the manipulation of material objects is consequential, resistance is an important domain of interactional competence. Proposals for joint courses of action unfold sequentially, and the manipulation of objects and embodied actions figures importantly into how participants formulate resisting actions.

The data for this study comes from a longitudinal study on newcomers in research laboratories. In particular, this data set focuses on participants in a physics laboratory where high-harmonic generation, intracavity lasers are built. Data was collected over the course of a year looking at the everyday interactions among co-workers in the laboratory and are in English.

By analyzing what I call *resisting actions*I aim to show four dimensions to resisting actions:

- Resistance is embodied and material. Practices for resisting are situated within and made intersubjective in the inspection and manipulation of the array of sensitive scientific materials through which participants conduct their work.
- Resistance is conducted verbally through the use of formulaic expressions and grammatical connectors that project and make relevant the inspection and manipulation of scientific materials as a next move.
- Resistance is inherently bound up in participants' *deontic rights* (Stevanovich & Perkyäkyla, 2012) and produced as accountable next actions.
- Resistance is a longitudinal accomplishment that reflects the dynamic nature of changes in participation.

Results of this study show that the interactional dynamics of getting others to do things in laboratory work are balanced with the dynamics of preventing others from doing things. These results have implications for our understanding the development of L2 interactional competence and language use in ‘the wild’ (Hellermann et al. 2019) and the diverse material and interactional ecologies of bilingual professionals (Day & Wagner, 2007) with implications for how complex multimodal constructions are a resource for the development of interactional competence.

# A matter of Sam and Greta: a text mining approach on discourse in IMDb reviews about *1917* and *Little Women*

Panel contribution

***Ms. Bianca Di Virgilio<sup>1</sup>***

**1.** Universidad de San Andrés

In Western society, despite the advancements and conquests of feminist movements in the national, regional and global levels, modernity's gender role assignments still govern the ways we perceive the world according to the male-female binary (Cuddy et al., 2015). This is also true for cultural matters, and specially so for the way we assign value to certain cultural products over others, depending on the gender with which they are associated. It has been observed that those products that associate with or are directed to a female audience are considered shameful, illegitimate, vapid, among other valorizations (Allen, Harvey, & Mendick, 2015; Barratt, 2016; McRobbie & Garber, 1977), and this is revealed when it comes to film .

Evidence shows that certain genres are associated with both gendered contents and audiences, that gender works as a predictor for genre preference and that both men and women are prejudiced regarding which genres the opposite gender will prefer (Kotsopoulos, 2003; Krämer, 1998; Velandia-Morales & Rodríguez-Bailón, 2011; Wühr, Lange, & Schwarz, 2017; Wühr & Schwarz, 2016). Of course, this is a consequence of ideological biases rooted in culture which can be accessed through discourse (van Dijk, 1998). In this regard, a type of discursive genre directly associated with cinema is that of film reviews (Hall, 2001; Verboord, 2014). Originally reserved for the elite who set the agenda on legitimate cultural consumption (Baumann, 2001), nowadays the Internet allows for any movie-goer to publish their opinions on any film within public websites, such as the Internet Movie Database (IMDb), where all reviews and ratings on cinema and TV products are user-generated content (UGC). Because of this, this site has allowed to access the deeper meanings that audiences generate, reproduce and perpetuate regarding cinema and television (Boyle, 2014; Lipsett, 2013). Nonetheless, these users-turned-reviewers can resort to lexicon and concepts typically associated with the art world to legitimize their opinions (Baumann, 2001, 2007; Schmutz & Faupel, 2010). In this legitimization they can favor films from certain genres, and even styles, that are more socially accepted and valued, which incidentally can coincide with those associated with the dominant gender, class, ethnicity, and so on.

Two of the films nominated for Best Picture in the 2020 Academy Awards serve as representatives of genres associated with the male and female genders respectively: *1917*, a war movie directed by Sam Mendes, and *Little Women*, a romantic period drama directed by Greta Gerwig. These movies are comparable, as they had close premiere releases in December 2019, they made similar box office figures considering their initial budget, and their IMDb ratings are within a close range (to date, 8.3/10 and 7.8/10, respectively).

Taking a corpus of 250 English-language IMDb user reviews for each film, a text analysis in R was performed to obtain the most frequent words employed, the sentiments expressed, and the topics that words shape up when speaking about both movies. The phenomena that we aimed to observe show the difference in discourse when talking about cultural products targeted for each gender.

# A Matter of Timing: Noticings in Copresent Social Interaction

Panel contribution

**Mrs. Sonja Salerno<sup>1</sup>, Prof. Anja Stukenbrock<sup>1</sup>**

***1. University of Lausanne***

Referring and jointly attending to objects is one of the most basic practices in social interaction, and a prerequisite for actions such as requesting, assessing, transferring and manipulating objects. One way in which participants establish reference and joint attention is by producing a noticing in response to a phenomenon that is thus established as an interactionally relevant item or event. Sequentially, noticings constitute “retro-sequences” (Schegloff, 2007), they treat the noticeable phenomenon as their source. Schegloff distinguishes between the use of *noticing* to denote “a perceptual/cognitive event” on the one hand and “an interactional event” on the other hand (Schegloff, 2007: 87). Whereas the latter constitute objects of conversation analytic studies (Goodwin, 1996; Goodwin & Goodwin, 2012; De Stefani, 2014; Hayashi, 2009; Keisanen, 2012; Stukenbrock & Dao, 2019), the former may not be articulated at all and are then not part of the conversation analytic endeavor to reconstruct the endogenous order of social interaction as collectively organized, reflexively built, and publicly displayed.

Based on a video corpus recorded with external cameras and mobile eye tracking glasses worn by participants (German, Swiss German) in naturally occurring activities (cooking, visiting a museum, shopping at a market), our paper investigates environmental noticings (Sacks, 1992) as interactional achievements, which are made publicly known by verbal and embodied practices. While these noticings establish reference and joint attention to visible phenomena in the participants' surroundings (Stukenbrock, 2020), they, moreover, fulfil particular interactional functions in the local activity context and the participants' spatial configuration. We examine how these noticings are multimodally constructed and made contingent on the co-participants' observable activities within those local contexts. More specifically, our analysis focuses on how noticers temporally fine-tune their noticing in such a way as to interrupt co-participants' projected line of action and re-engage them by inviting bodily reorientation and joint attention to the noticeable.

The aim of our paper is threefold: first, to offer a sequential analysis of how noticers invite co-orientation and joint attention in moments of diverging action trajectories; second, to shed light on the relationship between the two concepts of noticings (Schegloff, 2007); third, to invite a methodological reflection on what we can gain from applying mobile eye tracking to the study of conversation analytic objects that challenge the phenomenal boundary between the individual and the social, between action and perception.

# A methodological paradigm for addressing variability in pragmatic intuitions

Panel contribution

***Prof. Marina Terkourafi***<sup>1</sup>

**1.** Leiden University

A frequent problem for researchers in experimental pragmatics is that pragmatic intuitions among experimental participants can diverge. In (experimental) politeness research, to give but one example, what is face-boosting for one participant may not be so for another, or may even be face-threatening for a third. A mix of individual differences, differences in social background and real-world knowledge, and differences in their assessment of the context can lead to this outcome. Yet, despite having been noted as a reason for rejecting quantification some 20 years ago (Eelen 2001), variability in pragmatic intuitions has yet to be methodologically addressed, while quantification of participants' judgements in experimental pragmatics has proceeded apace.

This is problematic for expressions whose interpretation is context-sensitive: no matter how closely experimenters try to control experimental scenarios, there can be no guarantee that individual participants will interpret them as the experimenters intended. And while the experimenters' sharing a similar background as the participants can afford them with an emic perspective into possible interpretations, this difficulty (in experimental politeness research, at least) is compounded by the fact that contexts themselves may not be unmixed: once face is seen as a constellation of Quality face, Social Identity face, Relational face, Equity rights, and Association rights (Spencer Oatey 2007), a single context may be face-boosting of some aspects of a character's face and face-threatening of others. Moreover, such a move would unduly limit participants to those who are like the researcher, excluding participants from other walks of life.

One possible work-around to this difficulty is to combine judgement elicitation with introspection (Goldshtain et al., in prep). Such investigations have shown that the same inference can be made for different reasons. While such mixed (quan-qual) methodologies are promising, they rely on participants' willingness and ability to engage in introspection, which can itself be variable and modulated by self-presentational concerns.

I propose an alternative research paradigm that relates participant judgements directly to participant assessments of the context and illustrate its application through a case-study in experimental politeness research. While not granting insight into what features may have motivated a particular assessment of context (which can be done via extra qualitative questioning), this paradigm allows us to track correlations between context assessments and utterance interpretations, thereby discovering patterns in interpretation as a process, even if there is no majority consensus on one prevailing interpretation as a product. In this way, we can avoid conflating participants' individualities toward a statistical mean, while at the same time identifying possible patterns in their behaviour, patterns that can be traced back to their situated assessment of each context rather than other (more commonly tracked) aspects of their background alone.

# A motivation for politeness from interpersonal to textual mode: the case of well as a discourse marker

Panel contribution

***Mr. Ryo Takamura<sup>1</sup>***

**1.** Aoyama Gakuin University

This paper proposes that politeness is a key to explaining the functional vagueness of well as a discourse marker.

In a functional-semantic model (Traugott 1982), discourse markers mainly have two functions: textual and expressive. I provide the examples of textual function and expressive function, and show how politeness is intertwined in these uses. This paper also discusses the possible developmental process of well as a discourse marker: propositional > interpersonal (expressive) > textual.

As for the case of well as a discourse marker, there are uses which cannot be attributed to one single mode, but to both modes. For example, as the case of textual function, a speaker can use well to close a conversation or change a topic. However, these acts express that the speaker is no more interested in the current conversation, involving an inherent face-threatening act. The speaker uses this marker to show acknowledgment of the current conversation (“expressive”), then the slot of conversation is terminated (“textual”). Therefore, the intersubjective use of well is related to the development of the textual function. On the other hand, as the case of expressive function, a speaker can use this marker to show an objection, which threatens the hearer’s face. This is also mitigated by well. Thus I propose that politeness (Brown and Levinson 1987) is involved in both the textual and expressive functions of the discourse marker well.

This functional vagueness can also be discussed from the diachronic perspective on discourse markers. Discourse markers derive historically from their original propositional meanings and thus, are related to them in some way (Brinton 2017). Many of the items come from sentence adverbs. The change from an adverb to a discourse marker is considered as an example of “grammaticalization” (Traugott 1995a). Grammaticalization of discourse markers is known to develop in the unidirectional order: propositional > textual > expressive (Traugott 1982). Afterwards, expressive is further divided into two functions: subjective and intersubjective.

Turning back to the cases of well, while Jucker (1997) supports the unidirectionality of well, Marcus (2009) and Defour and Simon-Vandenbergen (2010) claim that well has consistently retained an interpersonal meaning from the beginning. This is because well as an adverb ‘in a good way’ already reflects the speaker’s subjective stance on its use. This can support the close relation between propositional and interpersonal modes.

Marcus and Defour and Simon-Vandenbergen show that well as an interpersonal function has a stronger connection to propositional use rather than textual function. Then, as for the development of well, propositional > expressive (subjective > intersubjective) > textual seems to be a smooth progression. Moreover, well in the propositional mode is a clause-internal adverb, which syntactically, cannot be moved to the utterance-initial. However, for mitigating an upcoming face-threat, well is moved to clause-initial position by the motivation for politeness.

This paper explores this functional vagueness through the modern examples of well as a discourse marker in terms of politeness. A motivation for politeness leads well to a different pathway than other markers have gone through.

# A Multimodal Approach to Understanding Discourse Connectives Marked by “Na” in Chinese Dementia Discourse

Panel contribution

***Ms. Lu Song<sup>1</sup>, Ms. Yao Li<sup>1</sup>, Prof. Zhanhao Jiang<sup>1</sup>***

*<sup>1</sup>. Xi'an International Studies University*

In spoken discourse, “Na” (gloss: *that*; English discourse marker: *then, so, well*) has already been distinguished from other demonstratives by its various functional usages (Miracle, 1991). “Na” is gradually portrayed as a discourse marker (Liao, 1986; Biq, 1990; Miracle, 1991; Xu, 2005, 2008) which contributes to non-truth-conditional sentence meaning (Blakemore, 2006) and functions as a discourse connective to relate or connect “topic related segments of talk” (Schiffrin, 1987) by looking within and above at the sentence in which it appears (Biq, 1990; Tao, 1999). The connective usages of “Na” in marking different relationships between units of talk have also been clarified (Biq, 1990; Miracle, 1991; Huang, 1999). However, their data are limited to the healthy persons’ natural spoken discourse, and therefore the investigation of how discourse marker “Na” is used by individuals with cognitive impairment remains to be done. Based on Biq’s (1990) distinction of three types of relationship manifested between units of talk marked by “Na”, this study aims to explore the topic succession relationship marked by “Na” in dementia discourse from a multimodal pragmatics perspective. Our study aligns with Miracle’s (1989) proposal that the unifying function of “Na” is to establish the connection and the relevance of the following unit of talk to a prior unit of talk. Via analyzing about 40 minutes of video recorded semi-structured interview between the first author and a Chinese woman who suffers from a moderate to severe stage of dementia, we found the topic-maintenance usage of “Na” in ideational/textual dimension and the seeking-for-scaffolding usage of “Na” in interactional dimension. Both two usages are within the topic succession type of relationship manifested between units of talk marked by “Na”. However, being different from Biq (1990), it is found that in topic succession the continuation marked by “Na” is also anchored in the interactional dimension through our interviewee’s multimodal resources such as body movement, facial expression, laugh, and silence, etc. Recognizing these can, from a multimodal pragmatics perspective, lead to expectations about how multimodal resources of individuals with cognitive impairment contribute to interpreting the pragmatic significance of their discourse markers.

# A Multimodal Study on Chinese Alzheimer's Speakers' Speech Acts in Situated Discourse

Panel contribution

***Prof. Hongyan Liu<sup>1</sup>***

*<sup>1</sup>. Key Laboratory of Artificial Intelligence and Human Language, Beijing Foreign Studies University / Beijing Technology and Business University*

Unbalanced contribution between research carried out in the US and Europe and the Asian-Pacific region on Alzheimer's discourse abilities highlights the need of studying the discourse data of Chinese Alzheimer's speakers. Recent literature on communication for Alzheimer patients is the recognition that analyses of lexis, syntax and semantics do not give sufficient focus to some of the complexities of pragmatic abilities. In contrast to traditional analyses carried out by psychologists, neurolinguists and speech pathologists based on speech samples elicited in clinical settings, with language and cognitive impairments as research focus, the present study explores multimodal data of the actual use by Alzheimer's speakers in their daily life.

Speech acts, as naturally occurring linguistic activities for Alzheimer patients, should be studied in particular to help researchers find out how patients behave in everyday life. The perspective of pragmatic abilities such as situated discourse abilities is seen as extremely relevant to the nature of interaction in Alzheimer's speakers, in that pragmatic theory focuses on dynamic aspects of interaction, which are seen to be vulnerable to Alzheimer's speakers. Both discourse abilities preserved and discourse disabilities in Alzheimer's speakers' use of speech acts are examined in comparison with age/gender-matched comparable healthy aging speakers. Results show that simple formulaic speech acts are preserved in Alzheimer's utterances and should be categorized as automaticity discourse abilities. Both moderate and severe Alzheimer's speakers demonstrate preserved discourse abilities of the use of simple formulaic speech acts such as making inquiries, extending greetings, expressing thanks and expressing compliments, with different frequencies of occurrences for different types of formulaic speech acts. Compared with healthy aging speakers and moderate Alzheimer speakers, the severe Alzheimer speaker ignores making apologies and using polite formulaic expressions, which is caused by loss of self-image awareness due to severe cognitive decline.

# A plea for hypocrisy: pragma-philosophical considerations

---

Panel contribution

---

***Prof. Sandrine Sorlin***<sup>1</sup>

**1.** Université Paul Valéry – Montpellier 3

The aim of this talk is two-fold: it intends to make a plea for hypocrisy, showing to what extent it is more ubiquitous and essential than one may think. There are however degrees of hypocrisy that I will highlight by elaborating a continuum of the phenomenon that moves from insincere politeness to conscious deception. Secondly, my aim is to give a pragmatic approach to what has hardly ever been studied in pragmatics. I will first start by establishing the “pragmatic space” (Jurgen and Taavitsainen 2000) of hypocrisy and try to establish its pragmatic frontiers. Politics being one of the fields where hypocrisy has been shown to be inevitable (Grant 1998, Runciman 2008), I will use the satirical political TV series *Veep* (HBO 2012-2019) as illustrations to what I present as a “Hypocrisy Principle” comprising several maxims consisting in flattering, dissimulating and simulating. The TV series enables the observer to perceive both encoded Hypocritical Discourse (HD) and the way it is interpreted and taken up. I have also chosen *Veep* because it is a comedy wherein traits are exaggerated, exposing what cannot be perceived in real life politics through what the media make visible since verbal hypocrisy, as opposed to what I call ‘situational hypocrisy’, can be said to be a covert pragmatic act that is not normally meant to be detected.

# A post on the international women's day: expectant / hopeful speech acts

Panel contribution

***Dr. Dina Ferreira<sup>1</sup>***

***1. State University of Ceará***

By centering on a social media post by Brazilian federal deputy Maria do Rosário, of March 8, 2020, we discuss the hope speech act of the female voice in search of emancipation in contrast to male voices, whose comments on the post seek to subvert the voice of her projection of an emancipatory hope. The male language, in the comments of the post, becomes a colonizer of the female, maintaining and sedimenting the patriarchal symbolic system, even if the female voice is in a position / function of power. In this post, the female existence in "utopian effervescence" (BLOCH, 2005, v1, p. 194) is verified, which encourages human beings, in their daytime dreams, not to allow themselves to be submitted to the insufficient and the scarce. Although the history of women's struggles provides a concrete sense of what is real, the celebration of International Women's Day is the possibility of another possible future with the strength of the new and the unexpected. In this post, an utopian realization is not denied, as "the dynamic possibilities of historical development" (JAMESON, 1985, p. 117) are already marked in their speech acts of struggles, but "perceptual potentialities" still remain in latency (Jameson , 1985, 117-118), in order to overcome the course of events. The female speech acts reveal daytime dreams, which are anticipators of the really possible, proactive in satisfying desires and changes in future needs, that is, the female figures in the post do not seek the interpretation of what is the International Women's Day, but rather, they perform speech towards thinking that elaborates planning (hope in becoming), inasmuch as "thinking means transposing" (BLOCH, 2005, V.1, p.14).

# A pragmatic perspective on conditional constructions in political disagreement: how to save Grice with Searle (and loose Occam's razor)

Panel contribution

*Ms. Léa Farine<sup>1</sup>*

1. University of Neuchâtel

Historically, research on conditional constructions investigates an alleged asymmetry between the truth-functional definition of the logical material implication ( $A \rightarrow B$ ) and its linguistic correlate (If A, then B). “If Grice is an owl, then Searle is a rabbit”, e.g., despite its oddity, is a logically true conditional.

In *Studies in the Way of Words* (1989), Grice argues that material implication and ordinary indicative conditional are in fact symmetrical, i.e. equivalent in meaning and truth-conditions. According to him, the inferential relation (indirectness condition) holding between the two constituents A and B of a natural conditional is a conversational implicature and thus not part of the meaning of the conditional itself. However, Grice acknowledges that for some non-indicative conditionals (e.g. imperatives), “the suggestion that there is an implicature of the Indirectness Condition is nonplausible.” (Grice, 1989, p. 61).

In order to discuss this claim, I propose to study an “imperative-like” use of conditionals as a constituent of pragmatic argumentation, i.e., as supporting a prescriptive standpoint (Gerlof, 2009, p.150-157). To do so, I examine two real indicative conditionals in the context of a deliberative debate about a popular initiative in Switzerland:

- a) [“No Billag” initiative should not be accepted] because, if the initiative succeeds, we will witness an audio-visual slaughter.
- b) [“No Billag” initiative should not be accepted] because, if “No Billag” is accepted, it will inevitably lead to the end of democracy in Switzerland.

At first sight, it seems that the inferential relation holding between A and B in these conditionals is not explicitly cancellable. However, a simple shift from a conversational implicature to a “socially recognized conventional device” (Searle, 2010, p. 76), i.e., socially conventionalized implicature, permits to save the gricean account for indicative conditionals. Nevertheless, it is doubtful that the Occam’s razor principle is better respected by multiplying types of implicatures rather than meanings for the conditional connective (Lewinski, 2017).

# A pragmatic study of doctors' professional identity management in psychiatric encounters

Panel contribution

***Ms. Zhenzhen Zhu<sup>1</sup>, Prof. Yongping Ran<sup>1</sup>***

***1. Center for Linguistics and Applied Linguistics, Guangdong University of Foreign Studies***

While studies on doctors' professional identity mainly focus on its role of constraining patients' participation and agency (Pomerantz and Rintel 2004), less attention has been directed to how such identity is blatantly challenged by patients and how doctors preserve their expert roles. Such challenge to professional identity becomes particularly salient when patients insist on voicing their own understandings of the health problem that contrast with those of the doctor's. This study aims to analyze doctors' professional identity management through their responses to patients' self-diagnostic sequences in psychiatric encounters. The datasets contain 42 hours of audio recordings of doctor-patient interactions collected from a psychiatric out-patient clinic in China and the focus is on the treatment delivery phase of doctors' first encounters with middle-aged patients of anxiety disorders. Informed by the socio-constructivist approach to identity construction (Bucholtz and Hall 2005) and Conversation Analysis (CA), we examine doctors' discursive acts of professional identity management with particular focuses on (1) what aspects of doctors' expert identity are threatened by patients' self-diagnostic sequences, (2) how doctors preserve their professional identity as they respond to and incorporate patients' self-diagnostic sequences, and (3) why doctors prefer to highlight the hierarchical identities between themselves and the patients.

Initial analysis suggests that professional competence, roles and ethics of the doctor are frequently challenged by patients' self-diagnostic sequences that varies in directness and force of imposition. In response, doctors mostly adopt disaffiliating discursive strategies like ignoring, disagreement and plain rejection etc. to re-enact their professional identity and reaffirm the unequal doctor-patient relationship (Pilnick and Dingwall 2011). Under this context, such a disaffiliating relationship seems to be appropriate or even desirable as it facilitates shared understanding and treatment process. This study adds to our understanding of the dynamic management of professional identity and subtle doctor-patient relationship in Chinese psychiatric encounters.

# A Procedural Model of Medium - Communication Form - Genre: The Case of a Seminar Session Taught via Zoom

Panel contribution

***Prof. Alexander Brock<sup>1</sup>, Dr. Peter Schildhauer<sup>2</sup>***

***1. Martin Luther University Halle-Wittenberg, 2. Universität Bielefeld***

This talk seeks to validate theoretical claims made in a model that relates the concepts medium, communication form and genre to each other by drawing on two key principles: (semiotic) potentiality and convention (Brock & Schildhauer 2017). In this context, we conceptualise communication forms as clusters of technical and communicative constellations with certain potentials, which arise out of communicative needs and which are commonly restricted by conventions. The medium, understood in a technical sense as a tool for semiotic production, storage and transmission, is an integral part of these clusters. Conventions can be defined as the essence of usage on the one hand and as the crystallisation of meta-communicative negotiation processes on the other. Thus, our model is procedural, viewing communication forms (and, consequently, media) as both influenced by and influencing actual communication processes.

So far, our claims have rested on our earlier work on TV comedies (Brock 2019) and personal weblogs (Schildhauer 2016), also taking into account related work, e.g. on TV news broadcasting (Luginbühl 2014), public signage (Domke 2014) and election posters (Michel et al. 2017). However, in all these, actual negotiation processes of complex digital communication forms are often all but impossible to trace.

We assume that these negotiation processes are a key component of the first session(s) of digital seminars, in which newly-formed groups need to negotiate conventions, e.g. with regard to which channels of a complex video tool to use for which communicative acts (chat vs. VoIP) or whether/when to activate one's own video feed. In this talk, we will trace instances of these negotiations in a webinar in order to a) show how participants orient to and actively negotiate aspects of communication form and media, and b) use the results to enrich and/or modify our initial model.

# A prosodic comparison between Chinese and English response tokens

Panel contribution

***Dr. Jeroen van de Weijer<sup>1</sup>, Dr. Hua Gao<sup>1</sup>***

*<sup>1</sup>. Shenzhen University*

In conversation, some “response tokens” (such as *yeah*, *yes*, *yep*, *hm*, etc. in English and *en*, *o,dui*, *ah*, etc. in Chinese; henceforth RTs) can either be used to initiate changes of speakership or as backchannel devices. We refer to the former as “reply response tokens” (RRTs) and to the latter as “backchannel response tokens” (BRTs). RRTs are used to initiate a responsive turn in the sequence. BRTs are used in the background to signal the speaker’s continued attention to the other speaker’s message, but does not claim the floor.

In this study, we examined how prosodic features relate to the functional distribution of RRT and BRT by the same token, namely, ‘dui’ in Mandarin Chinese and ‘yeah’ in English (including some phonetic variants). The data come from casual telephone conversations from the CallFriend-Mainland Mandarin corpus and the CallHome-English corpus (Canavan and Zipperlen (1996) and Canavan et al. (1997), respectively). We collected sixty tokens of *dui* and sixty tokens of *yeah* which could be clearly identified as BRTs (equally divided between male and female speakers), and sixty tokens of *dui* and *yeah* as RRTs, including cases when the token occurs as a stand-alone object in the turn or as the first prosodically-independent unit of the turn (120 tokens total). We excluded such cases as repeated RTs (i.e. *dui-dui-dui*, or *yeah-yeah*) and *dui'a* where the phonetic shape of *dui* is greatly impacted by the ensuing utterance final particle *a*.

For each token, we measured total duration, average pitch (F0), pitch rise and average loudness and compared these between males and females, between RRTs and BRTs and between Chinese and English. We tried to find answers to the following questions:

- 1) Are there differences between males and females, e.g. in average pitch, across English and Chinese and across RRTs and BRTs?
- 2) Are RRTs more prosodically prominent than BRTs in pitch level, loudness and/or duration?
- 3) Is there a difference in use of prosodic factors between English (a stress language) and Chinese (a tone language) with respect to RRTs and BRTs?

Our provisional findings are that such prosodic differences indeed arise, especially concerning pitch and duration, which are likely to play a role in signaling the functional distribution of a same RT. We propose a distinction in terms of accent (i.e. not a lexical distinction), in line with the status of English as a stress language and Chinese as a tone language.

Based on these initial findings, we also discussed the complexities involved in cases where an RT is not sufficiently clear in prosody (i.e., in between values that are associated with typical RRTs or BRTs) yet no misinterpretation or misalignment is incurred.

# A provisional suggestion on linguistic and cultural inclusion in the co-occurrence of verbal and non-verbal cues: The case of overlaps

Panel contribution

***Prof. Lala Takeda<sup>1</sup>***

**1.** Showa Women's University

This study investigates how listeners are involved and “included” into speakers’ topics or ideas in the interactions. It stems from the research outcomes exploring the mutual understanding pursuant to the common ground (Clark, 1996; Brennan & Clark, 1996) between the interlocutors (Tanimura & Yoshida 2017; Yoshida 2018; Takeda in press). The author focuses on the co-occurrence of overlaps and nonverbal aspects between American English and Japanese interactions among the same participants across two genres (conversation and problem-solving tasks). The Common ground between individuals is reinforced with communication (Clark, 1996), by demonstrating the understanding of a particular utterance and sharing it with one’s interlocutors. Moreover, nonverbal cues, such as gazing and gestures, are analyzed to clarify the way of “inclusion” in the co-occurrence of verbal and nonverbal cues (Enomoto & Okamoto 2010). This study utilizes data consisting 11 sets of recordings from each of the two genres between female university student dyads. Overall, 11 American and 11 Japanese pairs (aged 19–23 and 20–22, respectively) were extracted from the “Mr. O Corpus,” which consists of L1–L1 dyadic conversations, recorded under experimental conditions, between 22 female students (11 pairs) in American English and 26 female students (13 pairs) in Japanese. The analysis examines the management of overlaps in student-student L1 interactions by comparing conversation and problem-solving tasks in the two languages by paying attention to nonverbal features accompanying the verbal ones to appropriately and collaboratively manage overlaps. Data analysis shows that speakers in the American English conversation see a hand gesture as showing similarity. However, speakers in the Japanese conversation either see it as an affirmative reaction or an attempt to avoid silence by gazing and laughing to share the awkwardness of talking at an experimental setting. In interactions in the problem-solving tasks, American English speakers follow the interlocutor’s directions, in terms of pointing gestures and gazing, whereas Japanese synchronize the interlocutors’ hand gestures or confirm the commonality of contents by gazing. Based on these results, this study will conclude the provisional suggestions on a feature of pragmatic attunement in the process of linguistic or cultural inclusion: how to facilitate smoother L2 interactions with overlaps for Japanese EFL learners using multimodal analysis that focuses on their gazing behavior and hand gestures, accompanying verbal communication.

# A public sphere of meaning negotiation: The interpreter-mediated Chinese Premier's Press Conferences

Panel contribution

***Dr. Rui Zhang<sup>1</sup>***

*1. Dalian University of Technology*

This study is to conduct a contrastive discourse analysis of a consecutive interpreter's meaning negotiation process at the annual Chinese Premier's Press Conference (the CPPC). Chinese researchers and practitioners have long realized that the translated Chinese official political discourses have difficulty in getting its intended meaning properly conveyed to the outside world and seem to arouse misunderstanding among their international readers. The same comments come from the outside that translations of Chinese governmental discourses are often difficult for international foreign readers to digest. However, little attention has been paid to interpreting in this regard. Meanwhile, in the international front, interpreting as interaction among participants of the communicative event and the (communicative, social, ethical) role of the interpreter has become a very prominent paradigm in interpreting studies today. This paper is to address this overlooked topic.

The present research chooses the CPPC as the data. As one of the most important contemporary Chinese official political discourse and the most spontaneous one, the CPPC features mediated and public discourse (Fetzer and Weizman 2006). I am going to conduct a case study of the 2017 CPPC and look into the interpreter's utterances in contrast to the speakers' ones. The notions of *meaning potential* and *affordances* (Verschueren 2018) within the more general framework of *a theory of pragmatics* (Verschueren 1999) are adopted as the theoretical underpinning, the tool of *shifts* in descriptive translation studies serves as the locus of departure. Shifts in meaning that are induced from the interpreter's shifts in forms, whether consciously or unconsciously, are under scrutiny with an aim to identify an overall tendency of the lingua-pragmatic features of the interpreter's utterances. This research therefore aims to investigate how meaning gets generated, constructed and recontextualized on the part of the interpreter as both the hearer and speaker in the triadic exchange, and eventually to look into the interpreter's active involvement in the process of meaning generation.

# A relevance-theoretic approach to interpreting ELF input

Panel contribution

**Mrs. Katrin Andermatt**<sup>1</sup>

1. ZHAW School of Applied Linguistics

Although the use of English as a lingua franca (ELF) has become a new professional reality for translators and interpreters, its implications for translating and interpreting have only recently started to be investigated scientifically (Albl-Mikasa, 2018). This study focuses on the impact of (the often hybrid nature of) ELF on simultaneous interpreters' processing of source text from a pragmatics perspective. Findings from Reithofer's (2013) comprehension-testing study, namely that an ELF speech was understood less well by the audience than its simultaneous interpretation into the audience's first language, suggest that interpreters manage to produce coherent target texts from less coherent source text input, presumably levelling out ELF-induced problems. To date, no research has been done on how exactly this is achieved. Drawing on the pragmatic framework of Relevance Theory (Sperber & Wilson, 2001), transcriptions of professional interpreters' renditions of an ELF source text are subjected to a qualitative product analysis and compared with renditions of an edited English version of the same source text. More specifically, the explicatures identified in the interpretations are compared with those in the source texts with regard to the enrichment processes interpreters may have engaged in. According to Relevance Theory, these include "disambiguation, reference assignment, the resolution of vagueness, and the recovery of ellipsed or unexpressed material" (Blakemore, 1987: 72). This contribution will present preliminary results of a pilot study conducted as part of a larger study, on two interpretations of the ELF source text and two interpretations of the edited English source text and report on possible differences in the interpretations of ELF as opposed to edited English input. One of the objectives is to understand whether and to what extent interpreters enter into compensation and optimisation processes.

# A repertoire of teacher conduct facilitating whole-class discussions

Panel contribution

***Dr. Annerose Willemse<sup>1</sup>***

**1.** Linköping university

This presentation synthesizes the outcomes of four conversation analytic studies on teacher conduct facilitating whole-class discussions about text in upper-primary school. The analyses reveal a large repertoire of teacher practices facilitating discussion and give cause for nuancing the rather general recommendations that have been given to teachers until now.

Previous research has indicated that discussions, and specifically discussions about texts, are an important means for learning. They can enhance students' text comprehension (e.g. Murphy, et al. 2009) and offer them the opportunity to build knowledge together by reasoning collaboratively. A meta-analysis by Soter et al. (2008) indicated that this dialogical type of classroom interaction asks for a facilitating teacher who poses open-ended questions, gives students the floor for extended periods of time and offers ample opportunities for uptake. Although these suggestions clearly entail a participation framework that deviates from the canonical teacher-fronted classroom interaction (Cazden, 1988, Myhill 2006), it remains unclear how exactly the suggestions should be practised in order to increase student participation.

The studies reported in this presentation used conversation analysis to uncover specific teacher practices and types of conduct that facilitate discussion and student participation. The studies investigated 1) open invitations: opening the floor to the students; 2) invitations for elaboration: asking students to expand on their previous contribution; 3) pass-on turns: inviting responses to another student's prior turn; and 4) teacher conduct around episodes of subsequent student turns. The first three studies uncover important differences and nuances in the practices used and the interactional implications these practices have. For instance, one open invitation can be much opener than the other and therefore functions differently in eliciting student contributions. Secondly, in passing on a student's turn teachers can either preserve or alter the sequential implications, leading to strikingly different types of student responses. Starting out from subsequent student contributions instead of focussing on a specific teacher practice, the fourth and last study reveals a large and at times unexpected repertoire of facilitating conduct. It shows that teachers, while refraining from verbal contributions, nonetheless actively realise and retain a discussion with an array of bodily means such as gestures, gaze and even laughter.

# A Statistical Analysis of Chinese Requests

---

Panel contribution

---

**Ms. Xuetong Yan**<sup>1</sup>

*1. University of Leeds*

Through the investigation of requesting acts in expert Chinese speakers, this study presents the politeness phenomenon in Chinese culture. There are two aims of this study: one is to display the distribution of alerter, supportive move, internal modification requesting strategy in all elicited requests and most importantly to have an overview that which one is the popular linguistic strategy (direct or indirect) to perform a request in Chinese; the second aim of this study is to study whether social variables including social power between the speaker and the hearer, social distance between S and H, and ranking of imposition have combined or separate impact on the choice of requesting strategies in ten situations.

There are two frameworks that I follow in this study. For analysis of coding elicited requests, CCSARP (Blum-Kulka et al. 1989) and Lee-Wong's modification of CCSARP are used; for the investigation of social variables' influence on the choice of linguistic strategies, Brown and Levinson's (1987) face-saving model is used.

For data collection, the WDCT (written discourse complete task) is employed and there are ten scenarios in this study. The questionnaire is divided into two parts: one is elicited responses and the other is participants' assessment of social variables. For data analysis, Spearman rank-order correlation is used to study the relationship between social variables and choices of requesting strategies. In the end, a total number of 640 requests are collected.

The results show that no use of alerters, supportive move and internal modification take the majority in all requests, and for requesting strategy the direct one is most preferred in the realization of requesting act. Data analysis indicates that all three social variables including social power, social distance and ranking of imposition determine the choice of requesting strategies in total requests. However, from the aspect of the separate situation, there is no correlation between familiarity and level of directness in each situation while two situations display the correlation between power and level of directness and three situations show the correlation between imposition and level of directness. These findings indicate that conventionally indirect strategy is not preferred in making a request, which is against the results in CCSARP; and these findings also indicate that Brown and Levinson's claim that social variables will influence the choice of linguistic strategies is approved.

# A trajectory through texts and over time: the evolution of necesitar ‘need to’

Panel contribution

***Dr. Miriam Thegel<sup>1</sup>***

*1. Uppsala University and KU Leuven*

Over the last decades, scholars interested in language change have broadened their perspective to include new questions such as the role of discourse traditions in language change and the relationship between language of distance and language of immediacy (Kabatek 2005, Koch & Oesterreicher 2007).

One of the topics frequently studied in the 21<sup>th</sup> century is the diachronic development of Spanish modals (e.g. Garachana 2017). For instance, auxiliaries like *haber de*, *deber(de)* and *tener que* have been examined in detail, especially in texts of communicative immediacy, considered as closer to the spoken vernacular (Blas Arroyo 2019). Although recent research has contributed to solve the puzzle of Spanish modal auxiliaries, there are still important pieces missing. For instance, the modal *necesitar* ‘need to’, borrowed from Latin into Spanish in the Middle Ages, still lacks a proper diachronic description (cf. Thegel 2020). How does the evolution of this relatively recent modal look like in comparison with the more established modal auxiliaries? In which discourse genres did *necesitar* appear and how can its trajectory over time be described?

This study gives a diachronic account of *necesitar*, using a corpus-based approach. Random samples as well as individual examples have been studied to track the usage and meaning of *necesitar* over time. *Corpus del Español* (Davies 2002) has been used mainly for a quantitative analysis, whereas *CODEA 2015+* (GITHE 2015) and *CORDIAM* (AML n.d.) have contributed to in-depth insights about the discourse contexts of the verb. The results show that the earliest cases of *necesitar* are found in Latin-based text traditions, such as theological and jurisprudence documents, with a meaning of external necessity. However, in the 20<sup>th</sup> century, *necesitar* has moved from the pole of communicative distance towards the pole of communicative immediacy and its meaning has shifted towards an internal necessity, expressing the inner desire of the modal subject. The study exemplifies both a *change from above*, due to the influence of Latin discourse traditions, and a *change from below* (Labov 2007), when *necesitar* shifts meaning and environment from the external and formal to the personal and informal.

# A typology of healthcare interpreter positionings: When neutral means proactive

Panel contribution

**Prof. Yvan Leanza<sup>1</sup>, Dr. François René de Cotret<sup>1</sup>, Prof. Camille Brisset<sup>2</sup>**

***1. Université Laval, Ecole de psychologie (Québec City), 2. Université de Bordeaux, Faculté de Psychologie***

Public service interpreters are required to position themselves within the interaction and to do so in such a way as to influence it as little as possible. This is what Metzger (1999) calls the “paradox of neutrality.” This paradox is a challenge for the interpreter, who may fear not meeting the expectations of the practitioner with whom he or she is collaborating. René de Cotret, Ošlejšková, Tamouro and Leanza (2017) name this discomfort “*le malaise de la neutralité*” (an ambiguous or uneasy neutrality), referring to the ambiguity of the notion of neutrality of the public service interpreter and what it can represent for the interpreter, but also for the practitioner.

The general objective of the study was to minimize this discomfort (and increase interprofessional collaboration) by clarifying the practitioner’s expectations. In particular, the objective was to foster effective communication (Leonard, Grahem & Bonacum, 2004) through a vocabulary that, rather than questioning the ability and motivation of professionals to collaborate, targets some of the challenges inherent in their interactions.

Twenty-three health care practitioners were questioned on their perception of interpreters in order to create a typology based on Weberian ideal types (Niemants, 2013), and inspired by Mason’s work on interpreter positioning. The discussions focused on what distinguishes the interpreter who behaves professionally from the one who behaves unprofessionally. In other words, it was a question of grasping the attributes that could foster the practitioner-interpreter collaboration and those who could weaken it.

Notwithstanding the diversity of practitioners’ working experience with interpreters, all participants’ discourses shared similarities. The typology obtained is composed of four portraits referring to as many interpreter’s positioning: the Active Interpreter, the Proactive Interpreter, the Hyperactive Interpreter and the Reactive Interpreter. The portraits Active Interpreter and Proactive Interpreter each have four attributes that reinforce the interprofessional collaboration and the portraits Hyperactive Interpreter and Reactive Interpreter, five and four attributes respectively that compromise it. In addition, the typology depicts interpret neutrality as a powerful driver in the practitioner-interpreter relationship. The participants all agreed that interpreters must be able to take their place, even if this means to imposing himself or herself and modifying the speakers’ discourse. Navigating such situations while maintaining the practitioner’s trust requires a special combination of hard and soft skills (Pöchhacker & Liu, 2014).

The Typology and its four positionings provide a frame of reference to minimize the unease of neutrality. In particular, the 17 attributes that compose these positionings provide a vocabulary that comes from the practitioner’s speech and can be used by both the practitioner and the interpreter to clarify their respective expectations for collaboration. Furthermore, the proposed conceptualization reiterates the importance of neutrality, as an active interpreters’ attribute, in the work of public service interpreters and their complex social positioning as professionals.

# Accepted boundaries in barrier-free communication between people living with and without autism

Panel contribution

***Ms. Regina Mezőlaki<sup>1</sup>, Dr. Lívia Ivaskó<sup>2</sup>***

*<sup>1</sup> Developmental and Neuropragmatic Research Group, Department of General Linguistics, University of Szeged, 2.*

*Developmental and Neuropragmatic Research Group, Department of General Linguistics, University of Szeged*

Our aim is to draw attention to the following problem: complexity of the interpretation of successful communication could depend on sociopragmatic, neuro- and sociocognitive characteristics of the participants (Reboul et al. 2012), as well as on their perspectives developed on the basis of these properties.

“People like me – who have Asperger’s syndrome and autism, who don’t follow social codes – we are not stuck in this social game of avoiding important issues.” – claims Greta Thunberg (The Guardian 2020).

However, as she argues there could be some valuable outcomes of their special perspectives, the dissimilarity of neurotypical and autistic people’s perspective on human interactions can cause serious difficulties on both sides. According to the comprehensive research in Hungary (MASZK 2020), quality of life of adults with autism and their parents can be seen significantly worse than the results of neurotypical subjects and their families.

What do we know about the facework of people with autism? Do we have a reason to say that these differing intentions following differently Goffman’s (1959) face-protective strategies are motivated by diverse neuro/sociopragmatic skills of the two populations? How can it be possible to manage a social interaction where the two perspectives meet in various everyday life or workplace situations (Mezőlaki –Ivaskó 2019) ?

In this problem-based presentation, we would like to illustrate with concrete examples how the interpretation of the success of each interaction depends on the participants’ assumptions of social interactions (Baron-Cohen 1988).

Method: To comprehend these various perspectives, we interviewed online participants with Asperger syndrome and professionals, employers who work with people with autism, and asked 25 semi-structured questions from them. We applied qualitative data analysis.

Results: subjects of the two populations interpret successful communication and the features of social interaction differently in some cases. We assumed that our semi-structured questions might reveal some significant and unexpected coping strategies in multi-challenging situations, thus we might have a better understanding of barrier-free communication.

Referring to Howlin – Magiati (2017), we should say that people with autism might have different assumptions on a successful outcome of an interaction.

The guarantee of barrier-free communication with accepted boundaries in social inclusion could be explained as a social interaction where various perspectives are considered.

Our research was supported by ÚNKP-20-3 New National Excellence Program and EU founded EFOP 3.6.1-2016-00008.

# Accessing languages for specific purposes through professional narratives

Panel contribution

***Ms. Severine Wozniak<sup>1</sup>***

**1.** Université Grenoble Alpes

According to Matthew Crawford, professional languages are at the core of the process of building professional expertise and practitioners are the ones we should actually turn to in order to access language in context: The writers of modern manuals are neither mechanics nor engineers but rather technical writers. This is a profession that is institutionalized on the assumption that it has its own principles that can be mastered without the writer being immersed in any particular problem; it is universal rather than situated. (Crawford 2009: 176–177)

This paper is firmly rooted both in the framework of the applied linguistics' approach to literary practices in the workplace and in the interdisciplinary approach to the study of specialized varieties of English (Resche 2013: 14), based on the “language-culture-discourse” triptych that has emerged in the French ESP community in the last 20 years. The methodology we refer to considers ethnography as a “research-support” discipline in ESP (Isani 2014, Wozniak 2019).

We will first focus on professional narratives as a genre of workplace discourse developed within organizations, which, even though they sometimes seem disconnected from the organization's core activities, are nonetheless necessary to the community they contribute to building and strengthening. Following this first instance, our paper will study professional narratives as they appear in fiction. We will finally explore the possible ways in which professional narratives can be used to fulfill the specific functions of specialized domains as they have been defined by Michel Petit (2010). Our objective is the show how mastering not only professional “indexicality” (Dressen-Hammouda 2014) but also discourse and terminology helps novices to build their own professional expertise and, in turn, contributes to characterizing the discursive component of professional expertise.

# Accountability and enactment of leadership in US presidential discourse

---

Panel contribution

---

***Prof. Piotr Cap<sup>1</sup>***

**1.** University of Lódź

This paper explores discursive performance of accountable leadership in US presidential inaugurations, from F.D. Roosevelt to D. Trump. The enactment of leadership and accountable political action count among the most distinctive features of presidential inaugural, taking place at two interrelated levels: text-functional and pragmatic. The text-functional level involves structuring the inaugural speech with regard to its ideological and policy-setting content. In this structure, ideological segments are placed first, in order to earn credibility for later policy-setting segments (Cap 2002). Such an arrangement responds to the psychological condition of consistency and homeostasis: political audiences are more likely to accept a new message if it falls within the latitude of acceptance established by pre-existing indisputable beliefs (Festinger 1957). The pragmatic level involves structuring the address in terms of speech act patterns of interplay between assertion and directive acts (Jary 2010). In these patterns, assertion acts tend to precede and thus sanction directive acts, which the latter communicate more sensitive and potentially controversial content. Altogether, assertions are typically vehicles for ideological content, and directives (mostly indirect ones and many combined with commissive acts) for policy-setting content. The development of US presidential inaugural rhetoric since 1933 shows virtually no exception to this pattern.

# Accountability and manifestation of identity and values in digital Maker discourse

Panel contribution

***Prof. Michel Marcoccia<sup>1</sup>, Prof. Hassan Atifi<sup>1</sup>***

*<sup>1</sup>. University of Technology, Troyes*

One of the key aspects of Garfinkel (1967) is that the resources for understanding a given activity are part of the organization of that activity. In other words, this first level of accountability corresponds to the methods used by individuals to make their activity intelligible in a given social context and to the role of interaction in this process of making action visible for the others.

Heritage (1990) has defined “a second level of accountability” which corresponds to the possibility for an individual to provide an explicit description of his activity.

The goal of this presentation is to analyze these two levels of accountability in a particular situation: exchanges between users of digital platforms presented as belonging to the “Maker culture”.

Our research fits in the field of pragmatics of digital discourse (Herring, Stein, Virtanen, 2013). The study is based on a corpus of textual and video tutorials, comments and message exchanges about these tutorials, posted in two digital platforms claiming to be Maker culture: *OuiAreMakers* (<https://ouiaremakers.com/>), a French-speaking social network and *Futuremag- les Tutos des Makers* (<http://www.futuremag.fr>), the Youtube channel of a television program broadcast on the Arte channel.

The “Maker culture” is a contemporary subculture constituting a branch of the do-it-yourself culture, focused on technology and the production of small-scale objects. The typical areas of these projects are computer science, electronics, robotics, 3-D printing but also more traditional activities such as art and crafts. The Maker culture emphasizes learning-by-doing in a community context. This culture focuses on collaborative and community-based learning, shared during meetings places such as fablabs or on digital platforms.

The main questions are: How do users of these platforms manifest this belonging to the Maker community? Our analysis shows that the production of the Maker culture is, on these platforms, a continuous practical achievement based on various discursive and interactional mechanisms, which allow the accountability of the values of this culture. The description of the Maker culture is in fact revealed in the practical actions of the members, when they display identity features, explain how to make an object or when they describe the qualities or properties of this object.

The way in which the users of these platforms explain the procedure to follow to make an object makes their belonging to the Maker culture visible. Thus, the establishment of cooperation mechanisms (advice on how to do something, information seeking question, etc.) and the importance of the exchange of thanking and compliments, for example, make manifest some values of this culture. Likewise, the way of describing the objects and their qualities allows accountability of the maker culture’s values and make them intelligible: humor, simplicity, sharing of knowledge, spirit of cooperation, etc.

Finally, the way in which these two activities are carried out allows the users of these platforms to show that they are members of this community and that they master the common language.

# Accounting for one's political misdemeanor: the consequences of the Ibizavideo for Austrian right-wing politician H.C. Strache

---

Panel contribution

---

***Prof. Helmut Gruber<sup>1</sup>***

*1. Vienna, Austria*

A 7-minute video published at the websites of two German media (“Der Spiegel”, “Süddeutsche Zeitung”) in the evening of May 17, 2019, changed Austrian domestic politics within several days. The video (a montage of approx. 7 hours of video footage) shows then vice-chancellor Heinz Christian Strache from the right-wing populist FPÖ and one of his closest political collaborators Johann Gudenus during a secretly filmed dinner with an alleged Russian oligarch and her companion in a finca at Ibiza in July 2017 (only several weeks before parliamentary elections in Austria). During this evening, Strache (then leader of the right-wing FPÖ) and Gudenus discuss various ways of illegal financial transactions through which the Russian oligarch could support the FPÖ and in return could be favored in public contracting procedures as soon as the FPÖ would be part of a government coalition (which at this time in 2017 was highly probable but not yet sure).

One day after the video’s publication (May 18, 2019) Strache resigned from all offices and delivered a resignation speech which was live broadcast on TV. In my presentation, I will analyze this speech and show how Strache tried to account for his obvious political misdemeanor by framing it on the one hand as a plot staged by political opponents and/or secret services and on the other hand as male boasting behavior during a “drunken night” at a private dinner party with an attractive young female host. Whereas the first account is in line with right-wing populist self-victimization strategies, the second one counteracts the first by attempting to diminish the political relevance of the video’s content. I will trace these two contrary aspects throughout the speech on several levels of analysis (wording, rhetorical moves, speech genre) in an overall socio-pragmatic framework. I will show that the two contradictory tendencies result in a “scrambled” narrative of self-victimization. If possible, I will also shortly analyze how two other leading Austrian politicians (chancellor Sebastian Kurz and federal president Alexander van der Bellen) accounted for the activities shown in the video.

# Achieving joint attention in a fractured perceptual field: technology-mediated interactions between sighted and visually impaired people

Panel contribution

***Dr. Brian Due<sup>1</sup>, Ms. Louise Lüchow<sup>1</sup>***

***1. University of Copenhagen***

This paper shows how visually impaired people (VIP) exploits the affordances of present technological objects in the pursuit of achieving a joint multisensorial attention with a sighted colleague in a workplace setting. While studies concerned with technology-mediated interaction in workplaces have shown a variety of different resources for achieving joint attention, they have overwhelmingly focused on vision and gaze as a presupposed shared resource (e.g. Luff et al., 2000). Using video-recorded data from VIP's everyday lives in Denmark enables us to respecify "joint attention" (Kidwell & Zimmerman, 2007) as a multisensorial achievement. Although a VIP and a sighted cannot have a joint visual attention towards objects in the world - what we suggest calling a *fractured perceptual field* - our research nevertheless shows, that VIP utilize the visual affordances of technological objects as scaffolds in the interaction to support the sighted persons perception, thus enabling distributed perception (Due, 2021). We depart from the research question: how do VIP exploit sighted people's visual resources in technology-mediated workplace settings for achieving joint multisensorial attention? As a perspicuous case we explore an open office environment where employees are working at their desks using stationary computers. In this context, co-workers may approach a VIP at his desk in the pursuit of solving a work-related issue, that is displayable on the computer screen. The specific practice, that we are reporting on in this presentation, is the combination of the VIP's multimodal actions of describing an issue in combination with using his keyboard to open and close windows and type in text which observably steers the sighted persons gaze and enables the construction of an accountable common ground. Thus, this paper provides new knowledge on how multimodal and multisensorial resources are employed to achieve joint attention towards issue represented on a computer screen. The paper focus on how the VIP's audible sensation and verbal descriptions and the sighted persons visual sensation and verbal descriptions are resources used for co-operation. This research is based on ethnomethodological conversation analysis and it contributes specifically to research on how to achieve common ground in object-centered sequences focusing on technology mediated interaction. As a perspective, we use these insights to discuss the dominance of an ocular-centric sociality (Jay, 1994).

# Achieving participation: The work to engage young children to participate in video calls

Panel contribution

***Dr. Yumei Gan<sup>1</sup>, Prof. Christian Greiffenhagen<sup>2</sup>***

*1. Shanghai Jiao Tong University, 2. The Chinese University of Hong Kong*

The use of video-mediated communication (VMC) technologies has become significant in today's world, for example, distributed family members use this technology to keep in touch and to sustain their intimate relationships. Many studies have argued that the advantages of VMC technologies are that they enable people to "see" each other and to "participate" in shared activities (e.g., Share et al., 2018: 3019) across distances. However, participation in a video call, especially in those involving a very young child, does not simply happen. It requires the participants who use the technology to conduct important interactional work to make the so-called "participation" to happen. In this paper, we investigate how both co-present and remote participants manage to engage children to participate in video calls with their remote parents.

Following Goodwin and Goodwin (2004), we treat participation as *action*, i.e., as something that participants have to achieve through what they do. Using Mondada's (2013) notion of an 'interaction space', we are paying particular attention to the spatial and material context that allows participants to do this. We also draw on recent studies that have explored how the use of technologies (e.g., smartphones) reshapes the participation in social interactions, such as the creation of multiple participation frameworks (DiDomenico, Raclaw, & Robles, 2018) and the emergency of new ways to participate in social encounters (Oloff, 2019).

Our data are drawn from video recordings of video calls between Chinese migrant workers (who have moved to the cities) and their 'left-behind' children (who are left behind to live with their grandparents in rural areas). The children in our study are very young, aged 9 months to 3 years. We have collected 30 hours of data from 31 different families and in each case recorded two streams: firstly, a screen capture of their mobile phone; secondly, a traditional camera recording the interaction in front of the mobile phone (see Gan, Greiffenhagen, & Reeves, 2020).

In this paper, we adopt the methodology of conversation analysis to examine the moments where family members (including co-present grandparents and remote parents) trying to engage the children to demonstrate (degrees of) involvement to their parents on-screen. We show, firstly, that co-present and remote adults have different resources to engage the children. For example, while the co-present grandparents often employ haptic practices (e.g., touch) (Cekaite, 2016) to get the children's attention, the remote parents mobilize practices such as threats (Hepburn & Potter, 2011) and promises to offer a potential "activity contract" (Aronsson & Cekaite, 2011). Secondly, we show that participants distinguish between different kinds or levels of participation. That is, even though a child may have responded to remote parents' questions, the child may be asked to do more in order to demonstrate a deeper participation with his/her parents (e.g., by providing a longer response or a 'bigger' physical response).

# Activity transitions in robot-mediated remote participation in classroom interaction

Panel contribution

***Dr. Teppo Jakonen<sup>1</sup>, Dr. Heidi Jauni<sup>2</sup>***

*<sup>1</sup> University of Jyväskylä, <sup>2</sup> Tampere University*

Interactional activities that either involve technological tools or are mediated by technology have become more pervasive in modern societies. In educational contexts, developments in videoconferencing have provided new tools for designing hybrid forms of education that combine face-to-face and online instruction (e.g. Dooly & O'Dowd, 2018; Gleason & Greenhow, 2017). One technology that is finding its way into educational contexts is the telepresence robot, a videoconferencing tool supplemented with the capability of remote-controlled movement. Previous user experience studies suggest that remote-controlled movement can enhance the agency of remote students and increase inclusion and equality of access to education among vulnerable groups such as homebound or hospitalized students (Cha, Greczek, Song, & Mataric, 2017; Newhart, Warschauer, & Sender, 2016). However, as of yet, we know very little about what enhanced agency and inclusion mean in terms of interactional practices of robot-mediated communication (Herring, 2015), and the role that robot movement has in the multimodal ecology of classroom interaction (but see Jakonen & Jauni, forthcoming).

In this presentation, we investigate inclusive interactional practices in synchronous hybrid classrooms in which, alongside copresent classroom members, one student participates remotely by way of a telepresence robot. Our data consist of video recordings from university-level foreign language classes (Finnish, German, Swedish and English) from an engineering program, recorded with classroom cameras and as screen recordings from the remote student's computer.

Drawing on multimodal CA, our analytical focus is on moments of transition from one activity to another, such as moving from whole-class interaction to group work. Previous classroom studies suggest that such interactional 'seams' (Mehan, 1979) involve complex work as teachers negotiate 'smooth' transitions (Park, 2014) and students seek for turn-taking opportunities (Jacknick, 2011). We explore the multimodal nature of robot-mediated remote participation during transitory moments, including how the classroom teacher and students orient to, and facilitate, the remote participant and the robot in verbal and embodied ways.

Initial results suggest that classroom participants orient to activity transitions as potentially troublesome for intersubjectivity, and treat the remote students' participation as requiring assistance by giving instructions for navigating the classroom space. At the same time, the ability to move the robot is used by remote students to project activity transitions and display autonomy over their own participation. We briefly discuss the implications of these findings for conceptualizing asymmetries in synchronous hybrid education.

## Adaptation and ‘dirty’ promises

---

Panel contribution

---

**Prof. Jacob Mey**<sup>1</sup>

1. Odense University

Traditionally, political campaign promises are considered to not necessarily hold in a normal context. When they are not fulfilled, they are not strictly ‘broken’, since they were never meant to hold outside of the campaign trail – and that’s why such promises could be called ‘dirty’. On the other hand, one could argue that in principle, *all* promises have this built-in, dirty factor.

The classical view of promising as a speech act is predicated on a momentary view of the act. Traditional speech acts are a bit like Saussure’s famous ‘synchronic snapshots’: strictly valid in the moment the pictures are taken, the acts pronounced.

As the case of ‘Pete’ and ‘Barb’(pseudonyms for the actual protagonists referred to in the paper) shows, such reflections may create a moral obstacle in the minds of those who are about to enter a contractual situation such as that of matrimony. When interpreted as cases of Searle-Gricean promises, the concomitant, constitutive speech act (“I do”) is essentially an ‘armchair’ entity: it cannot strictly be extended or ‘lengthened’, even though mechanisms for trying to make this happen are available (compare the cases of religious vows, written commercial contracts, the use of audio-visually recorded utterances and activities in the courts of law, and so on). But even the most solemn promises uttered, and supposed, to be valid “until death do us part” are made in time and space, in a particular socio-historical context; and consequently, they are always contaminated by that context, hence ‘dirty’. That is, they are affected by the parameters of our existence and cannot be ‘cleansed’ to parade as exemplars of what Searle, Grice and their followers classified them as: acts solely defined and circumscribed based on the received felicity conditions and conversational maxims.

In contrast to this, promises are real, spatio-temporal constructs, necessarily ‘com-promised’ by the enduring influence in time and space of society and history, and not even “all great Neptune’s ocean”[1] can make them theory-clean. Just like speech acts, when considered as pragmatic acts, are ‘born’ indirect, so too, pragmatic acts of promising will have to be adapted to the environmental factors surrounding those who undertake the acting, respectively stand for its (current or later) interpretation.

Using an analogy from mathematics, one could say that just as unidimensional ‘points’, no matter how many, can never constitute a ‘line’, let alone a ‘space’ or a ‘cube’, so, too, the Searle-Gricean speech acts are one-dimensional entities in the linguistic universe. Like Saussure’s synchronic snapshots, such speech acts, considered on their own, are abstract utterances: they cannot constitute or change their dimensions of time and space, or the societal contexts and their ever-changing shapes. In this way, ‘com-promising’ becomes an existential, defining need for all speech – and this is, too, why from its very start, our verbal behavior is ‘compromised’ and ‘dirty’.

# Addressee-Based Considerate Expressions in English

Panel contribution

**Dr. Koichi Nishida**<sup>1</sup>

1. Yamaguchi Prefectural University

This study focuses on considerate expressions in English, especially those based on the addressee's support of the speaker. The following is an excerpt from Lanigan 2014: 111:

"I'm on my way to work right now, but I could drop by this evening. What's the address?"

"Fifteen ten Maple Avenue."

"I'll see you then. Sorry, I forgot to ask your name."

"It's Beabots. Mrs. Beabots."

Like the underlined part above, the "*I forgot to* infinitive" sequence, often appearing at the near end of a dialogue, is a conventionalized formula with which the speaker asks the addressee to pay attention to him. It takes the form of what Goffman 1978 calls "response cries"; (i) it is the speaker's description of himself, (ii) it is a comment on the task failure he has made with the addressee and (iii) it is situational because his intension in it is understandable only its relation to the relevant situation as a whole. Thus, his apparent self-talk is not directed to the addressee, and the question is why and how he may use it, and the addressee may react to it in dialogue.

The answer lies in the fact that it is an addressee-based considerate expression for asking without asking. In the above excerpt, the first speaker uses *I forgot to ask your name* to mean 'Tell me your name,' which is not derivable from its literal meaning, but only from the addressee's considerateness about the speaker.

This is an example of what Keyser 2008 calls "egocentric speech": the speaker intentionally speaks uncooperatively when he shares little information with his addressee. By contrast, she tries to avoid him being uninformed about her because cooperation with an uninformed partner is unlikely to be beneficial to her.

The addressee-based considerateness comes in three steps. First, the speaker acknowledges his task failure with his utterance. Second, by expressing himself as being ignorant, he is sure that his utterance causes a perlocutionary effect on the addressee who is ready to compensate for his failure (Kissine 2013). Third, she is expected to support the speaker who has less information than her.

Generally speaking, speakers use considerate expressions to keep good relations with their addressees. In this sense, considerateness is expressed as being unidirectional from speakers to addressees, which may be unmarked and prevail in number. However, there are marked cases that build on addressees, as shown by the *I forgot to* infinitive formula. The marked considerateness lies in the speaker's non-action toward the addressee. Considerate expressions based on the addressee's benefit are effectively used when she is superior to the speaker in having the information that he wants. They show that considerateness may be bidirectional and they are expressed as uncooperative utterances, which means that speakers opt not to observe Grice's 1975 Conversational Maxims so as to let addressees support them.

The addressee-based considerate expression is not considerate in its static form; rather, it dynamically functions as a considerate expression in the dialogue between an egocentric speaker and an equally egocentric addressee.

# Addressing participation of students with non-visible, speech and hearing impairments in German student journey mapping: A discourse analysis

Panel contribution

***Prof. Magdalene Lévy-Tödter<sup>1</sup>***

**1.** FOM University of Applied Sciences

In recent decades, the inclusion of students with visible or non-visible impairments in everyday university life has been the object of numerous studies from various disciplines (Barkas et al. 2020; Grimes et al. 2018; Stemmer 2017; O’Shea et al. 2016; Cameron 2016). In many cases, interviews were used in these analyses to determine the self-/foreign perception of students, counsellors, and lecturers of challenges in implementing inclusion in higher education at institutional level or on individual barriers. The few text analyses of external higher education communication also indicate that the discourse on student involvement revolves primarily around (digital) barriers (Aust 2016; Gabel et al. 2016; Collinson et al. 2011). Studies with resource-oriented approaches, on the other hand, show which cognitive, social, and other competences students or lecturers with disabilities possess. Against the background of an increasing diversity at Universities, the question arises as to whether the questioning of “normality” (also called “cultural turn” (Waldschmidt 2017)) is reflected in the “discursive construction” (Keller et al. 2005, 2018) of empowerment (Conger and Kanungo 1988) and participation (Arnstein 1969/2019) of students in the university environment.

While the “discursive construction” of disability, participation or exclusion has a firm place in the sociology of knowledge approach to institutional communication, there is still a lack of discourse-linguistic or (functional-)pragmatic analyses of how to address students with disabilities in communication in higher education and in the university environment. Linguistic pragmatics has long been concerned with the question of the illocutive dimension of language in institutions (Lévy-Tödter and Meer 2009). The discourse-analytical multi-level analysis by Spitzmüller and Warnke 2011 can provide a bridge between the two approaches.

This empirical study analyses how the participation of students with non-visible, speech and hearing impairments are addressed in websites and social networks of German universities and actors in university environment. Since these settings are multimodal, several approaches were required for the interpretation of the corpus. The discourse-linguistic Multi-Level Analysis (Abbrev. DIMEAN) by Warnke and Spitzmüller 2011 offers the opportunity to analyse elements from the transtextual and intratextual level systematically. In higher education marketing, there is increasing use of “student journey maps” or of designing the external university communication along virtual contact points (touch points). Studies using the Social Semiotics (Kress and van Leeuwen 2006) framework are used in the analysis of modalities in discourse (Lévy-Tödter 2017). At the intratextual level, functional-pragmatic analysis offers a theoretical framework for analyzing the units of linguistic action in the thematization (or staging) of empowerment, skills, attitudes, participation or “self-advocacy” of students. Some of the results like the discontinuities in visual design and conceptual uncertainty in addressing students along the touch points will be addressed in the presentation.

# Addressing the child as an interactional resource: The management of (non)seriousness in talks between nursery school teachers and parents

Panel contribution

***Dr. Kaoru Hayano<sup>1</sup>***

**1.** Japan Women's University

This paper examines the interaction between nursery school teachers and parents, where the teacher gives a day's report of a child to the parent in the presence of the child. In his analysis of stories told in multi-party conversations, Goodwin (1979, 1981) observed that while the teller mainly addresses "unknowing recipients" (recipients who have no prior knowledge about the event being described), they may also address "knowing recipients" (those who do have such knowledge), which serves as a means to handle interactional contingencies at hand. Using the methodology of conversation analysis to analyze a corpus of teacher-parent conversations at a nursery school, I show how the teachers address children as to manage one particular aspect of their exchange: the (non)seriousness of the matter being reported.

It is first observed that teachers often address the child when reporting on non-serious matters—innocuous but often amusing things that the child has done or said (e.g., a child's telling a story about her imaginary bird friend), but not when reporting on a serious matter (e.g., the child's health condition, injury, or an upsetting incident that the child experienced or caused). This distribution of the practice of addressing a child therefore reveals the teachers' orientations to the (non)seriousness of the matter they are reporting about and how serious and nonserious matters should be discussed. However, there are exceptions to this general distribution. For instance, the teachers may withhold addressing a child to playfully present a trivial, fun report as a serious matter. By contrast, the teacher may address the child toward the end of a report about a serious matter, in which case addressing the child serves as a means to negotiate the seriousness of the matter and/or achieve an exit from the topic. The findings will be discussed in terms of how children's participation is encouraged or discouraged by adult participants in the situation where they need to both accomplish necessary transactions and attend to the child.

# Advice-giving as a practice for producing hope in mental health rehabilitation

Panel contribution

***Ms. Taina Valkeapää<sup>1</sup>, Dr. Melisa Stevanovic<sup>2</sup>, Dr. Elina Weiste<sup>3</sup>***

***1. University of Hel, 2. Tampere University, 3. Finnish Institute of Occupational Health***

For people with mental health problems, the position in the labor market is difficult. Getting seriously ill has permanent consequences for a person's work ability and it narrows down the range of jobs that are possible to perform. Also, prejudices can prevent the return to work as employers are reluctant to hire people with mental illness. Despite these challenges, the desire for employment has been reported to be a significant motivating factor for a person to attend mental health rehabilitation. On the other hand, such difficult life circumstance can limit the sight for the future.

In contemporary mental health ideologies, such as recovery approach, producing hope for clients is a core task for mental health professionals. Hope has an important function in helping the client to see their possibilities and in directing their agency towards desired outcomes. However, little is known about what producing hope means at the level of interactional practices.

Drawing from a set of 26 video-recorded rehabilitation group meetings as data and Conversation Analysis as a method, we explore *how hope is talked into being in the encounters between clients and their support workers*. The overall goal of the rehabilitation group is to further the employment of the mental health clients. In the analysis, we focus on the segments where clients and support workers make plans for contacting potential employers in the open labor market.

Our findings suggest that hope is connected to the support workers' *advice-giving turns* following the clients' complaints about the difficulties of finding a job. The support workers' advice-giving turns describe how clients should orient to the obstacles in the job-seeking process both at the levels of thought and action: when an employer rejects the request for a job, the client should not be provoked but uphold the connection to the employer. Advice-giving is constructed in a way that emphasizes the support workers' expertise in the job-seeking process. Support workers substantiate their advice by highlighting the positive elements in the current situation that, based on their previous experiences, predict desired outcomes in the future. Another, somewhat contradictory element in the support worker's advice-giving turns is the attempt to keep the clients' expectations on a realistic level by orienting to considerably modest outcomes of the job-seeking process as highly rewarding and satisfactory. In our presentation, we analyze the support workers' subtle act of balancing between invoking the clients' hope, while keeping their goals realistic.

Contemporary ideologies behind mental health rehabilitation emphasize future-oriented working methods where the discursive production of hope is central. This study demonstrates how hope is connected to the agency and control over the job-seeking process. The support workers, from their position of expertise, advise the mental health clients to follow the implicit norms and rules of the process that – despite being momentarily obscure for the clients – can eventually lead to successful employment outcomes.

# Affect and speaker meaning: Behavioral and neurophysiological evidence

Panel contribution

***Dr. Nikos Vergis***<sup>1</sup>

1. (None)

Emotion, affect and mood (EAM) have been found to play an important role in word and sentence processing (Majid, 2012). What is less understood is the effect they have on processes that help interlocutors to arrive at what speakers mean. My goal in this paper is two-fold: a) To review available experimental evidence from a host of behavioral and neurocognitive studies that strongly suggest that EAM is involved when producing conversational inferences, and particularly when comprehending interpersonal meanings, and b) to suggest possible ways in which EAM can become part of the theoretical apparatus in pragmatics, by highlighting the need to go beyond propositional meanings.

Participants' mood has been found to contribute to the use of polite strategies (Forgas, 1999a, b) and to the identification of interlocutor's referential intention (Converse *et al.*, 2008). Information about the speaker's emotional state (Vergis & Terkourafi, 2015), the interlocutors' relationship affect (Slugoski & Turnbull, 1988) and the listener's face sensitivities (Vergis, 2017) also affects the way address terms and mixed messages are interpreted. Crucially, speakers categorize speech acts on the basis of their interpersonal affective significance (e.g. grouping threats with complaints; Holtgraves, 2005; Liu 2011). Furthermore, neurocognitive evidence suggests that affective Theory of Mind influences the way social functions of irony (e.g. criticizing) are comprehended (Shamay-Tsoory, *et al.* 2005; Shamay-Tsoory *et al.*, 2007; Shamay-Tsoory & Aharon-Perez 2007), while understanding face-saving indirect language has been shown to draw upon affective systems of the brain (Basnakova *et al.*, 2015). Listeners rapidly infer various sociopragmatic meanings (politeness or motivation) on the basis of prosody (Vergis *et al.*, 2020; Zougkou *et al.*, 2017). Further evidence from neuroimaging and eye-tracking demonstrates that contextual parameters (e.g., speaker identity, situational context, presence of bystanders) modulate the processing and interpretation of lexically encoded emotion words (taboo words) (Christianson *et al.*, 2017; Otten *et al.*, 2017).

As part and parcel of the processes involved in computing speaker meaning, EAM could be conceived as a non-propositional component to the inferential process that yields various sociopragmatic meanings. This component *may* be intentional (or emotive à la Arndt & Janney 1991), but its intentionality is not necessary for the inference to be successful. It is also proposed that, apart from the classical social cognitive mechanisms that mediate conversational inference, another mechanism that feeds sociopragmatic interpretations is *moral cognition* with its multifold role in interpersonal evaluations.

---

## Affect in mind

---

Panel contribution

---

***Dr. Tim Wharton<sup>1</sup>***

*1. University of Brighton*

Given that among humans the communication of information about emotional states is ubiquitous, one could be forgiven for assuming that theories of utterance interpretation include quite well-developed views of how such information is communicated. However, for a range of reasons, scholars working on meaning have tended to persist with the view that the mental processes behind rationality and affect exist in separate domains. As a consequence, the emotional dimension to linguistic communication has tended to play a secondary role to the rational or cognitive one. Indeed, in many accounts it plays no role at all. This paper argues that the successful integration of expressive acts of communication into an inferential theory of pragmatics faces a major challenge: while the majority of post-Gricean pragmatic theories have worked to develop accounts of the interpretive processes at work in the communication of propositions, the content of expressive acts appears to be non-propositional. Following previous research (Wharton, 2009, 2015; Wharton and Strey, 2019; Wharton and de Saussure, (forthcoming)) this paper proposes that the relevance-theoretic notion of ‘cognitive effect’ needs to be supplemented with the new notion of ‘affective effect’. I link the affective effects produced as a result of expressive acts to the broader notions of descriptive ineffability and procedurality and argue that they find relevance through the activation of experiential heuristics (de Saussure and Wharton, 2020). Affective effects, it is argued, can cause further cognitive effects insofar as they act as attention attractors and boosters for optimally relevant cognitive effects, but sometimes the affective side of cognition can win out over the non-affective side: at least some (for example) poetic artefacts may activate ‘pure affective effects’, which can be relevant in their own right (and without cognitive effects). This approach stands at least partially within the development of recent approaches to emotion as cognitive appraisals and demonstrates the importance of keeping affect in mind.

# Affective atmosphere and intercorporeality in open learning environments

Panel contribution

***Dr. Julia Katila<sup>1</sup>, Dr. Kreeta Niemi<sup>2</sup>***

***1. Tampere University, 2. Jy***

Our study investigates how different types of emotionally salient affective atmospheres (Brennan, 2004) emerge among 10-11 years old schoolchildren in an open learning environment. Open learning environments, which result from the ongoing reform of physical school spaces, challenge the conventional organization of traditional classrooms as they lack the traditional role of the teacher, organization of space into pupils' desks and the teacher's podiums, and predefined structures of classroom activities.

We adopt microanalysis of video-recorded interactions to show the interactional dynamics of how the children manage and create either "calm" and "orderly" or "chaotic" and "stressful" affective atmospheres in learning interactions through displays of emotion, touch and other corporeal ways of the bodies (Streeck et al., 2011). We reflect how these affective atmospheres and the embodied behavior of the school-children in the situations are mutually constitutive; they both influence and are influenced by each other. Moreover, we discuss how the open learning environment as a context (dis)affords the fluctuation of affective atmospheres through intercorporeal exchanges (Meyer et al., 2017).

We investigate if the lack of institutional structures in open learning environments makes "emotional contagion" (Barsade, 2002) more fluent than in traditional classrooms. Therefore, open learning environment makes the students' embodied and affective selves more "open" and vulnerable to being influenced by other participants' emotions. Our paper discusses the tendency of human beings to attune to each other's emotions, as well as the complex interrelationship between affective atmospheres and embodied interaction between the individuals.

# Affiliative responses to complaining in talk-in-interaction in pre-mediation interview at family court: a professional dilemma for mediators

Panel contribution

***Dr. Paulo Gago<sup>1</sup>, Dr. Maria Oliveira<sup>2</sup>***

*1. Federal University of Rio de Janeiro, 2. Pontifical Catholic University of Rio de Janeiro (PUC-Rio)*

This paper focuses on mediation in family justice and professional practice. Brazil is on its way to becoming a country with a multiple doors system of justice, where citizens can choose among different methods for dealing with conflict. Mediation represents the a more inclusive form of justice, where every citizen can defend him/herself without a lawyer or a judge telling him/her what to do. Many mediations programs (e.g. transformative mediation, researched here) make use of pre-mediation interviews (PMI). Moore (2014) considers the PMI mainly a method of data collection on several issues: parties' interests, positions, motivations, conflict dynamics. Centrally, in the PMI mediators establish rapport with parties and host their feelings, helping create a trust environment for the mediation sessions and deal frequently with complaining about a non-present party (Heinemann, 2009). Complaining means to express feelings of discontent about a state of affairs, for which responsibility can be attributed to some person, organization etc. (Heinemann & Traverso, 2009). It transform a personal and private experience into openly acknowledged interpersonal difficulties (Emerson & Messinger, 1977). As a social action in interaction, complaining is a paired type of action (a first pair part), projecting a response as a second pair part, accepting or rejecting it. Although the mediator is not a complained party, she must deal with it somehow. We argue here that this situation of sustaining a rapport environment and hosting the complainant's feelings without taking party and maintaining neutrality reflects the operation of simultaneous conflicting value systems, posing a professional dilemma (Komter, 1998). How do mediators manage this in real situations? Based on a larger corpus of PMIs at family court, we will examine this issue in one mediation case, in which mediator interviews separately two parties in conflict regarding children's visiting schedule, using conversation analysis. We analyze responses to complaining in terms of their affiliation, an action "with which a recipient displays that s/he supports the affective stance expressed by the speaker" (Lindström & Sorjonen, 2013: 351). Our research benefits from collaborative work with practitioners in joint data sessions, where we co-constructed a better understanding of professional practice. As a first major result, mediator's response was sensitive to the type of complaining underway. In the interview with the ex-husband, he complains indirectly about third parties, expressing overwhelmingly feelings of suffering. The mediator produces most of the times affiliative empathic responses, through the use of common sense knowledge assessments or impersonalization about complained party, institution, or the complainant himself, maintaining mostly balance in neutrality, but we found out instances where neutrality can also be questioned. As a main contribution, our study can help to build an analytic mentality (Schenkein, 1978, Sarangi 2004) in the mediation field in Brazil, and can contribute to illuminate the interactional competence of mediators (Greatbatch & Dingwall, 1997; Garcia, 2010), based upon scrutiny of transcripts of what mediators do in their turns at talk, in natural language environments. As a whole, the study can be used for Applied Conversation Analysis purposes (Antaki, 2011) and professional training.

# Affinity spaces created by public service media on social media: The role of the moderator

Panel contribution

***Dr. Tina Hougaard<sup>1</sup>, Ms. Elisabeth Andersen<sup>2</sup>, Dr. Marianne Rathje<sup>3</sup>***

***1. Aarhus University, 2. University of Southern Denmark, 3. The Danish Language Council***

As an effort to expand user participation, public service media companies use social media to distribute news stories, promote content, involve users in current debates etc. In order to support this effort, these companies have started to hire social media managers (SMMs) who monitor and moderate discussions.

This paper investigates the practices of SMMs on three social media sites hosted by Danish public service media companies. Data for this study consists a corpus of 300 posts on three media companies' Facebook and Instagram sites relating to entertainment programs that they produce.

Viewing moderators as 'moral gatekeepers', the paper investigates characteristics of user contributions that SMMs respond to and how SMMs display understandings of norms and breach of norms through their involvement.

Contrary to our initial hypothesis that SMMs mainly delete or moderate content assessed to be uncivilized (Boberg et al., 2018), we show that the majority of SMM involvement works to acknowledge and invite user contribution.

We therefore present analyses of the linguistic and interactional strategies SMMs use to attempt to achieve alignment and continued participation from users, both in cases where SMMs treat user contributions as breaching norms of conduct and in cases where SMMs display a positive stance towards users.

In particular we will outline how so-called response mobilizing strategies (Stivers & Rossano, 2010), such as formulating actions as requests for information, accomplish different purposes in different interactional settings (e.g. how requests for information may communicate a negative or positive stance towards a user contribution) and how the specific designs of the requests imply different assumptions about the nature of the interactional relationships between users and SMMs and thereby different assumptions of the affinity space that SMMs function as gatekeepers of.

# Ageing, disease and death: a narrative medicine approach

---

Panel contribution

---

**Prof. Yingxi Wen**<sup>1</sup>, **Prof. Yueguo Gu**<sup>2</sup>

*1. Guangxi Medical University, 2. Beijing Foreign Studies University*

Aging, disease and death are three major events in one's life course. They are so vital in human life that they have given rise to a range of disciplines dedicated to their studies. This paper focuses on the last phase of life course of late adulthood, starting from the diagnosis of incurable cancer to the brain death. In this phase, aging, disease and death, separated indefinitely before, are compressed and experienced intensely, death preoccupying the minds of the patient, the doctor and the relatives. Adopting narrative medicine as its theoretical framework, the paper first reviews the medical doctors' narration of death, including those who are "the wounded storytellers". Aged dying cancer sufferers and their relatives are recruited to narrate their experiences. A sample of their narrative discourse is analyzed in terms of biomedical reasoning and narrative reasoning. The differences between the two contribute to the misunderstandings and communication failures between doctors and patients/relatives.

# Agency and identity of Chilean university students with invisible disabilities as communicated in medical consultations

Panel contribution

***Dr. Agnieszka Sowinska<sup>1</sup>***

***1. Universidad Católica del Norte***

Invisible disabilities, which are common in modern societies, refer to “both mental and physical conditions that are not immediately noticeable by an observer” and the choice to hide or to disclose the disability lies with the individual (Matthews & Harrington, 2000). They can embrace mental disorders (e.g. anxiety, depression), cognitive conditions (e.g. dyslexia) or long term conditions (e.g. juvenile diabetes). Although internationally laws and statutes mandate inclusion for the disabled in all areas of life, students with invisible disabilities experience difficulty navigating through college more than their physical disabled peers just because of the invisible nature of the disorder (e.g. Mullins & Preyde, 2013).

The objective of this paper is to explore agency related to the students’ experience of living with an invisible illness as disclosed during a medical consultation. It is assumed that agency, understood as the capacity to have some degree of control over one’s behaviour while producing actions that affect others and self (Duranti, 2004), can be exercised verbally through narrative structure and content, as well as nonverbally through patients’ behaviours, in particular their gestures during symptom presentation (Sowinska, 2019). This, in turn, points to the ways patients conceptualize their identities and selves.

The data are 9 videotaped medical consultations with students with invisible disabilities conducted at the health centre of Universidad Católica del Norte in Antofagasta, Chile. The preliminary analysis has shown that the student patients tend to present themselves as lay experts and take actions when it comes to looking for the right treatment. However, their actions often have a detrimental impact on their health and negative impact on their academic performance.

# Agency in collaborative storytelling - reflecting competence in aphasia

Panel contribution

***Mrs. Helene Killmer<sup>1</sup>, Prof. Jan Svennevig<sup>1</sup>, Dr. Suzanne Beeke<sup>2</sup>***

***1. University of Oslo, 2. University College London***

To be a competent member in society, agency is required. Agency - understood as a person's influence on interaction - is distributed among participants (Enfield, 2013) and its distribution can become visible in participants' conversational practices. Aphasia challenges the conversational practices of persons with aphasia (PWAs), affecting their inclusion in interaction (Simmons-Mackie & Damico, 2007), and thus potentially diminishing their agency. Storytelling is a common activity in social interaction (Norrick, 2007), and being a competent storyteller might be said to further social inclusion through a demonstration of agency. We explore storytelling that is collaboratively constructed between a PWA and his wife as a way of investigating agency, competence and inclusion.

We analyse a storytelling sequence in a German multiparty interaction involving a 39-year-old man with anomic aphasia of 10 months' duration with his wife, their daughter and another couple. The data originate from the corpus *AphaDB* (University of Freiburg, Germany). The method is *Conversation Analysis*. Specific research questions are: How is agency accomplished in collaborative storytelling by a speaker with aphasia? Which conversational practices do participants employ to organize collaborative storytelling and achieve agency? The analysis demonstrates that the PWA and his spouse accomplish PWA's agency collaboratively with different conversational practices. The PWA contributes to the activity by initiating the story sequence. Furthermore, he facilitates agency by producing short but significant utterances in which essential information is provided. For example, laughter characterizes the story as an amusing one and displays PWA's epistemic access to it. The PWA intensifies his display of access through the deployment of gaze by looking to the story recipients during turns. Thus, he takes an active role (Goodwin, 2004) instead of merely aligning himself as a recipient (Barnes and Ferguson, 2012). The spouse aligns with PWA's initiated action and supports his agency by giving him room to speak, e.g. by gaze retraction and by sharing epistemic authority instead of ignoring actions or claiming primary authority (*ibid.*).

The study offers insight into conversational practices that allow PWAs to use their limited communicative resources to contribute competently to storytelling. Through achieving agency in co-telling a story, this PWA appears interactionally competent and is treated as such by his interlocutors. We show resources to (co-)construct competence in aphasia by illuminating how agency is achieved. Our study highlights ways in which a PWA can be a competent conversation partner in an everyday activity.

# Agency, participation, and inclusion of deaf and hearing-impaired students in Switzerland and Germany

Panel contribution

***Prof. Christiane Hohenstein<sup>1</sup>, Ms. Petra Stemmer<sup>2</sup>***

***1. ZHAW, 2. KDA in cooperation with University of Cologne***

The inclusion of students with non-visible impairments still proves difficult to implement in higher education. Once the hurdle of access to university is overcome, support and encouragement become relevant. Hearing impairments represent non-visible impairments par excellence. They often go hand in hand with the fact that affected students avoid to “come out” in their study contexts and try to remain as “inconspicuous” as possible in learning environments shared with other students. Students who are deaf, hard of hearing, or hearing impaired (DHH students) are generally considered to be particularly burdened in a university environment.

This paper explores how DHH students experience inclusion and participate in German-speaking universities’ academic life. Inclusion not only requires equal access to study programs, but also inclusive everyday life interactions at university. Communication and situations of interacting, in particular, are decisive, as will be substantiated with empirical examples from German and Swiss higher education. In Switzerland, disproportionately small numbers of DHH students are succeeding in tertiary education up to now, if compared with blind and visually impaired students. As a part of a 4-year project on barrier-free communication in Swiss Universities, we explored DHH students’ experiences, opportunities, and challenges regarding access to and success in Swiss Higher Education (Hohenstein et al. 2018, Hohenstein & Zavgorodnia 2019, 2020). Based on 15 narrative interviews with deaf and hearing-impaired/hard of hearing persons who experienced or are currently enrolled in tertiary education in Switzerland, we ask how inclusion and inclusive communication are reflected in statements about participation and agency during tertiary education. The statements are analysed regarding linguistic agency using a functional pragmatics framework. In Germany little is known to date about students with hearing impairments at German higher education institutions. Few empirical studies have been documented (cf. Stemmer 2016, 2017). To participate in university life, communication, and situations of interaction with teachers and fellow students are decisive, in addition to structural support. Linguistic discourse is an important means of making patterns of perception and interpretations visible that lie beneath the surface, making them accessible to redefinitions with a view to actually creating a culture of inclusion. Problem-centered qualitative interviews with hearing-impaired students and supporting staff (n=8) at a German university are analysed through qualitative content analysis (cf. Mayring 2015). Discourse- and action-analytical deductions regarding effective support systems will be evaluated in a larger context of previous perceptions about this group of students. Questions we will deal with are (i) How do DHH students perceive participation? (ii) Which concepts of inclusion are revealed in their narratives? (iii) How can measures of inclusive communication on the structural administrative level and in teaching and studying change the current outcome? (iv) How can technical devices improve agency and inclusion? (v) How does that tie in with a concept of inclusive communication that encompasses all students? Inferences are drawn on possible discourse-related and action-analytical consequences with regard to support measures that make use of both technical devices and linguistic resources.

# Airlines' responses to customer complaints on Twitter during COVID-19: a corpus-based move analysis

Panel contribution

***Dr. Matteo Fuoli<sup>1</sup>, Dr. Monika Bednarek<sup>2</sup>***

***1. University of Birmingham, 2. University of Sydney***

The COVID-19 pandemic has caused severe disruption to people's lives and has brought huge swaths of the economy to a screeching halt. One of the industries hit hardest by the pandemic is aviation. In this study, we investigate how airlines addressed the dual challenge of handling customer dissatisfaction and protecting their brands in their communications on Twitter. Specifically, we use corpus analysis methods to identify and describe the *rhetorical moves* used by airlines in response to complaints, drawing on the approach to move analysis developed by Biber et al. (2007).

The corpus is made up of 1300 complaint-response interactions collected from the Twitter profile of 13 major airlines between March and July 2020. We used the UAM corpus tool (O'Donnell 2008) to annotate the rhetorical moves in the complaint responses. We developed our coding scheme inductively through multiple readings of interactions sampled from the corpus and collaborative pilot coding (Biber et al. 2007: 33). We identified 16 major moves used by companies in response to customer complaints, including 'apology', 'show concern' and 'pledge further action'. Results from an inter-coder agreement test confirmed the reliability of the coding scheme.

We will report the frequency of each individual move, show which moves are obligatory and which are optional, describe recurring move sequences (Groom and Grieve 2019), and provide a systematic description of the typical linguistic characteristics of each move. The move analysis will be complemented by a qualitative analysis of *dialogic resonances* (Du Bois et al. 2014) between the wording of the customer's complaint and the company's response.

The study provides valuable insights into the role of language in managing the unfolding economic crisis triggered by COVID-19. Moreover, it offers an original contribution to the emerging literature on business communication via social media (e.g. Page 2014, Fuoli et al., 2020) by introducing a typology of rhetorical moves commonly used in response to customer complaints.

# Aligning Performance with Awareness in L2 Pragmatics: Responses to Invitations and Offers in Chinese

---

Panel contribution

---

***Dr. Yunwen Su<sup>1</sup>***

***1. University of Utah***

This paper investigates the pragmatic resources that L2 learners draw on by exploring their L2 pragmatic performances and cognitive processes (Felix-Brasdefer, 2008). Eighteen advanced American English learners of Chinese and 22 native speakers (NSs) completed a six-scenario roleplay task with five native interlocutors. The four experimental scenarios were balanced in initiating speech acts (invitations/offers), power relations (hierarchical/solidary; Scollon & Scollon, 2001), and motivations (outright/return-for-favor). Participants made their own choices of accepting or rejecting the invitation/offer. Thirteen learners and 15 NSs also completed a retrospective interview of 10-15 minutes right after. All learners completed the roleplay task in English two weeks later. Participants' responses were audio-recorded.

A total of 160 roleplays in Chinese, 52 in English, and 28 verbal reports were transcribed. Roleplay data were coded within each turn (choice of speech act, semantic formula, content, and form) and across turns (discourse patterns). Verbal reports were coded into emerging categories to explore participants' sociopragmatic awareness. Results suggest that though advanced learners have access to the same pragmalinguistic resources at interactional and strategic levels as NSs, their actual use of the resources differ. Specifically, learner responses in the hierarchical scenarios feature an overuse of acceptance postponed across turns and do not reflect situational variations, whereas NSs responses represent a high use of the same pattern only in the invitation-as-return-for-favor scenario. Analysis of the verbal reports shows that the weightiness of the invitation/offer plays an important role in shaping participants' responses, but learners and NSs perceived the same cost differently, and learners' decision-making process often drew on sociopragmatic conventions in English.

# Ambiguity as an artefact of essentialism – or how the context solves all the problems

Panel contribution

***Prof. Ferdinand von Mengden***<sup>1</sup>

*1. Freie Universität Berlin*

I argue that most problems orbiting around ambiguity are artefacts of an essentialist view on human language which sees language in isolation from a specific usage event. Logically, ambiguity entails clarity as a default, i.e. expressions are taken as by default unambiguous form-meaning pairings (e.g. Goldberg 1995: 67). But if non-ambiguity is the norm how, then, does ambiguity emerge given that it is not part of the plan?

The key to escaping the dilemma is, I argue, the fact that cases of ambiguity only arise when linguistic examples are seen in isolation. In order to assess what interlocutors access when communicating such data cannot be seen as independent of an act of communication. While this has in principle been pointed out even in code-based approaches to language (Wasow 2015, Piantadosi et al. 2012), I would like to propose a theoretically more fundamental alternative. I argue that no type of linguistic expression has an ontology outside the communicative situation in which it is employed. Ambiguity only arises in meta-linguistic problem settings, i.e., it is a problem of linguists (and of linguistic theories), but it poses no difficulty for speakers.

While the meaning of an expression is generally underspecified, it is the context – any knowledge shared among the interlocutors irrespective of its source – that provides the required clues for an utterance to be brought across successfully. The more common ground among interlocutors, the more unspecific can the utterance be. When communication (rarely) fails, it's not because the linguistic expression is underspecified, but because of a wrong assumption of the speaker about the addressee's expectations.

Change and variation, I argue, result from the flexible transfer speakers make when using the same utterance in a (slightly) novel configuration of context and communicative task.

(1)

a *drive* 'make something move'

b *drive* 'make animals move'

c *drive* 'make animals move in order to pull something'

d *drive* 'make animals move in order to pull a vehicle'

e *drive* 'make a vehicle move which is pulled by animals'

f *drive* 'make a vehicle (of whatever propulsion) move'

g *drive* 'make a vehicle move in order to travel somewhere'

h *drive* 'travel somewhere (in a vehicle)'

In (1), any one line can be seen as a mere instantiation of the immediately preceding line without that we need to assume two different meanings. Only if we compare two distant lines would we be able to identify vagueness or ambiguity. Speakers do not require the kind of clarity that linguists need for describing form-meaning pairings. Instead, by merely transferring the same underspecified form-meaning pairing from one communicative task to the next, speakers contribute to altering the potential of the expression without actively changing or manipulating it.

My theoretical proposal is meant to contribute to promoting the idea of language as an emergent system with units and relations that defy clear delimitations. Whether expressions are vague or ambiguous therefore depends on our (the linguists') descriptive requirements, but not on any inherent features that might be relevant for speakers.

# Ambiguity in Discourse: The Tübingen Interdisciplinary Corpus of Ambiguity Phenomena

Panel contribution

**Dr. Asya Achimova<sup>1</sup>, Mrs. Maren Ebert-Rohleeder<sup>2</sup>, Ms. Natascha Elxnath<sup>1</sup>, Mr. Lorenz Geiger<sup>1</sup>, Ms. Lea Hofmaier<sup>1</sup>, Mr. Joel Klenk<sup>1</sup>, Ms. Thalia Vollstedt<sup>1</sup>, Prof. Angelika Zirker<sup>1</sup>**

*1. University of Tuebingen, 2. University of Tübingen*

According to Tuggy (1993), whether a predicate is ambiguous or vague is at times difficult to decide even if we apply formal logical and linguistic tests. We argue that this difficulty is in part driven by the assumption that these terms are mutually exclusive, on the one hand, and the lack of terms that allow distinguishing heterogeneous phenomena on the other. We propose a three-way distinction between ambiguity, vagueness, and underspecification. Following Quine (1960), we treat vagueness as a property of lexical items that denote predicates that can be both true and not true at the same time creating a logical paradox. Underspecification is the lack of information about a particular property or relation; in that sense, the word ‘aunt’ (Tuggy 1993), is ambiguous between a paternal or maternal sister. Finally, we define ambiguity as a phenomenon that arises from having several distinct interpretations for a given linguistic unit. Crucially, underspecification can lead to ambiguity in discourse.

We apply this classification procedure to annotate examples in TInCAP, The Tübingen Interdisciplinary Corpus of Ambiguity Phenomena (Hartmann et al., to appear). It is a multimodal collection of ambiguity phenomena in a single resource, comprising examples from linguistics, literary studies, rhetoric, media studies, theology, psychology, philosophy, and law. TInCAP’s annotation schema includes the classification of the relevance of ambiguity in production vs. perception, its strategic vs. non-strategic use and its classification on different levels of communication (e.g. the perspective of characters in a narrated world and the interpretation of readers). This approach allows us not only to study ambiguity of words and sentences in isolation but rather investigate the functional use of ambiguity, such as the rhetorical consequences of ambiguity in political speeches and legal texts, as well as stylistic and literary effects in prose, poetry, and drama.

Furthermore, our annotation schema lets us identify how ambiguity *emerges* in discourse. In the following example, a particular context may trigger two different speech acts: either (1) is interpreted as a mere statement (1a) or as a directive speech act (1b):

- (1) It is cold.
- a). The temperature in this room is low.
- b). Please shut the window.

(Winter-Froemel & Zirker 2015)

In sum, the corpus offers new possibilities for researchers working across disciplines to trace the functioning of ambiguity in a variety of text genres, and identify elements essential for ambiguity creation and resolution on multiple levels of analysis.

# Amor proprio/amour propre: self-love and face in nineteenth-century Italian and French conduct books

Panel contribution

**Dr. Annick Paternoster<sup>1</sup>**

1. Università della Svizzera italiana, Lugano

In the *Corpus of Galatei italiani ottocenteschi* (ca. 50 Italian conduct and etiquette books published between 1800-1920), cortesia ‘politeness’ is rather consistently defined as brotherly, neighbourly love, love of other because of the love of God, *amore per il prossimo*. However, there are also frequent references to *amor proprio* ‘self-love’. A search string *amor\** produces 883 results, which is to be expected given the central importance of brotherly love, however, *amor proprio* still produces 176 occurrences. The paper aims to tease out the relationship between self-love and politeness and proposes a semantic analysis of the term *amor proprio* in CGIO.

Firstly, I examine the bimillenary history of the term *amor proprio* (Latin *amor sui*, French *amour propre*, English ‘self-love’ or ‘self-loving’) in authors working at the interface between religion, moral philosophy, political science and conduct. The literature is abundant; hence, I provide the most concise of summaries. Since Antiquity, there have been two conflicting views. On the one hand, self-love is considered as selfishness and vanity, a distraction from the pure love of God. On the other, there is a positive view of self-love, as the search for public recognition and esteem. The latter view makes it clear that self-love comes close to present-day academic definitions of face as public self-image. Spencer-Oatey (2007) underlines the cognitive underpinnings of face, such as self-esteem, self-concept, ego and pride, which, although they relate to identity, influence how face unfolds in interaction. Whilst, in CGIO, *faccia* ‘face’ is only used in an anatomical meaning, the reflexive, metapragmatic meaning of ‘face’ might have been circulation via a different term: *amor proprio*.

Secondly, I interrogate the corpus with two questions: 1) what is the socio-cognitive meaning of *amor proprio*? and 2) is it evaluated in a positive or negative way? There are three main findings: a) the sources distinguish between two types of self-love, i.e., self-love in other, and self-love in self; b) this distinction determines whether the moral evaluation is positive or negative; c) self-love in other is more relevant to interpersonal interaction, whilst self-love in self is relevant to identity and self-improvement. Adopting a contrastive angle, I include preliminary findings from a collection of French sources.

In sum, *amor proprio* appears to cover both identity and face, and this is a fascinating find, as it historically grounds the theoretical discussion on the demarcation between identity and face (see Garcés-Conejos Blitvich & Sifianou 2017), which is increasingly seen as fuzzy.

# An action-based model of projective content recognition

---

Panel contribution

---

***Prof. Maciej Witek<sup>1</sup>***

**1.** University of Szczecin

Presuppositions and other projective contents seem to pose a challenge to the ostensive-inferential model of communication (Grice 1989; Wilson and Sperber 2012; Mazzarella and Domaneschi 2018). One can argue that even though what the speaker presupposes contributes to the overall meaning of her speech act, it can hardly be regarded as what she speaker-means; more specifically, quite often the projective content of an utterance is not at issue relative to the current question under discussion (Beaver et al. 2017) and as such is best understood as what the speaker is committed to (Geurts 2017, 2019) rather than what she intends to communicate. One can also argue that rather than being determined by pragmatic inferences guided by general principles governing communication (Simons 2013), projective contents are decoded as conventional properties of certain lexical items (van der Sandt 1992; Domaneschi and Di Paola 2017).

My aim in this paper is to address the second of the above-mentioned controversies and develop an action-based model of projective content recognition. The model rests on two hypotheses: first, for every or almost every presupposing utterance, there is an action to which it corresponds; second, the presupposed or projective content of an utterance is determined by the structure of its corresponding action. More specifically, what the utterance presupposes coincides in content with one of the preconditions — ‘precondition’ in the sense of the ‘enlightened update’ model proposed by Thomason, Stone, and de Vault (2006) — that have to be met in order for its corresponding action to be appropriately performed; in particular, if an utterance constitutes a certain speech act — which is the action to which it corresponds — its presupposition coincides in content with one of the conditions under which the act can be felicitously performed (Austin 1975; cf. Simons 2013; Witek 2015, 2019).

The paper is organised into three parts. In the first one, I present the action-based model of projective content recognition; in particular, I distinguish between three types of cases to which it applies — that is to say, between actions (a) constituted, (b) expressed, and (c) described by presupposing utterances — and argue that their explanation requires three different though closely related explanatory patterns. In the second part, I use the patterns in question to account for a number of presupposing utterances that involve the use of illocutionary verbs and other force-indicating devices, factive verbs, anaphoric pronouns, possessive noun phrases, and other presupposition triggers. In the third part, I focus on the cognitive aspect of the action-based model and argue that projective contents are neither decoded nor inferred along the Gricean lines.

# An empirical study of Chinese vocatives in terms of Ba theory

---

Panel contribution

---

***Prof. Yansheng Mao<sup>1</sup>***

***1. Harbin Engineering University***

While extensive research has been done on Chinese vocatives in numerous fields, little is known about how and why Chinese vocatives emerge and dissolve in social interaction – a kind of interactional practice that might influence the effect of interpersonal communication. Based on the analysis of first-hand data in light of Ba theory, the present study will investigate diverse linguistic situations that examine Chinese vocative practices situated in context with a focus on descriptions of how the cluster of vocatives used in Chinese can fulfil a variety of contradictory functions – such as empathy and de-empathy. It is hypothesized that these paradoxically contradictory functions drive Chinese vocatives to emerge and dissolve in accordance of a dynamic Ba of relationship where the language users remain in a merged and interdependent relationship. Moreover, I will argue that the idea of non-separation of Ba helps explain why the usages of certain vocatives in Chinese function to reinforce a state of non-separation between speaker and recipient at the level of social interaction. In this sense, the research findings can partially explain how empathetic and de-empathetic articulation of vocatives contribute to stabilization of relationship, which is immediate in Ba theory but ignored for some unknown reasons in Western literature.

# An empirical study of the act of congratulations in Chinese social media

Panel contribution

**Mr. Zepeng Wang<sup>1</sup>**

***1. Harbin Engineering University***

Despite Austin's (1962) and Searle's (1969, 1975) claims on the universality of the pragmatic principles underlying speech acts, Green (1975), Wierzbicka (1985), and Blum-Kulka et al (1989) believe that conceptualization and verbalization of speech acts may vary across cultures and languages. This controversy serves as the departure point for the current study that takes the speech act realization of congratulation as a case, which has been widely used but understudied for its nature and importance in creating a harmonious environment. Although Austin's (1962: 150) original classification of the speech acts of congratulating into the 'behabitatives' group is challenged by Habermas (1998), Searle (1969), Bach and Harnish (1979), Leech (1983), and Holmes (1990), the fact that congratulations involve the speaker's demonstration of emotion or attitude stays unanimously agreed (Edmondson 1981). Based on the speech act typology by Edmondson 1981 (see a revised form in House and Kadar 2021), our research intends to pinpoint how congratulation is constructed linguistically in Chinese on the basis of naturally occurring data from social media while testing whether conventional speech act categories can be systematically applied to approach congratulation in Chinese data. Moreover, the present study aims to revisit previous coding schemes of speech acts in light of linguistic pragmatics and explore in what ways they are fully applicable to Chinese data. Against this background, congratulation as a speech act in Chinese is first defined, then strategies which can be used in its execution are detailed and discussed. We argue that the speech act of congratulation in Chinese, a salient behavior of politeness that signifies the effort of the language users' orientation to constructing a harmonious relationship characterized by empathy, benevolence, and identification, must be identified, described, and explained with unique coding schemes of Chinese.

# An exercise in interactional semantics: definitions

Panel contribution

***Prof. Arnulf Deppermann<sup>1</sup>***

***1. Institut für Deutsche Sprache***

In linguistic semantics (e.g., Saeed 2015), social interaction does not play a role for the description, analysis and explanation of meaning. Interactional linguistics, in turn, has yielded a wealth of knowledge about prosody, grammar and action in interaction, but studies of the interactional constitution of the meaning of words and expressions are largely absent (but see Bilmes 2009, 2015; Deppermann 2007, 2020). This paper will make a case for the need and the usefulness of taking an interactional approach to meaning to be termed “interactional semantics”. Interactional semantics is interested in how participants display and negotiate the meaning of expressions they are using in the interaction itself. In contrast to cognitive approaches, meaning is not accounted for by assumptions about mental representations and lexico-encyclopedic knowledge. Instead, interactional semantics zooms in on participants’ practices, by which they clarify, define, contrast, repair, exemplify, etc. the situated meaning of the expressions that they are using (see, e.g., Deppermann 2005, Deppermann/De Stefani 2019, Helmer/Zinken 2019, Helmer 2020, Traverso (ed.) 2016).

Meaning in interaction becomes an issue for participants in particular contexts, namely, non-/misunderstandings, pedagogical instruction/testing, and conflict. In these contexts, participants can be seen to be doing local semantic work by which misunderstandings are tried to be solved, new meanings are explained, understandings are checked, and disputed meanings are tried to be asserted. The talk will focus on the use of definitions and neighboring practices, as in the following extract from a driving school lesson, in which the instructor checks whether the student knows what a green traffic light with an arrow means:

*FOLK\_00168\_SE01\_T\_01\_DF\_01\_c695*

01 INS °h WICHTig is,(0.7) dass du den UNterschied kennst;

*(it) is important that you know the difference*

02 (.) GRüne ampel(.) mit(0.2) pfeil drin(.) HEISST?

*green traffic-light with arrow within means*

03 STU der gegenverkehr bleibt STEHN; (0.3)

*the contraflow stops*

04 INS UND auch die KREUzenden.

*and also the crossers*

05 STU (0.4) ja–

*yes*

By producing a designedly incomplete utterance (Koshik 2002), the driving instructor checks the student’s knowledge about the meaning of the green traffic light with an arrow. The extract shows how for participants issues of definition are inextricably intertwined with the practical use of the referents they denote, here: what to expect and what to observe when encountering a member of the class of objects that the expression denotes while driving a car. In terms of interactional organization, the extract shows how intersubjective meaning is brought about by sequential organization. In the unproblematic case, three consecutive turns by which participants mutually display their understandings of a certain turn are minimally required (Arundale 1999, 2020, Deppermann 2015, Sidnell 2014). As in the extract, four turns are needed in the case of third-position repair (Schegloff 1991, 1992; see the instructor’s turn in line 04) – more complex negotiations will require more extended sequences, until intersubjectivity for all practical concerns is accomplished.

# An Experimental Exploration of Quotidian Framing

---

Panel contribution

---

***Prof. Kerstin Fischer<sup>1</sup>, Prof. Yoshiko Matsumoto<sup>2</sup>***

*1. University of Southern Denmark, 2. Stanford University*

Quotidian framing is a pragmatic strategy originally observed in studies of conversations among older women in Japan (Matsumoto 2011). In the observed conversations, when recounting a painful event such as the death of a husband, the narrator included trivial details from the perspective of ordinary life, thereby reframing the extraordinary event into the “quotidian” with the apparent effect of lightening the atmosphere and regaining a normal life.

In the current paper, we investigate to what extent this strategy is acceptable also in other languages and in situations with other participants, and we aim to gather empirical evidence on the functions of this strategy. The languages investigated are Japanese, English, Danish and German.

Our procedure was to first identify two representative examples from the original data set and to condense the original story told in conversational interaction into more coherent stories that can be told in one multi-turn unit. Then, we had native speakers of the respective target languages perform the narrations, using a technique that has been shown to produce prosodic realizations with very similar characteristics as authentic conversational speech. The way in which these performances are elicited are a) to have a real partner to whom the utterances are presented; b) to allow the speakers to rehearse the speech; c) to allow the speakers to change the one or other word in order to feel comfortable with the utterance (Niebuhr & Michaud 2015). The thus elicited audio files were used to manipulate the synthesized speech files using the speech manipulation software Praat (Boersma 2001) to represent conversational speech melody better. The audio files thus created were then combined with videos of a small, humanoid robot speaking to a female listener, who was portrayed from the back. We chose a female listener since in Japanese, reference to the addressee in terms of gender and status is encoded in the grammatical structure of an utterance.

Next, for each language under consideration, two different videos were created: On the one hand, the video was paired with each audio file comprising the whole story told, including the quotidian framing, on the other, the same video was paired with audio files from which the quotidian framing had been removed. The two conditions are thus identical, except for the presence of the quotidian framing.

To identify the functions of the quotidian framing in the story told, a questionnaire was created, in which participants were first asked demographic information and questions about their attitudes towards robots and about their attitudes towards talking about death, because strong opinions in these two areas may influence participants' ratings of the robot in the videos presented. After having viewed the video, participants were asked questions about the robot. These questions were designed to tease out the suspected functions of the quotidian framing and to elicit culturally relevant distinctions.

The questionnaires were sent to the crowdsourcing platform Prolific, where we aim for 60 responses per language, 30 per condition. Results will be presented at the conference.

# An experimental investigation of perceived disagreement in straw man fallacies

Panel contribution

***Ms. Jennifer Schumann<sup>1</sup>, Prof. Sandrine Zufferey<sup>1</sup>, Dr. Steve Oswald<sup>2</sup>***

***1. University of Bern, 2. University of Fribourg***

In this paper, we investigate whether participants perceive the disagreement between interlocutors when one of them performs a straw man fallacy on the other. In the literature (see e.g. Aikin & Casey, 2016; de Saussure, 2018; Oswald & Lewiński, 2014), the straw man is generally defined based on two core characteristics: the form (i.e. its misrepresenting nature) and the function (i.e. its refutational aim). In previous experiments (Schumann, Zufferey & Oswald, 2019, 2020) we focused on the misrepresentational aspect of the straw man fallacy, demonstrating that its acceptability can vary depending on the linguistic elements that are used to formulate it. The effects we found already contribute to a more fine-grained picture of the fallacy but one question was only partially answered: do participants perceive that the person uttering a straw man attack disagrees with the victim of the fallacy?

To answer this question, we used the same experimental design but this time with measures specifically targeting the refutational aspect of the straw man. We tested 75 people separated in two groups: one group evaluated the perceived agreement between the speakers, the other group evaluated their perceived disagreement. The participants read 40 dialogues on various topics. For each dialogue, the participants had to evaluate Alexander's response to Barbara by answering one question targeting Alexander's agreement/disagreement with Barbara's standpoint and another question targeting Alexander's agreement/disagreement with Barbara's argument. Our results indicate that statements with a straw man fallacy systematically yielded lower acceptability rates, showing that participants intuitively perceive the disagreement between the interlocutors. Furthermore, our results show that participants discriminate between agreements/disagreements with standpoints and arguments. The results also confirm that the formulation of the question (agreement vs. disagreement) makes a difference. Overall our experiments demonstrate that participants are not only sensitive to manipulations that target the form of the fallacy, but also to the factors that target the function of the fallacy.

# An exploratory analysis of discourse relations in TED talks in English and translations into Lithuanian, Portuguese and Turkish: Results from the analysis of an annotated multilingual corpus

Panel contribution

**Prof. Deniz Zeyrek<sup>1</sup>, Dr. Amália Mendes<sup>2</sup>, Dr. Giedrė Valūnaitė Oleškevičienė<sup>3</sup>, Ms. Sibel Özer<sup>4</sup>**

**1.** Middle East Technical University, **2.** University of Lisbon, **3.** Mykolas Romeris University, **4.** Middle East Technical University, Department of Cognitive Science

Discourse relations (DRs) denote the semantic and pragmatic relatedness of discourse units and are crucial for understanding discourse structure. DRs may be explicitly signaled through discourse connectives/DCs ('because, however'), alternate connectors ('that's because') or realized implicitly via adjacency. Corpus-based studies show that the implicit-explicit encoding of DRs varies systematically, affected by factors like relation semantics (Das & Taboada 2018), genre (Hofmockel et al. 2017), or continuity (Asr & Demberg 2012). The investigation of how DRs are encoded in translation also contributes to this line of research (e.g. see Zufferey 2016).

With an empirical goal, we propose to analyze the realization of DRs in English and translations into three less-studied languages (Lithuanian/Portuguese/Turkish) using a state-of-the-art method that exploits information available from a manually annotated multilingual corpus. We seek answers to the following questions to understand whether the implicit/explicit encoding of DRs differs systematically in the data:

- are DRs more frequently explicit or implicit?
- which senses tend to be expressed explicitly?
- how frequent are implicitations (omission of a DC present in English)?

The data ( $n \sim 2500$  DRs) comes from the English/Lithuanian/Portuguese/Turkish parts of TED-Multilingual Discourse Bank reliably annotated for DRs and their constitutive discourse units in six TED talks in seven languages within the Textlink project (<http://textlink.ii.metu.edu.tr/>) following the Penn Discourse Treebank principles (Zeyrek et al. 2019). We use descriptive statistics, and the chi-squared test to analyze the data.

Results from 484 parallel DRs indicate certain trends across languages (e.g. DRs are overall more frequently explicit than implicit), and reveal some patterns where languages differ from English or each other (e.g. causal relations are more frequently explicit than implicit in English, a pattern followed by Turkish but not Portuguese and Lithuanian). We will assess whether our first findings extend to the whole corpus and discuss the results in comparison to the findings in the literature.

# An Impersonal Axis of Combination: Poetic Function and Life Trajectories in Iran

Panel contribution

***Prof. Setrag Manoukian<sup>1</sup>***

**1.** McGill University

Drawing on ethnographic research in contemporary Iran, this paper examines how, by constituting an impersonal plane of existence, poetry provides an alternative to life's challenges and a respite from medicalized relationships to oneself and the world. Though in Iran, as Behroozan (2016) argued, biomedicine might nowadays have replaced poetry as a means to address psychic instability, the Persian poetic tradition remains relevant to think or cope with affective states. However, rather than probing the therapeutic value of poetry, not unlike Bateson studying schizophrenia to reflect on the "pattern that connects," this paper reflects on the power of poetry to destitute biography. Developing the existential potential of Jakobson's idea of poetic function, I describe how the projection of the axis of selection onto the axis of combination enables an affective modality with alternative connective patterns to one's existence. In 2015, an elderly shopkeeper famous for his quatrains sat in a courtyard in Shiraz, reciting his verses to an ethnographer. Sudden shifts in voice and body jolts accompanied fragments of life stories, national events and psychiatric treatments, interspersed with verses channeling the poems of the fourteenth century poet Hafez. These shifts signalled movements between times and places but also passages between different relational modalities to oneself and the world. The shopkeeper's verses sharply diverged from the account of his life. In contrast to his descriptions of political disruptions and mental suffering, his verses performed a mystical quest in ordered and conventional meter, rhymes and metaphors. The poet's gestures and commentary framed the verses as coming to him from a separate domain of experience: the semiotic and semantic dimensions of the poem appeared tautologically focused on the message itself. If, with Jakobson, poetic experience rests on the play between warranted and frustrated expectations, the shopkeeper's verses engaged in such play by expressing an impersonal territory that transcended his own biography – a plane of sensations alternative to his schizophrenic associative chains, which, the poet explained, collapsed reality and imagination into one. The poetic function operates as an axis of combination that in structuring one's selection processes within the conventions of genre makes possible the experience of what would otherwise be inaccessible. The exclusion of the poet's affective states and their political entailments warranted poetic experience. In a critical dialogue with Jakobson's essay on Hölderlin, I argue that, in the Shiraz courtyard, poetry made sense of life by displacing it. Unlike Paul Celan or Ann Sexton's verses that capture something of their affective states, and complementary to studies of the association between poetic discourse, mental disorder and personality (for example Biehl 2013), this case illuminates how poetic ordering reconfigures a life by producing an impersonal axis of experience. The social meaning of the poetic function lies in its potential to reconfigure one's psychic and social destiny, destituting one's biography by reframing it in the apparently self-contained, but in reality existentially unfolding process of poetic diction.

# An “attractive alternative way of wielding power”? Hidden ideologies of gender in the portrayal of women heads of state during the Covid-19 pandemic

Panel contribution

**Dr. Stephanie Schnurr<sup>1</sup>, Dr. Sophie Reissner-Roubicek<sup>1</sup>, Dr. Carolin Debray<sup>2</sup>, Ms. Joelle Loew<sup>3</sup>**

***1. University of Warwick, 2. Universität Hildesheim, 3. University of Basel***

In line with the panel’s focus on gender, power and ideology in political discourse during the Covid-19 pandemic, this paper explores the gendered discourses of the – seemingly favourable – media coverage women heads of state worldwide are receiving for their handling of this crisis.

Looking at opinion pieces published in different media outlets and using Critical Discourse Analysis, we identify and describe some of the discursive and pragmatic strategies through which female leaders around the world are constructed as doing better in handling the Covid-19 pandemic than their male counterparts. While these texts on the surface appear to challenge hegemonic – and largely masculine – discourses of leadership, we argue that these pieces in fact reinforce these discourses of leadership and their underlying discriminatory gender ideologies (for a similar argument see Cameron, 2020). We discuss how this is discursively achieved in the opinion pieces and show how complimenting women leaders on their performance continues to compare them against the masculine norm of what Grint (2010, p. 69) calls the “tall, handsome, white alpha males (of) privilege” in constructing their leadership as “alternative” and exceptional.

This gendered portrayal of political leadership in times of crisis thus illustrates how the discursive construction of identities, responsibilities and relationships during Covid-19 is largely hinging on power relations and political ideologies that systematically disadvantage and undermine women. The purportedly positive form in which this occurs makes it particularly difficult to challenge and subvert these discourses of leadership and their underlying gendered ideologies.

# Analysing Cross-Cultural Socio-Pragmatic Failure (CCSPF) in the classroom

Panel contribution

***Mr. Johannes Schulz***<sup>1</sup>

**1.** Postgraduate Student Oxford University Applied Linguistics

In order to communicate successfully, pragmatic competence in L2 education is at least as important as achieving sound grammatical competence. In fact, research on *Cross-Cultural Socio-Pragmatic Failure* (CCSPF) has shown that pragmatic failure becomes even more severe with increasing grammatical competence of a non-native speaker: in such cross-cultural settings, “pragmatic failure reflects badly on [the speaker] as a *person*” (Thomas 1983: 96f) and reinforces negative stereotypes such as “‘the abrasive Russian/German’ [...], ‘the stand-offish Briton’” (Thomas 1983:97).

A frequent source for CCSPF is the identification and comprehension of implicatures. In my talk I will present a linguistic tool I have designed that aims at identifying such implicatures induced by underlying culturally informed perspectives – the *Unintended Implicature Deduction Process* (UIDP). The model is predicated on a Gricean Implicature analysis expanded by a fifth maxim of politeness (cf. Kallia 2007) and on a system of communicative value dimensions (i.a. (in)directness; cf. House 2006). The deduction process involves the six steps shown in (1):

(1)

[X is a research-data-based system of communicative value dimensions, e.g. House (2006)]

1. *S (speaker) utters A and intentionally implicates B according to his/her habitus. B can also be a standard conversational implicature.*
2. *S is aware that H (hearer) is located elsewhere in X than S him/herself.*
3. *Filter: Depending on the classification of H in X, S estimates the importance and communicative-value-dependent interpretation that H is likely to ascribe to the five maxims during the deduction process of A.*
4. *S, now being aware of these ascriptions, reassesses his/her own utterance, re-operates the deduction process that H is most likely to apply and arrives at C, the cross-cultural, unintended implicature that H is most likely to arrive at from A.*
5. *S, being aware of B and C, can now adapt his/her attitude towards H's potentially inadequate/impolite reaction in order to avoid misunderstandings or the reinforcement of stereotypes.*
6. *The same applies for H the other way around.*

In my presentation, I will apply the UIDP to authentic data of politeness-misunderstanding in a German-English setting (medical staff). The application will show how the UIDP makes indiscernible cross-culturally informed implicatures visible, tangible and also comprehensible to learners.

As it is impossible to fully predict human communication, rather than being a purely theoretical linguistic tool, the UIDP is meant to be a technique of didactical reduction, that can be applied in classroom settings and, thus, adjust L2 learning strategies to improve the outcomes of pragmatic competence. Students themselves might have come across situations of CCSPF before – without understanding the background settings. With little to no linguistic knowledge required on the students' part, the UIDP allows educators in the classroom to explain and make comprehensible the difficult linguistic mechanisms that underly CCSPF.

# Anger: A Contrastive Pragmatic Analysis

---

Panel contribution

---

**Prof. Daniel Kadar**<sup>1</sup>, **Prof. Juliane House**<sup>2</sup>

1. Dalian University of Foreign Languages, 2. University of Hamburg

In this talk, we contrastively examine Chinese, German and British English expressions of anger in the realisation of various speech acts, including Complaint, Request, Congratulate, Excuse/Justify and Thanks. We will argue that manifestations of anger can be captured in an empirical corpus-based way if we focus on breaches of the conventionalised ritual frame holding for these speech acts. This theory is based on our previous work (see Kadar and House, 2020; House and Kadar, 2021), in which we provided a model systematically interconnecting pragmatically important expressions, speech acts and discourse. However, in this framework we have not discussed emotions, although emotions seem to us a very important aspect to contrastively examine language use. In the research presented in this talk, we extend our model to capture emotional facets of the various discursively embedded speech act categories under investigation.

# Antiracism, liquid racism, or internalized racism? Scrutinizing a newspaper article written by a young migrant in Greece

Panel contribution

***Prof. Argiris Archakis<sup>1</sup>, Dr. Villy Tsakona<sup>2</sup>***

***1. University of Patras, 2. National and Kapodistrian University of Athens***

One of the main concerns of Applied Linguistics during the last thirty years in Greece has been to examine how migrant students who crossed the geographical borders and entered Greece will also cross the Greek symbolic borders. That is to say, how they will learn the Greek language and adopt the dominant Greek cultural characteristics in order to become accepted by the majority (cf. May 2017: 149, Bennett 2018: 1). In this paper, we rely on the premise that Greek national discourse promotes linguocultural homogenization within the Greek borders often through racism against migrants. Racist homogenizing practices are not always explicit, but are quite often *liquid*, namely covert, indirect, and hard to trace (Weaver 2016). The effective promotion of national homogenization not only naturalizes linguocultural assimilation, but may also infiltrate antiracist discourse, and eventually lead to migrants' internalization of racism (Pyke 2010).

Within the framework of Critical Discourse Analysis, we analyze an article written by a young migrant in Greece and published in a newspaper of leftwing and antiracist orientation, investigating whether and how the migrant's text aligns with the Greek national discourse promoting migrants' assimilation. The article proposes that the communication problems migrants face in host countries such as Greece can be overcome 'only' through learning the host language and culture, in the present case, Greek.

Our analysis relies on the interaction between national discourse (at the macro-level) and the migrant author's discoursal choices and their implications for the Greek readership (at the micro-level). Exploiting Hoey's (1983) *Problem-Solution pattern* and the concept of *face* (Brown & Levinson 1987), we argue that the structural and interactional choices made by the migrant author (at the micro-level) comply with the homogenizing impositions and goals of the national discourse (at the macro-level), especially as far as linguistic assimilation is concerned. More specifically, the analysis in terms of the *Problem-Solution pattern* demonstrates that the author perceives learning Greek as the main and most effective solution to the communication problems migrants face in their encounters with Greek majority members. As a result, the migrant author's proposal for assimilating to the language of the Greek majority enhances the collective positive face of her Greek majority readers (cf. Brown & Levinson 1987, Sifianou & Bayraktaroğlu 2012), while she simultaneously represents Greek speaking migrants as "suitable others" (Barsky 1994: 5, 164), namely as willing and ready to comply with majority norms and expectations. Concurrently, racism emerges as liquid (see above), since the text expressing the author's internalized racism is published in an antiracist newspaper. The article reproduces racist standpoints typical of the dominant national discourse in a way (and in a context) that disguises such standpoints and deflects any antiracist criticism potentially raised against them. Thus, the hegemony of Greek national discourse is further reinforced.

## Acknowledgments

The research work was supported by the Hellenic Foundation for Research and Innovation (H.F.R.I.) under the "First Call for H.F.R.I. Research Projects to support Faculty members and Researchers and the procurement of high-cost research equipment grant" (Project Number: HFRI-FM17-42, HFRI 2019-2022).

# Apologies and facework in the history of Italian: from negative to positive politeness

Panel contribution

**Ms. Tanja Trebuichi<sup>1</sup>, Ms. Chiara Fedriani<sup>2</sup>, Dr. Chiara Ghezzi<sup>3</sup>**

**1. University of Bergamo, 2. University of Genoa, 3. Università di Bergamo**

Cooperation in conversation is often motivated by the need to maintain face, which is mutually vulnerable because it has emotional imports, and a vast number of speech acts have the potential to threaten it. The behaviour motivated by these concerns for face is ‘politeness’.

Apologies represent prototypical face-threats to the positive face of the speaker, as they are acknowledgements that the speaker has done something that might demean his/her standing in the eyes of the addressee. Therefore, apologies can be considered positive politeness strategies which protect the speaker’s face and minimize potential conflicts (Held 2005, Leech 2014: 121). These acts contribute to modulating interpersonal relations and are highly ritualized as linguistic indicators of ‘politic’ and socially institutionalized behavior (Jucker/Taavitsainen 2010: 160).

Recent studies on Italian apologies underlined how many polite functions of these speech acts are recent developments that do not characterize previous stages of Italian (Ghezzi/Molinelli 2019). Over the centuries not only Italian speakers tend to apologize more frequently, but they also overextend the use of the apology marker *par excellence*, *scusa* ‘excuse me’, to other polite functions in addition to repair work, e.g. addressing someone by cueing a request or calling for attention.

Moving from these findings, this paper analyses the empirical realization of face and facework from the perspective of historical pragmatics. Our study is philological in essence, as it is based on a selected corpus of plays throughout the history of Italian, and aims at deepening the diachronic development of apologetic acts in relation to different ways of perceiving and enacting face.

Our data show a change with time in the use of apologetic acts which are more oriented to negative face in earlier centuries and to positive face in later ones. Until the 18th century most apologies were truly apologetic acts, expressing social indexing and aiming at preserving the established etiquette, with a clear orientation toward negative politeness concerns. From the 20th century onward, apologies are more routinized and used mostly in mixed messages connected to potentially FTA – thus being more involved in socio-pragmatic contexts implying facework and positive politeness practices. This corresponds to a greater use of the apology marker *scusa* and to a higher degree of its intersubjectivity and polyfunctionality.

In this diachronic analysis, we take into consideration the comparison of polite behaviour in different social groups at different times and different social contexts, its relationship with the notion of face, and their developments through time – this ultimately shedding light on the diachronic instability of the notion of face itself and on its dynamic relation with politeness.

# Apology as hypocrisy: Examples from Bill Clinton and Donald Trump

Panel contribution

***Prof. Helena Halmari***<sup>1</sup>

**1.** Sam Houston State University

In this presentation, I approach the pragma-linguistic aspects of hypocrisy by focusing on one kind of speech event: apologies. Intuitively, apologies fall into sincere and insincere ones. The latter are typically also considered as hypocritical. Yet, to study the linguistic manifestations of hypocrisy, one must go beyond the average language user's intuitions in order to unveil how hypocritical apologies differ from sincere ones.

I analyze two notorious apologies—Bill Clinton's 1998 apology about the Monica Lewinsky affair and for his previous lie about it under oath, and Donald Trump's 2016 apology after a recording of his vulgar comments about women surfaced during the final weeks of the presidential campaign. I address the following questions: What is the connection between the speech event of apology and verbal hypocrisy? What components and what changes in felicity conditions define an apology as, distinctively, a hypocritical one? My starting point is earlier research on components of apologies (Blum-Kulka et al. 1989) and their felicity conditions (Searle 1969; Leech 2014).

I argue that hypocritical apologies can be separated from sincere ones via a detailed analysis of move structures and felicity conditions. *Oxford English Dictionary* defines *hypocrisy* as “assuming of a false appearance of virtue or goodness, with dissimulation of real character or inclinations [...]”; hence in general sense, dissimulation, pretense, sham.” For *apology*, *OED* gives three meanings, of which two reflect the classical definition of *apologia*, a statement in defense of one's previous actions. Only the third *OED* definition reflects today's popular understanding of an apology as involving a Hearer who has been wronged and a Speaker's expression of contrition.

Clearly, the felicity conditions for hypocritical and non-hypocritical apologies are different, and public apologies must be studied as realizations of the classical definition: justifications, explanations, and defenses for one's wrongdoings. This, *per se*, does not make these apologies hypocritical. It is the added moves toward the end of the apologies (absent from “genuine” apologies) that make my examples hypocritical. Clinton shifts the topic to remind his audience that it is time to move on; Trump points out that his vulgarities are merely language, and, by contrast, the Clintons have committed worse crimes than he. Both mention that what necessitated their apologies was a politically motivated attack (i.e., they are “victims”). These apologies are not hypocritical because of the potential mismatch between speakers' words and intentions; it is the motivation that makes them hypocritical. Both men hoped to continue their political careers: Clinton did not resign, and Trump did not abandon the presidential race. By contrast, a non-hypocritical apology does not attempt to justify one's transgressions by reducing their consequences to a distraction or by pointing at others' wrongdoings. These contextual factors must be built into the definitions of the hypocritical apology.

# Apparently in an English-Swedish contrastive perspective

Panel contribution

***Prof. Karin Aijmer<sup>1</sup>***

**1.** University of Gothenburg

## *Apparently* in an English-Swedish contrastive perspective

Recent years have witnessed a growing interest in evidentiality also in languages where epistemic modality is most prominent such as English. Evidentiality in narrow sense refers to the information on the basis of which a statement is made and can be encoded grammatically or lexically in language. A question frequently debated in research on evidentiality concerns the relationship between evidentiality and epistemic modality (see Squartini 2016 and the references there). Evidentiality has here been regarded as a mixed category where evidential and epistemic adverbs are intertwined (Dendale and Tasmowski 2001). The epistemic meaning is not explicit but the speaker indicates the degree of reliability of the information by referring to the source of evidence. Evidential adverbs have mostly been discussed when they imply certainty (*clearly, obviously*). On the other hand, *apparently* conveys that the speaker is uncertain that a state of affairs will take place (has taken place). The aim of this paper is to disentangle the modal and evidential meanings that *apparently* can have on the basis of its cross-linguistic correspondences. This also involves investigating the types of evidence associated with *apparently* (perceptual, inferential, reportative) and their association with modal meanings.

Methodologically the study is based on parallel corpora. The hypothesis is that *apparently* is multifunctional and that its meanings can be specified in the translations to another language. The occurrences of *apparently* have been retrieved from the fiction part of the English-Swedish Parallel Corpus (ESPC) (about 1.5 million words) (<https://spraakbanken.gu.se/en/resources/espc>). The corpus is used to search for examples of *apparently* and their correspondences in Swedish both in translations (English originals->Swedish translations) and in Swedish sources (English translations ->Swedish sources). The translation paradigms show what the Swedish equivalents are and their frequencies. Confirming evidence for the different meanings of *apparently* will be provided by its correspondences in French and in German.

The preliminary results indicate that several linguistic factors are relevant for how *apparently* is translated, for example whether the evidence is unspecified (Swe *tydlig* ‘obviously’) or whether it refers specifically to perception (Swe *till synes* ‘as can be seen’). The translations distinguish between the inferential meaning of *apparently* which is evidence-based (‘it is apparent that’) and implies probability and meanings based on the speaker’s perception of reality or unreality (‘seems as if’). When *apparently* is pragmatically ambiguous between the two meanings one of the meanings may be foregrounded by the translator. The cross-linguistic correspondences show that *apparently* has also developed the function of hearsay from the inferential meaning.

# Are “we” European? Self- and other-reference in British national newspapers in 1975-2015

Panel contribution

***Ms. Jenni Räikkönen<sup>1</sup>***

**1.** Tampere University

Before Brexit, the first-person plural pronouns increasingly referred to the UK alone and less to the whole European Union in British parliamentary debates related to the EU (Räikkönen 2019), emphasizing the national point of view to EU-related issues instead of the European point of view. In this study, I diachronically examine the use of the pronouns *we*, *us*, *they* and *them* in British newspaper articles about the EU to see whether the trend observed in the parliament can also be found in newspapers. Has the main point of view in the articles been national, European, or something else? Also, who are “they” in newspaper articles about the EU? I compiled a corpus for this study, consisting of 940 full newspaper articles about Europe and the EU from four British national newspapers – two broadsheets (*The Daily Telegraph* and *the Guardian*) and two tabloids (*Daily Mirror* and *Daily Mail*) – from the years 1975, 1985, 1995, 2005 and 2015. The size of the corpus is approximately 475,000 words. Using methods of corpus-assisted discourse studies (CADS) (Baker 2006; Partington et al. 2013), I analysed the referents of all instances of the first- and third-person plural pronouns *we*, *us*, *they* and *them* in the articles. Which entities do these pronouns refer to in the newspapers? Do *we* and *us* refer to the UK itself, to Europe/the EU or something else? I also investigated the ways in which the newspapers differ from one another in this regard.

The results suggest that, of the volumes studied, the 1985 and 2005 volumes were the most European-centred, i.e., the first-person plural pronouns referred more to the EU than in the other volumes, while the volumes of 1975 and 2015 – the years when there were national referenda on EU membership – were the most UK-centred. In the right-affiliated papers (*The Daily Telegraph* and *Daily Mail*) *we* and *us* referred more to the UK and less to the EU than in the left-affiliated papers (*The Guardian* and *Daily Mirror*), and on average, *Daily Mail* was the most UK-centred of the titles studied. In EU-related articles, “they” have often been national politicians, EU’s leading politicians or “the core” of the EU, i.e., France and Germany.

# Ascribing and demonstrating ‘knowing how’ to a co-expert – neurological examinations in triadic telemedical stroke consultations

Panel contribution

***Prof. Karin Birkner<sup>1</sup>, Dr. Alexandra Groß<sup>1</sup>***

***1. University of Bayreuth***

Telemedicine has increased considerably in patient care, especially in the case of acute conditions. In our paper we investigate telemedical consultations in a triadic setting between patients with suspicion of a stroke and an attendant physician (face-to-face), consulting with a neurological telemedic in a remote clinic (face-to-screen). These interactions are focused on the examination which aim at diagnosing what kind of neurological damage has been experienced by the patient. Conducting them in *fractured ecologies* (Luff et al. 2003) requires the inter-professional collaboration of the attendant physician and the remote neurologist. Recruited by the telemedic (Floyd et al. 2020), the attendant physician assists (Zinken & Rossi 2016, see also Kendrick & Drew 2016) the telemedic as an “extended arm” in different neurological tests. This has to be achieved in such a way that the telemedic can make a diagnosis by observing the bodily reactions of the patient (e.g. assessing the reaction of the pupils to light, following movements of a finger, etc.).

Using the methods of multimodal conversation analysis for examining the interplay of talking, examining and perceiving professionally, this paper focuses on the multimodal and multimedia practices of instructing (e. g. Stukenbrock 2014) in order to accomplish neurological testing (Birkner & Groß in print). We will show that the orientations to co-expertise and possible lack of declarative or procedural knowledge is evident in the recipient design of the requests for action. Our findings show that the telemedics initially tend to ascribe K+ knowledge (Heritage 2012) to the attendant physicians, before they proceed to perform the tests (*knowing how* as professional procedural knowledge). The attendant physician has to anticipate and secure visibility for the remote neurologist (*knowing how* as ad hoc adjustment to the mediatisation and the fractured referential dimensions). Further, by instructing the patient on how to collaboratively execute the tests appropriately, the attendant physicians demonstrate professional ‘*knowing how*’ both verbally and in an embodied way (see Sacks 1992 on *demonstrating vs. claiming knowledge*). Failed test performances and repair disclose that ascribing knowledge about professional procedures makes primary use of medical terminology, while transferring ‘*knowing how*’ tends to make use of embodied demonstrations.

# Asking the obvious: Other-repeats as requests for (re)confirmation

Panel contribution

***Mrs. Marit Aldrup<sup>1</sup>***

1. University of Potsdam

Other-repeats – that is, full or partial reproductions of a co-participant's prior turn – are a popular object of conversation-analytic and interactional-linguistic research. Depending on their sequential environment, position, and prosodic design, they may be used for various interactional ends (see Betz et al. 2013: 135-136 for an overview). On a basic level, we can distinguish between repeats which initiate (retro-)sequences, responsive repeats in second position, and repeats which serve as sequence-closing response receipts in third position (Schegloff 1996: 177-178; 2007). While repeats in second and third position need not be taken up by the co-participants, second sayings in sequence-initial position typically entail a response in that they reissue (part of) a prior speaker's turn for reconfirmation.

The present study focuses on such sequence-initiating other-repeats, which have variably been treated as repair initiations (e.g. Benjamin & Walker 2013; Dingemanse, Blythe & Dirksmeyer 2014; Robinson 2012; Selting 1996) and newsmarks (e.g. Heritage 1984; Jefferson 1981; Schegloff 2007: 155; Wilkinson & Kitzinger 2006) in previous research. Drawing on video recordings of informal German and English face-to-face conversations as data, it investigates the interactional deployment and multimodal design of these other-repeats from an interactional-linguistic perspective (Couper-Kuhlen & Selting 2018). The aim is to tease apart repair-implicated and news-marking uses more clearly and to locate requests for reconfirmation (like other-repeats) in relation to other types of confirmable turns-at-talk (like 'simple' requests for confirmation and candidate understandings).

## Asking where someone is: An in-passing corridor activity

---

Panel contribution

---

***Prof. Esther González Martínez<sup>1</sup>***

*1. University of Fribourg*

We are conducting a research project that deploys multimodal conversation analysis (Stivers, Sidnell, 2005) to study unscheduled on-the-move interactions among hospital personnel. These interactions are prevalent at the hospital, and accomplish relevant organizational work there (Burm et al., 2018; Crawford, Brown, 2010), but detailed analysis of them is nevertheless still rare (González-Martínez et al. 2016, 2017a, b). The project is based on a corpus of video recordings captured in the corridors of an outpatient clinic at a hospital in the French-speaking part of Switzerland. The clinic's staff included several physicians, nurses, nurses' aides, nursing assistants and students as well as the clinic secretary. The recordings document staff activities taking place in the clinic's corridors and adjacent liminal spaces such as the entrance areas of treatment rooms.

The paper focuses on a specific in-passing interactional activity. Staff member A asks colleague B where colleague X is and B responds. The question is conveyed by an interrogative like: "Is X there?", "Is X in the (name of the room)?" or "Have you seen X?". Recurrent responses are "Yes", "No" and epistemic disclaimers like "I don't know", sometimes followed by informings on X's whereabouts. In some cases, the talk ends there. In other excerpts, the talk continues with A acknowledging the response, accounting for his or her search for X and other activity-related actions. These interactions do not have formal opening and closing sequences. They are monofocal talk events concentrated on one unique main activity. In terms of bodily conduct, the examined excerpts have several common features. One or both staff members are on the move as they talk. They come close to each other and then shift away without stopping their walking. The specific spatial configuration varies: participants may engage in talk as they pass by each other following parallel trajectories in opposite directions, while crossing past each other, or when converging in a transient common spot. Sustained close face-to-face interaction is not required to produce the studied activity.

The paper examines how talk and bodily conduct are articulated to produce conformations recognizable as instances of a particular action (Schegloff, 2007, p. xiv). We show that talk is carefully organized to be recognizable as accomplishing an action projecting and requiring only a minimal response. Participants shape and deal with the "Is X there?" type question as just a brief inquiry, versus for instance a request for help requiring a more elaborate response. Our analysis thus provides insight into the specificities of contingent, mobile interactional work practices that incorporate strong time constraints and calls for efficiency. The paper contributes to the panel by examining an ordinary workplace activity that exhibits and constructs participants' belonging to a team that conducts interrelated activities and whose members' whereabouts are accountable and accounted for each other.

# Assessing pragmatic competences of children with autism spectrum disorder

Panel contribution

***Ms. Lisa Vössing<sup>1</sup>, Prof. Friederike Kern<sup>1</sup>***

***1. Bielefeld University***

As the term autism spectrum disorder (ASD) suggests, autistic children show heterogeneous language competences. The communicative skills range from autistic children without functional speech to those with predominantly pragmatic impairment (Eberhardt & Snippe, 2016; Wilkinson, 2019). The latter are often said to experience problems in conversation and social interaction because of perceived difficulties in e.g. maintaining conversation, sharing topics or considering the interlocutor's perspective and needs (Paul, Landa & Simmons, 2014).

There are a variety of methodical approaches to assess those pragmatic characteristics. On the one hand, clinical language pragmatics assessments (partly validated) e.g. standardized tests, checklists and profiles are used, while on the other hand, qualitative approaches, e.g. ethnomethodological conversation analysis, are also employed, the latter focusing on interaction between all participants, not only on the child's performance, to describe communicative patterns (Adams, 2002; Fasulo & Fiore, 2007). Test settings have been criticized to insufficiently capture autistic children's interactive competences, as clinicians are constrained by the standardized interaction protocols of diagnostic instruments, thereby contributing to the reduced competences measured according to the diagnostic test procedures (Maynard & Turowetz, 2017).

In our paper, we will compare the notion of pragmatic competence as operationalized in clinical assessments with autistic children's interactive competences shown in authentic conversational interaction at home, thereby aiming to get a better understanding of the role of participants and contexts for autistic children's competence displays. The matter of interest is whether the pragmatic items from checklists employed in clinical assessment (e.g. little reciprocal exchange, irrelevant/ inappropriate detail) match the pragmatic competences revealed in authentic interactions (e.g. management of turn-taking-system, recipient design of turns). The comparison should shed light on the appropriateness of clinical assessments procedures for detecting pragmatic competence. The paper will discuss the limits and potentials of an empirically based evaluation procedure for autistic children's pragmatic competences by taking empirically based, CA-informed studies into account.

# Athlete, Vienna, 14teen: #EinTagohneFußballisteinverlorenerTag – Identity Construction and Impression Management of Young Female Footballers on Instagram

Panel contribution

**Ms. Melanie Fleischhacker<sup>1</sup>, Prof. Eva-Maria Graf<sup>1</sup>**

***1. University of Klagenfurt***

Social networking sites such as Instagram play an increasingly important role in the construction and negotiation of people's personal, professional and social identities online (Benwell and Stokoe 2006; Page 2012; Georgalou 2018). Especially for athletes, social media in general and Instagram in particular, thereby provide unique technological and semiotic opportunities for identity crafting, strategic self-presentation and impression management (Thurlow and Mrocze 2011; Herring, Stein and Virtanen 2013; Reichart Smith and Sanderson 2015; Sheffer and Schultz 2015). This includes a careful selection of identity facets or position features to be displayed with the help of various modes and practices; as such, online self-presentation entails acts of foregrounding and/or backgrounding certain identities (File 2015; Tagg 2015; Baker and Walsh 2018).

This is of particular relevance for professional female athletes such as footballers, whose athletic identity still seems to go against the grain of "ideal" femininity (Scranton et al. 1999; Cox and Thompson 2000; Harris 2007; Jeanes and Kay 2007; Jeanes 2011). In response to hegemonic discourses, female footballers often foreground feminine identity traits such as physical attractiveness (e.g. long hair and nails, make-up, sexy dresses) and heterosexuality (e.g. topicalizing male partners).

Against the backdrop of these tensions, this contribution more generally examines multimodal identity construction and impression management in the posts of young female footballers on Instagram: 1) What identities (e.g. athletic, gender, adolescent, cultural etc.) are foregrounded or backgrounded across all posts? 2) Looking into the posts of individual footballers, what kinds of identities do these players foreground? How do they strategically enact e.g. an athletic identity and thereby practice impression management?

The data comprises all Instagram posts and stories posted by 11 young female footballers aged 14 to 16 from Austria in June 2018. We will focus on both image and text and, in particular, on how images, captions, hashtags and emojis are (strategically) used to construct and foreground various identities on Instagram; special attention will be paid to the strategic enactment of the players' athletic identity and how this (possibly) bears on their feminine identity construction. The data will be analyzed applying (visual) content / thematic analysis (Braun, Clarke and Weate 2019) to carve out *what* players display as part of their various identities. Moreover, Multimodal Social Semiotics (Kress and van Leeuwen 2001; 2006; van Leeuwen 2008) allows for the analysis of *how*, i.e. via what modes, they engage in virtual identity construction and impression management. Here, both a separate and a comprehensive analysis of the modes players use for such displays will be carried out.

# Attention in Action – The Companions’ Conversational Practices with Intellectually Disabled Stage Artists

Panel contribution

***Dr. Maud Verdier<sup>1</sup>***

*1. Laboratoire Ligérien de Linguistique - UMR 7270*

Recently, there has been a substantial transformation in performing arts due to the professionalization of individuals with intellectual disabilities in the artistic field. This paper examines the nature of the accompaniment implemented by those who care for and support professional actors. In France, public organizations such as the ESAT, play a central role in organizing the professionalization of adults with intellectual disabilities (Couder 2020). The ESAT related to the artistic sector provide a safe and caring environment for the adults with disabilities who find constant support to perform at a professional level. Whereas numerous studies span the link between art and care, very few have examined the nature of the accompaniment needed for professional artists with disabilities (Creux 2014), which is understandable given the poorly organized professional trainings for artists with intellectual disabilities. This paper analyses the nature of the attention companions need to acquire and develop in the specific context of the performing arts.

The paper is based on the ethnographic study of the French theatre company of an artistic ESAT of twelve actors and actresses with a range of intellectual disabilities. It includes the observation and the video recordings of the entire creative process, from the first read-through and the rehearsals, to the public performances. The video data document the complex semiotic and interactional resources that contribute to the creation of a play, including the nature of the support that contributes to the artistic work. They are transcribed and analysed according to Conversation Analysis.

Care and attention in the theatrical context require a complex mode of participation from the individuals who support the actors during the rehearsals. The presentation will focus on times where care workers mediate between the artists with disabilities and the stage directors. These forms of attention and care involve a specific relation to all the participants involved in the creative process. Three dimensions must be considered: (1) *The allocation of responsibility*: When a problem arises, who can act on it and when; who is in charge of what?; (2) *The attention*; (3) *The modes of action and participation*. The creative work being based on the relationship between the director and the actors and the actresses, care and support require a subtle positioning, which is likely to change according to the requirements of the creative process. This paper studies the interactional formats and practices for displaying modes of attention during rehearsals, in relation to the nature of the activity and the participant framework. The demands of the theatrical production explain why the companions are required to leave the mode of echoing the stage director’s requests, and take a more active role in the setting. Addressing the rehearsal sequences will demonstrate the transformation of the stage director’s instructions when they are communicated by the “third party” in the interaction. It emphasizes the specific nature of the “attention in action” deployed by the caretakers as a form of transposition of their attention into activity.

# Authorizing authenticity: The Influencers' lives as formatted small stories

Panel contribution

***Prof. Alexandra Georgakopoulou<sup>1</sup>***

***1. King's College***

Small stories research has been extended in my work as a critical paradigm for interrogating the current 'story-telling boom' on social media, which includes designing stories as specific features (i.e. on Snapchat, Instagram, Facebook, Weibo, LinkedIn). The popularity of stories with influencers, ordinary users & businesses alike is such that sharing through stories has now overtaken sharing through feeds. In other work (Georgakopoulou 2019; Georgakopoulou, Iversen & Stage 2020), through a technographic tracking of such story-facilities & a corpus-assisted discourse analysis of the platforms' own ideologies about stories, I have documented three *directives* (cf. prompts, preferential conditions) to users in the design of stories that result in the recognisability and normativity (cf. formatting, Blommaert et al 2020) of specific modes of storytelling online: i) sharing life-in-the-moment, ii) audience engagement as quantified viewing, and iii) authenticity in tellers' self-presentation. In this presentation, using a corpus of Instagram Stories, I zoom in on the role of (female) Influencers in authorizing (cf. naturalizing, legitimating, Jaffe 2011) the directive of authenticity through stories. I bring to the fore certain linguistic, visual, and plot-based choices that are mobilized for presenting an 'authentic' self and life. In the process, I demonstrate the role of the pragmatics of affect in constructing authenticity in online storytelling.

# Automated assessment of writing and pragmatic competence: a critical review.

---

Panel contribution

---

*Mr. Curtis Gautschi<sup>1</sup>*

*1. ZHAW*

The automated scoring of essays and other written texts (AES), by means of natural language processing tools, is playing an ever-increasing role in the evaluation of writing ability. While able to provide quick, cost-effective and consistent feedback to learners of foreign languages (Shermis & Burstein, 2013), the use of computers to assess writing skills has been met with considerable scepticism (Condon, 2013). Of particular concern is the issue of construct relevance and representation in the automated assessment of writing (Weigle, 2013), which has relied heavily on a narrow range of linguistic features (e.g., McNamara, Crossley & McCarthy, 2010), cohesion markers or complexity indices (e.g., Coh-index; see Allen, Jacovina, & McNamara, 2016). Thus, while aspects of organizational competence (e.g., grammatical, lexical, syntax and text-level organization) are to some degree measurable, the valid measurement of pragmatic competence remains a challenge for AES (e.g., communicative facets including message conveyance, communicative intent, sensitivity to genre, and the socially constructed transfer of meaning - see, Allen et al., 2016; Bridgeman, Powers, Stone & Mollaun, 2011; Deane, 2013). This has been acknowledged by leaders in the high-stakes AES industry in their efforts to improve the measurement of pragmatic aspects in the communicative paradigm for both automated assessment of writing and speaking (e.g., Chen et al., 2018; Evanini, Hauck & Hakuta, 2017).

This presentation seeks to problematize the issues raised above. First, an AES tool and CEFR-level prediction algorithm created and experimentally implemented at a major University of Applied Sciences in Switzerland as part of an online English placement test for first-year engineering students (Gautschi, 2020) is critically examined with respect to its design, results and coverage of pragmatic competence aspects. Second the AES tool is placed within the context of current AES research and approaches to modelling pragmatic competence, with a view to critically reviewing:

- current scoring model approaches
- claims of communicative and pragmatic competence assessment
- advancements in scoring accuracy through deep learning / neural network techniques
- the reliance on human-machine agreement for validation support.

Finally, it is argued that the value of future AES in testing crucially requires the active involvement of linguists and applied linguists to safeguard construct coverage of pragmatic competence in high-stakes assessment of communicative language ability by means of automated writing assessment.

# Avoiding unwanted inferences

Panel contribution

**Dr. Chi-He Elder<sup>1</sup>, Prof. Michael Haugh<sup>2</sup>**

**1.** University of East Anglia, **2.** University of Queensland

Communication does not solely rest on hearers successfully inferring speakers' intended meanings. Divergences in understandings of utterance meanings between speakers are inevitable, as are negotiations on what has been said or what has been meant. These empirical facts are acknowledged in accounts of meaning in interaction that focus on on-record meanings that are interactionally achieved between participants (e.g. Arundale 1999; Clark 1996; Sanders 1987). Such accounts move away from focussing on meanings as they are derived from speakers' intentions or hearers' recovered inferences, as they instead give co-constructed meanings centre stage in meaning theorisation.

We subscribe to the view that attending to the local processes of interactionally achieving meanings provides important insights into how utterance meanings become understood as public commitments (Elder & Haugh 2018). It also provides insights into how speakers draw on inferable aspects of others' utterances, even when those aspects were not necessarily intended to be communicated, thereby demonstrating how implicatures, despite being implicitly communicated, are no less public in their sequential context than the meanings of explicit markers. But given that interactional achievement accounts also highlight that the meaning that is operationalised between participants isn't always the speaker's main intended meaning, we are reminded that speakers may have alternative meanings in mind that are both left unaccounted for in interaction and are hence left inaccessible to an observer. What is still lacking, then, is an account of how processes of meaning negotiation provide insights into the inner mental states of participants, which in turn can inform meaning theorisation in a way that better reflects cognitive reality.

We propose that one way of addressing this gap is to examine how speakers engage in interactional work to avoid unwanted implications of what they say as evidence for the kinds of alternative meanings that are in their minds. To do this, we present instances of both (explicit) 'repair' (Schegloff, Jefferson & Sacks 1977), as well as instances of 'embedded corrections' (Jefferson 1987), and argue these provide insights into the multiplicity of meanings that speakers are aware of in both clarifying their intended meaning(s), while inviting the hearer to neglect potentially undesirable, unintended meanings. We then present some observations on how those meanings are drawn upon and negotiated by all parties, providing new evidence for the degree of success that explicitly avoiding unwanted interpretations can have on interactional outcomes.

## Back-channels of First Face-to-face Conversations in Chinese

---

Panel contribution

---

***Mr. Yusuke Mochizuki<sup>1</sup>***

***1. Nagoya University***

Back-channels in conversations have two functions; one is that it can indicate whether or not the listener is listening to what the speaker says, yet another is that it can further promote the conversation. Since these roles are played in the interaction between the speaker and the listener, back-channels is a function of speech necessary for the smooth development of conversation. In my presentation, which references the Japanese back-channels research of professors such as Mizutani (1983), Maynard (1993), and Horiguchi (1997), I will show the mechanism of back-channels use by native Chinese speakers.

In my presentation, I will use a face-to-face conversation between two subjects whom are meeting for the first time collected by the presenter. Based on this data, I will begin by focusing on back-channels and show the essence of the forms and frequency in back-channels for first timers' face-to-face conversation in Chinese. Next, I will focus on the utterances in which back-channels is struck, and analyze in what situation back-channels is struck from the perspective of a discourse style.

When I analyzed the back-channels that are observed in the first timers' face-to-face conversation in Chinese from the viewpoint of discourse style, there was a difference of the back-channels in the styles such as a narrative style and an interactive style. From this fact, the results found that the environment in which back-channels originated in Chinese is closely related to the style in which the utterances are communicated.

Finally, from the perspective of Emancipatory Pragmatics, I analyze the linguistic behavior of the listener by a native Chinese speaker based on the analysis of Chinese back-channels. The listener considers the interaction of native Chinese speakers, showing how they are following the rules required by the context, rather than blindly slamming.

# Balancing between instruction and problem-solving: The role of demonstrations in the teaching of digital skills for the elderly

Panel contribution

***Dr. Joonas Råman<sup>1</sup>***

*1. University of Oulu*

Found at the intersection of two megatrends, digitalization of goods and services and the ageing population, are elderly users of digital devices, an often overlooked or inherently problematized group. While not necessarily the earliest adopters of novel technologies, the elderly are none the less a growing user group of ICTs. This fact is recognized in Finland, where several state-funded initiatives have been launched with the goal of ensuring that the citizenry has the knowledge and skills required to participate in the discourses of a digitalizing society. This paper examines how such skills are taught and learned in a course organized by an adult education center in Northern Finland, specifically targeted to elderly users of ICTs.

This paper utilizes multimodal conversation analysis (e.g. Mondada 2013) to provide a micro-level examination of the two responsibilities teachers face when a student asks for help with their device (smart phone, tablet or laptop). In this educational setting, the teachers are responsible both for ensuring that the individual student learns how use their devices, and that the class as a whole advances according the curriculum and the course plan. To ensure that these two responsibilities are met, teachers engage in individual instructions to illustrate to the student how their device functions, and in pragmatic problem-solving to ensure that the issue is promptly resolved in a way which allows the teaching to advance. This paper shows how these two actions can both be accomplished within instructional demonstrations (e.g. Råman, 2019). In particular, the focus is on identifying the moments within the demonstration where the problem-solving seems to take precedence over the more in-depth instructions and vice versa. The ways the students can participate in the demonstration are also shown to reflect these two responsibilities, as instructions tend to be more inclusive and collaborative while the pragmatic problem-solving tends to be carried out by the teacher alone.

# Basic principles of interlingual mediation: relevance in ELF contexts

Panel contribution

***Prof. Michaela Albl-Mikasa<sup>1</sup>, Prof. Maureen Ehrensberger-Dow<sup>1</sup>***

***1. ZHAW School of Applied Linguistics***

Interpreters' professional self-image and quality requirements have been summed up as follows: "What our listeners receive through their earphones should produce the same effect on them as the original speech does on the speaker's audience. It should have the same cognitive content and be presented with equal clarity and precision in the same type of language if not better, given that we are professional communicators, while many speakers are not, and sometimes even have to express themselves in languages other than their own." (Déjean Le Feal 1990: 155). The same expectations apply to professional translators. In the traditional sense, this entails constantly navigating between speaker fidelity or source text loyalty and audience design, because a good performance in terms of doing justice to the speaker or author does not necessarily imply rendering a good service to the target audience. In the increasingly common context of English used as a lingua franca (ELF), as touched upon in the above quotation, this task is further complicated by an additional dimension. When interpreters and translators deal with non-standard input from non-native speakers, they also have to balance expectations of speaker/text fidelity with speech/text optimization.

This raises important questions such as the following. How do interpreters or translators do justice to the basic principles of fidelity, accuracy, and complete rendition, when propositional content and illocutionary intent are unclear? What are the implications for notions of quality in translation and interpreting (T&I), including those of faithfulness, loyalty, user expectations, accuracy, errors, and norms? How do the task requirements change when compensation, normalization, and optimization measures would be needed in the target audience's interest (as a type of domestication), compromising the requirements of speaker fidelity or loyalty to the source text producer? What does interlingual mediation mean in this more recent context, and to what extent do intervention and agency become more necessary, acceptable and even desirable?

We will present data collected as part of an on-going mixed-method project on cognitive load (see Albl-Mikasa et al. 2020; Ehrensberger-Dow et al. 2020), in order to shed light on the practices and strategies used by language mediators in dealing with ELF input. Based on this analysis, we will discuss the implications for traditional notions and concepts in T&I as highlighted above.

# Becoming a Shakaijin: Recent Japanese Graduates Constructing New Professional Identities

Panel contribution

***Prof. Andrew Barke<sup>1</sup>, Prof. Momoyo Shimazu<sup>1</sup>***

***1. Kansai University***

Entering the workforce for the first time after years of study in the education system can be a highly challenging experience in that significant adjustments must be made in the way that one's own and others' social identities are conceptualized and constructed (e.g. Kroger 1996). Assuming a social constructivist approach (e.g. Archakis & Papazachariou 2008) in which identities are seen to be actively performed in social contexts (e.g. Marra & Angouri 2011), the present study considers the processes involved in the formation of new professional identities, including the struggles that new employees in Japanese companies face and the strategies (both linguistic and other) they employ as they attempt to demonstrate legitimacy of membership and thereby attain acceptance in their new workplace Communities of Practice (Wenger 1998).

The analysis draws on recorded interviews with 13 recent graduates (6 males and 7 females) of a private university in the Kansai region of Japan who reflect on their experiences as they make the transition from student to *shakaijin*(full member of society). Qualitative analysis of the interview data reveals participants encountered a wide and complex array of social behavior in their new workplaces that they were expected to internalize and model their own behavior on as they constructed their own professional identities. Participants often reported receiving little direct instruction on what is considered (in)appropriate behavior in their workplace, but learnt over time through observing their *sempai*(more senior colleagues) "doing things as if they were common sense" (*jōshiki mitai ni yatteru*) and through their experiences of being positioned by *sempai*s having the identity of an unknowable new-recruit through such utterances as 'That is obviously such and such' (*sore wa naninani ni kimatteru jan*) or "That is common sense for a full member of society" (*sore ga shakaijin no jōshiki*).

Furthermore, the social behavior observed by participants in their workplaces did not always correspond with their own values and preconceptions of appropriate workplace behavior, prompting some to adopt creative solutions to try to modify or (re-)negotiate self and others' identities through their own attempts at social positioning.

# Beginning to explain: Nanka-prefaced responsive and initial actions in Japanese conversation

Panel contribution

***Dr. Satomi Kuroshima<sup>1</sup>, Prof. Makoto Hayashi<sup>2</sup>***

**1.** Tamagawa University **2.** Nagoya University

This paper explores a Japanese filler-like object, *nanka* (lit. “something”), serving a particular interactional task in various positions in turns and sequences in conversation. While *nanka* is ubiquitously observed in various positions within a turn in a naturally-occurring conversation in Japanese, the majority of its occurrences are found in turn initial position (Uchida, 2001). The omnirelevance of usability of the token suggests its distinctive and unique character as a filler-like object (Suzuki, 2000), making it difficult for analysts to discern and describe what is achieved by the use of this token in respective positions. In this paper, we will present our analyses on the cases in which *nanka* is used at the beginning of a turn with or without other accompanying tokens such as *iya* (Hayashi & Kushida, 2013) and/or *anoo* (Morita & Takagi, 2020) and aim to elucidate the interactional mechanism of the practices using *nanka* to achieve various social actions.

We have identified the following interactional positionings where speakers utilize *nanka* to inform the recipients of a particular relationship between the currently unfolding turn and what precedes it. These environments include: 1) the first position of a sequence which accounts for the speaker’s own deeds in the preceding talk, 2) the second position of a question and answer sequence, a post expansion as well as a post-first insert sequences (Schegloff, 2007), 3) the third position of an informing sequence. For instance, in the cases of *nanka* used at the beginning of a response to a polar question, respondents usually reformulate the question’s terms and accounts for why their answers do not conform to the presupposition of the question. In this way, they design their response to not disagree or disconfirm the general state of affairs, while displaying their less committed stance towards the proposition of the question; thereby showing their orientation to preference organization (cf. Sacks, 1987).

(1) (English Translation)

15 Masa: Yuri, are you getting used to your new job then?

16 (0.7)

17 Yuri: → *nankait*’s not so busy:::

18 Masa: oh:::[:::]

19 Yuri: → [yeah]=*nankaa* day goes by while not doing

20 [anything. hh .hh

21 Masa: [ah hah hah hah hah

22 Shiho: °oh[:::::::::::::°]

23 Masa: [it’s okay, as such.]

Alternatively, when responding to a Wh-question, respondents adjust the epistemic gradience between the questioner and themselves posited by the question through the demonstration of *unspecifiability* of the matter in question.

In all of the cases with *nanka*-prefaced turns, the speaker’s stance in their response or account as being ‘non-straightforward’ (Schegloff & Lerner, 2009) is conveyed so that the speaker produces a multi-unit turn to accomplish their relevant interactional tasks. Despite the ubiquitous and frequent appearance of this token in Japanese interaction, our systematic analysis shows that, with *nanka*, participants demonstrate their orientation to alert the recipients to the nature of an incipient turn in relation to what is expected to occur next, all of such cases indicating their orientation to the preference organization of these sequences.

# Being attuned to the wishes of the Allied occupation?: A reexamination of ideology formation of Japanese newspapers' use of imperial honorifics

Panel contribution

***Dr. Noriko Sugimori***<sup>1</sup>

*1. Kalamazoo College*

This paper examines the concept of pragmatic attunement from a historical perspective, using the case of imperial honorifics in Japanese newspapers after World War II. A growing trend towards more simplified honorific use is occurring in many languages, and globalization and language contact with languages with fewer honorifics have been used to explain this phenomenon. The contact of Japanese with English during the post-World War II Allied occupation of Japan was such an example. However, according to the “official” history published in the National Language Council’s *Forthcoming Honorifics* in 1952, although particularly complicated Chinese vocabulary-based imperial honorifics had been used, the Japan Newspaper Publishers and Editors Association (NSK) and the Imperial Household authorities agreed in 1947 to use “the best honorific within the range of those used every day,” without mentioning any influence of the allied occupation. Subsequent research cited *Forthcoming Honorifics* as it was without scrutinizing the contents, with a few exceptions (Yasuda 2007, Sugimori 2010, 2011, 2016).

Because there is no surviving evidence of the occupation’s direct intervention in the national honorific policy-making process, the occupation’s involvement was explored in other ways. Materials such as the memoirs of newspaper reporters, diaries of high-ranking government officials, and the records of the NSK from the occupation era were examined. The results showed that the origin of the idea mentioned above, “the best honorific within the range of those used every day,” originated from the newspaper reporters’ interpretation of such use that was found in Japanese translations by foreign press in 1948 (Togashi & Tanaka 1948). In other words, the use of honorifics in these translations was used as a benchmark for their correct use, showing that the Japanese press’s attunement to the foreign or American press was an indirect influence resulting from language contact. Considering that during World War II, Japan tried to regulate the terminology concerning the imperial household in other countries, this is a significant contrast. Even so, a move towards imperial honorific simplification was also found during the war. These diverse findings support Woolard (2020, 2021), who states that language ideologies are dialogic, and contrast with other views that may have been erased over time. They also illustrate that caution is needed when applying the concept of attunement in analyzing the data.

# Being guided into play –autistic and non-autistic children’s joint activities in an inclusive kindergarden setting

Panel contribution

***Prof. Friederike Kern<sup>1</sup>***

***1. Bielefeld University***

Autism is described as a neurological condition with strong effects on communicative and interactive behaviour [1], often leading to viewing affected people as having diminished social interest [2]. Among features seen as typical are low frequency in eye contact, unconventional prosody and repetitive linguistic behaviours, such as echolalia [3]. While studies, especially in the area of conversation analysis, show that autistic children indeed use verbal, vocal and/or embodied resources in unusual ways, they also demonstrate the children’s ability to organise their participation in an ongoing interaction. So, instead of interpreting the atypical use of linguistic and embodied features as signs of diminished social interest, as it is often the case [1], the focus is on the children’s interactive and communicative competencies [4].

Though the role of practitioners as ‘hinderers’ of social interactions with autistic children has been pointed out [5], case studies suggest peers to be more supportive [6; 7]. The paper addresses this ambivalent issue by investigating joint play activities in an inclusive kindergarten in a medium-sized city in Western Germany. So far, approximately four hours of free play have been collected (due to the pandemic, further recordings had to be cancelled). The analysis focusses on two autistic children and the ways they move in and out of interactions with their peers, and teacher’s role as a ‘facilitator’ and ‘interpreter’ of the children. Preliminary results show that the teacher provides embodied support and manual guidance for children to engage in brief sequences of playing together by accomplishing close embodied participation frameworks in which the children produce previously established patterns of joint activities. Findings also suggest that setting up a pre-established sequential context with fixed verbal cues especially helps the autistic children to engage in games with their peers, and, at the same time provides all children with opportunities to learn.

# Being touched by the physiotherapist during instructed exercise activity

Panel contribution

**Dr. Sara Keel<sup>1</sup>**

**1.** Haute Ecole de Santé Vaud

The aims of physiotherapy are to improve mobility and strength, relieve pain and restore physical function. In order to achieve these goals, an important task of the physiotherapist is to teach the patient exercises, so that the latter can do them at home and thus support the therapeutic process. To instruct the patient how s/he is to accomplish home exercises, therapists combine different resources: verbal and written instructions, drawings, in vivo or video demonstrations of the exercise that the patient is to follow and last but not least touch. This contribution is based on video recordings and multimodal transcriptions (Mondada 2018) of a naturally occurring therapy consultation, in which the author of the paper is the patient. It also draws on the author's self-experience and discussions with the physiotherapist, notably on the importance of touch within physiotherapy in general and within the patient's acquisition of therapeutic exercises in particular.

It focuses on moments in which the patient follows the physiotherapist's verbal instructions or her demonstration, thus realises the instructed exercise, while the physiotherapist monitors her closely, evaluates and corrects the patient's instructed activity. More precisely, it analyses moments in which the physiotherapist uses touch to correct and/or support the patient's embodied compliance with her instructions/demonstration.

As pointed out by studies on other educational settings (Hindmarsh et al. 2014; Levin et al. 2017), within instructional sequences, "corrective instructions" play a central role in the learning process. They provide the learners with relevant details about the trouble that the corrective instruction addresses on the one hand and with specifications, explanations about how the remedial action(s) is to be realised on the other hand. They thus allow the latter to acquire new knowledge and to learn new ways of doing things.

In order to "unpack" the embodied organisation of corrective instructions implying physiotherapist's "touching" and patient's "being touched" (Levebfre 2020), two extracts are analysed. In both extracts, the therapist's first touching consists in modifying the patient's wrist or knee position. It is straight-forward and of short duration. After its occurrence, the patient continues with the instructed movement, while the physiotherapist monitors her. The physiotherapist then realises a second touching. It consists in applying slight pressure on the patient's elbow or knee in one direction, thus supporting the patient's instructed movement during a longer stretch of time.

# Bending and bonding: Complaints in school-based App for university students

Panel contribution

**Ms. Ying Tong<sup>1</sup>**

1. Nanjing Xiaozhuang University

This paper explores how the semi-public complaint-interactions in computer-mediated communication turn out to be a discourse of impression management for *brand-identity face* and *public face* of the company under study. The primary data include an invitation post by the representative of the company (CR hereafter) inviting the target customers (here the university students) to “complain” about their experience using the company’s newly-released App, and around 344 comments attached to it, all anonymized. As complainers’ identities are also their avatars in the App *per se* for other functional navigations and some mandatory activities (e.g., daily check-in in the Covid-19 pandemic), complaining in such a semi-public arena (as these comments are viewable to all school-based users of the App) can invoke face concerns. On the other hand, the CR’s responses to most of the comments seem more discursively powerful in terms of length and semiotic resources deployed in comparison to the complainers’ brief, sometimes unelaborated, and mostly unmitigated complaints. The most intriguing part of the CR’s replies is the strategic performance of *méng*[1] (*cuteness*) to most, if not all the comments. Taking the sociocultural perspective and following the paradigms of virtual ethnography, I intend to demonstrate:

(a) What constitutes the *méng* performance and what triggers the CR’s *méng* performance in the collapsed context of school-based App?

The reframing of the complaints as part of the responses expands on the represented inconveniences or accusations, which, although seldom unfolds further, constitutes a discursive context for other ratified viewers to evaluate. Thus, the paper also asks:

(b) To what extent is such an act of performing *méng* acceptable among targeted social media users?

Both research questions need probing into meta-pragmatic awareness that goes beyond a discourse analysis of the complaint-response text. I integrate my etic reading of the data with a questionnaire survey and focus group interviews, showing how (in)effective such a *méng* style can be among the target audience. The paper is expected to contribute to the studies on effective handling of customer dissatisfaction on the web that is hitherto underrepresented from a sociocultural perspective.

[1] Méng, literally translated as ‘cuteness’, here refers to a strategy in complaint response. Méng is a Chinese translation of the Japanese word *Moé*, referring to a feeling of affection a character can evoke. From a sociocultural perspective, méng as a localized term for Japanese anime and manga culture mainly refers to the childish style of net talk in this paper. The main features of such talk include the use of diminutives, image-texts (i.e. emoticons and emojis), non-standard use of punctuations, among others.

# Between-desk encounters as sites for learners' understanding and inclusion in project work

Panel contribution

**Mrs. Marwa Amri<sup>1</sup>, Dr. Olcay Sert<sup>1</sup>**

**1.** Mälardalen University

Project work is a common teaching method used in Swedish upper secondary classrooms (Vinterrek, 2006). It is often carried out over several lessons in which students work either individually or in groups to solve several interrelated activities that revolve around one specific theme. These activities are organized by teachers to provide for a variety of participatory modes of communication, including whole-class interactions, group work, and individual student work. One of the common modes of interaction that is proffered by the students' individual or collaborative work during project work is between-desk instructions, also known as *Kikan Shido*, where the "teacher walks around the classroom, predominantly monitoring and guiding student activity" (O'Keefe & Clarke, 2006, p. 76). This presentation is based on a corpus of 10 video-recorded hours of English as Foreign Language (EFL) classroom interactions at an upper secondary school in Sweden. Informed by conversation analysis as a methodological framework, we focus on student-initiated between-desk instructional sequences and explore how the teacher organizes her responses (e.g., clarifications or explanations) to maximize the students' engagement and understanding of the task. Our collection first demonstrates the practices that the teacher draws on to respond to students' inquiries. We then document how these responses make relevant "gist and upshot formulations" (Heritage & Watson, 1979) by the students, bringing interactional evidence to student understanding of task procedures. We also show how these formulations shape the subsequent interactional trajectories on instructional-related matters. Our research has implications for teachers by bringing empirical evidence on the role of between-desk instructions as an effective inclusive classroom practice that may generate more opportunities for participation and language use.

# Beyond a filler: managing progressivity and solidarity with *neige shenme* ‘that what’ in Mandarin conversation

Panel contribution

***Prof. Xiaoting Li***<sup>1</sup>

*1. University of Alberta*

*Neige*‘that’ is a distal demonstrative; and *shenme* ‘what’ is an interrogative pronoun in Mandarin grammar. Their compound form, *neige shenme*, literally translated into English as ‘that what’, is commonly used as a semantically-empty filler in Mandarin conversation. This study explores how *neige shenme* is used in situated sequential environments in everyday Mandarin conversation? There is a growing body of research on the use of *neige*‘that’ as a discourse marker. For example, it is documented to have a variety of discourse functions, such as initiating a topic (Yin, 2009; Wang, 2011; Yue, 2020), managing turn-taking (Xu, 2008; Liu, 2009; Yin, 2009), introducing a list-construction (Yue, 2020), and a pause filler (Liang, 2002; Yue, 2020). Similar to *neige*, the compound form *neige shenme* also seems to serve as a filler in Mandarin conversation. However, how *neige shenme* ‘that what’ is actually used in Mandarin conversation is surprisingly undocumented.

Adopting the methods of conversation analysis, interactional linguistics, and multimodal analysis, this study investigates the interactional functions of *neige shenme* in Mandarin conversation. The data for the study are approximately 6 hours of everyday face-to-face Mandarin conversations. An examination of the data shows that *neige shenme* seems to occur in three sequential environments: mid-TCU in the speaker’s (story)telling sequences, mid-TCU in responsive positions in informing sequences, and turn-final in assessments. First, when used in mid-TCU in (story)tellings, *neige shenme* seems to serve as a dummy phrase occupying the syntactic slot of a NP without impeding the progressivity of the TCU- and telling-in-progress. It is immediately followed by the semantically explicit full NP that it replaces, constituting a self-repair. The deployment of *neige shenme* immediately followed by the full NP it replaces in a telling-in-progress seems to display the participant’s orientation to progressivity in interaction, and to serve as a device to manage two possibly undercutting preferences: preference for progressivity (Schegloff, 1979) and preference for being maximally informative (Grice, 1975; Heritage, 1984, 2012) in telling sequences. Second, when used in mid-TCU in responsive positions in informing sequences, the recipient seems to utilize *neige shenme* to project a divergent epistemic stance from the informing speaker. The semantically-empty *neige shenme* seems to be used by the informing recipient to soften their epistemic challenge in this sequential environment. Third, when used in turn-final position in assessments, *neige shenme* occupies the position of the assessment term. It appears in summarizing assessments after extended disagreements where the speaker reiterates and moves away from ongoing disagreements. *Neige shenme* is recurrently produced with very low loudness, and lenition that blurs the boundaries of the four syllables. Turn-final *neige shenmes* also co-occur with gaze withdrawal from the recipient, indicating a disengagement from the extended disagreement (Goodwin, 1986). The findings show that *neige shenme* has rich interactional functions beyond a filler in managing progressivity, intersubjectivity, and stance in different sequential environments. Its use and organization are orderly in Mandarin conversation.

# Beyond FACE: Developing Intercultural Competence in German and Russian as Foreign Languages

Panel contribution

***Prof. Federica Ricci Garotti<sup>1</sup>, Dr. Marco Magnani<sup>1</sup>***

*<sup>1</sup> University of Trento Department of Humanities*

In this paper we aim to show that the concepts of ‘face’ and ‘politeness’ as spelled out in Brown and Levinson’s model are a helpful but insufficient tool for implementing pragmatic instruction in German and Russian as foreign languages. Many studies have criticized the universality of Politeness Theory’s principles outside the Anglo-Saxon culture (e.g. Arundale 2006), showing that a number of cultures consider pragmatic directness as an indicator of clarity rather than lack of concern for facework (Blum-Kulka 1989). Such cultures are therefore expected to resort to on-record strategies more freely and with less face redress (Ogiermann 2009). In this regard, German and Russian offer an intriguing testing ground. On the one hand, compared to English, they are traditionally viewed as languages instantiating a higher degree of pragmatic directness, reflected for example in the formulation of requests without modal verbs in German (Faerch & Kasper 1989), or in the choice of the imperative mood in Russian (Benacchio 2002). On the other hand, research on the relationship between politeness and directness has led to very conflictive results in both German (House 2005, Marti 2006) and Russian (Dorodnych 1995, Larina 2003). Crucially, these studies point out a wide range of very diverse strategies, whose variation does not seem to be interpretable in terms of politeness as ‘face-saving’ vs ‘face-threatening’ in general, or yet as differences in power, social distance and intrinsic ranking in particular. How can then the concept of ‘face’ be effectively revisited in view of helping learners of German and Russian as foreign languages to choose culturally appropriate linguistic strategies, thus preventing cross-cultural misunderstandings?

In order to answer this question we report on the results of a larger project involving 10 learners of L2 German and 10 learners of L2 Russian studying in Italy, and compare them with a control group of native speakers of German and Russian. Specifically, we focus on the speech act of requesting, and look at our subjects’ strategies in terms of (a) directness of the head act, (b) lexical and grammatical modifiers, and (c) speaker- vs hearer-oriented perspective. All subjects are tested with discourse completion tasks targeting a variety of situated interactions in everyday communication. Results show interesting patterns, which can contribute to both the intercultural research on politeness and the construction of an appropriate syllabus for learners. The latter should be formulated by identifying which areas of pragmatic awareness are more problematic for L2 learners of German and Russian along their path towards intercultural competence. More generally, our findings suggest a fresh reading of the notion of face which encompasses, in a principled way, both contrastive and developmental perspectives.

# Beyond the colonized lifeworld? Audience design in Social Media Influencers' advertising discourse

Panel contribution

**Ms. Olivia Droz-dit-Busset<sup>1</sup>**

1. University of Bern

As content creators, social media influencers (SMIs) are at the forefront of contemporary language work; people whose professional livelihoods depend on the crafting of language (see Thurlow, 2020; cf. Cameron, 2000). As ‘new-generation’ copywriters, SMIs (strategically) blend commercial and social discourses in peer-to-peer recommendations, for example (cf. Kelly-Holmes, 2016), and walk the fine line of catering to both viewers and the brands who want their products endorsed. As part of a larger project, this paper documents the discursive tactics SMIs use for integrating and framing advertising as more or less explicit, while also considering audience design/uptake (cf. Bell, 1984). For this, I focus on sponsored posts from five SMIs working in different but sometimes overlapping content genres (travel, comedy, fashion, beauty, self-help). These posts range from undercover or so-called native advertising, which have recently become thoroughly regulated by law, to overt, unapologetic commercial messaging. I show how SMIs draw from a variety of styles to save face from accusations of ‘selling-out’, while viewers show diverging alignments towards these styles, from praising creative advertising to accusations of dishonesty and lack of transparency. My paper ends by considering the sociopragmatic implications of these sorts of blended discourses and exchanges between SMIs and their followers. For all the parasociality and self-commodification involved, these exchanges are not straightforwardly a matter of colonized lifeworlds, in the way Habermas (1984) might have us imagine things.

# Blame games online: How governments deal with blame attacks on social media

Panel contribution

**Dr. Sten Hansson<sup>1</sup>, Dr. Ruth Page<sup>1</sup>**

*<sup>1</sup>. University of Birmingham*

In modern democracies, governments increasingly engage in blame avoidance behaviour when they initiate loss-imposing policies that hurt the interests of some groups. Blame avoidance in government is interesting linguistically, for whilst it may attempt to limit powerful officeholders' blame risk it can also escalate public disaffection and derail public debates over important policy issues. Existing political science and discourse-analytic research about blame avoidance has mainly considered official documentation and statements from governments or reports in the mainstream media. Blame avoidance by politicians has not yet been studied in relation to social media, nor from a perspective of internet pragmatics. However, blaming and blame avoidance are intrinsically related to the face-work of the governmental organisations and individual officeholders.

We explore the blame avoidance strategies used by British government departments and ministers in a specialised corpus of tweets, gathered from 20 Twitter accounts using the R software. The corpus consists of more than 20,000 tweets and more than 1 million replies. The data is analysed in Sketch Engine for the pragmatic features of blame avoidance as defensive language use (Hansson, 2018) and blame as offensive language use (Culpeper, 2011) to trace the unfolding, strategic manoeuvrings of the government officeholders in relation to two highly controversial policy issues: the UK's transition from the European Union and the governmental responses to the Covid-19 pandemic in 2020. Using corpus-assisted pragmatic analysis, we compare and contrast the rhetorical strategies used by individual politicians and governmental departments and the responses that these garner in Twitter.

We address the following research questions: (1) How do governments and political figures respond to the blame that is directed to them in Twitter? (2) In what ways do the patterns of blame and blame avoidance vary according to (a) departmental or individual accounts and (b) the nature of the blame issue (Brexit or responses to Covid-19).

Our initial findings suggest that government departments and ministers engage in positive facework on Twitter characterised by self-legitimising appeals to personal and collective authority, goals and effects of their policies, and the authority of official documents. While the replies to their tweets often contain face attacks in the form of dismissals, insults, and sarcasm, there is little evidence that the politicians and governmental departments engage directly with these attacks, suggesting that the 'blame games' in Twitter are somewhat one-sided, where the avoidance of blame on the part of the government does not resolve the blame attacks nor promote civic discourse.

# Blind Spots: Verbal Gaps as Resistance in Kahana-Carmon's Bridal Veil

---

Panel contribution

---

***Dr. Michal Ben-Horin***<sup>1</sup>

*1. Bar-Ilan University*

Amalia Kahana-Carmon, a prominent Israeli writer (1926-2019), was known for her unique poetic language that questions official cultural and social procedures. In exploring this language, the paper proposes a closer look at the correlation between the oppressive mechanisms Kahana-Carmon attempts to resist and her poetic strategies. More precisely, the paper claims that Kahana-Carmon creates gaps in her prose text by deferring the stable semantic values on which verbal communication practices are based. Like blind spots, in these moments the verbal text is silent. The silence, however, plays a double role: On the one hand it imitates the socio-cultural mechanism that prevents the literary characters, mostly women who are dominated by father figures, from seeing through and speaking out, namely taking action against their oppressive situation. On the other hand, it reveals to the readers how the system "works", through manipulating and maintaining power relationships. The argument will be demonstrated by focusing on Kahana-Carmon's 1968 story "Bridal Veil" which takes place in Israel in the 1960s. The story depicts thirteen-year-old Shoshana who meets a UN-soldier on returning home from a visit to her father, who lives separately from her mother and siblings. The awkward conversation between the girl and the unnamed soldier includes foreign words. Alongside the incorporation of foreign words in the Hebrew text, additional strategies are employed, such as neologisms and sound repetitions (alliteration and rhyme, rhythmic and metric patterns), while calling attention to the concrete, mostly sound components of the language. From this perspective, the sound is not the opposite of silence but rather an extension of it, as the "musicalization" of the language interferes with communication based on verbal signification. As this paper argues, these "holes" in the prose net create alternative modes of meaning that are crucial in Kahana-Carmon's criticism of patriarchal traditions.

The theoretical framework of this paper includes Theodor Adorno's critical theory, especially his view of the relationship between language and music and his work on "foreign words", and Julia Kristeva's linguistic-psychanalytic model developed in her essay on the revolution in poetic language.

# Blindness as resource and competence in institutional communication: Blind audio describers and team translation

Panel contribution

***Dr. Maija Hirvonen<sup>1</sup>***

***1. Tampere University***

This presentation discusses blindness as a communicative resource and a professional competence. The context is audio description (AD): an access service for television, cinema, theatre, etc., that supports the blind and partially sighted persons' participation in visual and audiovisual culture and communication. In AD, visual content is translated into verbal descriptions which are spoken out loud. Some countries (Germany, Austria, and Finland) have adopted an inclusive working model to produce AD: the practice employs sighted and blind describers as teams to write AD for TV and cinema. Research into these production processes has discovered that blindness – far from being an impediment – is a benefit to the collaborative accomplishment (Hirvonen & Schmitt 2018, Hirvonen in prep.). Examples of the findings are: a) the blind co-participant supports the sighted co-participant's visual perception, and b) the blind co-participant acts as language and audio specialist. In my talk, I will first present these findings and then reflect upon their consequences to a wider arena: How can blindness and visual impairment be re-conceptualized as resources, rather than obstacles, for communication and interaction? What kind of professional and interactional competence do blindness and blind-sighted-teamwork implicate, for example in the context of cognitive processing and multimodal communication? The findings and reflections contribute to the theoretical notions of 'resource' (e.g. in ethnomethodological conversation analysis, Mondada 2016), and of 'competence' in professional contexts (e.g. in translation, Shreve et al. 2017). There is also an emerging interest in the resources and competences of differently abled people, such as disabled students at universities (Moriña et al. 2020) and deaf lecturers in higher education (Holmström & Schönström 2018). It is argued that this focus can change the paradigm in the field of dis/ability studies (Waldschmidt 2017).

# Bodies in the pandemic: How people orient to risks of contagion

Panel contribution

***Ms. Mizuki Koda<sup>1</sup>, Dr. Hanna Svensson<sup>1</sup>, Dr. Burak Tekin<sup>1</sup>***

***1. University of Basel***

A recurrent injunction for securing safety during the Covid-19 pandemic concerns physical distance (often misleadingly called ‘social distance’) between individual bodies. Prevention discourses by relevant authorities invite to keep distance, but little is known about how distancing is actually achieved and adjusted to the local ecology of interaction, and how distance is oriented to and managed by participants in social interaction who jointly and collaboratively engage in situated activities.

Within the framework of ethnomethodology and conversation analysis (Garfinkel, 1967; Sacks, 1992), this paper analyzes various ways in which interactional spaces (Mondada, 2009) and body arrangements (Kendon, 1990) are organized and accomplished by the participants orienting to risks and safety measures. In particular, this paper explores three specific contexts in which body arrangements in space are done accountably, possibly orienting to the risks of contagion:

- how people keep their distances while they approach each other and enter into interaction in outdoor public spaces,
- how participants organize queuing while maintaining distance and how distancing in queueing affects the accountability of the queue, raising normative issues as well as problems of intelligibility of the queue,
- how mobile trajectories in specific spatial environments are shaped by imperatives of safety, as observable in the cases while people enter a building or a room together.

The analyses collectively address the organization of bodies in the pandemic and their spatial arrangements, drawing on video recorded data collected over the course of the Covid-19 pandemic. Whereas our focus is reduced onto the bodily and spatial arrangements in interaction, we will also discuss to what extent we can attribute people’s orientations in the conducts to the safety.

# Boiling down recipes and cooking up emotions: The poetics of creating multimodal involvement and social meanings on TikTok

Panel contribution

**Dr. Alla Tovares**<sup>1</sup>

1. Howard University

The study of poetics in linguistics, going back to Jakobson (1960), typically involves examining isolated forms and focusing on immediate contexts and individual speakers. Kiesling (2020) argues that while several researchers (e.g., Tannen [1989]2007; Lempert 2008) have considered how poetic forms create interpersonal involvement that stretches beyond a single interaction, the interrelationship between poetics and the social meanings in language remains underexplored. In this study, challenging the conventions further, I understand poetics as going beyond language to explore how social meanings, including those related to identities and ideologies, are constructed through different modalities and semiotic resources. Specifically, I analyze a set of 20 TikTok posts by Joanne Molinaro (이선영), *thekoreanvegan*. Each post consists of a video clip of her cooking a veganized Korean dish (with its ingredients as captions) and an audio of her narrating a personal – unrelated to the dish – story (e.g., *Kimchi Chigae & My Dad's Accent*; *Kimchi Soondooboo & Interracial Dating*; *Peach Tteok [Ricecake] & Can I Really Be Korean if I'm Vegan?*), with soft piano music in the background, all contributing to creating “ambient involvement” (Tovares 2020) with her audience. Extending Erickson’s (1982) multimodal understanding of cohesion and meaning-making as constructed across multiple conversational floors in mealtime discourse, I suggest that poetics is the product and process of sustaining multiple (inter)actional modes and modalities simultaneously, and show how the totality of poetic involvement “localizes” (Silverstein 1976) and personifies such global and abstract notions as divorce, interracial marriage, parent-child relationships, discrimination, veganism, and the authenticity of one’s ethnicity and food.

Tannen ([1989]2007: 29) views involvement as “total engagement” and “emotional identification,” comparing it to the “spell” cast by the classical Greek poets who mesmerized their audiences. The poetic posts by *thekoreanvegan* – the semiotic aggregates of cooking, recipes, storytelling, and lyrical music – create multisensory “total engagement” with viewers who take up affective (Ochs 1993) or emotional (Kiesling 2011) stances in their comments (e.g., “The onions made me cry not the story”; “Now I’m crying and hungry”; “Your stories, your resilience, and your meals warm my soul”). The analysis further demonstrates that in how the *thekoreanvegan*, akin an ancient rhapsode, “stitches together” diverse resources – including (multimodal) parallelism, repetition, and other tropes – she creates her identities as a Korean-American, vegan, (grand)daughter, wife, and lawyer and indexes ideologies surrounding immigration, veganism, family, and social justice. For example, in her most popular post, *Kkampoong Dooboo & My Favorite Birthday Card* (7.7 million views and 1.9 million likes), she uses synesthetic parallelism and metaphor in narrating her relationship with her father as she adds chopped ingredients to the pan: “I’ve always chopped it up to the comfortable aloofness he [Dad] and I have developed.” Her Labovian narrative codas (e.g., “There are some things in life that are more important than even Samgyeopsal [grilled pork belly]”) are in sync with the video images of the finished dishes. Analyzing such examples, I illuminate multimodal poetics as a resource for constructing social meanings and involvement on TikTok.

# Border security as social interaction: Citizenship in intra-Schengen borders

Panel contribution

***Mr. Michael Mora<sup>1</sup>***

**1.** Universitat Pompeu Fabra

Borders are sites where interactions take place in a multilingual context. In police border checks, police officers talk with people from different countries. Although this is a perfect example of ‘police speak’ in an L2 setting, there are no relevant studies that look at border security as talk-in-interaction. Hence, it is unknown how participants respond to one another in this micro-level border field, considering their communicative practices and strategies with consequences for the management of border security. By looking at police-civilian encounters in the Spanish-French internal border area, this research sheds light on police interactions outside English-speaking societies.

## Methodology

I employ conversation analysis to explore the correlation between verbal and non-verbal exchanges performed by border state agents (police officers) and non-state agents (civilians) in police checks in intra-Schengen border areas. These interactions are taken from a collection of 272 videos showing conversations that took place in the Spanish-French internal border area. These video recordings are transcribed following standard conventions (Jefferson, 2004). The majority of these transcriptions are in Spanish, for which idiomatic English translations are included.

## The case study of the Spanish-French border

This study focuses on police border checks performed by the *Guardia Civil* (the Spanish police corps that has a military nature), which is tasked with preventing activities of illicit trafficking, such as drugs, merchandise or illegal substances (crime control). To accomplish this task, police officers stop and talk with civilians. This is an example of task-oriented interaction. Because of the merging of crime control and immigration control within the European Union (Van der Woude & Van der Leun, 2017), the purpose of this study is to identify which participants’ communicative actions move police officers away from their main objective of crime investigation. Consequently, this research focuses on a common immigration topic: citizenship.

RQ1: Does the civilians’ citizenship have any relevance on police interactions in intra-Schengen borders?

RQ2: How can the civilians’ citizenship interfere with the police check encounter?

RQ3: What interactional strategies do police officers and civilians use?

## Results

1- Police interactions are not coherent with their main objective of crime investigation when civilians’ citizenship is treated as meaningful in the course of the interaction. Civilians, both Spanish and non-Spanish speakers, introduce citizenship topics to avoid difficult, problematic encounters.

2- The civilian’s citizenship determines the questions asked in police crime controls. Likewise, the introduction of citizenship topics in conversations makes difficult to distinguish institutional talk from ordinary conversations. Consequently, interactional asymmetries between police officers and civilians are reduced.

3- Civilians and police officers reinforce citizenship-related topics by smiling and laughing.

# Bounded agency in late stage dementia: The example of assisted eating

Panel contribution

***Prof. Lars-Christer Hyden<sup>1</sup>, Dr. Anna Ekström<sup>1</sup>, Dr. Ali Reza Majlesi<sup>2</sup>***

*1. Linköping university, 2. Department of Linguistics, Stockholm University*

People living with late stage dementia are often overlooked in discussions about personhood and social inclusion. Even if the agency of people living with late stage dementia is bounded, knowledge about what they can do is important in order to support personhood and social inclusion. Persons living with late stage dementia have access to few communicative resources and can often just produce minimal bodily actions. These minimal actions risk being overlooked or not being defined as actions but as meaningless behavior. If the minimal bodily actions are recognized they can be used by healthy participants to support the remaining agency of the person with late stage dementia and to re-organize activities in such a way that the actions the person with dementia can perform become part of the activity; i.e., a form of scaffolding. In the following assisted eating is taken as a case in point of how persons living with late stage dementia can be supported and their agency and personhood recognized. Due to motoric and perceptual challenges persons with late stage dementia are challenged with the activity of eating. Based on five videotaped situations of assisted eating at a care home facility, two descriptive research questions were formulated: (i) what behaviors produced by the person with late stage dementia are treated by the carer as meaningful actions in the interaction; and (ii) what is the sequential place and function of these actions in the organization of the interaction. Through a detailed multimodal analysis of the assisted eating the interactional organization of the activity were identified in the form of a feeding cycle consisting of five stages: (i) carer puts food on to a spoon; (ii) carer raise the spoon from the platter towards mouth of person with dementia, (iii) who then opens mouth and carer enter food into the mouth; (iv) receiving the food and start of chewing and swallowing; (v) carer withdraw hand to base position by the platter. Two types of minimal actions produced by the person with dementia and recognized by the carer, were identified: (a) eye contact at stage (i) and (iv); and (b) the opening of the mouth as the spoon with food approaches the person with dementia. Both these actions are necessary for the performance and completion of the feeding cycle; without them present, the feeding cycle comes to a halt and have to be repaired or restarted. One conclusion from this study is that even such a small action as not opening the mouth or avoiding eye contact can have far reaching consequences. Recognizing these actions is thus an example of how bounded agency in late stage dementia might be supported as a way of acknowledging the personhood of the person living with late stage dementia.

# Boys' emotional practices of intimacy and power on the edge of exclusion

Panel contribution

***Prof. Ann-Carita Evaldsson<sup>1</sup>***

*1. Department of Education, Uppsala University*

This study explores boys' normative and non-normative emotional practices of intimacy and power in the doing of dyadic friendship relations. More specifically it outlines how children with long interactional histories use emotionally charged talk and embodied action to form exclusive friendship relations, and how particular children become repeatedly excluded and treated as non-persons in this process (Goodwin 2006; Svahn & Evaldsson 2011; Evaldsson & Karlsson, 2020). The data draw from video recorded data based on an ethnographic study of everyday peer group interactions within an elementary school setting in Sweden. The analysis combines ethnography with ethnomethodological work on membership categorisation analysis (MCA) (Stokoe, 2012) with a multimodal interactional approach (Goodwin, 2000), to the study of how affective practices become manifested and configured in social interaction through talk, bodies and features of the material environment (Goodwin, Cekaite & Goodwin, 2012). In preserving the exclusivity of intimate relations the boys strengthen affective alignments, of two-against-one through "collusive alignments" (Goffman, (1971: 338) and mutual adjustments of embodied moves (synchronized talk, mutual gaze, bodily orientation, touch, physical proximity). Dyadic friendship alliances are manifested through gestures of intimacy; such as affectionate touch (close bodily contact, strokes or putting an arm around the other); and through synchronized talk and laughter, and mutual approval. The long-term effect being that one particular boy, become repeatedly ridiculed, degraded and excluded. The ethnographic analysis indicates that the presence of a third party has implications for the formations of intimate relations. Micro-processes of exclusion include collusive embodied forms of aversion (through face, prosody, movements and the use of objects) to more explicit negative emotional stances of disapproval and rejections (negative assessments, derogatory category work, ridiculing, negative person depictions). The ethnographic analysis demonstrates the importance of how wider social identity categories, linked to disability and class, carry negative affective valence, and are mobilized in the midst of micro-processes of exclusion, and affect boys' co-constructions of intimate relationships and the accountability of actions.

# Bridging language barriers in psychiatry: Lingua franca or interpreter?

Panel contribution

***Ms. Sofie Van de Geuchte<sup>1</sup>***

**1.** University of Antwerp

Communication is of vital importance in psychiatry, because language is needed for anamnesis, diagnosis and treatment. Good communication contributes to a good therapeutic relationship and treatment outcome (McCabe & Healey, 2018; Wong, et al., 2019). If there is a language barrier, communication can be hindered. Moreover, language barriers have an impact on health access: foreign language speaking people are less inclined to go to the doctor (Kim, et al., 2011).

During an internship in two Flemish psychiatric hospitals (Belgium), it became clear that, in general, doctors first try to assess the patient's Dutch language proficiency. Only if this appears to be really insufficient, they look for other solutions. A first option is the use of a common foreign language (lingua franca). If this does not work, an interpreter can be involved.

This paper discusses part of a larger research project on communication with foreign language speaking patients in psychiatry. In that project real-life consultations were (video) recorded. This paper focuses on a consultation between a psychiatrist and the Albanian parents of a mentally ill child. The first part of the consultation is held in a lingua franca (French), while in the second part, a professional interpreter is present, after he arrives too late. The consultation is transcribed, translated and analyzed. It is a mixed-method research in which quantitative data provide context for our main qualitative analysis. The quantitative analysis includes turn duration and number of turns, words and questions. The qualitative analysis focuses on questions that are being asked throughout the consultation, topic development and topic shifts.

The results reveal that, although both a lingua franca and an interpreter are intended to include patients in communication and in the decision process, the choice of language mediation has an important influence on the communication and the way participants engage in the consultation. In the lingua franca part of the consultation for instance, the father was left out of the conversation and he felt frustrated. This completely changes once the interpreter is present. However, we found many alterations in the interpreter's rendition of the doctor's questions and the parents' answers. Some of them with consequences for the further consultation. It shows that interpreting in this setting is a challenging responsibility and that it is hard for the interpreter not to deviate from existing professional standards. As regards a lingua franca, the analysis revealed that the language proficiency of both patient and doctor are an important factor to come to successful communication.

# Bridging the Migration-/Mobility-Divide in the Study of “the Other”: Transnational Ties and Alternative Constructions of Albanianess in the Face of Stereotypization and Discrimination

Panel contribution

***Mx. Shpresa Jashari<sup>1</sup>***

1. Z

Linguistic literature on the nexus of language, alterity and mobility is marked by a similar epistemological dividing line, I argue, as in social sciences: On the one hand there are studies on *mobility*, with so-called *highly skilled expats* at its center, often dealing with English as L2 (Higgins 2011); on the other hand there is research on *migration*, referring to its subjects as *migrants or refugees* and their *heritage languages* (Borland 2005). This binary logic risks reproducing and naturalizing this divide and overlooking complexities, ambiguities and transformation processes.

The paper contributes to bridging this divide based on the analysis of the identity work of Albanian speakers in Switzerland and Germany, a community that has been represented in stereotypical and racist imageries by dominant discourse in the past two decades. The paper shows how members of this group, generally perceived as “migrants” in their country of residence and speaking a language with little prestige, mobilize their transnational social, cultural and linguistic ties to Albanian speaking places to enact more positive selves, resisting discriminatory and stereotypical ascriptions.

The narrative-interpretative discourse-linguistic analysis is predominantly based on 18 language-biographical interviews in Switzerland and 120 guideline-interviews in Germany and Switzerland. They open up intersecting perspectives on language practice and self-positionings. I employ a mixed method approach, combining the shorter guideline-based interviews with extensive biographical narratives (Pavlenko 2007), which entail language portraits (Busch 2011) as well as maps of language practice. Ethnographic field work complements my narrative data.

I analyze language practices, language attitudes and self-positionings in the context of biographic experience and local, national and transnational fields (Blommaert 2010). This approach focuses on (reactive) boundary making practices *within* a discriminated group rather than on the ways, in which they are targeted by dominant discourse. This allows grasping a wide range of experiences and forms of resistance - and the dynamics between them.

The cross-border-approach is crucial here, as the life world of this population is highly transnational. Data show how individuals, positioned differently in terms of age, class, gender, dialect etc. engage in different types of transnational ties, mobilizing Albanian as resource. While family relations to villages and cities of origin remain relevant, particularly to the first generation, an upcoming elite growingly builds on new ties to urban locales in Albanian-speaking countries, experiencing alternative forms of *Albanianess*, accessing urban art scenes or even finding new business opportunities.

These results speak against clear-cut categorizations into *migrants* and *mobiles*, witnessing a shift in constructions of *Albanianess* from the former towards the latter.

# Bringing smartphone users (back) into the conversation

Panel contribution

**Ms. Iuliia Avgustis<sup>1</sup>, Prof. Florence Oloff<sup>1</sup>**

***1. University of Oulu***

Using mobile devices in co-presence of other participants can impact the participation framework: on the one hand, the mobile device user's availability for interacting with others is potentially reduced (Mantere & Raudaskoski 2017; Henriksen, Skaar & Tjora 2020), on the other hand, co-present others have limited access to the device screen and thus do not know if the device use is *convergent* or *divergent* with respect to the ongoing interaction (Brown, McGregor & Laurier 2013). Previous studies have shown how smartphone users themselves can provide solutions to these practical problems, for example by announcing and formulating their on-screen activities (Hendry, Wiggins & Anderson 2016), by precisely timing their device manipulation with respect to the organisation of the ongoing conversation (DiDomenico & Boase 2013; DiDomenico, Raclaw & Robles 2018), or by initiating mobile-supported sharing activities (Raclaw, Robles & DiDomenico 2016, Oloff 2019). Whereas most ethnographic and interactional research focuses on the perspective and agency of the smartphone user (and sometimes even attributes agency to the mobile device itself), in this presentation we wish to focus on "non-users", i.e. co-present others not using a mobile device. More specifically, we will explore how they multimodally respond to others' smartphone use, and how they can act on the smartphone users' availability. Based on video data of everyday interactions among friends and family members in different languages (Czech, German, Russian), we will start with the observation that smartphone users' activities and their device screens are monitored (M. H. Goodwin 1980) by co-present others, even if the latter do not actively participate in the on-screen activity (cf. Hendry et al. 2016). Using the framework of multimodal conversation analysis (e.g. Mondada 2013, 2016), we will then illustrate how this monitoring allows for different types of interventions from "non-users": they can display their interest in the device use by gazing or pointing at it and/or by formulating their current understanding of the device-related activity. Moreover, they can explicitly request to be informed about the media content or type of device use, and they can introduce a new conversational topic or possibly tease the smartphone user with respect to what they can perceive to be ongoing on the device screen. We will show how these various verbal and embodied "approaches" to the mobile device by a co-present non-user can act on the participation framework of the ongoing social encounter by bringing the smartphone user back into the conversation. This means that not only smartphone users themselves, but also co-present non-users can actively contribute to the upholding or dissolution of the potential asymmetry of individual mobile device use. More globally, these sequences will also allow to reflect upon the general accountability of mobile device use in face-to-face encounters and upon its impact on the organisation of interactional engagement (C. Goodwin 1981).

# Building family-school partnerships: Parents' interactional practices during homework talk

Panel contribution

***Dr. Vittoria Colla***<sup>1</sup>

**1.** Department of Education, University of Bologna

In the last decades, a great amount of research has reported the advantages of parental involvement in children's education. Concurrently, many Western countries have implemented education policies promoting the "family-school partnership" as the formula for maximizing students' success and increasing social equality. Home-school relations have therefore increased along with expectations that parents get involved in their children's school life (see among others, Kremer-Sadlik & Fatigante, 2015).

In the building of family-school partnerships, two activities appear to be central: parent-teacher conferences (see Pillet-Shore, 2003, 2015) and homework. Being a school activity carried out inside the home, homework constitutes a potential site for implementing parental involvement on a daily basis. Indeed, according to the dominant discourse on family engagement, monitoring and helping children with the assignments is an essential task for "good parents" (see Forsberg, 2009). Yet, despite being an allegedly "good practice" of parental involvement, parent-assisted homework is still little explored as an arena for the interactional construction of the family-school partnership (but see for example, Wingard, 2006; Forsberg, 2009; Kremer-Sadlik & Gutiérrez, 2013; Kremer-Sadlik & Fatigante, 2015).

This presentation fills this gap by demonstrating how the family-school partnership is presupposed and constituted in and through ordinary family talk. Drawing on video-recorded parent-child homework interactions in 19 middle-class Italian families with children aged 6-10 years old, and adopting a conversation analysis informed approach, the present study examines practices recurrently deployed by parents when supervising children's homework. It identifies three central practices: quoting the teacher, comparing family to school, and advocating for the teacher. This paper argues that, through these practices, parents establish themselves as "pedagogical parents" (Popkewitz, 2003): they demonstrate their knowledge of, and alignment with, the standards, norms and expectations of the school, and reproduce the cultural patterns of the school inside the home. In this way, parents implement the family-school partnership and comply with the model of the "involved parent" proposed by pedagogical research and policies.

# Building the nursing intern's social and spatial position through "walking behind" interactional practices

Panel contribution

***Ms. Sylvia Trieu<sup>1</sup>, Prof. Esther González Martínez<sup>1</sup>***

***1. University of Fribourg***

Over the course of her studies, a nursing student will complete several hands-on training internships at a hospital. We are currently conducting a study on the nursing trainee's lived world of work, meaning his/her embedded experience of the workplace through interactional activities. The study is based on a corpus of video recordings, supplemented by ethnographic material, collected at a hospital clinic in the French-speaking part of Switzerland. We adopt the multimodal conversation analytic approach to examine the interplay of talk, bodily conduct and spatial resources in the organization of the interns' activities with co-workers. We are particularly influenced by the literature on "on-the move interactions" as mobility is ubiquitous in the nurses' daily work. The intern's most common and routine activity is indeed walking around in the clinic, moving from one room to another, alone or with other team members. We have noticed that when the intern is with a nurse, she usually walks behind her, sometimes at some distance, even when they are speaking to each other. In a group, nurses often walk side-by-side and/or one behind the other, adopting positions that tend to vary. In contrast, the intern systematically walks behind the others, at the very end, unless an aide occupies this position. However, the intern often walks side-by-side with a newcomer rotating aide.

Our presentation will show how the intern's walking behind the nurses is interactionally produced. We will first present some basic features of the intern's moves in the clinic's corridors when walking alone, in a pair or in a group, with or without talking. We will then examine several video excerpts suggesting that the intern is in fact brought by her co-workers to walk behind them. For instance, the intern contingently merges with a nurse in the corridor and speaks to her, but the nurse passes her by and responds while moving away. Or the intern summons a nurse who is walking away and moves toward her but the nurse pursues her trajectory and responds without stopping, creating a situation in which the intern has to follow her.

We argue that these mobility practices are instrumental in constructing and displaying the intern's social position within the team. The clinic's social order has indeed a spatial dimension. The intern is interactionally included in the clinic's activities in a specific spatial and interactional configuration (behind the others) that orients her possible contributions. For instance, walking ahead allows the nurse to determine the destination, trajectory and pace, to confront any contingent event first, and to initiate the projected activity as soon as the destination is reached. Echoing the panel's rationale, the paper thus respecifies the inclusion/exclusion dichotomy in the activities of the work community, advancing that interactional practices project and build distinct opportunities for participation when any given party of interactants achieve social activities as being common to them.

# Cabaret and the Carnivalesque: Examining the Construction of Regional Identities through Humorous Cultural Performance

Panel contribution

**Mrs. Sara Atwater<sup>1</sup>**

1. Maastricht University

This presentation will look at multimodal examples of the humorous cultural performance of cabaret in the former mining region of the German Ruhr Valley. It examines how these performances reproduce or question gender ideologies in a region which is characterized by heavy labor and working-class masculinities (Connell; Donaldson). The anthropologist, Milton Singer, used the term “cultural performances” to describe festivals like carnival and cabaret along with events like religious ceremonies, film, radio and theatrical performances and other media forms. Subsequent studies have employed the term and similarly looked at how cultural performances can offer alternative ways of understanding tensions within regional and national collective forms of identity (Gabbert).

The discussion will explore Mikhail Bakhtin’s theory of carnivalesque humor which highlights collective practices of humor. In Bakhtin’s framework, carnival and carnivalesque humor are associated with a temporary triumph of everyday citizens and culture and the subversion of traditional roles and power structures. This dénouement is relevant in performances which enact gender roles and gendered power relations because they often subvert women’s social positions in ways which question gender normative hierarchies. However, while cabaret practices which employ carnivalesque humor can realign unequal power relations, gender identities and gender norms, they can also reify them. Likewise, the double-faced role of humor as a tool which can facilitate in-group cohesion while simultaneously constructing and heightening gendered otherness becomes evident in some of the regional humorous performances of cabaret which will be presented (Attardo, Zekavat; Pailer; Kotthoff).

This discussion of carnivalesque humor is helpful to understand how cabaret in the Ruhr Valley region plays a role in the formation of gendered regional identities. Local Ruhr Valley cabaret troupes and individual performers often distinguish themselves as being from the Ruhr area through the language, material and performance features of the show. This submission will examine how these humorous cultural performances are linguistically mediated and part of a broad multimodal discourse which can illuminate social ideologies related to nationality, language, gender, ethnicity and social class. Language interaction will be examined alongside of a larger range of semiotic resources which get employed in the performances, such as costumes, gestures, gaze, music as well as the use of digital media (Kress & Van Leeuwen).

# Car sharing and the organization of encounters between unacquainted drivers and passengers in public places.

Panel contribution

***Prof. Christian Licoppe<sup>1</sup>, Dr. Beatrice Cahour<sup>2</sup>***

*1. Department of Social Sciences, Telecom Paristech, and I3 (UMR CNRS 9217), 2. Department of Social Science, Telecom Paris, and I3 (UMR CNRS 9217)*

In this communication we explore a particular type of encounter between ‘strangers’ in public places, in which people who have never met in person, but have interacted previously online on such platforms, are supposed to meet in public spaces. Such encounters in public spaces between ‘pseudonymous strangers’ (Licoppe, 2016), which become more frequent with the development of online collaborative practices are distinct both from encounters between ‘complete’ strangers (because they have interacted online before) or between acquaintances (unlike the latter, the ‘pseudonymous’ participants may not be able to identify one another visually). Our data is based on a study of car sharing, which involves strangers agreeing online on a trip, and then having to meet for the intended trip, though they have never met in person and cannot recognize one another visually. We have video-recorded such encounters by recruiting participants to wear camera glasses. Relying on the EM/CA perspective and multimodal interaction analysis (Mondada, 2016), we discuss here two aspects of such encounters:

- A particular emphasis on categorization in the pre-opening phase and on mutual identification and recognition in the opening itself
- The way participants might be affected by mutual gaze and categorization-oriented scrutiny in the pre-opening approach, with consequences regarding such an interactional achievement.

# Challenge me softly: Requests for confirmation as devices for implementing challenging and other disagreement-implicative actions

Panel contribution

***Dr. Oliver Ehmer<sup>1</sup>, Dr. Uwe-Alexander Küttner<sup>2</sup>, Dr. Martin Pfeiffer<sup>3</sup>***

**1.** University of Freiburg, Department of Romance Philology, **2.** Leibniz-Institute for the German Language, Mannheim, **3.**

University of Freiburg, Department of German Linguistics / Freiburg Institute for Advanced Studies (FRIAS)

Requests for confirmation and the sequences they engender have figured prominently in prior conversation analytic and interactional linguistic research (e.g., Barnes, 2012; Betz, 2015; Couper-Kuhlen & Selting, 2018; Stivers et al., 2010). To date, however, there are hardly any cross-linguistic studies that focus on different formal realizations and/or interactional uses of this action type. This research gap constitutes the point of departure for the scientific network *Interactional Linguistics*, which seeks to investigate request for confirmation sequences across a range of typologically distinct languages (<https://interactional-linguistics.org>). Within the framework of this network, we understand request for confirmation sequences (RfCs) as “context-free device[s] with a general structure that can be put to different kinds of pragmatic uses” (König & Pfeiffer 2019: 3). In our understanding, RfCs are primarily characterized by a particular epistemic configuration, such that they propose a relatively flat, recipient-tilted epistemic gradient and make confirmation/disconfirmation relevant next actions (Heritage, 2013; Küttner, 2016, 2018).

Across our different data sets (English, Spanish, German), we find that RfCs recurrently do not only operate in the epistemic domain but are frequently also used to accomplish a range of other social actions and interactional functions (e.g., topic management, stance management, repair-related actions). In our contribution, we focus on RfCs that are used to implement challenging and other disagreement-implicative actions. By this we mean that the participant who initiates the RfC sequence is questioning or refusing to accept a prior turn’s substance, its implications and/or its action, treating it/them as doubtful, unacceptable, (self-)contradictory and/or incompatible with what is supposedly in the common ground. We will show that across languages such RfCs are used to implement rather soft challenges and mild disagreements, as opposed to more straightforward versions of these actions (see also Bolden & Robinson, 2011; Koshik, 2003). They may therefore be understood as resources for accomplishing disagreement without escalating social discord.

## Challenges in interpretation of silence in cross-cultural encounters

---

Panel contribution

---

**Dr. Bashir Ibrahim**<sup>1</sup>

*1. School of General Studies Kano University of Science and Technology, Wudil*

The study of silence has continued to draw the attention of researchers in the field of sociolinguistics, ethnography and pragmatics. As silence is ambiguous, its interpretation could be as difficult as understanding unfamiliar language. Similar situations in the use of silence may evoke varying interpretations, often even within the same culture, depending on the social orientation of the interpreter. Among the Igala people of Nigeria, for example, silence during conversation can be interpreted both as wickedness and as a strategy of thinking, just as among the Yoruba. Jensen (1973) asserts that silence performs two opposite functions: positive and negative. Later studies confirmed opposite interpretations of silence in cross-cultural encounters as among New Yorkers and non-New Yorkers (Tannen 1985), the Athabaskan people of Canada when engaged in conversation with English speakers (Trudgil 1983), and between Navajo people (a native American people of South-western United States of America) during their conversation with English speakers (Saville-Troike 1985). It has been reported that, in the above cited examples, the conversation partners interpreted the silence of one another negatively as non-cooperative during the conversation. As cultures and situations differ, interpretation of silence can be a ‘would be’ phenomenon. The aim of this paper is to review some related literature of silence with a view to propose that interpretation of silence is intricate both intra-culturally and cross-culturally.

# Changing practices of paying tribute in parliament

Panel contribution

***Dr. Elisabeth Reber***<sup>1</sup>

1. University of Heidelberg/ University of Würzburg

In this talk, I analyze the practices of paying tribute as an emergent formulaic ritual at British Prime Minister's Questions (PMQs). PMQs has been described as "an aggressive ritual setting" (Bull et al. 2020: 64), which has been undergoing rapid change and shows evolving formulaic structures on various levels (Reber in press). Informed by Variationist Sociolinguistics, Interactional Linguistics / Conversation Analysis, and Usage-grammar theories, this study draws on data taken from some of the earliest recordings available (when PMQs was audio-taped for radio broadcasts; 1978-1988) and from more recent video footage (2003-2013). In addition, Hansard, the official record of parliamentary proceedings, was used.

The broader research questions addressed in my talk are twofold: 1) How do parliamentary speakers pay tribute at PMQs? 2) How did these practices change during a span of 36 years?

A first comparison between the older and newer recordings suggests that paying tribute constitutes an unusual practice in which parliamentary speakers display unity across party ranks. In the 2003-2013 data set, paying tribute represents a fixed ritual where the Prime Minister (PM) invites others to join him in paying tribute in his first turn in a session. This is picked up by the Leader of the Opposition (LO) when he is allocated his turn. Ex. (1) exemplifies the PM's paying tribute.

(1) PMQs 08 Dec 2010

PM: David Cameron (Con); LO: Edward Miliband (Lab); S: John Bercow

- 1 PM: i'm sUre the whole house (.) will wish to join ME;
- 2 in paying trIbute to private john HOWard;
- 3 from THIRD battalion;
- 4 the PARachute rEgiment;
- 5 who DIED on sunday the fifth of decEmber.
- 6 he was an incrEdibly gIfted and POPular pAratrooper;
- 7 we should send our condolences to his FAMily-
- 8 his frIends and the love' his lOved ones at this VERy sAd tIme.

Ex. (2) illustrates how the LO follows up on this move.

(2) PMQs 08 Dec 2010

PM: David Cameron (Con); LO: Edward Miliband (Lab); S: John Bercow

- 1 LO: =can i (.)

2 can i JOIN the prIme minister; (-)

- 3 in paying trIbute to private JOHN hOward;=
- 4 =from THIRD battalion;
- 5 °h the PARachute rEgiment;
- 6 °h he showed eNORMous courage,
- 7 °h we pay TRIbute to his sAcrifice;
- 8 °h and our THOUGHTS and deepest condOlences are with his fAmily.
- 9 MPs: <<(1.73)> ((soft cheering))>

These interactional structures contrast with the older data set which did not reveal any instances where the PM initiates such a ritualized action package followed up on by other parties. Instead, it is the PM who is occasioned by MPs to pay tribute to third parties.

Bull, Peter; Fetzer, Anita; Kádár, Dániel Z. 2020. Calling Mr Speaker ‘Mr Speaker’. The strategic use of ritual references to the Speaker of the UK House of Commons. *Pragmatics* 30(1): 64 – 87.

# Changing trajectories: Hands-on instructions in Pilates courses before COVID-19 and workarounds during COVID-19

Panel contribution

**Dr. Heike Ortner**<sup>1</sup>

1. University of Innsbruck

**Outline:** Apart from communicating general affective qualities, touch can be an important resource of instruction in embodied practices. In a Pilates class, touch is used in so-called “hands-on” sequences. Here, touch serves both tactile and haptic functions by providing information to the learners and the course instructor alike (e.g. correcting positions, facilitating movements, deepening kinesthetic transfer). Any application of touch as a resource of instruction is based on a set of specific gestures reflecting a repertoire of professional practices. The COVID-19 pandemic shut down all indoor sports activities in Austria for over half a year. All Pilates classes had to be suspended or transferred to an online format.

**Research question:** The focus of this talk are the alternatives to touch used in online classes in comparison to the physical and gestural trajectories of instruction before the pandemic. The main research question is: How do Pilates instructors replace the resource of touch in online settings in situations they usually would have used tactile feedback?

**Data:** The data consist of a total of 10 Pilates classes video-recorded before COVID-19, gathered in the Austrian Pilates studios in 2017 for an older project, and online classes in 2021 for this talk. The language of instruction is German with varying degrees of diatopic variation (Austrian German, local varieties, but also other varieties of German).

**Method:** The research questions will be explored by applying a qualitative ethnomethodological approach (cf. Mondada 2014).

**Preliminary outcomes:** The data illuminate that the lack of touch as a resource of instruction shake the very foundations of a Pilates class. However, the course instructors develop new practices of professional gaze and verbal precision to guide their clients through complex motion sequences. Also, the initiation, the hierarchy of involvements, and the participation frameworks (Goodwin, 1981) are quite different, marking a phase of re-orientation in the professional practices of fitness trainers as well as regarding the instructor-learner-relationship.

# Children's linguistic and embodied practices of inclusion and exclusion in preschool

Panel contribution

***Prof. Asta Cekaite<sup>1</sup>, Dr. Matthew Burdelski<sup>2</sup>***

*1. Linköping university, 2. Osaka University*

This presentation examines young children's linguistic and embodied practices of peer inclusion and exclusion in play activities. Based on approximately 100 hours of audiovisual recordings of naturally occurring interaction from a Swedish and Japanese preschool with children ages 2 to 5, the multimodal interaction analysis shows ways in which children in both cultural contexts mobilized multiple modalities – these included verbal language, body posture, gestures, facial expression, touch, and objects – to organize joint play activities where they attempted to include or exclude other children's participation in them. The analysis shows ways in which children established *interactional spaces* (Mondada, 2013) and protected their *territories of self* (Goffman, 1963) by deploying a variety of linguistic and embodied practices to configure multiparty participation frameworks. The linguistic practices included directives, interrogatives, and style shifts (e.g., switching from informal to formal registers), which were accompanied by paralinguistic resources such as changes in prosody (e.g., vowel elongation, loudness). These linguistic practices were mutually informed by embodied practices, such as gaze direction and spatial distancing in relation to core members of the peer group, in ways that allowed children to indicate various participant positions and footings in play activities. In situations of peer conflict, children's gaze and body postures were deployed to sustain dyadic participation frameworks that worked to exclude third-party peers from the on-going activities, despite another child's attempts to gain a participant position by manifesting and extending distress. Although it was not accompanied by verbal actions or talk, spatial distancing from the core participants provided a means for temporary self-exclusion. In all, the study identifies various pragmatic resources for positioning others as either a participant/person or a non-participant/non-person (Goffman, 1963) in constructing identities.

# Children's Participation in Discourse – Co-Constructions in Peer-Groups

Panel contribution

***Dr. Judith Kreuz<sup>1</sup>, Prof. Martin Lugimbühl<sup>2</sup>***

***1. University of Teacher Education Zug, 2. University of Basel***

Peer interactions are usually characterized by symmetrical reciprocity (Youniss 1994) and they support collaborative social and cognitive learning (e.g. Farris 2000). Peer relationships contain also elements of complementary reciprocity and offer opportunities for mutual imitation and internalization of social and language actions (Reusser 2001). For both facets of interaction, we can reconstruct co-constructed and synchronized (speech) actions on different analytical levels by means of conversation analysis (e.g. Sidnell & Stivers 2013), including multimodal aspects (Mondada 2016).

Our data consist of a sub-corpus of 60 videotaped small-group discussions between peers aged 8 to 12 aiming to find a solution to a problematic issue. Starting point of the analysis are argumentative sequences, in which the children participate in the conversation through argumentative co-constructions in order to reach consensus. Under co-construction on an argumentative level we understand first of all the joint production of ideas (Kreuz in prep.), specifically the joint work on an argument (assertion + justification) by at least two participants in the discussion. The data show how the children achieve a high degree of synchronization in order to become involved in the discussion in an argumentative way – not only on the content-argumentative level through the co-constructed reasoning that allows for the elaboration of a complex argumentative structure and the expansion of ideas, but also on the level of morpho-syntax (e.g. utterance completions, e.g. Lerner 1991), prosody (e.g. rhythmization) and non-verbal expression (e.g. imitation of gestures).

Co-construction reveals the children's attentiveness to each other's stances and requires high-level knowledge of conversational conventions (e.g. recognizing TRPs and grammatical constructions in order to introduce argumentative elements cohesively), and skills in appropriate social behaviour. By means of co-constructions, the children display togetherness, which seems to be an important tool of access to controversial topics and therefore gives a chance to participate actively in group discussions.

The data also show that children of different ages have "preferences" for different types of synchronization in moments of co-constructed negotiation processes. Thus, younger children perform synchronization for example in the gestural illustration of an argument of their interlocutor, while older children show their orientation towards their interlocutor by argumentative continuations of argumentative contributions or by morpho-syntactic completions. At such co-constructive moments, various functions can be differentiated. While in older children co-constructions often serve to deepen the relationship to other group members and suggest "doing being best friends" (Kreuz in prep.), younger children use their joint synchronization efforts to quickly reach consensus or to mark epistemic authority on the level of argumentative content.

# Clause Linking and Turn/TCU Extension: The Interactional Pragmatics of FANZHENG in Mandarin Conversation

Panel contribution

***Dr. Hua Gao<sup>1</sup>, Prof. Hongyin Tao<sup>2</sup>***

***1. Shenzhen University, 2. UCLA***

An important tenet of Emergent Grammar (Hopper 1987) is that grammar emerges from repeated patterns of use in human interaction, and as such, it is best understood as routinization and sedimentation of discourse practices, and thus ultimately as epiphenomenal. In this paper, we show that an erstwhile modal adverb in Mandarin Chinese, *fanzheng*, lit. ‘back-front’, or roughly ‘anyway/in any case’ etc. in English, shifts from its canonical preverbal position to a turn- and turn constructional unit (TCU)-initial position as well as their final counterparts (Gao and Tao 2021). When these phenomena occur, *fanzheng* often serves to expand a TCU and/or continue a turn, and in doing so, more importantly, it manifests as a way of linking two or more clauses together, in ways similar to clause combining elements such as ‘since’, ‘and’, and ‘but’, but with more nuanced meanings. In other words, what looks like an omnipresent clause combining device in fact corresponds to a conversation TCU/turn extension action.

Excerpts 1 and 2 illustrate *fanzheng* linking an account and a concession respectively but the former is done as a projected part of a multi-unit turn while the latter is used after the prior TCU has reached a terminal intonation contour.

## Excerpt 1

Xiaoye ye keyi zhuan a= fanzheng ta xianzai ye hai mei kao qualify a.

NAME also may transfer UFP FANZHENG he now also yet no test qualify PRT

‘Xiaoye may also transfer= since he hasn’t done the qualification anyway.’

## Excerpt 2

06 A: yinwei wode fellowship, wo keyi- daizou. .hh wusuowei- zai na.

because my fellowship I can take-away no-matter at where

‘Because I can- take my fellowship with me. No matter- where I am.

07 >fanzheng<- dou- doushi gei wo zheme duo qian.=

in-any-case all all-COP give me so much money

>In any case<- I am given this much money.’

Excerpt 3 illustrates successive occurrences of a TCU-final/extension *fanzheng* and a TCU-initial *fanzheng* resulting in turn continuation or transition.

## Excerpt 3

04 A: dajia dou- dou shuo zhe’er rongyi ban yimin,

everybody all all say here easy do immigration

‘Everybody all- all say immigration is easy here.

05 qishi ne, .hhh (.) xianzai ta ye yue-lai-yue-jin ba fanzheng=

actually UFP, now it also more-and-more-strict UFP FANZHENG

Actually, .hhh (.) there’re more and more restrictions FANZHENG=

06 >fanzheng< yaoshuo ban ba, women zai xuexiao li de zhongguoren wo kan,

anyway TM do UFP we at school inside AM Chinese I see

>Anyway< in case of application, the Chinese people at our school I think

07 (0.2) chabuduo dou ban le.

almost all do UFP

(0.2) almost all have got it.’

As can be seen in all three contexts, *fanzheng* emerges as a multiple clause linking and extension device, corresponding to conversation structural extensions in TCUs and/or turns. The reason for such flexibility and functions, as shown in Gao and Tao (2021), is the pragmatic function of *fanzheng* to calibrate negatively valenced stances in talk-in-interaction and the combination pattern becomes routinized over repeated use.

# Climate Change Denial: A Content Analysis of Social Media

Panel contribution

**Ms. Audra Bacon**<sup>1</sup>

**1. Tex**

Climate change science is strongly supported within the scientific community, yet there is still much public debate on the topic. To date, there have been few analyses on the online discourse around climate change denial. The goal of this research is to evaluate online discussions regarding climate change and gain a better understanding of the climate change denial countermovement. Additionally, this research aims to assess the public reactions on global climate change legislation, and finally, determine how public opinions have changed over time. The data collected for this study are derived from two different climate change Facebook pages. In order to gather information from users who both support and deny the validity of climate change science, the researcher specifically chose two Facebook pages to analyze: 1) NASA's Climate Change; 2) Climate Change LIES. The study is comprised of a non-random purposeful sample that reviews content from Facebook users. The conventional content analysis approach was used throughout this study.

The researcher analyzed posts and comments on the selected Facebook pages for the five days before and after major climate change related events occurred. For example, on June 1<sup>st</sup> 2017 President Donald Trump announced the United States withdrawal from the Paris Climate Agreement, therefore all comments posted between the dates of May 27<sup>th</sup> and June 6<sup>th</sup> 2017 were obtained. To determine if there was a change in social media discourse over time, it was necessary to obtain data from three consecutive years; the selected sample included data from the years 2017, 2018, and 2019. This method was chosen to: 1) provide information about the ways in which social media can shape public opinion; 2) describe public discourse on this topic within the forum of Facebook; 3) and demonstrate how climate change denial is framed online.

This research indicates that climate change denialist explanations are grounded in personal experience, personal politics and preferred news sources. Arguments over the authenticity of news sources is central in the climate change debate, as seen in this study. Such arguments commonly included offensive language, which allowed for a new discussion on the social implications of these types of interactions. Comments that were hateful in nature, insulting, sarcastic, or specifically directed towards a person or group of people were found throughout the data set. This type of derogatory discourse occurred on both Facebook pages, and often led to attacks on individuals not involved in the conversation. It was common for users to insult an entire group of people. This emerging type of online communication is problematic for many reasons, but emblematic of the emerging "troll" culture that social media seems to breed. The data collected for this research is unique in that there have been few studies on how people are communicating on social media about important environmental issues. The data show the need to further analyze the emerging ways offensive language is affecting how social media users interact.

# Co-Completion as Early Response in Extended Telling

Panel contribution

**Dr. Yue Guan**<sup>1</sup>, **Mr. Zixuan Song**<sup>2</sup>

1. The Hong Kong Polytechnic University – Peking University Research Centre on Chinese Linguistics, 2. Department of East Asian Studies, University of Alberta

This paper examines co-completion as one of the responsive actions in telling sequences. In daily conversation, it is not uncommon that while a speaker's turn is still in progress or syntactically incomplete, a co-participant may start a bit earlier and produce an utterance that practically completes that turn. Previous studies have shown that co-participant's completion of another's turn-in-progress reflects an orientation towards the syntactic structure of that turn, and the social action that it is implementing.

Drawing on 10 hours of video-recorded face-to-face Mandarin conversation, and adopting the conversation-analytic approach, the study reported here focuses on co-completion as early response (hereby 'co-completing response', CCR) in extended telling.

Two patterns in which CCRs emerge are found salient in our data. The examples below serve as a quick illustration.

(1) (Y is talking to Z about the worst possible results they should foresee when planning to run a playroom.)

6 Y: 咸鱼 再 一 卖 或者 ga 一 卖,  
 Xianyu zai yi mai huoche ga yi mai,  
 NAME again one sell or MIM one sell  
 'sell them on Xianyu or sell them entirely'

7 能， 说白了 可能 就是:  
 neng, shuobaile keneng jiushi:  
 can put.it.plainly probably just  
 '(we)can, put it simply, probably ju:st'

8 Y: 少 赔 点儿 @@  
 shao pei diar @@  
 less compensate a.little  
 'lose a little less @@'

(2) (L is talking to R about the similar disposition of herself and her boyfriend.)

14 L: 就是 他 会 觉得 这 种 人 ^恶心.  
 jiushi ta hui juede zhe zhong ren ^e'xin.  
 just 3sg would think this kind people disgusting  
 'He would find those people ^disgusting.'

15 R: @@@@

16 L: 所以@@=  
 suoyi@@=  
 so  
 'so @@='

17 R: =所以 你们俩 很 投机=  
 =suoyi nimenlia hen touji=  
 so you.two very compatible  
 'so you two are very compatible with each other='

In (1), the word search as evidenced in the lengthening at the word '*jiushi*' (just) (line 7) seems to have provided for L's entry into R's turn, where L co-completes R's turn with a fitted syntactic continuation, through which

he also presents a candidate understanding of what R's telling is amounting to before it is actually articulated by R herself. (line 8). In contrast, the clause started with 'suoyi' (so) at line 16 of (2) is produced with a 'trail-off' prosody. R picks up the syntactically incomplete clause (line 17), and makes explicit what is left unsaid in L's trailed-off turn through 're-opening' it, although its speaker has indicated through prosody no intention to continue.

While (1) illustrates co-completion much discussed in the literature, cases such as (2) are less explored. This study examines both types of CCR and explores their possible interactional motivations in relation to other types of responses in extended telling.

# Co-constituting face via claims of deontic authority in online medical consultation

Panel contribution

***Ms. Minwen Wei<sup>1</sup>, Prof. Yongping Ran<sup>1</sup>***

***1. Center for Linguistics and Applied Linguistics, Guangdong University of Foreign Studies***

Although the relation between epistemics and face has been examined (Izadi 2018), the deontic ground of face needs further exploration. Informed by the notion of deontic authority (Stevanovic and Peräkylä 2012) and Face Constituting Theory (Arundale 1999, 2006, 2010), this study aims to reveal how participants co-constitute face, understood as relational separateness and connectedness, via claims of deontic authority. The data was collected from text-based online pediatric encounters, a setting where caregivers' resistance to doctors' treatment recommendations is pervasive (Jager and Stommel 2017). Adopting a discursive approach, this study probes into how caregivers and doctors orient to the relational separateness and connectedness through challenging or maintaining the presumed distribution of deontic authority between them, i.e. how much deontic authority they possess relative to their counterpart in a certain domain, in doing and solving resistance to treatment recommendations. It is found that challenging the presumed distribution of deontic authority may lead to relational separateness while maintaining it may create relational connectedness. Thus, this study argues that deontic authority, a relational concept in essence, forms the ground of face. Besides, the result indicates that although counselees participate in online medical consultation more actively than in offline ones, they are still not acknowledged as sharing equal status with doctors in the decision making of a treatment plan.

# Co-constructing a funny story for a listening audience: observations from Italian radio phone-ins

Panel contribution

***Dr. Daniela Veronesi***<sup>1</sup>

1. Free University of Bozen-Bolzano

As a central activity of human interaction and sociability, storytelling in interaction has been examined since the '80 by several disciplines, including anthropology, conversation analysis and interactional sociolinguistics. While recognizing that narratives result from an interactive process with teller and recipient playing an active role (cf. for instance Goodwin 1984; Duranti & Brenneis 1986; Lerner 1992; Ochs et al. 1992; Norrick 1997; Quasthoff & Becker 2005), scholars have focused on tellers' contributions such as pre-announcements and recipient design, on listeners' 'story-interventions' through continuers, questions, collaborative completions and heckling (cf. Monzoni & Drew 2009), as well as on conarration and epistemics (Mandelbaum 1987; Norrick 1997; 2020a; Monzoni 2005).

Within the field, humorous discourse has also been investigated with analyses of conversational joking and humor in narratives (Norrick 2002; 2004; Ervin-Tripp & Lampert 2009, among others), usually in ordinary face-to-face contexts, while little is still known about non-scripted humorous storytelling in media settings; a case in point in this regard is radio phone-ins, studied primarily with reference to overall structure (Hutchby 1996; Thornborrow 2001; Dori-Hacohen 2015), problem exposition and advice-giving (Traverso 2008; Hutchby 1995), audience participation (Hutchby 1999), membership categorization and intimacy (Fitzgerald & Housley 2002; Dori-Hacohen 2012; Rubino 2016), dual-hosting (Ames 2013), and irony in political broadcasts (Dori-Hacohen & Livnat 2015; Livnat & Dori-Hacohen 2018).

Taking this body of literature as a departure point and adopting a Conversation Analysis perspective, in this study I thus examine a collection of 50 short narratives (ca. 2 hours) from an Italian entertainment national public radio show, in which listeners are invited by the two shown co-hosts to share their experiences on a variety of topics presented within a play frame (Bateson 1972; Norrick 2010) – as in “Weird attempts at sanitations during the Covid-lockdown”, “Never again in my life”, “When you pretended not to know each other” and the like.

Against the background of institutional features of radio broadcast such as intentionality, sociability, performativity and interactivity (Dori-Hacohen 2015; cf. also Hutchby 2006), I analyze how the two hosts, as unknowledgeable listeners (Norrick 2000), sustain callers' live tellings of personal anecdotes and co-construct their narratives through a variety of moves – continuers, questions, and laughter, but also ironic comments and wisecracks, puns, mock denials, assessments, repetitions, advices, as well as pre-recorded applause –, thus enhancing the potential humor of these narratives and rendering them as “funny” for the listening audience. I thereby explore how such moves may be implemented in different sequential environments (e.g. opening and preface, story development, climax, closing) and how the caller's narrative progressively emerges from the dialogic interaction between caller and hosts acting as a team. Final considerations are devoted to the way in which such collaborative stories may be crucial in establishing, ratifying and sustaining group membership (Norrick 2010), in this particular radio show to a community of listeners, strongly oriented to humor and the demonstration of a sense of humor.

# Co-Constructing Emergent Common Ground: The Role of the Intercultural Mediator

---

Panel contribution

---

***Dr. Adriana Merino<sup>1</sup>***

*1. Princeton University.*

This research addresses the question of how multilingual interactants interpret and use figurative language (*i.e.* formulaic, idiomatic, and metaphoric expressions) in intercultural interactions. Drawing on the socio-cognitive approach to pragmatics (Kecske 2006, 2008, 2009, 2010, 2014), the analysis accounts for misunderstandings, communication breakdowns, and pragmatic missteps among interlocutors when dealing with nonliteral language. It also focuses on the co-construction of Common Ground (CG) in figurative language interpretation and use, while examining the interlocutors' collaborative metapragmatic reflections. The datasets come from transcribed conversational exchanges that took place in study abroad settings, between native (NS) and non-native speakers (NNSS), with different linguistic and cultural backgrounds, and who were using Spanish as a lingua franca. As part of my findings on multiparty, multilingual encounters, I propose the concept of the Intercultural Mediator (IM), as that interlocutor who displays a greater understanding of linguistic and intercultural communication among interactants and contributes to establishing a match between their private/prior context, and the actual situational context. In so doing, the IM actively, and positively, contributes to the dynamic co-construction of meaning (Kecske 2008), and the creation of emergent common ground (Kecske 2014). The IM brings to light correlations between indicators of awareness of potential misunderstandings and figurative language processing. The findings also provide some insight into pedagogic interventions for enhancing pragmatic awareness, intercultural social skills, and figurative language use in language learning.

# Co-Creation of Merging Discourse in Japanese Conversation: An Interpretation Using the Notion of Dual-Mode Thinking

Panel contribution

***Dr. Kishiko Ueno***<sup>1</sup>

**1.** Tokyo City University

This study analyzes a conversational phenomenon that I label “merging discourse,” observed in Japanese conversations between two women. In merging discourse, the storyteller and the recipient improvise one storyline through repeating, overlapping, and taking over each other’s utterances while entraining each other’s head-nodding rhythms.

I explicate why and how merging discourse is made possible by introducing “dual-mode thinking,” one of the key notions of *ba*-theory (Shimizu, 2004). Dual-mode thinking assumes that the self is organized through mutually induced fit interactions of two domains of self: explicit and implicit. The explicit domain is called the egocentric domain, which manages rational thinking, while the implicit domain is called the *basho* domain, which coordinates an individual’s corporeality and feeling. In face-to-face communication, speakers’ *basho* domains can resonate and merge. The merged *basho* domain leads to the sharing of feeling and corporeality between the speakers; this enhances the feeling of empathy and sometimes promotes identification with another’s viewpoint and anticipation of another’s moves. Corporeal sharing is revealed in forms such as entrainment and synchronicity, in which speakers resonate rhythmically and automatically entrain with each other’s body movements and voices.

I claim that merging discourse is an outcome of the merged *basho* domain shared between the storyteller and the recipient. When the speakers nod to each other while repeating, overlapping, and taking over each other’s utterances, their *basho* domains resonate and merge. In this state, the egocentric domain sustaining individuality is subsumed by the merged *basho* domain, whereby the speakers attain heightened resonance and empathic connection, and their egocentric activity is minimized. Thus, merging discourse can be seen as a form of “communion of empathy” (Ueno 2017), whose logic is primarily the pleasure of oneness. Mutually induced fit interactions of the two domains of self drive the process of merging discourse, embodying seemingly conflicting orientations; the merged *basho* domain promotes dissolution of the teller-recipient distinction, while the egocentric domain of each speaker attempts to maintain coherence attributable to each speaker’s identical roles of storyteller and recipient in the conversation.

# Co-membership in technology-mediated job interviews

Panel contribution

**Mrs. Melina De Dijn<sup>1</sup>, Dr. Dorien Van De Mieroop<sup>1</sup>**

**1.** KU Leuven

Ever since the early work on gatekeeping (Erickson & Shultz, 1982), there has been a growing interest in job interviews from an interactional sociolinguistic perspective. This research has, among others, shown that candidates in job interviews construct both personal and professional identities and that it is beneficial for candidates to highlight the characteristics they share with recruiters, as such possibly constructing co-membership (*ibid*). Yet, the COVID-19-situation has turned job interview practices upside down: while in Belgium, it was common practice to organize face to face job interviews, we now see a surge in technology-mediated job interviews (TMI's). Research from an HR-perspective shows that interviewer ratings of applicants and applicant reactions to the interviews are more negative for TMI's when compared to face-to-face interviews (Blacksmith et al, 2016). Possible reasons offered for these differences are the shortening of the 'rapport-building stage' and the more limited possibilities for the observation of nonverbal behaviors (*ibid*). As this 'rapport-building stage' is often crucial for the establishment of co-membership, we may thus hypothesize that the online medium will significantly affect the construction of co-membership.

We adopt a micro-analytical perspective to analyze to what extent and in what ways co-membership is constructed in TMI's. First, we draw on a corpus of 8 video-based job interviews recorded with screen-recording software. These were transcribed using conversation analytic transcription conventions complemented by multimodal conventions developed by Mondada. We scrutinize these TMI's using a qualitative, multimodal discourse analytical approach to zoom in on sequences in which the interlocutors potentially construct co-membership. Second, we complement these interactional data by eight follow-up interviews with the recruiters, each consisting of two parts: (a) an ethnographic part focused on the recruitment context and the recruiters' evaluation of the impact of the digital medium on the interview and (b) a part following stimulated recall methodology (see e.g. Pomerantz, 2005) where the recruiters were asked to recall thoughts they had during the interview while re-watching video fragments. These interviews are used to provide background for our analyses and enable us to check our understanding of the interactions and how these can be related to the construction of co-membership.

Our preliminary findings indicate that 'typical' opportunities for rapport building are indeed reduced in a digital setting (exemplified by a lack of small talk in these interviews), but that somewhat contrary to what HR-research shows, interlocutors seem to be adapting to the new setting and use verbal as well as nonverbal interactional strategies to compensate for the limitations of the TMI. In this way, they create 'other' opportunities for the construction of co-membership. These findings thus once more emphasize the importance of personal identity work and co-membership in these gatekeeping encounters, even – or maybe especially – in a technology-mediated context.

# Co-operative multimodal participation frameworks in refugee toddler baby doll play

Panel contribution

***Dr. Amanda Bateman<sup>1</sup>***

***1. The University of Waikato***

Using language socialisation theory, the sequential orderliness of embodied interaction during toddler baby-doll play is explored to reveal the early socialisation practices present (Ochs & Shiffer, 1989) in an early childhood centre for refugees in Auckland, New Zealand.

The co-operative actions of caring for baby-dolls demonstrate the toddlers' competence in 'performing specific operations...on materials' (Goodwin, 2018, p. 6) to co-produce participation frameworks (Goffman, 1981; Goodwin & Goodwin, 2004) through their skilful use of semiotic resources.

In each of the three episode presented, the toddlers are observed initiating an interaction with each other through orientation to baby dolls, where crying (Bateman, in press) and gaze shift (Kidwell, 2009) are used to recruit the assistance of a teacher when problems with object transfer (Takada & Endo, 2015) arise. Once initiated, the subsequent sequential unfolding of the interactions demonstrate how the toddlers use gesture and joint attention through orientation to an object (Kidwell, in press) to convey the activity of 'doing' being a carer of the dolls as they engage in collaborative baby doll play in close proximity to one another. The closing of each interaction is managed through a child being 'shepherded' (Cekaite, 2010) away by an adult following an altercation with the baby doll, and by one child breaking the close proximity of the participation framework by walking away.

The pragmatic ways in which the toddlers manage their bodies and gesture to perform specific actions such as wrapping the dolls in scarves and carefully carrying them close to their bodies, demonstrates early empathy socialisation practices (Burdelski, 2013). Through engaging in this play, the children's actions make demonstrable their collective belonging to a group of people who engage in specific caretaking activities. The affordances of early childhood centres as places to meet other children and engage in such practices for children who may have experienced displacement from their home country are discussed.

# Code accommodation as a measure of inclusion for bilingual people living with DAT: A case study

Panel contribution

**Ms. Carolin Schneider<sup>1</sup>, Prof. Birte Bös<sup>1</sup>**

**1.** Universität Duisburg-Essen

With the aging societies the number of diagnosed dementias, such as dementia of the Alzheimer's Type (DAT), is constantly on the rise and so is the number of bilinguals who are living with DAT (cf. Plejert, Lindholm & Schrauf 2017). Communication can pose many challenges for people who are living with DAT (PWD) as well as for their conversational partners (cf. Hamilton 2019: 12ff), due to the high dependence on contextual knowledge, cognitive resources and emotional demands (cf. Wray 2020: 185). Bilingualism adds another layer of challenge, but also of great opportunity in this communicative constellation.

Drawing on a qualitative analysis of two narrative interviews held with PWD and their daughters speaking English and Spanish, this study investigates the interlocutors' code choices and the communicative effects of code accommodation on the interaction. The analysis takes account of how accommodation and instances of non-accommodation (cf. Gasiorek 2016: 87) relate to approximation, interpretability, discourse management, interpersonal control and emotional expression, i.e. the five types of communicational behaviors outlined by Communication Accommodation Theory (CAT, cf. Dragojevic, Gasiorek & Giles 2016). Previous studies in institutional settings (e.g. Watson et. al 2016) have demonstrated the benefits of accommodation in bilingual (verbal) interaction (e.g. Yazdanpanah & Plejert 2017) when conversational partners (i.e. PWD – professional staff) do not share a common linguistic ground. Adding a new perspective, this study investigates interactions between PWD, their family care partners and the interviewer, shedding light on the complex interpersonal as well as intergroup dynamics in a private setting on the grounds of a shared bilingual background. The analysis of code choices and their motivations is underscored by metalinguistic commentary by the conversational partners who negotiate bilingualism and code choice throughout the interviews. The results of this meso-level study indicate the positive effects of code accommodation as an inclusive tool for bilingual PWD.

# Code-switching and social identity negotiation in Cantonese-English bilinguals

Panel contribution

***Ms. Ariel Chan<sup>1</sup>***

**1. UCLA**

Code-switching refers to the practice of alternating between two or more languages in a conversation, either between sentences or within the same sentence (Clyne, 2000; Myers-Scotton, 1989, 1993). Previous sociolinguistic research has revealed bilinguals deploy code-switching as a strategy to achieve various interpersonal purposes in conversation, for instance contextualize preference organization and repairs (Li Wei & Milroy, 1995), establish or destroy group boundaries (Gal, 1988), reposition and reconstruct their identities (Chen, 2008), and negotiate and assign group memberships (Lo, 1999, Silverstein, 1997).

Adopting a socio-interactional perspective, the present study examines how Cantonese-English bilinguals employ code-switching as a tactic to negotiate their social identity with their listener and assign group membership to them in oral narratives. Specifically, it focuses on high-proficient Cantonese-English bilinguals from three different communities: (1) *homeland bilinguals* raised in Hong Kong in a Cantonese-dominant environment and received their higher education in English, (2) *heritage bilinguals* raised in a Cantonese household in the U.S. in an English-dominant society, and (3) *immersed bilinguals* raised in Hong Kong but later moved to U.S. for higher education. Using a novel approach to elicit spontaneous code-switching data in an online experiment setting, this study collected naturalistic spoken data from the three groups of bilinguals in a semi-structured verbal production task (Yim & Biastylok, 2012). In the task, bilinguals were asked to narrate life experiences related to the Hong Kong and American cultures for a maximum of two and a half minutes on four different topics (i.e., Chinese New Year, Moon Festival, Christmas, and New York) upon hearing an audio-recorded prompt for each topic. The prompts were recorded by an immersed bilingual in a mix of Cantonese and English (For the American topic, the matrix language is Cantonese; for the Hong Kong topic, the matrix language is English) to elicit code-switching speech. A total of 3 hours of data were collected from 18 participants across the three bilingual groups.

Discourse analysis suggested that bilinguals are conscious of both their own and their listener's social identities. Depending on their own social identity and the perceived co-membership with the listener, they index their inclusion or exclusion of the listener through code-switching in different ways. Given that there were only two involved parties in the speech, inclusion is defined as bilinguals' identification with the listener while exclusion is defined as bilinguals' distancing with the listener. Positioning and negotiation of one's and the other's identity can be manifested by the code-switching styles at the micro level, and code-choice and cultural reference at the macro level. For example, while a heritage speaker would indicate the immersed listener as an out-group member by switching into Cantonese, a homeland speaker would include the listener as an in-group member by avoiding switching into English. The findings of the present study will be able to highlight the variation of bilinguals from different communities in terms of both language and identities. In addition, it will shed light on how the interaction of language choice, social identities, and sociocultural context is manifested through linguistic practices.

# Collaborative domestication: How patients account for their experience of video consultations with their general practitioner

Panel contribution

***Ms. Elle Lüchau<sup>1</sup>, Mrs. Anette Grønning<sup>1</sup>***

*<sup>1</sup>. University of Southern Denmark*

Video consultations are a new doctor-patient communication subgenre within the genre of consultation forms (Laursen, Brøgger, Fage-Butler, Møller, & Grønning, in preparation). They are being implemented in general practices with the aim of remedying the growing pressure and lack of resources in health care and thus securing a sustainable health care sector in Denmark (Sundheds- og Ældreministeriet [Ministry of Health], Finansministeriet [Ministry of Finance], Danske Regioner [Danish Regions], & Kommunernes Landsforening [Local Government Denmark], 2018). Denmark is leading the 2020 ranking of the 193 United Nations Member States in terms of digital Government (United Nations, 2020) making it an important case to investigate. In this study, we pose the following research question: How do patients account for their experience of video consultations with their general practitioner (GP)? To answer this question, we conducted a qualitative study. Our approach was based on domestication theory with the aim of investigating how patients integrate video consultations into their daily lives. The concept of domestication focuses on describing and analysing processes of acceptance, rejection and use of media technologies (Berker, Hartmann, Punie, & Ward, 2006). Silverstone and colleagues divide the domestication process into four phases: Appropriation, objectification, incorporation and conversion (Silverstone, Hirsch, & Morley, 1992). These phases represent the stages of domestication from a user's initial use of the technology to how use of the technology affects the relation between the user and the world. This study is an attempt to counteract the lack of research about the use of video consultations in general practice. Moreover, our approach accounts for the context in which individual patients experience video consultations, which has similarly received little attention. We conducted in-depth interviews with 13 patients and their GP from a practice in a larger Danish city. To include different perspectives, the patients included 11 users and two non-users of video consultations.

We analysed the interviews from the perspective of domestication theory's four phases. Our results show that technological literacy and the amount of guidance the patients received from the GP impacted the success of the video consultation. In spite of varying outcomes, however, there is a general optimism surrounding the use of video consultations. Moreover, our results show that the GP plays a central role in the patients' domestication process. Consequently, we propose the term collaborative domestication, which we define as the ongoing mutual influence and interdependency of the users involved in using the technology in a specific interactional context, in this case the GP and the patient. We also found that saving transport time and working hours is perceived as a key advantage of video consultations. Finally, and most importantly, we found that each patient differed regarding which matters they perceived as being suitable for video consultations and the degree to which they regard video consultations as an impersonal consultation form. As a result, based on these findings we argue that qualitative studies are crucial for developing our understanding of the object of study.

# Collaborative mobilizations of embodied grammar

---

Panel contribution

---

**Prof. Steven Thorne<sup>1</sup>, Dr. John Hellermann<sup>2</sup>**

**1.** Portland State University and University of Groningen, **2.** Portland State University

Drawing on recent conversation analytic research on mobility in interaction (Haddington et al. 2013), embodied approaches to cognition and communicative action (Goodwin, 2017), and innovations in place-based language learning in the wild (Hellermann et al., 2019; Thorne et al., 2021), this paper investigates how people collaboratively develop routinized language practices in situated, temporally unfolding language learning tasks. Data includes video recordings (two head-mounted cameras and a third camera capturing the entire group's interaction) of three English language learners and three German language learners playing an augmented reality game in a city using an iPhone. The game asks players to take on the identity of an agent from the future and to find examples of sustainable technology at five sites in the city. When located, players are to make an unscripted video-recorded oral 'report' about the technology. The recordings were transcribed and analyzed using multimodal conversation analysis (Mondada, 2014).

The analysis focused on the co-construction of this oral report which, in three cases, due to technical difficulties, was repeated. Analysis reveals emergent interactional dynamics for language learning that include 1) collaboratively produced linguistic units at word and clause level, akin to compound turn-constructional units (Lerner, 1991), with synchronized shifts in gaze and bodily deixis, 2) the recombinatory reuse of specific words and constructions in the process of building a discourse object (their report), and 3) microgenetic language development visible as routinization of the reused linguistic material (lexical items and constructions) over the course of game play (45-60 minutes). This empirical investigation shows how participants engage progressively and collaboratively in building both the language learning task and the product for that task (the oral reports) in a situated, dynamic way, without a pre-defined telos or trajectory for the talk-in-interaction. The language used for the task emerges as a semi permeable, embodied grammar assembled as gestalt units comprising gesture, gaze, touch, and linguistic constructions. More specifically, the data show how the usage-based process of language learning, at the microgenetic level, involves embodied language practices that are collaboratively produced using a range of semiotic resources within which language is central. The analysis highlights how the emergence of grammar for social action is iterative and collaboratively constructed across turns-at-talk as linguistic items are reused and repurposed, aligning with Hopper's discussion of 'emergent' theories of language (1998) – that language structure develops temporally "and may only appear as grammatical form retrospectively as it is assembled during acts of dialogic communication" (Hopper, 2015, p. 125). Analysis also illustrates a physical proximity effect: collaboratively produced linguistic units co-occurred more frequently when participants were in close proximity to one another. The 'proximity effect' analyses suggest the value of expanding an individualist frame of 'embodied cognition' and to consider exploration of 'interbodied cognition' dynamics. Implications for L2 education include spatial and environmental considerations for the design of learning tasks and underscoring that in dialogic interaction, with language structure potentially distributed across speakers and turns at talk, task performance may benefit from assessment at both individual and group levels.

# Collaborative multimodal explanation sequences in the L2 French classroom

Panel contribution

***Ms. Loanne Janin<sup>1</sup>***

***1. University of Neuchâtel***

Second language learning has recently been reconceptualized as participation. This perspective views learning as involving not only the acquisition of linguistic skills, but also the development of an array of interactional resources in order to participate in L2 social interaction (e.g., Nguyen 2011). These resources include for example appropriate turn taking – when to take turns and how to display their ‘fit’ to the ongoing flow of action – and co-constructing larger sequences of social actions with others, in order to engage in classroom activities (Gardner 2019). Increasingly, studies also shed light on learners’ participation through use of multimodal conduct, including gestures, gaze, and object manipulation.

In line with conversation analytic SLA research investigating the systematic interactional procedures that L2 speakers use to accomplish social actions (Hellermann 2008), I examine L2 French learners’ participation in collaborative and multimodal explanation sequences. These activities are ubiquitous in the language classroom and require adaptation to the interaction partners, the context, and initiative on the part of the students (Konzett-Firth 2019).

Data consist of audio-video recordings of classroom interactions in a language school for adult migrants in Switzerland. The students are following intensive French L2 courses at a beginner level (A1 according to the CEFR). The study relies on multimodal Conversation Analysis to investigate, from an emic perspective, how participants ask for and provide collaborative explanations and how these explanation sequences are organized, distributed and locally accomplished.

More specifically, I address the following questions:

- How do learners manage the organization of collaborative explanation sequences, in particular their opening and their development?
- What linguistic and multimodal resources do learners use to accomplish explanation sequences, and how are they mobilized?
- How does collaboratively conducting explanation sequences enable learners to improve their participation and thereby possibly their L2 learning?

My analysis shed light on the socially distributed nature of the explanation sequences as a locus of active student participation. Students and teachers engage in a collaborative effort to solve comprehension problems. Moreover, they organize their interactions in and through multiple modalities: participants rely on both verbal – talk, non-lexical vocalizations – and non-verbal – gestures, drawings, objects – resources to accomplish explanations jointly with their co-participants.

Results contribute to the understanding of how L2 speakers learn to use interactional resources, how they interface language with other modalities in order to participate in classroom activities, and how explanation sequences represent one site for such active interactional participation. Based on these findings, I discuss pedagogical implications for L2 learners and teachers.

# Commentation as Recontextualisation

Panel contribution

**Dr. Michael Bender<sup>1</sup>**

1. Technische Universität Darmstadt

In this paper, commentation is seen as a communicative practice, which can be regarded as a special form of “retro-sequence” according to Schegloff (2007: 217). The approach presented in the talk describes the central function of this practice: the introduction of recontextualizing perspectives into the interactive constitution of meaning, coherence and thematic progression. This is related to both (conceptually and medially) oral and written communication (cf. Bender 2020). ‘Linguistic recycling’ plays an important role in this context because commentation always refers retrospectively to a part of previous communication, which is usually also cited or paraphrased. This approach takes up and further develops an early theory of commentation (in German: “Theorie des Kommentierens”) according to Posner (1972).

It is based on the following assumed structure: Commenting is related to a text or reality excerpt of the previous communication (the “Kommentandum”). A certain part is selected and reproduced or reformulated (recycled), which is called “Kommentat”. This is connected with an utterance with own propositional content, the “Kommentor” (cf. Posner 1972: 25).

Of particular interest is not only the interaction between “Kommentat” and “Kommentor”, if the recycled elements remain unchanged. It is also interesting how recontextualization can be achieved already in the “Kommentat”, as the ‘recycling part’ of the commentation, by smallest changes or reformulations.

Schegloff describes such practices in principle in his definition of ‘retro-sequences’ as a special type of adjacency pair: “These are sequences *activated from their second position, [...]*” (Schegloff 2007: 217). Schegloff mentions other-initiated repair as an example, but commentation is also covered by this definition. The excerpt from the “Kommentandum” is subsequently made the first part of an adjacency pair – by the commentation as the second part of the adjacency pair. The selected utterance is set relevant and recontextualized in the sense of the need for further discussion or elaboration. It is, so to speak, up-cycled, more or less unexpectedly, into an additional discussion life cycle. In this respect, commentation can contribute to various communicative jobs (cf. Sacks 1995). All have to do with a resumption and revision of previous utterances - not necessarily in the sense of practices of evaluation or opinion-driven positioning, which are often equated with commentation in an under-specified way. This approach, its methodical application/operationalisation and analytical potential will be demonstrated on corpuspragmatic annotation studies (cf. Becker / Bender / Müller 2020) in different corpora (e.g. political plenary debates, science blogs).

# Common Ground and Positioning in EFL Classrooms

---

Panel contribution

---

***Dr. Deniz Ortactepe Hart<sup>1</sup>***

*1. Middlebury Institute of International Studies at Monterey*

Language socialization refers to the process in which novices/children acquire the linguistic and cultural norms of their speech community while also becoming competent members of it (Ochs & Schieffelin 1984; Ochs 1986; Schieffelin & Ochs 1986). This study aimed to investigate the nature of L2 socialization practices, namely common ground building acts and positioning, in an EFL setting through the observation of six NEST and NNEST participants. The researchers collected data through classroom observations, field notes, and a researcher journal. Three NEST and three NNEST teaching partners who taught the same classes in tertiary language classrooms in an EFL setting were observed and audio recorded during the first and fifth weeks of a language course. Data were transcribed and analyzed through discourse analysis using Kecskés and Zhang's (2009) socio-cognitive perspective on common ground and Davies and Harré's (1990) positioning theory.

The findings revealed several differences in the ways NESTs and NNESTs established common ground and positioned themselves in their social interactions. NESTs' lack of shared background with their students led to the establishment of core common ground (i.e., building new common knowledge with their students), which also positioned them as outsiders in a foreign country. NESTs created more meaningful contexts that enabled opportunities for language socialization through which students not only practiced language but also negotiated meaning. On the other hand, NNESTs maintained the already existing core common ground with their students by positioning themselves as insiders. It was observed that NNESTs activated the common knowledge they shared with their students to facilitate classroom instruction rather than in engaging in authentic communication.

Since L2 socialization is based on the availability of communicative contexts, the variety of communicative activities, the positioning of novices in participant roles during interactions, and so on (Ochs & Schieffelin 2011), intercultural communication may seem to be more conducive for language socialization practices with its focus on the negotiation of meaning, activation of common ground, and the teacher being positioned as both teaching and learning from students. On the other hand, intracultural communication seems to have different advantages with NNESTs' positioned as an insider and a source of information, yet these advantages seem to be utilized for pedagogical purposes rather than socializing language learners into the target language and culture.

# Communicating affect through “My plans vs 2020” memes: Opportunities and constraints for (online) humor

Panel contribution

***Dr. Anna Piata<sup>1</sup>***

*1. Independent researcher*

By way of a metaphor, one could say that the recent global pandemic of Covid-19 is like humor: it subverted what people were expecting for the year 2020. This paper will focus on a category of internet memes that was designed to express specifically people’s failed expectations over 2020: the “My plans vs 2020” memes. These are image macros that consist of two captions (“My plans” and “2020”) paired with two corresponding images, which draw primarily on pop culture, especially well-known characters (or scenes) from films and TV series. The incongruity that resides in the two images is aimed to implicate the discrepancy between expectations and reality with regard to the year 2020, thus giving rise to humor.

The present study is based on a corpus of 80 “My plans vs 2020” memes that initially appeared on Twitter and were later reproduced on other platforms. Understanding the humorous meaning of these memes involves visual frame metonymy (Dancygier & Sweetser 2014), which I will show to be established by means of parallelism (i.e., consecutive repetition of structures with similar characteristics). While they jointly evoke frame structure, the parallel images do so in opposingly valenced terms: positive for the first part (that of anticipation), and negative for the second part (which corresponds to reality). Importantly, in its prototypical structure, this meme presents the two parts in linear order, in accordance with the Western representation of earlier/later events along the horizontal axis, known as the mental timeline (see, e.g., Santiago *et al.* 2007; Weger & Pratt 2008).

In all, the “My plans vs 2020” memes offer an opportunity to express affect, more specifically people’s frustration over aborted expectations. The memes’ affective meaning is shown to be motivated by the visual parallelism of the juxtaposed images, which foregrounds incongruity in terms of valence (positive vs negative). At the same time, the expression of online humor is constrained by metaphorical associations of affect (Crawford 2009), together with the spatial representation of events in the timeline. Clearly, this entails that embodiment is involved in humorous meaning-making not only in the domain of verbal expression, as already noted (Bergen & Binsted 2015), but also across modalities. Non-prototypical instantiations of the meme (e.g., when the images appear vertically, or when affect is only implicitly inferred) are also accounted for in terms of embodiment, thus suggesting that discourse is interwoven with embodied cognition across the board.

## Communicating rights to L2 suspects

---

Panel contribution

---

***Prof. Jan Svennevig<sup>1</sup>, Dr. Paweł Urbanik<sup>1</sup>***

*<sup>1</sup>. University of Oslo*

In the beginning of each investigative interview in Norway, police officers are required to provide a package of cautions that inform the suspect about his status, rights (especially the right to silence and the right to have an attorney), obligations, and additional provisions. To do so, the Norwegian police do not use a scripted formula such as the Miranda warnings in the USA but leave it to the individual investigator to find the most appropriate and efficient formulation relative to the addressee. As a result, the wordings of cautions may differ significantly depending on the investigator. Yet it is him/her who bears the responsibility that the suspect understands the rights fully and correctly. The officially recommended way of securing understanding is to (1) present the rights in a way that is understandable for a given suspect and (2) ascertain that they have been understood correctly. There is however no guidance on how to secure and ascertain understanding, especially when the suspect is a second language (L2) speaker.

The current paper presents an empirical investigation of 40 authentic police interviews with L2 suspects. Using Conversation Analysis as our method, we examine to what degree and how investigators adapt to the linguistic proficiency of the suspect when communicating cautions. A recurrent pattern observed in the data is that investigators start by presenting the cautions by quoting verbatim the formulations in the prosecution instructions, with a highly technical legal vocabulary and high information density. After this, they reformulate the caution, using more common, high frequency vocabulary. In this way, they seem to balance the contradictory requirements of both heeding the wording of the law and simplifying the formulation for the purpose of making it accessible to the L2 speaker. Some even ask an explicit question whether the suspect has understood, but very few check in any detail what that understanding amounts to.

# Communicating risk and reward to COVID-19 vaccine trial participants

Panel contribution

**Mr. Peter Grundy**<sup>1</sup>

**1.** Durham University

This presentation reports an investigation into the way in which risk and reward are communicated to participants in *A phase 2/3 study to determine the efficacy, safety and immunogenicity of the candidate Coronavirus Disease (COVID-19) vaccine ChAdOx1 nCoV-19* (the Oxford vaccine trial) based on two sections in the 17-page ‘Participant Information Sheet’ sent to volunteers ahead of their initial screening visit.

The longer of these sections, ‘Are there any risks from taking part in the trial?’ (994 words, version 11), enumerates the relatively predictable ‘side effects’ of the trial procedures as ‘local’, ‘general’ and ‘serious reactions’ before describing yet to be resolved ‘theoretical concerns’. These side effects and theoretical concerns are addressed in retrospective accounts based on historical evidence and speculative accounts detailing probabilistic expectations.

As a study of authorial intention and recipient interpretation, the investigation assumes the authors’ preference for controlling inference by means of conceptual encoding likely to communicate in as far as possible what might be taken to be default meanings. At the macro level, the authorial strategies include the ordering of content and the use of a wide range of typographical conventions; at the micro level, the strategies include the presentation of information as answers to putative participant polar and *wh*-questions, the extensive use of passive voice, existential constructions, epistemic and deontic modality, conditional constructions, sentence-initial indexing of context, the presence / absence of complementizers and relative pronouns, and other more general constructions of register and footing. These strategies invite conclusions as to the authors’ view of the degree to which participant inclusion and professional distance are considered appropriate and, as such, likely to enhance participant confidence.

The analysis shows that the authors convey seemingly unintended as well as intended implicatures and that participants are likely to construct ad hoc concepts for lexical items which vary with occasions of use and sometimes differ from expectable professional and lay defaults. In particular, the analysis reveals varying degrees of inclusion on a professional-lay, authorial stance continuum within quadrants in which retrospective and speculative accounts are plotted against predicted side effects and yet to be resolved theoretical concerns.

Sadly, it’s outside the scope of the study to come to any conclusion as to whether the formulation of risk in the participant information sheet, taken together with participant screening procedures, media coverage, views of friends and family and so on, impacted on the initial intention of volunteers to participate in the trial.

# Communicating risk in the linguistic landscape - Safety information signage on-board Stockholm and Helsinki metros

Panel contribution

***Dr. Väinö Syrjälä<sup>1</sup>***

**1.** Södertörn university

Many people travel through the city on a daily basis using the metro. As the stations and trains are an environment riddled with potential risks, informing travellers about safety issues is an important part of the official signage in the *linguistic landscape* of a metro system. The communication of risks can utilise different strategies regarding language choice, multimodal design and the wording on the signs. This paper identifies and compares these strategies in the linguistic landscapes of the metros in two Nordic capital cities, Stockholm and Helsinki. The focus of my study is on two key questions. First, what kind of risks are identified in the signage and how are these risks communicated using multimodal resources? Second, who is assigned the responsibility to prevent risks in these texts? To address these issues, *Linguistic Landscape studies* is combined with a theoretical and methodological framework based on *social semiotics*. The data consist of different safety information signs photographed inside metro carriages and on the platforms of metro stations in the two cities.

The first step of this two-fold analysis is a multimodal analysis of the signs as part of the linguistic and semiotic landscapes, with focus on the choice of language, the emplacement of the signs and the use of different semiotic resources to make the safety information stand out. The systematic inclusion of English in both cities has resulted in bilingual (Swedish and English) and trilingual (Finnish, Swedish, and English) signage in Stockholm and Helsinki, respectively. Several multimodal resources, from pictograms to colours, are used, prompting a discussion of the local authorities' strategies for risk communication. A more in-depth interpersonal analysis of the texts included on these signs is used in the second step in order to investigate how the intended reader (i.e. the traveller) is addressed, e.g. in order to assign the traveller active responsibility for avoiding risks. Differences in practises between the three languages as well as between the two cities can be identified. In Stockholm the signs speak directly to "you" with a focus on preventing risks. In Helsinki, on the other hand, the signs more often include passive statements of facts and instructions for when something has already happened. Some additional comparisons will be made regarding the recently emerged signage dealing with Covid-19-related risks when travelling with the metro.

# Communicating through... The Logistics and Pragmatics of Communication of Persons Affected by Locked-In Syndrome.

---

Panel contribution

---

***Dr. Lina Masana***<sup>1</sup>

***1. University Rovira i Virgili***

Locked-in Syndrome (LIS) is a rare condition usually resulting from a stroke (sudden LIS) or a neurodegenerative disease such as amyotrophic lateral sclerosis (gradual LIS) that entails body paralysis with preserved cognition. Most people in LIS are quadriplegic and cannot speak (anarthria). They communicate through vertical eye movements or blinking, and/or spelling by means of an alphabet board or technological system (tablet or computer). The aim of this presentation is to examine both the logistics and pragmatics of communication between people affected by sudden LIS and their relatives and professional caregivers looking at the evolution of multimodal means of communication since the onset of the condition till present and at the communication situations. Narrative data have been gathered from different sources: autobiographical books written by people affected by LIS, public audio-visual material on people with LIS, and 18 LIS participants' responses to a qualitative questionnaire from an ongoing research project on the phenomenology and anthropology of LIS. Our ongoing analysis will show how persons with LIS manage to communicate with others, how they express their needs, thoughts, feelings and wishes, and how they present and negotiate their individual and social identity by communicating through multimodal means, autonomously or through others.

# Communication on the pitch during times of social distancing

Panel contribution

**Dr. Catherine Diederich<sup>1</sup>, Ms. Aline Bieri<sup>2</sup>**

**1.** St. Gallen University of Teacher Education, **2.** University of Basel

Following the widespread introduction of social distancing measures as a consequence of COVID-19, there is a growing research interest in the effect of such measures on social interaction, interpersonal relationships, and personal wellbeing (cf. Lewis, 2020; Mondada et al. 2020). The following paper examines to what extent social distancing effects and possibly impedes effective communication on the football pitch.

While a few edited collections on football discourse include communication on the pitch (e.g. Askin et al. 2018; Caldwell et al. 2016), language use on the pitch is still largely under-researched. In their study on multilingualism in football teams, Lavric and Steiner (2018) observe that communication on the pitch is characterized by few words. Players' limited vocabulary on the pitch is often complemented or even replaced by paralinguistic cues such as exclamations or non-verbal resources such as gestures and facial expressions.

In times of COVID-19 and social distancing measures, players, managers, referees, and staff engage in joint activities at (additional) distance, challenging successful communication and collaboration. Such joint acts have been addressed by the Premier League itself e.g. celebratory acts after a goal are subject to renegotiation based on official rules issued with regard to the restart of football after the (first) lockdown (cf. "Season 2019/2020 Restart Guide" Premier League 2020).

This study investigates communicative acts such as player-player, coach-player, and player-referee interactions, as well as goal celebrations and players' objections to referee decisions in broadcasted Premier League games pre- and post-lockdown. More specifically, it examines and compares two datasets: a) the Premier League games in the last round before the three-month break due to the lockdown (round 29, 10 games, 7-9 March 2020) and b) the games in the first round after the restart of season 2019/2020 and implementation of the above-mentioned Premier League protocols (round 30, 10 games, 19-22 June 2020). Based on a data-driven analysis of video-footage, we aim to identify comparable scenarios (e.g. celebration of a goal, rebuttal of a given penalty) and show varying realizations of similar acts, thereby demonstrating how and whether meaning and intention are transmitted across an enforced and unnatural distance. Further, this study aims to give insight on the implementation of behavioral measures in a highly cooperative and well-established arena, thus observing the flexibility and adaptivity of communication on the pitch.

# Communicative competence across atypical interactional contexts - The case of recruiting help

Panel contribution

***Dr. Niklas Norén<sup>1</sup>***

***1. Uppsala University***

This presentation reports findings from a study of communicative competence as it emerges from participants' ways of recruiting help when involved in aided interaction within two contexts - everyday conversation at home and classroom talk.

Four children (12 yrs) were video recorded during one day each, beginning at school in the morning and then at home in the afternoon and evening. The children had severe speech and physical impairment due to cerebral palsy and interacted with their usual everyday communication partners (mainly personal assistants, teachers, and parents). The interaction was aided by Blissymbolics communication boards. These boards were accessed via a structured method of symbol choice based on the communication partner's proffering of possible symbols (partner scanning), as the children could not point at the board themselves.

The analysis was carried out within an ethnomethodological and conversation analysis perspective on communicative competence as locally achieved within situated multimodal interaction (Clarke & Wilkinson 2013; Goodwin 2000; Light 1989). Recruitment sequences (Kendrick & Drew 2016) were identified in both context types where help was recruited to support the child. These sequences were analysed with regard to who initiated the sequence, in what local sequential contexts recruitment was done, how the sequence developed, and the outcome of the sequence in terms of receiving help and resolving the issue at hand.

Findings indicate that when the children were at home, they displayed communicative competence by way of self-initiating other-help, while at school, it was mainly the teachers or the personal assistants that other-initiated other-help. This finding may be attributed to differences in activity type and participation framework between whole class interaction and ordinary conversation at home. In the classroom, the students' contributions were achieved within a competitive time frame, while at home, there were no competition and the children were provided with ample time to construct turns.

At school, the students received help and managed to co-construct answers together with assistants. Requests for help were never negotiated or denied. At home, on the other hand, negotiation sometimes occurred regarding the child's right to receive help, and sometimes the children were denied help with explicit orientation to norms of independent communication.

The two interactional contexts offered the children very different opportunities to contribute to the activities at hand. These findings have implications for the notion of communicative competence as an interactional rather than individual phenomenon, as well as implications for professionals' assessment of communicative competence when persons transfer between different interactional contexts and participation frameworks.

# Communicative competence displayed using speech generating devices- a comparison between two special education classroom settings

Panel contribution

***Dr. Helena Tegler<sup>1</sup>, Dr. Maja Sigurd Pilesjö<sup>2</sup>***

*1. Department of Sociology, Centre for Social Work (CESAR), Uppsala University, 2. Department of Language and Communication, University of Southern Denmark*

The notion of communicative competence has traditionally been considered as a set of intra-cognitive abilities (Light & McNaughton, 2014). However, scholars have argued for a more situated, multimodal and interactional concept of communicative competence (Clarke & Wilkinson, 2013). Microanalytic studies of everyday interaction argue for viewing communicative competence as a dynamic and reciprocal interactional achievement. The aim was to investigate if changes in the use of speech generating devices (SGDs), participatory roles, and sequential organization affected the observed communicative competence of a non-speaking individual using an SGD in two different settings. The research questions posed were: How were the interactions in the two settings organized? What were the consequences for the interaction?

The participants were a non-speaking 19 year old young man, Robert, with intellectual disability and severe speech and physical impairments, his personal assistant Dan, two teachers, eight classmates, and eight assistants. Robert used an eye-gaze accessed speech SGD for interaction. Data consisted of video recordings of two multiparty interactions of morning assembly at Robert's school, collected close in time. Robert and Dan participated in both settings, the other interlocutors differed. Data were transcribed and analyzed according to conversation analytic principles.

The two morning assemblies mirrored each other in organization of initiative-response-evaluation (IRE) sequences, but differed in participants' participatory roles, activities and SGDs. In the first setting Robert was the responder and in the second, he was the initiator in cooperation with the assistant. In the first setting, the activities were to tell one's name and watch a movie and in the second, to capture the schedule of the day. In the second setting, the task of identifying the day was divided into a trajectory of two steps by the assistant: (1) to allocate who was going to identify the day and (2) to let the allocated person do the identification. By dividing the task into steps the assistant left two interactional spaces for Robert to participate in. The SGDs differed in the two settings. In the first setting, Robert had access to an SGD with solely one message and in the second, he had access to his own SGD with more than 200 symbols. In the second but not the first setting, the assistant took on additional jobs: he reformulated Robert's turns, presented candidate understandings of Robert's turns and followed Robert's turns with continuers. These actions functioned to support Robert to continue to claim the interactional space. The co-operative interactional work in combination with access to his own SGD resulted in a higher degree of involvement and participation of Robert in the second setting compared to the first setting.

# Communicative practices of inclusion in the discourse of #depression on Twitter

Panel contribution

***Dr. Susanne Kabatnik<sup>1</sup>***

*1. University of Greifswald*

According to a study by the RKI, in 2019 9.2% of the German population suffered from depression (Hapke/Cohrdes/Nübel 2019, 65) and thus belong to a minority in Germany. The disease is subject to a social stigma and those suffering from it experience discrimination and exclusion, e.g. from social groups, activities or the job market (Richter et al. 2006, 704). In addition, experiences of stigmatization and discrimination lead to secrecy and to difficulties in maintaining or initiating essential interpersonal relationships (Baer et al. 2016, 4). However, a stable social environment and inclusion in different areas of society is essential for those suffering from the disease and can improve symptoms. A lack of a social environment and permanent exclusion from private and professional spheres can have serious consequences and even lead to suicide (see Hapke et al. 2019).

Speaking about depression is a taboo in society and therefore it is only predestined for a few specific communication situations in face-to-face communication (see Andalibi et al. 2017, 1493f.). What experiences people have with depression often remains unknown and is largely inaccessible to research fields that are not primarily psychological-psychotherapeutic, such as linguistics. So how can practices of inclusion of people suffering from depression be studied when the content is so private and protected?

On social media platforms on the Internet, the boundaries of what can be said are shifting, and open up communication spaces by talking about tabooed and highly private content, also including depression. By using the hashtag #depression and contributing to the discourse, a discourse boundary is created, in which the users form a social group and thus practice inclusion (see Andalibi et al. 2017). There are various practices of inclusion, such as the validation of experiences of exclusion, appreciative and supportive comments on depressive self-expression, invitations to participate in the discourse or the inclusion of new users, as in the following example:

(1) @ User1 is relatively new on Twitter and maybe some of you want to become his #follower. He writes like me about the not easy life with #Depressions. I can empathize well with his tweets. #night shift #depression (User2, 03.05.2020, 21:58:35)

Using the inventory of methods of corpus and interactional linguistics, the discourse space #depression on Twitter will be examined for practices of inclusion. The data basis is the Twitter corpus for the search query #depression, which was automatically generated in May 2020.

# Companion Participation in Traditional Chinese Medicine

Panel contribution

**Ms. Wan Wei**<sup>1</sup>

1. Rutgers University

Researchers have long been interested in how a co-present third party may impact the interactional dynamic of medical encounters. Adelman, Greene and Charon (1987) have proposed that there are three (hypothetical) kinds of roles that a third party may play in medical interactions: the advocate, the passive participant, and the antagonist (p. 731). This means that a third party may work for or against the patient and form a coalition with either the doctor or the patient. After conducting an extensive review of literature on triadic medical interaction, Laidsaar-Powell et. al. (2013) pointed out that current literature on patient-companion-physician interaction has a limited scope: research is much needed in more diverse medial situations and across different cultural contexts.

In this paper, I extend the discussion of companion participation to the context of complementary and alternative medicine. Drawing on a corpus of 51 hours of video recorded TCM (Traditional Chinese Medicine) consultations, I examine how and why patients' companions get involved in the medical consultation and what impact companion participation has on the interactional dynamic of TCM encounters. According to the findings of this study, in the context of TCM visits, companion-participation is primarily occasioned by patient resistance (Stivers, 2007; Koenig, 2011). That is, when patient overtly or tacitly displays resistance towards the doctor's medical opinions, their companion sometimes gets implicated in the "tug of war" between the doctor and the patient.

83 cases of companion-participation that I have examined show that there are two ways for companion- participation to occur: it may be volunteered(39 out of 83 cases, 47%), meaning that the companion spontaneously joins the consultation; or prompted (44 out of 83 cases, 53%), meaning that the companion participates in the consultation upon the doctor's invitation.

Results of this study also indicate that when the patient displays resistance towards the doctor's medical opinions, there are three kinds of positions that the participating companion may be in: a) the companion may choose to be on the patient's side by also displaying resistance to the doctor's medical opinions; b) the patient's companion(s) may extract themselves from the patient-companion collectivity and forms coalition with the doctor to offset patient resistance; third, the companion may choose not to side with any of the co-participants, but rather, use the contention between the doctor and the patient as an opportunity to launch domestic complaints of the patient's certain behaviors.

# Companions brokering understanding between patients with intellectual disabilities and healthcare practitioners

Panel contribution

***Dr. Deborah Chinn<sup>1</sup>***

**1. King's College London**

## Introduction

When individuals with intellectual disabilities (ID) attend medical appointments they often benefit from communicative support provided by a companion (family member or paid support staff). One role taken up by companions is that of '*brokering*', namely putting their linguistic expertise at the service of others in the interaction to resolve potential or actual problems in understanding (Bolden, 2012). Companions' expertise includes their knowledge of the idiosyncratic communication style of the patient with ID and their 'lifeworld' (Mishler, 1984) as well as their familiarity with the 'voice of medicine' enacted in the consultation. This presentation explores how companions use these resources in the course of a medical interaction, and how their participation is elicited and received.

## Data and method

Video and audio recordings were made of 24 people with ID attending an English General Practice (GP) health check accompanied by another person. During the health check healthcare practitioners (HCPs) run through a checklist of questions that are meant to flag up any as yet undetected conditions. Typical of a checklist format, many questions elicited an expected 'no problem' response from the patient with ID. However, situations arose when mutual understanding between the patient and HCP broke down, with either partner struggling to make sense of their interlocutor's talk.

The analysis presented here is drawn from a collection of instances featuring repair operations on the utterances either of the patients with ID or the HCP, where 'repair' refers to the set of practices with which interactants deal with potential or actual breakdowns in understanding (Schegloff et al., 1977). Our focus is on the intervention of the patient's companion as a broker within these repair sequences.

## Findings

Different contexts were identified when companions undertook repair on others' talk in the medical consultation. With respect to repair of patients' utterances, brokers might be invited to intervene, either by the HCP or the patient, or they might elect to intervene without an invitation, conveying an evaluation that further elucidation of a prior utterance is needed. Companions also engaged in repair of HCP's utterances, using interactional clues that the patient they were supporting was having some difficulties with responding to the HCP's question. The intervention of the companion could assist the progressivity of the interaction, though on occasion infringement of the patient's speaking rights was also evident, in one instance leading to resistance and complaint from the patient.

## Conclusions

The willingness of companions to intervene as brokers can 'take the pressure off' the other participants to work on ensuring mutual intelligibility. This can help the interaction proceed smoothly, but may have the effect of deskilling the HCP and patient with ID.

# Comparative perspectives on African expressions of sympathy

Panel contribution

**Dr. Alice Mitchell**<sup>1</sup>

**1.** Universität zu Köln

This paper introduces the panel “Signs of care: Communicating sympathy in African contexts” by providing some theoretical and empirical groundwork for the study of language and compassion in Africa. It begins by examining the meaning of the English terms ‘sympathy’ and ‘empathy’ and outlines the phenomena of interest as affiliative interpersonal stances that orient to another person’s physical or emotional trouble or misfortune. The paper poses a series of questions about such stance-takings:

- Which semiotic resources do people recruit to express sympathy?
- What role do different communicative modalities play in these affective stance-takings (e.g., voice quality, prosody, touch, gaze, gesture) and how do they interact?
- In what situations is sympathy appropriate, and when is it unnecessary or even inappropriate?
- Who can show sympathy to whom, and how?
- How are sympathy displays calibrated to the perceived severity of the situation?
- To what extent are expressions of sympathy gendered or otherwise socially indexed?

Reviewing the limited literature that addresses these questions in African contexts, I show that while interjections constitute a salient resource for indexing sympathy, we also find mention of other “affect-laden sound objects” (Reber 2012) such as clicks (e.g., Pillion et al 2019). Very little work so far has investigated embodied aspects of sympathy displays in African settings. As an example of what such research might look like, and inspired by recent studies of tactile communication (Cekaite & Mondada 2020), I briefly examine the role of touch in comforting children, using audiovisual data collected in Datooga-speaking households in Tanzania.

The final part of the paper makes the case for more in-depth study of sympathy displays in interaction, positioning this work as valuable both for interpersonal pragmatics and for larger-scale anthropological conversations about everyday ethics and care—increasingly important themes in medical as well as sociocultural anthropology (e.g., Lambek 2010; Black 2018). In closing, the paper also considers how we can relate fine-grained studies of sympathetic communicative practices to specifically African concepts of ethical conduct and sociality (such as *ubuntu*; Ramose 1999). At least in some African contexts, the sociocultural importance of showing sympathy to others, even in apparently trivial situations, points to a relational ethics defined by interdependence and shared experience.

# Competing demands on facilitators' responses to clients' complaints within bereavement support group meetings

Panel contribution

***Dr. Marco Pino<sup>1</sup>***

***1. Loughborough University***

Complaining is the action of “[expressing] feelings of discontent about some state of affairs, for which responsibility can be attributed to “someone”” (Heinemann & Traverso, 2009, p. 2381). This presentation investigates the practical dilemmas and solutions entailed in responding to complaints about absent persons or parties within support group meetings for bereaved people (people who experienced the death of someone they are attached to). The presentation examines how the task of responding to an emotionally charged action (complaining) presents service providers with competing demands. It also identifies practices they use to navigate those competing demands.

Data for this presentation consist of 6.5 hours of audio-recorded support group meetings. The meetings were run by a UK charity and facilitated by unpaid volunteers. The analytic approach is conversation analysis.

The clients recurrently complain about absent persons and parties, mostly family members and friends (an example being a client complaining about her son not visiting her). The analysis will demonstrate that these complaints present support group facilitators with competing demands.

On the one hand, the facilitators welcome the emotions embodied in the clients' complaints. The facilitators' actions reflect an orientation to the relevance of a compassionate response—one that validates the client's experience and conveys recognition of the emotions entailed. The facilitators also work to normalise the expression of negative experiences, that is, to make their articulation acceptable and welcome.

On the other hand, there is evidence that some aspects of the clients' complaints require careful handling. The facilitators orient to the risk of being heard as joining in the blaming of the complained-of person or party when they empathise with the client. They also orient to the relevance of doing more than acknowledging the client's experience: they work to introduce an alternative perspective on it, for example, by suggesting constructive ways of thinking about or dealing with the complained-of person's actions.

Therefore, responding to clients' complaints involves a careful balancing of “involvement and distancing” (Raymond & Heritage, 2013). The facilitators navigate these competing demands through practices that vary along a gradient of intervention and present different affordances: (a) formulating the impact of the complained-of person's actions on the client's experience whilst avoiding commenting on those actions directly; (b) introducing an alternative perspective on the complained-of person's actions through general-case accounts; (c) interpreting the client's experience in more individualised way.

# Complaining as affect-intensive activity: Balancing conflicting interests in performance appraisal interviews

Panel contribution

**Dr. Birte Asmuss<sup>1</sup>, Prof. Johanna Ruusuvuori<sup>2</sup>**

***1. Aarhus University, 2. Tampere University***

The study focuses on the role of emotional labour (Hochschild, 1983) –manifested as affective displays and management of their reception – in accomplishing central managerial tasks in performance appraisal interviews (Asmussen, 2013). One central task in these interviews is uncovering potential problems related to work environment and employee well-being. In many organizations, the questionnaire that structures the course of the interview addresses these potentially problematic areas, which recurrently results in employees launching the activity of complaining (Ruusuvuori et. al. 2019). Complaining as such is a delicate action which is further complicated by the hierarchical institutional roles of employee and manager. Furthermore, the tension between institutional versus relational concerns can impact the professional relationship between the participants (Thornton et al. 2012). In order to manage these interactional challenges, the participants make use of various verbal and visual resources to accomplish the delicate activity of complaining. From an interactional, embodied perspective, this paper investigates the emotional labour invested in the activity of complaining in the organizational, hierarchical context in question. We focus particularly on affect-intensive sequences where the participants' competing interests become observable.

Our findings indicate that reciprocal emotional displays are fundamental to the activity of complaining, and specifically, to the building of joint understanding in relation to the appropriateness of the complaining activity and the relevancy of affiliating with complaining. Employees and managers make use of emotional displays in order to facilitate the progression of potentially problematic organizational activities, and this progression is organized stepwise continuously building upon and responding to each other's prior turns. We expect to be able to show how the degree and scope of the participants' affective displays intertwines with the competing interests related to their institutional roles.

Data consist of video-taped, authentic performance appraisal interactions (PAIs), in total 138 PAIs from both private and public organizations. We investigated in detail 30 employee initiated complaint sequences towards a co-present manager about a non-present colleague (13 Finnish and 17 Danish). Informed consent was obtained from all participants in accordance with the Statement of Ethical Practice (BSA) for Danish data and the Declaration of Helsinki (WHO) for Finnish data. For the analysis of the PAI interactions, we use Conversation Analysis (Sidnell & Stivers, 2012).

# Complex syntax in Finnish and Japanese

---

Panel contribution

---

**Prof. Ritva Laury<sup>1</sup>, Prof. Tsuyoshi Ono<sup>2</sup>**

***1. University of Helsinki, 2. University of Alberta***

Earlier studies of complex syntax have mostly concerned a small number of Indo-European languages. In order to add essential new data and to advance our general understanding of complex syntax, we closely examine Finnish and Japanese everyday speech. These non-Indo-European languages, distinct genetically, areally, and typologically, force us to be particularly careful in analyzing and discussing data not only because they are very different from each other and from what we are used to seeing in previous studies, but also because they come from different research traditions with different analytical categories and labels. Our study focuses on the combining of clause-sized utterances.

The Finnish data come from the Arkisyn database of videotaped everyday conversations (University of Turku), and the Japanese data from the Corpus of Everyday Japanese Conversation (NINJAL).

In Finnish and Japanese everyday talk, biclausal sentences are rare but "neverending sentences" (Auer 1992) are quite common, findings similar to English and German (Hopper & Thompson 2008; Auer 1992). While such longer stretches of talk may consist of clause-sized units, their final shape is an adventitious outcome of various on-line factors. Although the whole may be more or less coherent semantically, syntactic connections are normally grammatical only locally; speakers only seem to know how to build clause-sized units and to continue (or not) to another clause, using language-specific, conventionalized, often entirely fixed means for projecting continuity or lack of it (e.g. Pekarek Doehler 2011, Laury & Ono 2014).

In Finnish, relative clauses follow their heads and complement clauses their matrix clauses. Subordinating and coordinating conjunctions, traditionally thought to occur clause-initially to join clauses within the same utterance, also occur utterance-initially and finally without any preceding or following clauses in everyday talk. In utterance-initial position, they may project the social action the utterance accomplishes, such as a request (Laury 2012), and in final position, an unsaid implication from prior talk, relinquishing the floor (Koivisto 2011). Connections carried by the particles are made across turns, not just across clauses.

Japanese is quite different. Relative clauses precede their heads. Subordinate and coordinate clauses are marked at the end of the predicate with a suffix or particle and said to be followed by the matrix clause forming a biclausal sentence (Hasegawa 2014). In conversation, these elements appear to mark a clearer continuation of the ongoing talk forming part of "neverending sentences" (Iwasaki & Ono 2007). Finite predicates are said to end the sentence, and they (often along with a final particle such as *yo*) are in fact found to end the utterance in everyday talk. There are exceptions, however. Sometimes, the utterance continues even after the finite predicate. Earlier studies missed this, most likely because they didn't examine spontaneous speech which unfolds temporally and contingently through interaction.

Finnish and Japanese complex clausal syntax is not represented by biclausal sentences or larger global structural units, but by conventionalized resources for ending an utterance or continuing to another within and across turns, resulting from emergent structuration, constant change, and the multimodal negotiation of meaning in interaction.

# Compound and independent if-clauses at the hairdresser's: negotiating the procedures of the treatment

Panel contribution

***Dr. Anne-Sylvie Horlacher<sup>1</sup>***

*1. University of Neuchâtel*

An *if*-clause is traditionally described as a subordinate clause (protasis), usually followed by a main clause (apodosis), with which it forms a conditional (*if-then*) construction (e.g., Sweetser 1990, Lerner 1991). Alongside compound *if*-clauses (Lombardi Vallauri 2010, Auer 2000, Günthner 2020), the literature mentions occurrences in which the *if*-clause is not followed by any second component. These occurrences are described, pragmatically, as "if-requests" (Evans 2007), "polite directives" (Ford and Thompson 1986) or "insubordinate conditionals used as directives" (Lindström, Laury and Lindholm 2019) among others. However, little is known about compound and independent *if*-clauses in French talk-in-interaction (but see Corminboeuf and Jahn 2020), and even less about how such constructions interface with the participants' embodied conduct.

Using conversation analysis (Sacks, Schegloff and Jefferson 1974) and multimodal interaction analysis (Streeck, Goodwin and LeBaron 2011, Mondada 2019), this paper analyzes compound and independent *if*-clauses in video recordings collected in four different hair salons located in the French-speaking part of Switzerland and in France (43 hours in total). In these data, compound and independent *if*-clauses typically occur during the consultation phase, when hairdressers and clients collaboratively delineate the haircut in prospect and negotiate the project to be pursued, i.e., when participants engage in the *talking part* (Lindwall, Lymer and Greiffenhagen 2015) rather than the *doing part* of the hair treatment, and the clients' wishes are not immediately turned into courses of actions. In this context, *if*-clauses are a resource for professionals to resist the clients' requests (Nissi 2016). They typically occur in professionals' responsive actions and the apodosis (if there is any) expresses some kind of undesirable consequence (e.g., *si on refait une couleur partout, on voit chaque fois les racines* 'if we redo a color everywhere, we will see the roots of the hair'). On some occasions, the consequence is not verbalized (*mais si j' coupe court là*: 'but if I cut short there'; *si je fais trop près de la racine bah après* 'If I apply (it) too close to the root, well then'); instead, the *if*-clause is accompanied by manipulations and demonstrative gestures through which the professional depicts a hypothetical negative result. Independent *if*-clauses are likewise a resource for clients, especially when a client asks for a service that is different from the one he or she usually asks for (e.g., *SI (...) en couleur on pouvait passer sur un peu du: plus roux*. 'IF (...) for the color we could change for a bit more red.'). These requests are not accompanied by any touching practices of the client's own head, but make relevant a response from the professional.

By analyzing the participants' use of compound and independent *if*-clauses conjointly with the deployment of specific embodied resources, this study advances our understanding of how verbal resources and embodiment operate in concert with each other in the resistance to requests and in the negotiation of professional and lay visions, thereby feeding into new areas of research on the grammar-body interface (Keevallik 2018, Pekarek Doepler 2019, Maschler *et al.* 2020).

# Comprehension patterns in indirect requests: do we always rely on our theory of mind?

Panel contribution

***Ms. Eleonora Marocchini<sup>1</sup>, Dr. Simona Di Paola<sup>1</sup>, Dr. Filippo Domaneschi<sup>1</sup>***

***1. University of Genoa***

Theory of Mind (ToM) is traditionally considered crucial in pragmatics. However, recent studies suggest that ToM's involvement depends on the phenomenon. Andrés-Roqueta and Katsos [1] propose a distinction between Linguistic-Pragmatics (including tasks, e.g., scalar implicatures, whose comprehension relies on linguistic abilities) and Social-Pragmatics (including those, e.g., irony, requiring ToM).

A clear picture of the linguistic and cognitive abilities underlying indirect requests (IR) comprehension is lacking. The literature distinguishes between conventionalized-IRs (*Can-you...?* forms), and non-conventionalized-IRs (up to highly-indirect forms): conventionalized-IRs are easier to process than non-conventionalized-IRs, but it is unclear whether conventionalized-IRs processing follows the same inferential path (though 'short-circuited'), relying on ToM, or a lexically-based process triggered by the *Can-you...?*[2].

Our study addresses these questions: (i) is conventionalized-IRs processing an inference based on metarepresentation or a lexically-based process? (ii) does ToM play a role?

If conventionalized-IR's processing is lexically-based, the indirect interpretation should be computed on-line, when the trigger-word (e.g., the *Can-you...?*) is read: at a local level. If it follows an inferential path based on metarepresentation, it should be computed off-line (like irony): at a global level. In this case, ToM would be necessary.

Ninety-one Italian adults participated (59F; years=22-59, mean=35.85(SD=9.85)) in a self-paced reading online experiment with a within-subjects, Latin-square design. We created three conditions, comparing the same utterance in our target condition with a literally-interpretable condition and one that would require an off-line interpretation (and ToM).

Context could suggest: (i) an IR interpretation (i.e., request to perform an action); (ii) a non-directive (ND) interpretation (i.e., question about the interlocutor's ability); (iii) a sarcastic (SAR) interpretation (i.e., joke about the interlocutor's ability/will).

The (12) *Can-you...?* target sentences occurred at the end of each story, through self-paced region-by-region reading. Reading times (RTs) were calculated per region (*Can you-T1, bring-T2, some wine?-T3*) and per sentence. Participants performed true-false judgments about the stories. ToM was tested through a subset of Happé's (1994) Strange Stories test.

The analyses through Linear Mixed Models revealed different patterns depending on condition: at T1, IRs were read significantly slower than NDs ( $p<.0001$ ), no difference was found with SARs; at T2, the opposite occurred, IRs were read significantly faster than SARs ( $p<.0001$ ), no difference with NDs. At T3, IRs were read significantly faster than SARs ( $p<.0001$ ) and NDs ( $p=0.0002$ ). Moreover, at a global level, IRs and NDs did not differ, while SARs were read significantly slower than IRs and NDs ( $p<.0001$ ).

Individual ToM differences had an impact: interactions between participants' scores in Strange Stories and global RTs of IRs ( $p=0.03$ ) and SARs ( $p<.0001$ ) indicate shorter RTs on the sentence for participants with higher ToM. Locally, the interaction between ToM and IRs was only found at T1 ( $p<0.0001$ ). Overall, these results suggest that conventionalized-IRs interpretation starts locally, triggered by *Can-you...?*forms, relying on Linguistic-Pragmatics strategies.

University of Freiburg

In this presentation, we will investigate multimodal packages in confirming responses to requests for confirmation, i.e. responses that combine a verbal confirmation, head nods and specific facial expressions. In their study on polar answers, Enfield et al. (2019) distinguish between interjection-type and repetitional responsive formats, the former including both various response tokens (such as *yes*, *uhu*, *mm*) and head nods (cf. also Stivers & Enfield 2010). While there is a recognizable positive or negative polarity in both response tokens and head movements (according to which these might indeed be put in the same category), we would like to argue that the use of confirmatory interjections (or repetitional formats and possible combinations of these) and of head movements does not implement a uniform responsive action, despite a possible same polarity. More specifically, we will explore how multimodal packages consisting of a verbal confirmation, multiple vertical head nods and particular facial expressions or movements (such as raised eyebrows or eye blinking, cf. Hömke et al. 2017) allow for specific responsive actions, as compared to exclusively audible or visible confirmatory responses. Using the method of multimodal interaction analysis and based on collections of about 200 requests for confirmation-sequences for each language, we will examine the multimodal formatting of clearly confirmatory responses in Czech, German, Hebrew, Mandarin Chinese and Yurakaré (isolate, Bolivia).

Head nods and facial expressions as responsive actions have been previously investigated with respect to their potential for displaying affiliation, stance and affect, mostly within specific sequential environments such as storytellings (Kupetz 2014, Selting 2010, Stivers 2008) or assessment sequences (Goodwin & Goodwin 1987, Ruusuvuori & Peräkylä 2009). However, the precise role of head nods and facial expressions in basic responsive action such as confirmation has not yet been studied. We will therefore start by examining if and which types of facial expressions co-occur with clearly confirming verbal responses and vertical head nods. By then looking at how these features are distributed in confirming responses within our different data sets, we aim to reveal the difference between *verbal only* and *multimodal* responses to requests for confirmation. More generally, our study will reflect on the possibilities and limits of comparing multimodal packages across different data sets and languages, and on the context-dependent vs. context-free features of these multimodal confirmations.

# Congratulating and Responding to Congratulation in Chinese Online Interactions

Panel contribution

***Dr. Jia Qiu<sup>1</sup>, Prof. Xinren Chen<sup>2</sup>***

***1. Jiaxing University, 2. Nanjing University***

Compared to speech acts such as requests, apologies and complains, congratulations have received relatively less attention from scholars (but see Searle, 1969; Norrick, 1978; Coulmas, 1979; Makri-Tsilipakou, 2001; Ellwood, 2004; García, 2009; Gómez, 2016). More scarce are studies that examine the act of congratulating in Chinese (but see Chen & Liu, 2020), and there is no research dedicated exclusively to congratulating by Chinese speakers in computer-mediated communication. Drawing both on interactional pragmatics and multi-modal analysis, this empirical study investigates how Chinese WeChat users congratulate others on their professional achievements and how the recipient of a congratulation responds to it. The study shows that 1) while illocutionary force indicating verbs such as 祝贺 (zhu he) and恭喜 (gong xi) constitute highly conventionalised ways to do congratulating, there are many other possibilities at Chinese WeChat users' disposal to express the same communicative intention; 2) The recipient often responds to congratulation by expressing thanks, showing self-denigration and other-elevation, which is in accordance with politeness norms of interaction in Chinese culture; 3) The performance of congratulation and response to it in our corpus vary according to variables such as power relation, social distance and community of practice. The current study showcases how Chinese language users in our corpus do relational work by using the speech act of congratulating online apart from enriching our understanding of the cultural preferences in expressing and responding to congratulation.

# Considerate Expressions in Arabic

Panel contribution

**Dr. Lina Ali**<sup>1</sup>

1. Cairo University

Considerate expressions are universal and essential for communication in all languages in order to maintain good relationships with others. Whereas grammar and pronunciation mistakes don't have a significant effect on human relationships, pragmatic mistakes have a great influence on them. This study sheds light on the similarities between Japanese and Egyptian Arabic considerate expressions. As a result, it was found that the principle of consideration expression in Japanese presented by Yamaoka et al. (2019) can be also applied to Egyptian Colloquial Arabic. For example, in Japanese, usually the sentence 「つまらないのですが」 “it's something small” is used when presenting a gift in which the principle of “state that your burden is small” works. In Arabic, “dy Haga basyta” (it's simple) is used in similar situations. Hence, the same principle works in both languages. On the other hand, when receiving a gift, the expression of consideration, “Leh tafabt nafsak kda” (why did you exhaust yourself), which is equivalent to the Japanese expression 「お口いありがとうございます」 “Thank you for your concern” is used. This means that the principle of “state that the burden on others is heavy” works in both languages. In the refusal Speech Act, when we can't meet the needs of the others, they may feel hurt or offended; therefore, we use considerate expressions to show some consideration to them because the refusal Speech Act violates the principle of Generosity “Give a high value to O[ther]’s wants” presented by Leech (1983). In Japanese, however, the word 「～ちょっと」 “a little” is an adverb that expresses a low degree whose original meaning is lost in a refusal speech Act. It expresses refusal without making a clear statement and it has the function of reducing FTAs. In Egypt, it is believed that the realization of things is not in the power of human beings, but the power of God. Therefore, it is quite common to use “in sha allah” (if God wills/ God willing) to describe what you intend to do in the future. For example, “tomorrow I will go to the University in sha allah.” However, in Colloquial Arabic, when we refuse the invitation of others, we sometimes use “hashuf in sha allah” (Let me see, God willing) to avoid direct refusal and to reduce FTAs caused by refusal speech Act. The above mentioned expressions lose their original meaning in actual conversation and perform a politeness function.

# Considerate Expressions in Chinese

Panel contribution

**Prof. Qinan Li<sup>1</sup>**

**1.** Peking University

In China, as the saying goes, *harmony is the virtue* (*Analects*, 1:12) has always been seen as traditional Chinese culture. In modern China, people value the harmony, the equality, the friendship, and other principles in Core Socialist Values. This idea impacts the way Chinese people communicate in order to maintain the good relations to others. From which we can see that there are lots of ways to express such consideration like *Da rao yi xia* (sorry to bother you), *Jian yue* (with all due respect), *Yi dian xin yi* (as a token of appreciation), *Zhen bu qiao* (what bad timing), and so on.

There are variety of expressions forms of speech acts like requesting and advising. For example, using the verb *Deng* (wait) is a common way to make people wait. Such as *Shao deng yi xia* (wait for a moment), *Qing shao deng yi xia* (please wait for a moment), and *Qing shao deng* (a moment please). What's more, combining words like *Shao* (a little), *Yi xia* (used as a complement at the end of verbs to show an action is unrepeatable or only happens a few times), and *Qing* (please), we can get the expression forms that most used while asking someone nicely to wait.

The Chinese phrase *Neng bu neng?* can also be seen as a derivative expression form from enquiring if someone has the ability to do something. We see the same pattern in English.

(1) 你能等我一儿? (ちょっとおってもらえますか? Can you wait for me a minute?)

(2) 能不能等我一儿? (ちょっとおってもらえませんか? Can you wait for me for a moment?)

Comparing with *Neng ma*, the phrase *Neng bu neng* offers an opportunity for the other side to decline, which is considered to be a more polite way of speaking.

In Chinese, there are widely used adverbs such as *Ke neng* (maybe), *Ye xu* (might be) that carry the hedging function to avoid making a clear conclusion, which is same to *Kamoshirei* in Japanese.

(3) 这样可能会更好—儿 (I thought it would be better if you .....)

(4) 或许你可以试试 (Maybe you can try)。

From which we can see that due to the judgement of the situation or common knowledge of our society, it has become our habit of softening the tone when making requirements. In this report, I will discuss the Chinese expression forms mentioned above and try to find out the characteristics of their semantic structures.

# Conspiracy theories in Online debate as Arguments of Authority (Accountability in CMC)

Panel contribution

***Prof. Fabienne Baider***<sup>1</sup>

**1.** university of cyprus

(Accountability in CMC)

Arguments of Authority are commonly understood as arguments that draw power from their reference to/ association with well-established, recognized institutions, whether an entity or an individual. They are used for their symbolic, social and intellectual capital (Bourdieu 1982). Consequently, the aim of using such arguments is to claim victory in online debates—through silencing the opponent, cutting off democratic debate, or gaining approval of followers (with likes, etc.). However, analysis of databases of online comments referencing controversial issues (e.g., climate change and immigration) reveals that less established authorities—such as conspiracy theorists— are also quite present in such online debates (Harambam and Aupers 2015). Their arguments are often accompanied by personal examples, including testimonies, autobiographical comments, hyperlinks, etc.. According to Tseronis (2009), these are perhaps considered necessary to fulfill the so-called required ‘burden of proof,’ by supplying extra information that is not directly essential to understanding the core meaning of a statement, but that “facilitates the understanding of what is said and / or relates what is said to the context in which it is said and therefore adds coherence to the discourse” (Tseronis 2009: 26). This study is based on data collected within the framework of a research program (IMsyPP, 2020–2022) and will investigate three dimensions of the use of conspiracy theory as Arguments of Authority: 1) the most common strategies deployed as arguments of authority (public or private); 2) the most common counter-strategies deployed as arguments of authority (public or private); 3) the relative success of these different type of arguments.

The language investigated is English.

# Constructing a profession in Twitter. The case of Finnish artist-developers offering organisational training and consulting services

Panel contribution

**Dr. Suvi Honkanen<sup>1</sup>, Dr. Mikko Virtanen<sup>1</sup>**

*1. University of Helsinki*

Hybridisation of professions has become a key dimension of the new working life in gig economies. A case example is the emergence of artist-developers, that is, professionals who have expertise in arts and use arts-based methods in organizational training and development (Mikkola & Nissi submitted). For these hybrid professionals, overlapping jobs, careers and occupational identities have become an integral part of their everyday life. Consequently, for many of them, demonstrating a 'recognizable, consistent, and employable self' (Gershon 2014: 282) entails an active presence on social networking sites.

In order to shed light on the artist-developers' practices of professional self-presentation in social media, our presentation analyses how a group of Finnish artist-developers constructs and manages their multi-faceted professional identities in Twitter. For the analysis, the Twitter feeds of 10 professionals representing different career stages were archived for a duration of three years (2018–2020). In addition, semi-structured interviews with five of them will be conducted.

In particular, the analysis aims at discussing the functions of content sharing (e.g. 're-tweeting' and hyper-linking) as a fundamental constituent of professional self-positioning in social media (cf. Girginova 2015). In the presentation, an analysis of the Twitter data first demonstrates how content sharing is utilised for displaying one's credentials as an artist-developer, and, moreover, for legitimating the profession in itself (see van Leeuwen 2007). These findings are then nuanced with a discourse-analytic examination of the interview data, particularly with regard to the artist-developers' own perceptions and personal accounts of content sharing in online self-marketing. The study is conducted as a part of the interdisciplinary project 'Coping strategies: Communicative practices of mobile specialist professions in service and gig economy'.

# Constructing and negotiating otherness. Stories of discrimination, racism and abuse of international students in Belgium during the COVID-19 pandemic

Panel contribution

Ms. Haiyan Huang<sup>1</sup>, Ms. Anastasia Stavridou<sup>2</sup>, Dr. Stephanie Schnurr<sup>2</sup>, Dr. Kim Schoofs<sup>3</sup>, Dr. Dorien Van De Mieroop<sup>3</sup>

*1. Ghent University, 2. University of Warwick, 3. KU Leuven*

Since the beginning of the coronavirus pandemic, xenophobic attacks and racist abuse against international students in Europe have repeatedly made it into news headlines (e.g., Whitehead 2020; Times Higher Education 2020). Such incidents include verbal abuse of Asian looking students, in person and virtually via social media platforms, and physical assault, for example, for wearing masks in the public domain and for being allegedly responsible for the outbreak (e.g., Hongqiang, 2020; Weale 2020; Yang, Tsai & Pan, 2020). However, these issues have so far escaped academic scrutiny.

Taking these phenomena as a reference point, this paper aims to address how Chinese students in Belgium address verbal aggression and racial discrimination, i.e., the most common illustration of otherness during pandemics (Monson, 2017) by critically analysing their stories. Drawing on stories of personal experience as well as vicarious narratives, we explore the socio-pragmatic processes through which the storytellers construct, negotiate, and sometimes reject notions of otherness in their stories.

Using methodological tools of the narratives as social practice approach (De Fina 2008), we analyse 10 semi-structured interviews by combining fine-grained analyses of how narratives are constructed and formulated on a turn-by-turn basis with insights into how the wider social context surrounding these stories affects the storytelling process.

Preliminary findings illustrate that racism, discrimination and abuse take different forms and come from different sources – including face-to-face encounters with strangers in Belgium, as well as online messages from unknown online social media users “back home”. In recounting these incidents, the storytellers construct different identities for themselves in relation to their attackers. Sometimes they portray themselves as victims and as “others”, which they use as an explanation for their passivity. But at other times they reject those identities and portray their attackers as “others”, thereby problematising notions of otherness.

In line with the panel’s focus, we explore how sociocultural diversity is constructed in these stories and how it is deployed as a means to legitimise or reject ideologies of otherness underlying the experienced racism, discrimination and abuse.

# Constructing authenticity in the seduction industry's "guru discourse"

Panel contribution

***Dr. Daria Dayter<sup>1</sup>, Dr. Sofia Rüdiger<sup>2</sup>***

*1. Basel, 2. Bayre*

This study looks at the language of self-proclaimed seduction experts, including the 'pick up artists' (PUA) – a community that learns and practices speed-seduction for short-term mating. Specifically, we investigate the way that established members of the seduction community with a lot of social capital – so called "gurus" of pick-up – discursively warrant their status as being successful with women and proficient in PUA and seduction techniques.

PUA belong to the less extreme fraction of the "manosphere" and encourage men to use manipulative strategies to select, pursue and sexually conquer women, with the ultimate aim alternating among smaller communities from sex to having a stable relationship even to marriage. The PUA community is highly commercialized, with gurus trying to attract new members and sell them on seminars, bootcamps, and whole programs complete with online and printed material that can cost thousands of pounds. This means that the gurus are invested in establishing authenticity and attractiveness both of their own personal brand and of the pick-up paradigm. More recently, parts of the PUA paradigm have morphed into a more general seduction and lifestyle expert community.

We build on earlier work on the microlinguistic elements that PUA community members employ to construct their game as successful in the "field reports" (an online genre in which members give detailed accounts of their activities; see Dayter & Rüdiger 2016). In the present paper, we conduct a qualitative analysis of five one-hour guru lectures, available on YouTube and transcribed with the assistance of automatic closed captions. We aim to find out (1) if authenticity and success with women emerge as important values in the guru discourse; (2) how are these constructed linguistically.

Our preliminary results indicate that although most previously described objectification strategies can be found in the data (graphic narrative detailing, reported/animated talk), certain strategies are more important than others. Additional discursive strategies can be identified (e.g., brag stories, intensification). We zoom in on the strategy of polyphonic discourse (Schrader-Kniffke 2014), an evidentiality device that contributes to the construction of the identity of an expert in the struggle over who has the "right knowledge". Gurus include lavish direct quotations and 're-enactment' of their interactions with women, including role-play like representations of women's portion of the interaction. Polyphony is a tool that lends veracity to the account, despite the fact that the accuracy of a verbatim quote can hardly be proven. An additional function of polyphony in our data is the representation of stereotypes (e.g., the shy guy, typical woman).

# Constructing professional identities for newly hired employees: An analysis of *nyuushashiki* of automobile manufacturing companies in Japan

Panel contribution

***Prof. Miyuki Takenoya<sup>1</sup>***

1. Toyo University

The present study explores how the construction of new professional identities in transitional stages is carried out in the Japanese business contexts. Specifically, the study aimed to examine the kinds of ideologies influencing the process of new identity construction and the types of linguistic resources chosen and deployed in the construction of such identities in Japanese companies. The focus of the study is on the analysis of the positioning of speakers participating in *nyuushashiki* and their addressees, newly hired employees of the companies as “identity construction involves social positioning of self and other” (Bucholtz and Hall, 2005: 586). *Nyuushashiki* are the welcoming ceremonies for newly hired employees.

The data for the study were sourced from a collection of video clips of *nyuushashiki* ceremonies, which are the welcoming ceremonies held by automobile manufacturing companies in Japan between 2015 and 2020. These video clips, each about 5 minutes long, present the scenes in which the presidents made welcoming remarks, senior members of the companies provided job-related information, and the guest speakers gave speeches to the new employees. These video clips were recorded and uploaded on the Internet by the public affairs sections of the Toyota and Nissan car companies whose headquarters are located in Japan. They both offer their welcoming ceremonies every year at the beginning of April.

These video clips were transcribed and analyzed in terms of the positioning of the speakers and their audience members. Preliminary analysis revealed that the president's speech was characterized by the linguistic resources showing his work ethics and stating the mission of the company, as demonstrated in the following example.

Example: President's welcome address

01 ***Kuruma wa gokan de kanjiru mono da to omoimasu***

[Automobiles are the ones that I think you will need to know by using your five senses.]

02 ***Donna keisu no jidai ni nattemo subeteno hito ni idoo no jiyyu soshite kurumatte***

[In all times, (we need to provide) freedom of mobility to everyone.]

03 ***Tanoshiina to omou mono kuruma zukuri o minasan to issconi yatte ikimashoo***

[Let us enjoy our car making, together with you.]

In utterance 01, the president shares his view of the objective of the auto manufacturing industry, seeming to position himself as the role of an expert in the automobile industry, thereby placing his audience, the new employees of his company, in the position of the novice members of the community. His utterance is characterized by the expression “A wa B mono da,” meaning “A is supposed to be doing B,” an expression signaling the speaker's expertise that is properly only used by an expert speaking to non-experts.

# Construction of Womanhood Parameters: Local and Refugee Women's Encounters in a Turkish Town

---

Panel contribution

---

***Dr. Hasret Saygi<sup>1</sup>***

**1.** *Istanbul 29 Mayis University*

This linguistic ethnographic research explores everyday interaction between the refugee and local women sharing the same neighbourhood in a Turkish town. It explores how the parameters concerning womanhood are locally constructed and stances in relation to the societal roles and expectations about femininity are negotiated between the refugee and local subjects. The main data, the audio-recorded spontaneous interaction data in Turkish, were collected from the social events regularly organised by a group of local women in order to socialise and recite the Quran together. The participation of the Iraqi Turkmen women to these gatherings was made possible by the researcher. While the local and refugee women's getting together invokes a number of ideological and identity related issues, it also reveals how very simple everyday objects can be transformed into indexes of a specific social identities and are then used to exclude each other. In line with the hegemonic identity politics in Turkey, Sunni-Islamic values and Turkish nationalism are observed to be the two main discourses laying the foundation of the local women's constructed stances and developed social relations with the refugee women. Despite their shared identities, the interactional data reveal that the Iraqi Turkmen refugee women's attempts to construct belonging to the local women's community are rejected arguably due to their refugee identity, and the reciprocal intimacy built momentarily while engaging in shared activities cannot be sustained in the long run.

# Continuous vision and communicative distance. Notes on the use of the gerundial periphrases seguir/continuar/proseguir

Panel contribution

***Ms. Dorien Nieuwenhuijsen<sup>1</sup>***

*1. Universiteit Utrecht*

Syntactic-semantic classifications of Spanish gerundial periphrases usually treat *seguir*, *continuar* and *proseguir* together, because all three have a phasal meaning and express a continuous vision. According to this vision, the beginning of the event referred to by the gerund has occurred before the speaking moment or the moment that serves as a reference point, while the event continues after this reference point without specifying its ending. Therefore, these aspectual periphrases highlight the prolongation of the event (Fernández de Castro 1999: 125; García Fernández 2006: 236-238; Olbertz 1998: 166-167, 335-336; RAE, & ASALE 2010: 2209-2211; Squartini 1998: 140; Yllera 1999: 3421).

However similar in meaning, *seguir/continuar/proseguir* + ger differ as far as their earliest testimonies in Spanish are concerned and they also show differences in frequency both in contemporary Spanish and in the preceding centuries. Studies dealing with these periphrases agree that *seguir* + ger is the most common one, whereas the frequency of *continuar* + ger is notably lower, especially in colloquial speech. Furthermore, the use of *proseguir* + ger is very limited and is highly literary in nature (Spaulding 1925-1928: 262-265; Yllera 1980: 82-83; 1999: 3421-3422).

The observed differences in frequency and distribution in Modern Spanish raise several questions, particularly, i) does the current distribution reflect an earlier pattern or has it changed over time?; ii) how can the difference(s) in frequency be accounted for?

In our contribution we will discuss these questions providing quantitative data extracted from the diachronic Spanish language corpus CORDE. We will apply the concept of communicative distance in order to assess its relevance in explaining the frequency and distribution of the three gerundial periphrases in diachronic perspective and determine its role in the establishment of the usage patterns of *seguir/continuar/proseguir* + ger in Modern Spanish.

## Conversation as Inclusion: Verbal Play in Dementia Care

---

Panel contribution

---

**Dr. Shumin Lin**<sup>1</sup>

1. National Yang Ming Chiao Tung University

While many researchers have highlighted the importance of rich communicative interactions in dementia care (Corwin, 2020; Davis & Pope, 2010; Hamilton, 2019), task-oriented interactions have been found to predominate in care institutions (Backhaus, 2017). Based on eight months of participant observation and audio- and video-recordings of naturally-occurring interactions, this study reports on rich social engagement and meaningful interactions in an adult day center (ADC) in Taiwan, which served both healthy individuals and those with various degrees of cognitive and physical decline. One of the central ways in which persons with dementia are valued and their personhood sustained in this ADC is that they are engaged in meaningful conversations. This paper focuses on the interactions between a caregiver (Lily) and a man with mild to moderate dementia (Mr. Chen) over a period of one month when they engaged in ongoing verbal play. The verbal play centered on several themes (including flower names, kinship terms, classical Chinese texts, family names, and Taiwanese proverbs) that occurred during various activities such as walking, drawing, and chatting. This series of verbal play tapped into Mr. Chen's interests in playing with words and sounds and his familiarity with Taiwanese proverbs. He not only responded to but also initiated verbal play with Lily and others. Overtime, he learned and remembered new terms and names that Lily introduced. This study provides evidence for the value of meaningful conversation in dementia care that promotes cognition and affect and illustrates how a professional caregiver moves "beyond general principles of communication to tailored practices that take the particular individuals' experiences, interests, and expertise into account" (Hamilton, 2019, p. 224) in her use of verbal play in dementia care.

# Conversational contingency and its relationship to other developmental features during first language acquisition

---

Panel contribution

---

***1. Department of Linguistics, Stockholm University, 2. University of Kent, 3. University of Sheffield***

To maintain a conversation, a child must practice conversational contingency (i.e. providing information which is relevant to, and further, the topic of the conversation). We conducted three studies, with a longitudinal sample of 40 Swedish-speaking 5 year olds, investigating which external and internal factors to the child were the best predictors of children's conversational behavior. Study 1 investigated which concurrent linguistic and cognitive measures were the best predictors of appropriate conversation responses and found that only receptive vocabulary was related. Study 2 investigated which environmental factors were related to children's conversation skills and found that later preschool entry was positively related to children's conversational contingency. Finally, Study 3 investigated which social and cognitive factors measured in early development predicted the children's conversation skills four years later and found that action imitation in infancy – generally considered a measure of socio-cognitive development – was a negative predictor for the children's non-contingent responses. Together, our findings suggest a multi-pathway route to the development of conversational contingency.

# Conversational Structure in the Interaction between Examiners and Elders with Dementia Risk in Chinese Context

Panel contribution

***Dr. Deyu Zhou<sup>1</sup>, Prof. Lihe Huang<sup>1</sup>, Dr. Wei Zhang<sup>1</sup>***

***1. Tongji University***

This paper reports a preliminary study on the interaction between the examiner and patients during cognitive assessment screening for mild cognitive impairment or early dementia in the Chinese context. As China is moving into an aging society, there is an increasing need for identifying possible dementia patients for early intervention. Cognitive assessments such as MoCA and several others are designed as easy and sensitive screening instruments for detecting cognitive impairment. While the usefulness of such screening tests has been widely acknowledged, little is known about the actual interactional process in which the examiner and patient jointly accomplish the tasks required by the assessment.

The current study draws on data collected from a hospital in Shanghai which offers a set of assessment tests to patients recommended by neurological physicians as part of the examination procedure for differentiating patients with or without mild cognitive impairment or early dementia. The tests were administered to each patient by a trained examiner. For this study, we focused on one of the tests, namely, the Chinese version of the Montreal Cognitive Assessment (MoCA-B). The test consists of a list of tasks that assess a range of cognitive domains. Each task is organized by the examiner's instruction and the patient's implementation of the task. The instruction for each task is standardized and consists of multiple sentences. The examiners are advised to give the instructions once. However, it is observed that instructing the patients to complete the tasks is not a straightforward matter. The "task instruction – task implementation" sequence is usually complex and expanded.

This study adopts the approach of conversation analysis. The aim of the study is two-fold: (1) to examine the patients' response to the examiner's instructions, and the examiner's follow-up action; (2) to examine the possible influence of the examiner-patient interaction on the progression towards completing given tasks in the test. It is found that the implementation of the tasks is often delayed by patients' request for clarification and explanation, or their displayed lack of understanding or reluctance/resistance. The examiner's follow-up actions exhibit an attempt to balance their institutional responsibility of leading the assessment towards completion and the given constraints under which they administer the test. It is hoped that the investigation reported here is an initial step towards understanding the interactional pattern of the cognitive assessment, which will assist in the diagnosis of memory complaints. Furthermore, it can lead to more in-depth study which may have implications for research of medical interaction as well as for clinical practices.

# Conversing with laughter: Laughter alignment in mother-child interaction.

Panel contribution

**Dr. Chiara Mazzocconi<sup>1</sup>, Prof. Jonathan Ginzburg<sup>2</sup>**

**1.** Aix-Marseille Université, Laboratoire Parole et Langage (LPL)- Institute of Language, Communication and the Brain (ILCB), **2.** Université de Paris - CNRS, LLF - Laboratoire Linguistique Formelle

Laughter, emerging around 3 months of age (Sroufe and Wunsch, 1972), is one of the earliest means that a child has to take part in interaction and align to adult behaviour. It is a valuable means to practice the first intuitions of turn-taking (Hilbrink et al., 2015), but also to convey meaning, share attention and affect, assuring the adult of recognition of his behaviour, and therefore eliciting prosecution of interaction.

We longitudinally explore laughter mutual responsiveness in natural interaction in 4 American English mother-child dyads from 12 to 36 months of age, at 6 months intervals (Providence Corpus, (Demuth et al., 2006)). We studied the response to other's laughter annotating for two variables: dyadic laughter (a laughter starting shortly after or with the same onset of a laughter from the partner) and explicit responses to other's laughter (reactions to others' laughter constituted by laughter, other positive expressions -smile and exclamation- or by a clear orienting reaction -look).

For both variables, operationalised in terms of transitional probabilities, we observe significant changes over time in the difference between mother and child and in participants over time, coming to similar values at 36 months (e.g. explicit responses: 12-18m: M=81%, C=11%, p=.007; 36m: M=43%, C=40%, p=1). Child explicit responses to mothers' laughter increase significantly over time, in line with the finding reported by Thompson (1991) of infants responding more quickly to emotional elicitors with increasing age, showing more interest in others' reactions and more engagement in interaction.

Interestingly, we observe peculiarities in mothers' laughter behaviour in interaction with their children in comparison to adult-interaction (Mazzocconi et al., 2020), and a specific attunement to the child communicative and cognitive development. As the child grows older we observe a decrease in the transitional probabilities of dyadic laughter from the mothers (12-18m: 64%, 36m: 10.9%), signalling a decrease in the urge to respond to every instance of laughter, since the child has progressively available a broader range of means to establish communication.

Our data show the important role that laughter has in establishing the first interactions, both for the child and for the mother, and the changes observed over time suggest that laughter behaviour can give us insight into the development of communicative competences, and into children's interest in others' emotional vocalizations and mental states.

# Coordinating talk and space in the openings of potentially multilingual service encounters

Panel contribution

**Mr. Thomas Debois<sup>1</sup>, Ms. Federica D'Antoni<sup>1</sup>**

***1. KU Leuven***

This talk examines participants' verbal and embodied conduct in the openings of potentially multilingual service encounters. It is based on a 23 hours video-corpus of encounters recorded in different service settings in Flanders, Belgium (e.g., tourism offices), and Friuli-Venezia Giulia, Italy (e.g., the reception at a doctor's practice). Here, unacquainted individuals interact with each other as they ask for certain services, often using different languages and language varieties (e.g., (West-)Flemish, French, English, Italian, Friulian).

As previous research has shown, it is in and through openings that individuals become co-participants in interaction, by establishing the sequential organisation of interaction and by displaying their relevant identities for the encounter at hand (see Schegloff, 1967, 1968, 1986, on the openings of phone calls, as well as the numerous studies on the openings of face-to-face interactions, e.g., Kendon & Ferber, 1973; Duranti, 1997; Pillet-Shore, 2008). Recent research has focused on unacquainted individuals engaging in interaction (De Stefani & Mondada, 2010, 2018), especially in service settings in which multilingualism is expectable—for instance in multilingual areas (Heller, 1982) or in touristic and trade settings (customs, ticket counters, etc.; Mondada, 2018), where individuals do not know which language(s) the other speaks.

In this contribution, we analyse openings that take place at a counter where individuals can obtain a specific service. We zoom in on the way in which the organisation of talk is sensitive to the spatial arrangement of objects and persons. We show that individuals entering a service area coordinate their talk with their movement to the counter (Mondada & Sorjonen, 2016; De Stefani, 2019): typically, they produce greetings while they are still approaching the counter and introduce the reason for the visit as they reach the counter. Such openings can happen in a smooth way, or they can be extended, for instance because individuals have to negotiate the language(s) of their interaction. Also, the pre-opening phase of the encounter can be more or less extended, for instance, because officers at the counter do not display availability and service-seekers have to wait (and queue).

By examining how individuals coordinate talk with embodied conduct in openings of potentially multilingual service encounters, this talk describes openings as a situated achievement that is sensitive to the temporal and spatial organisation of actions and in which individuals orient to expectable/displayed membership categories and identities as made available, for instance, through greetings that provide a language sample in the very first moments of the encounter. The research method is Conversation Analysis (Sacks, 1992).

# Covid-19 and the Middle East: Social Media Analysis Across Political Imaginaries

Panel contribution

***Dr. Camelia Suleiman<sup>1</sup>, Dr. Ayman Mohamed<sup>1</sup>, Dr. Amr Madi<sup>2</sup>, Mr. Tareq Farghal<sup>1</sup>***

*1. Michigan State University, 2. independent scholar*

Our paper is a comparative study of the social discussion of Covid-19 on public Facebook pages in Egypt, Jordan, and East Jerusalem. The researchers followed the Facebook posts of four public and popular Facebook pages from each of these three places for the duration of March 2020, the time of the first global wave of Covid-19, and then compared and analyzed the discourse differences among them.

The locales have different political realities: Egypt is an example of a government whose citizens do not necessarily trust that sufficient information and resources about the virus is provided, as the social-media discussions make clear. East Jerusalem is home to about 300,000 Palestinian Arabs, left between a Palestinian Authority which is unable to assert itself towards them and the state of Israel which has an interest in the place but not its people (who are mostly non-citizens), factors revealed in their Covid topic discussions. Jordan is a state with limited resources but is effective in its law and order, which Facebook posters referenced in terms of Covid. Discourse analysis of orders of indexicality (Silverstein 2003) and enregisterment (Agha 2007) – in terms of links to political context and its constraints and how they can vary – shows that while the Egyptian Facebook users rely on humor in spreading information about Covid, the Jerusalem Facebook users seem to be more pragmatic, providing factual information. As for Jordan, their discussions highlight conspiracies and the need to be aware of them as much as the disease. Taken together, the Facebook content reflects the users' social and political imaginaries, reflecting the contextual realities of their lived experience under different political regimes.

# Covid-19 and the pandemic of gendering: assessing the representations of Angela Merkel in British and German media during the first months of the global crisis

Panel contribution

**Dr. Sylvia Jaworska<sup>1</sup>**

*1. University of Reading*

As the Covid-19 pandemic swept the globe in 2020, reports began to circulate across traditional and social media sites praising female leaders for their handling of the pandemic, which was evidenced with lower infection and death rates in their respective countries. While this recognition for ‘female’ leadership is to be commended, the positive evaluation has been offset by the ways in which the female leaders have been framed as caring, risk averse and motherly (e.g. Garikipati and Kambhampati, 2020). Such essentialist gendered representations have yet again delegated women to the sphere of ‘natural’ carers with protective instincts – traits that makes them somehow more ‘suited’ to deal with a health crisis (cf. Baxter, 2018), while competency, good decision-making grounded, for example, in science have been omitted.

The aim of this paper is to assess the extent to which media representations of the German chancellor during the first months of the pandemic conform to or challenge the gendering of female leadership during the pandemic. Merkel presents an interesting case in point; as the first female chancellor in the history of Germany, she has received a fair amount of media ‘gendering’ albeit in more subtle ways than her counterparts in other countries (e.g. Lünenborg and Maier, 2014). She came into politics from an unusual background and in contrast to many other female leaders, she does not have children. Adopting a contrastive corpus-based discourse analysis, this paper investigates the ways in which Merkel and her leadership were represented in the mainstream media in Germany and the UK. The comparison will allow us to explore the representations at ‘home’, where more neutral gender representations have been observed (e.g. Lünenborg and Maier, 2014), and in Britain, where female leaders are still predominately seen as unsuitable for positions of power (Baxter, 2018), and where German leadership has not always been framed in positive terms. This study will therefore make two important contributions: 1) it will assess the presence of gender stereotyping in portrayals of female leadership in a crisis situation, and 2) demonstrate the effects of specific political and cultural contexts on the representations of female leaders adding new cross-cultural and cross-linguistic perspectives to the research on language, gender and media.

# Covid-19 and “divine” hate speech against women on Arabic Twitter

Panel contribution

***Dr. Najma Al Zidjaly<sup>1</sup>***

**1.** Sultan Qaboos University

In this paper, I examine the appropriation of Covid-19 pandemic by Arabs as a resource to unleash systematic hate speech, including some which border on violence, against women on Arabic Twitter. The study is part of a larger longitudinal, ethnographic project on Arab identity and social media. To systematically analyze the connection between pandemics and hate speech against women in the Arabic context, I highlight the hostile posts Arabs in the understudied Arabian Gulf countries published on Twitter - and circulated on WhatsApp - in reaction to the Covid-19 pandemic in 2020. Analytically, I draw upon a relational approach toward impoliteness (Locher 2018); the concept of *moral order*(Kádár 2017), defined as situated cultural norms; and research that has identified the role that intertextual references can play in facework and identity negotiation in the digital Arabic context (Al Zidjaly 2019).

Specifically, I pose the following research questions: What are the reasons, types, and functions of systematic hate speech against Arab women used by Arabs on Twitter during the Covid-19 pandemic? What are the linguistic strategies used by Arabs to construct impolite-oriented discourse in favor of keeping the traditional Islamic moral order which highlights patriarchy? (e.g. directives, metaphors, intertextual references, sarcasm, and irony)? What is the role that *divine impoliteness*, or intertextually referencing religious texts in favor of or against an existing (im)moral order (Al Zidjaly 2019), and facework play in the negotiation of the Islamic intersubjectivity as apropos to gender equality? And what are the ramifications of such discursive actions for women and gender reform in Arabia?

I identify five types of verbal attacks used in tweets against women during the Covid-19 pandemic: 1) ridiculing Arab women by using metaphors that construct them as deadly viruses, 2) attacking the character and behavior of Arab women through erroneously positioning them as immoral, 3) encouraging physical violence against Arab women (taking advantage of the lockdown that shut down police stations), 4) directly requesting the removal of women's rights which have erroneously been constructed as the reason behind the pandemic, and 5) positively constructing the pandemic for forcing women to stay at home and cover up (i.e. verbally welcoming the coronavirus for “disciplining” or bullying women into abiding by Islamic sharia laws [e.g. staying indoors and covering up face]). Collectively, the strategies legitimize violence against women and uphold outdated patriarchal norms or moral orders.

The paper contributes to sociolinguistic research by examining the connection between pandemics and hate speech against women in understudied Arab societies. The findings further illuminate the role that hate speech can play in the negotiation of the Islamic moral order and gender reforms in Arabia.

# Covid-19 humor and the case of multimodal humor

Panel contribution

***Dr. Luca Bischetti<sup>1</sup>, Dr. Paolo Canal<sup>1</sup>, Prof. Valentina Bambini<sup>1</sup>***

***1. University School for Advanced Studies IUSS Pavia, Pavia, Italy***

Studies on Covid-19 inspired humor started to appear during the coronavirus pandemic, shaping a novel strand of research in the domain of (psycho)linguistics, pragmatics, and social communication.

Here we present two studies aiming at understanding the impact, the uses, and the responses to pandemic humor (i.e., Covid-19 related) shared on social media in 2020.

The first study was conducted during the early phases of the pandemic (March 2020) in Italy [Bischetti et al. 2020]. We examined how different forms of humor were perceived (one-liners vs. memes) and the individual factors modulating Covid-19 humor appreciation (i.e., funniness and aversiveness). Results showed that memes were perceived as funnier than verbal humor forms (i.e., one-liners), and that humorous instances revolving around some of the more gruesome consequences of the pandemic were judged as more aversive. Moreover, the use of humor as a coping mechanism has proved useful to boost how funny Covid-19 humor was perceived, as well as to mitigate the disturbing potential of pandemic humor. Even in the face of serious topics, the additional cognitive effort required to (re)solve multimodal instances of humor, as postulated by theoretical accounts [Dynel, 2016; Yus; 2019], is paid back by a modulation of the emotional response on the positive dimension of funniness.

While these results offer novel insights on the understanding of more traditional forms of humor (i.e., one-liners) versus more contemporary ones (i.e., memes) [Chiaro, 2017], more evidence is needed to confirm the pattern observed during the first pandemic wave in March 2020 (Time 1, or T1).

Using another online survey (in November 2020, T2), we investigated longitudinal changes in the emotional response to Covid-19 humor, as well as its therapeutic effects in reducing anxiety. 622 individuals already tested at T1 participated in the T2 survey and were asked to rate humorous items for funniness and aversiveness: stimuli included both T1 items, in order to examine longitudinal effects, and a novel set of memes and one-liners playing on either benign (e.g., masks) or gruesome themes (e.g., death), as well as non-Covid-19 topics. State anxiety was measured before and after the ratings with the STAI-Brief [Zsido et al., 2020].

At T2, people perceived Covid-19 humor as less funny than at T1. Modality and individual differences played a role, with memes being still the funniest items and rated as funnier and less disturbing than other humor formats with increasing age for both T1 and T2 sets of items. Remarkably, results on the novel set of memes confirmed the age-related effects observed during the first wave (i.e., increased funniness and reduced aversiveness). Concerning humor contents, darker forms of humor were rated as less funny and more disturbing than benign and Non-Covid related stimuli, and this was especially true for females. Humor exposure generally reduced anxiety, although stimuli inspired by gruesome themes attenuated such effect and their efficacy was limited only to individuals with higher education.

Facing the second pandemic peak, people laughed less to Covid-inspired humor, yet could ease their anxiety by adopting a humorous outlook.

# Covid-19 Humor: Memes and the pandemic across gender, generations and national languages

Panel contribution

**Dr. Inke Du Bois**<sup>1</sup>, **Ms. Hande Akin**<sup>2</sup>, **Ms. Ekaterina Buchminskaya**<sup>2</sup>, **Mr. Hasan Mir Saban**<sup>2</sup>,  
**Ms. Megan Dwinger**<sup>2</sup>

1. [www.dubois-linguistics.com](http://www.dubois-linguistics.com), 2. Bremen University

Online humor can be a constructive way of dealing with psychologically and socially difficult situations. The pandemic affected a rise in the way all generations used social media applications to communicate during the social distancing and lockdown phases. Psychological research revealed how different psychological humor types were preferred among different generations. Linguistic investigations revealed how different linguistic types such as multimodal voicing, creative reappropriation and incongruity resolution are prevalent humorous features of memes in general and Covid-19 memes specifically. The key question remains how humorous Covid-19 memes and items shared via social media differ in such linguistic and psychological humor types across the Silent Generation, Baby Boomers and Generations X, Y, and Z. To elucidate the conundrum what it is that some memes are considered funny to younger generations but not to older generations and the other way around, a corpus was compiled through a convenience sample.

Around 240 German senior citizen students and students of English submitted demographic data and memes sent by friends, parents and grandparents during the pandemic and imported into a qualitative data analysis software (MAXQDA 20). The corresponding demographic factors (age, sex, language, date sent) were annotated to each meme. In a second step, the memes were annotated firstly, with psychological humor types and secondly, with linguistic humor types. Overall, over 600 memes were coded with the youngest participant aged 13 and the oldest aged 93. The preliminary findings show that there are significant differences in the psychological humor categories in the usage of memes across generations. Baby Boomers and the Silent Generation used more affiliative humor in the Covid-19 memes, while Generations X applied the most aggressive humor and Generation Z the most self-deprecating memes. The linguistic humor types differ significantly as well: Generation Z applied personification and creative reappropriation as humor type significantly more than Baby Boomers. Further, the references to voicing, creative reappropriation applied to video games, cartoon characters and Netflix series which are unknown to older generations. All generations shared memes with incongruity resolution as humor type. This study therefore sheds light on how humor used and memes in social media apps varies across generations and might hint to possible lower response reactions between the generational groups.

# COVID-19 interactions that feature ageism: A case study of multi-party conversation among Japanese women

Panel contribution

***Ms. Mugiho Kojima***<sup>1</sup>

**1.** *Osaka University*

This study investigated how the exclusion of the socially vulnerable is encouraged during interactions regarding COVID-19 by analyzing online multi-party conversations among Japanese women. During crises such as earthquakes and pandemics, citizens have excluded and discriminated against the socially vulnerable by holding them responsible for the crisis. Today, in the context of COVID-19, ageism (Palmore, 1990) that discriminates against the elderly as having higher possibility of being infected and becoming severe has been observed worldwide. Conversations where participants casually and humorously discuss their experiences regarding COVID-19 with friends have been recorded. By analyzing the discourse, this study examines the perceptions of participants in the context of COVID-19, especially, who participants draw and consider as the people possibly infecting themselves and their family members. In addition, the study explores how this perception is displayed through their interactions as they conform to each other's perceptions during the multi-party conversation.

This study analyzes data recorded online (Zoom) in August 2020 as part of a longitudinal study on multi-party conversation among Japanese women that the researcher has been working on since 2018. The three participants are in their mid-20s, have been friends since they were in college, and two of them have a child each, aged one. As a theoretical framework, the study employed narrative analysis approach and positioning theory by referring to Bamberg (2004), to analyze the small story (Georgakopoulou, 2007) as interaction as well as to observe how the participants position and identify themselves and the others in it.

I found that the participants perceive the elderly as having high possibility of being infected and their condition becoming severe. The participants with children want the elderly to avoid contacting their children. Since the participants conformed with each other while laughing, the ageism in their discourse was reinforced. For example, one of the participants said that even though she wants to avoid them, she decided to "forgive and accept" an old lady who got closer to her daughter at a supermarket because "if the lady is that old, she is likely to have severe symptoms in case she is infected with COVID-19 (implying that if she is capable of being at the market, she is unlikely to have a virus)." The other participants reacted to this with laughter, and it confirmed the affiliation between them. Therefore, it was found that COVID-19 encourages ageism in social situations, and it is validated when friends conform to each other through laughter during private conversations.

# Critical Discourse Analysis of 2010 China's Trade Dispute with Major Trading Partners in the Headlines of Chinese and Western Newsmagazines

---

Panel contribution

---

***Dr. Damien Ng<sup>1</sup>***

*1. Julius Baer*

This paper explores the representation of China's trade conflict with its major trading partners in one Chinese and four Western newsmagazines. They include Caijing from China, Time from the US, The Economist from the UK, L'Express from France, and Der Spiegel from Germany. Based on both quantitative and qualitative approaches, the overarching methodological approaches of this research draws on two linguistic frameworks from the realm of critical discourse analysis: 1) van Leeuwen's (2008) socio-semantic inventory of social-actor representation to examine the media representation of the major social actors in the headlines, and 2) van Dijk's (1980) notion of macro-rules, which reveal the dominant topic of the headlines under analysis. In so doing, the methodological framework helps shed light on the changing dynamics of international relations between China and its major trading partners through the analysis of the global economy as reported in the Western media. The sample in this article consists of 100 headlines and the time frame stretches across a period of 12 months in the year 2010. The findings obtained from the empirical research of the Western newsmagazines have revealed that China was not only reported unfavourably in matters relating to economics, but also across a broad range of areas spanning politics and military affairs. It has also emerged that all the four Western newsmagazines tended to put their coverage on the United States and China in 2010. This paper makes the following two key contributions to scholarship: the inclusion of information drawn from primary sources in Chinese, French and German to complement English language sources, along with their translation into English by the author where necessary; the inclusion of one French and one German newsmagazine to complement the coverage by one American and one British newsmagazine, thus giving a fuller Western perspective on China, as well as the addition of a Chinese newsmagazine that reveals China's perspective on the trade conflict.

# Criticism and rapport in an early and present-day English advice column

Panel contribution

***Dr. Magdalena Leitner<sup>1</sup>***

**1. UZH Zürich**

Giving advice is potentially face-threatening in Anglo-Western contexts as telling others what to do might be perceived as imposing and as questioning the competence of advisees to solve the problem on their own (Locher 2006: 52, 113, and references there cited). It is therefore important for advisors in advice columns to create a good rapport with advice-seekers (and the wider readership) to mitigate potential offences. Modern advice columns and advice exchanges in other present-day contexts have been widely studied in pragmatics and other fields (e.g. Kouper 2010, Locher 2013, Locher and Limberg 2012). By contrast, little is known about advice in historical contexts (e.g. Berry 2003, Fitzmaurice 2002, Schrott 2014), while the linguistic study of early print advice columns and how the relational work of advisors has changed over time remains a research gap (Locher and Limberg 2012: 23).

This paper investigates how advisors create rapport through language in Defoe's *Review* (1704-1705), one of the earliest English advice columns, and a 21<sup>st</sup>-century advice column (Dear Mariella, accessed through *The Guardian* online). Thirty advisory answers are examined for each advice column. The focus is on advice concerning love and marital relationships. Advice-giving is examined with Locher's (2006: 113-151) discursive approach of relational work, which is useful for context-sensitive analyses of the verbal behaviour performed by participants to negotiate their relationships in advice exchanges, with the necessary adaptations for the 18<sup>th</sup>-century data of this paper. I will concentrate on advisors' acts of criticism since these are potentially face-threatening (Locher 2006: 143, and references there cited). The research questions are as follows: are acts of criticism in Defoe's responses to readers' letters unmitigated or accompanied by supportive relational work? How does the performance of criticism in Defoe's *Review* compare to relational work in a modern advice column such as Dear Mariella?

Preliminary findings suggest that Mariella combines criticism with hedging and involvement strategies, such as empathy and bonding, which create a face-saving and supportive rapport. When criticising advice-seekers' actions or attitudes, Defoe's responses show mitigation through hedging but also more unmitigated criticism than in Mariella's responses. Involvement strategies of empathy and bonding are less important or even rare. Aggressive speech acts, such as insults, are infrequent in Defoe's responses and near to non-existent in Dear Mariella.

# Cross-cultural similarities and differences in the indexing of social distance through gestures and body movement

Panel contribution

***Dr. Iris Hübscher<sup>1</sup>, Dr. Lucien Brown<sup>2</sup>, Dr. Hyunji Kim<sup>3</sup>, Dr. Bodo Winter<sup>4</sup>***

**1.** URPP Langue and Space; University of Zurich, **2.** Monash University, **3.** University of Oregon, **4.** University of Birmingham

The universality vs. specificity discussion in politeness research has attracted researchers' attention since the seminal work of Brown and Levinson (1987). A great number of papers have since been published, working out the cultural specificities in im/politeness. This research has typically been dominated by the investigation of verbal markers. However, recent research has revealed that several multimodal cues such as prosody (e.g. Winter & Grawunder, 2012 and Hübscher et al 2017) and different facial and body cues (e.g. Brown & Winter 2019) are adapted systematically in deferential face-to-face interactions pointing again towards certain, possibly shared features independent of a specific language.

To be able to cross-culturally compare multimodal politeness-related behaviour as well as possible, two parallel corpora were constructed in two different cultures. 14 Korean and 14 Catalan adult speakers participated in a total of four different pragmatic tasks (movie conversation, Tweety narrative retelling, map task and apology role play). Each speaker produced all of the tasks two times: once with a professor ("social distant" situation) and once with a close friend ("social close" situation). In an earlier paper, we investigated how manual gestures interact with politeness-related factors in face-to-face interactions in the Tweety narrative retelling task (forthcoming) and found an overall pattern towards gesture curtailment when the social distance is high in both languages. In this paper, we would like to expand on the previous findings by investigating not only how the manual gestural behaviour is adapted depending on the interlocutor and language, but also by factoring in the role of the pragmatic context. Furthermore, we are interested in including three other body signals which have been shown to play a role in the signalling of politeness-related meanings, namely head gestures, adaptors and eye gaze.

The video data has been annotated in ELAN and has been analysed both quantitatively and qualitatively in regard to the difference between gestures in relation to their frequency, size and also form and also the amount of further body signals such as head gestures (head nod, head shake), eye gaze (averted vs. at interlocutor) and adaptors (self-touches of hands, head, hair etc.). Preliminary results demonstrate that in both languages investigated there seems to be mitigation happening in relation to the use of manual gestures (similar to previous research) with variation in the overall occurrence of the total number of manual gestures in the different pragmatic contexts and more curtailed gestures (with differences between the two cultures). In Korean furthermore, a clear increase in head nods can be observed in conversations when talking to the professor leading to an increase of this type of gestural behaviour. The results from Korean and Catalan will be discussed in the light of specific vs. more universally oriented patterns in gestural im/politeness.

# Cross-modal and cross-linguistic effects in hate-speech perception

Panel contribution

**Dr. Jana Neitsch<sup>1</sup>, Dr. Oliver Niebuhr<sup>1</sup>**

**1. SDU**

The more people have access to smartphones and computers, the easier it is to become a victim of hate speech which, in turn, can result in drastic psychological harm ([1]).

Our study compares German (Ger) and Danish (Dan) spoken and written hate speech addressing the two societal minorities of *foreigners* (as a huge target group) and *Muslims* (as a more specific target group). We analyze the six most frequent hate-speech subtypes (i.e., feature conditions) in both languages – FGL: figurative language, IRO: irony, HOL: Holocaust reference, IND: indirectness, RQ: rhetorical questions, IMP: imperatives; 12 items per feature condition: 6 targeting *Muslims*, 6 targeting *foreigners* ([2]).

Based on our data collected in a web-based experiment, we compare participants' perceived severity of the feature conditions and whether one of the two modes (spoken, written) mitigates and/or intensifies hate speech. All hate speech items were derived from original written hate-speech utterances (ORIG) of the XPEROHS Twitter-Facebook corpus ([3]). Per language, a professional native speaker made the stimuli audible. In a within-subjects design, participants evaluated the items in each mode on two dimensions: personal unacceptability (x-axis); necessity of legal/societal consequences for the originator (y-axis).

For relative x-coordinates, mixed-effects regression models of 9 native listeners per language (Dan: $\bar{x}=25.3$  years; Ger: $\bar{x}=33.1$  years) showed interactions between *language* and *feature condition* (*p*-values  $<0.003$ ). Each feature-condition subset showed two main effects: Spoken stimuli (all  $p < 0.009$ ) and stimuli targeting Muslims (all  $p < 0.01$ ) resulted in higher ratings than written stimuli or stimuli addressing foreigners, except for IRO items (both  $p > 0.6$ ). Additionally, Ger participants gave higher ratings for HOL, IND, ORIG, and RQ than Dan participants on the x-dimension (all  $p < 0.03$ ). Similarly, there were also interactions between levels of *language* and *feature condition* for the y-dimension (all  $p < 0.003$ ): Results for IMP items were clearest, showing higher ratings in Ger for spoken items and those targeting Muslims (all  $p < 0.02$ ). Generally, HOL items were most unacceptable and triggered the strongest call for consequences in Ger, whereas in Dan it was the FGL items to which these judgements applied.

Overall, we see clear cultural differences in the highest ratings, but similarities for ambiguous utterances in the lower ratings.

# Crossing over: When emergency calls turn into emotional support and suicide helpline calls become urgent cases

Panel contribution

***Dr. Clara Iversen<sup>1</sup>, Dr. Heidi Kevoe Feldman<sup>2</sup>***

***1. Uppsala universitet, 2. Northeastern University***

Emergency numbers and suicide helplines are two institutional helplines that offer different types of support for persons in crisis. Emergency calls have a short duration with a single focus of getting pertinent information to send police, fire, or an ambulance. Suicide helplines are designed for a longer duration, offering callers a chance to talk through their problems by providing emotional support. However, on occasion, call takers in emergency lines might need to provide emotional support to get the caller to give their location, and call takers in suicide helplines will sense that callers are in the midst of an urgent crisis and needing emergency service. Thus, these call takers need to act quickly and step outside their routine tasks. In this paper we demonstrate where and how these helplines cross over in terms of institutional tasks and communication problems. Using conversation analysis to examine cases of U.S. 911 emergency calls and Swedish suicide helpline calls, we identify practices where the focal action becomes one whose interactional home is in the other arena. In our analysis we identify key practices that cross over each helpline, such as emergency dispatchers formulating and assessing callers' emotional experience and suicide helpline call-takers doing risk assessment or asking for callers' location. We examine missed opportunities to cross over, and cases where call takers cross over while maintaining the respective institutional agenda. By explicating crossover practices that call-takers use to manage crisis in these different settings, we contribute to an understanding of institutional boundaries in high consequence cases. The comparative approach enables us to identify interactional problems and unmet goals.

# Crying and crying responses: A cross-cultural exploration of pragmatic socialization in a Swedish and Japanese preschool

Panel contribution

***Dr. Matthew Burdelski<sup>1</sup>, Prof. Asta Cekaite<sup>2</sup>***

*1. Osaka University, 2. Linköping university*

This paper explores pragmatic socialization by examining episodes of two to three-year-old children's crying and adults' responses to this crying in two preschools: Sweden and Japan. Based on approximately 100 hours of naturally occurring interactions, it focuses on crying episodes that emerged within peer conflict, and analyzes ways that teachers structured a triadic framework of mediation. The results show how teachers mediated by using (1) question-response sequences to clarify what happened and (2) directives and declaratives to convey norms of behaving/speaking and to attune children to the crying of others as a negative affective act that requires a remedial response. The results reveal similarities and variations in adults' responses to children's crying in the two preschools. Although the findings in part instantiate traditional models of socialization in these two societies, they also suggest ways that departed from these models.

# Cultural factors in the diffusion of language change: a study on Spanish agreement markers in the last decades of the 20th century

Panel contribution

***Dr. Ana Belén Llopis Cardona<sup>1</sup>, Dr. Salvador Pons Borderia<sup>1</sup>***

*<sup>1</sup>. University of Valencia*

Over the last decades sociolinguistics has largely contributed to study the diffusion of language change (Chambers & Schilling 2013; Labov 2001, 2007, 2018; Trudgill 2002). Studies of changes in progress have highlighted the crucial role of social factors in the propagation of changes. Recently, the role of media has been put forward (radio and TV broadcastings in Tagliamonte 2012 and Stuart and Smith 2013). However, the role played by cultural practices has hardly been explored. This paper integrates cultural practices in a dynamic mechanism of diffusion in language change.

To do so, we analyse the functional shift between the agreement Spanish DMs *de acuerdo* and *vale*. This shift is part of the process of colloquialization undergone in Spanish since the 70s.

*De acuerdo* grammaticalised as a DM in the first decades of the 20<sup>th</sup> century and was not associated to a special register. In the 70s *vale* was selected over *de acuerdo* by young counterculture activists. Gradually, *vale* expanded over *de acuerdo* to other sociolects and geographical areas, and *de acuerdo* became an agreement DMs in formal speech, this producing a reallocation in register (Croft 2000; Pons & Llopis 2020).

This study agrees that a main factor in the propagation of this change was *weighted interactor selection*, (Blythe & Croft 2009, 2012), in the sense that speakers using the new variant were more influential, so their linguistic choices were adopted because they linked speakers to this influential group.

Nevertheless, so far disregarded factors turn out to be key in the *de acuerdo/vale* shift: social practices increasing social networks (rock concerts, night life); media, which accelerated linguistic changes, and cultural practices – like music, films, novels or, comics – which, by adopting the new forms, contributed to the consolidation and spread of linguistic changes. This case study shows that the current model of linguistic diffusion should be reviewed in order to provide a more comprehensive picture of linguistic changes.

# Cultural products, passing fashions, and linguistic changes. A view from the Italian pragmatic marker *ma vieni*

Panel contribution

***Ms. Chiara Fedriani<sup>1</sup>, Prof. Piera Molinelli<sup>2</sup>***

*1. University of Genoa, 2. University of Bergamo*

This study explores a pragma-linguistic innovation recently occurred in Italian, namely the emergence of the discourse marker *ma vieni* 'hooray', whose use was substantially boosted by its employment in a popular Italian film comedy. The emergence of this marker probably took place in connection to a larger set of pragmatic forms, all featuring the adversative conjunction *ma* 'but' combined with different fillers (*guarda*, *scusa*, *dai...*). Fedriani & Molinelli (2019) introduced the notion of *pragma-dyad* to account for such complex linguistic units which result from the recurrent association of two autonomous elements. Although *vieni* does not exist as pragmatic marker on its own, it has probably been attracted to this *pragma-dyad*, on account of the compelling paradigmatic analogy exerted by functionally neighbouring markers acting as multiple source models.

The core function of *ma vieni* is that of expressing enthusiastic joy and satisfaction, linked to a sense of positive surprise, as in (1) (see the co-occurrence of the claim *ho troppo goduto* 'I am so happy'):

(1) *finalmente, so riuscito a dare l'esame di teoria....1ERRORE!! MA VIENI!!ho troppo goduto!... (ItTenTen corpus)*  
 'I finally managed to pass the theory exam. 1 MISTAKE!! HOORAY!! I'm over the moon!'

The media presumably played a crucial role in the social embedding of *ma vieni*: more specifically, this discourse marker was used by a famous actor in a very popular film comedy (*Tre uomini e una gamba*, 1997), within a famous scene which became a sort of catchphrase for young people in the 1990s. This probably had a catalyst function in triggering and reinforcing its spread, above all in sports contexts (2):

(2) *Ma Vieni!!!! Ennesima ottima partita dei ragazzi in Champions, tenuto conto delle numerose assenze in difesa...INTER 3 BAYER 2* (<https://forum.termometropolitico.it/240109-mavieni.html>), 2002, title of the post: "Ma vieni")

'Go for it!!!! Further great match of the guys in Champions, and with numerous absences in defense... INTER 3 BAYER 2'

During the last five years, however, *ma vieni* underwent a gradual process of pragmatic and semantic expansion, as it came to express generic satisfaction and approval in a wider range of registers and genres (for instance, in restaurants online reviews). This points to the development of a possible pragmatic cycle, whereby *ma vieni* could have substituted, at least in younger generations of speakers, the synonomous marker *evvai*, which, in turns, constitutes an innovation with regard to the more old-fashioned *evviva*.

On the basis of a corpus-based study, this presentation thus addresses a set of issues included in the Call for Papers, offering a detailed micro-analysis of the acquisition and expansion of a linguistic change, considering the impact of linguistic modes and genres on it, and investigating the intriguing intersection between cultural products, passing fashions, and linguistic changes.

# Cultural Scripts of Communication: A Cross-cultural Analysis of African and Punjabi Proverbs

Panel contribution

***Dr. Lubna Akhlaq Khan<sup>1</sup>***

*1. National University of Modern Languages, Islamabad*

## Cultural Scripts of Communication: A Cross-cultural Analysis of African and Punjabi Proverbs

Lubna Akhlaq Khan

Dua092@yahoo.com

### Abstract:

This cross-cultural research began with an assumption that a culture's paremiological resources can give an insight into its ideology, preferences and a preferred code of conduct. The focus domain of the present study is the speech-related proverbs from Punjabi and Nigerian cultures. The theoretical framework is provided by the Linguo-Cultural Approach (Petrova, 2016) and the Theory of Cultural Scripts (Goddard, 2010), which is also used to formulate the scripts of communication. Cultural informants from both cultures helped to find and organize the living proverbs among the initially collected data from the recent publications of proverb collections. Thematic categories are developed according to the 'culturemes' found in the proverbs. The study confirmed the hypothesis by Fischer and Yoshida (1968) that the population density of a speech community affects the positive or negative attitude toward speech. Cultural scripts are developed for the dominant tendencies found in Punjabi proverbs for silence as a preferred strategy along with restraint, contemplation, and indirectness while the Cultural Scripts emerged from the Nigerian corpus delineated their cultural preference for speech, directness, and clarity. Overall, the dominant cultural script about Yoruba philosophy of communication is to 'speak-up one's heart in clear and straightforward words', as compared to the Punjabi ethics of speech which stressed 'being cautious' and 'contemplative' about one's speech practices and 'silence' as a preferred response in most of the situations.

# Cyberhate and feminism frames in the Brazilian presidential political campaign in 2018

Panel contribution

***Dr. Fabiana Poças Biondo Araújo<sup>1</sup>, Dr. Clara Dornelles<sup>2</sup>***

*1. Universidade Federal de Mato Grosso do Sul, 2. Universidade Federal do Pampa*

This paper presents a discussion about the construction of the idea of feminism within the discourse produced on the web during the Brazilian presidential political campaign in 2018. The nature of the election discursive practices was polarized between conservative and progressivist point of views about contemporary emergent topics, such as gender. We chose an Instagram page called “Quebrando o Tabu” (Challenging Taboo) to analyze how people mobilized linguistic and other semiotic modes as resources to portray their view on feminism and how it relates to dynamics of cyberhate. We lurked the discussions that happened before the first and second rounds of the election, visiting the site from August to November, in 2018. In this period, the moderators of the site posted 431 posts, which incited thousands of debates. As a criterion to delimitate the data of the present study, we manually organized them according to their themes, and analyzed the ones that explicitly brought the question of feminism, except for two of the posts, that focused on the presidential candidates. Therefore, the data is constituted by 12 posts about feminism published by the page moderators, during the mentioned period, and the comments on those posts. The analysis showed that three frames (GOFFMAN, 1974; ENTMAN, 1993; 2007) on feminism are present on the data: (i) feminism as an extremist movement of “scandalous” women; (ii) feminism as a movement of women against men; (iii) feminism as a movement of the left party. Based on dualistic conceptual structures such as “woman x feminist”, “women x men”, “us x them”, these discursive practices sustain practices of cyberhate against feminisms and feminists. They thus create a kind of “truth” about feminisms, that may be considered acts of “desinformation” typical of actual social media and which discursive strategies related to sensationalism, belonging, political alignments, among others (RECUERO, 2020). However, the question that raises our attention the most relates to the dynamics of the interaction in the analyzed page, almost exclusively directed by the creation of that truth, despite the little comments that try to expand possibilities to reflect on feminisms. The reaction of the “defendants” replicate the polarization, once it leads to discussions of personal character and swearing. The discussions recontextualize (BLOMMAERT, 2008) the posts, especially because while on the one hand some posts do direct towards a view on feminism as a plural movement, that works for gender equality, on the other hand emoticons and debauchery laughs that broke the discussion are used. In sum, the reframe of the posts indexes the social imaginary constructed about the feminist movement and of women who align to this movement.

## Cyberhate and political agenda: a study of Bolsonaro's discourse about COVID-19 pandemic

---

Panel contribution

---

***Prof. Barbara Gallardo<sup>1</sup>***

**1.** Universidade do Estado de Mato Grosso

This research analyzes inconsistencies in President Jair Bolsonaro's arguments to justify Brazilian Federal government's failure to fight COVID-19 pandemic. It concentrates on the government excuse for the lacking of vaccines and its encouragement of early treatment with drugs such as chloroquine and hydroxychloroquine. Both issues were discussed on January 14<sup>th</sup> and 21<sup>st</sup>, 2021 programs broadcasted on Bolsonaro's YouTube channel. We suggest that the way the president builds his arguments encourages his followers to practice cyberhate, referring to biblical psalms to attack contrary views. We use Critical Discourse Analysis of Social Media to analyze how the president demeans science and scientific facts and uses strategic discourse resources to convince people that Federal government is a victim of State governors; the argumentation theory, which allows us to point out inconsistencies in his discourse that encourage his followers to attack people based on fear and anger; and the post-truth theory, which highlights the dynamics of "truth construction". The results reveal the use of prestigious online contexts to reinforce political polarization and cause distrust and online hostility among citizens, which are in compass with Bolsonaro's political agenda and his sympathizers.

# Cyberhate, verbal violence and reflexivity in the context of covid-19 pandemic in Brazil

Panel contribution

***Prof. Anna Bentes<sup>1</sup>, Prof. Edwiges Morato<sup>1</sup>***

***1. UNICAMP***

Brazilian federal authorities have been producing statements that affect public policies related to health care in the context of the covid-19 pandemic. One example is the derogatory categorization produced by President Jair Bolsonaro of individuals who are in favor of wearing a mask and of social detachment.

The systematic verbal violence performed by the Brazilian President towards certain social groups has been fostering the deepening of his supporters' cyberhate practices towards these groups. But this systematic and specific form of verbal violence performed by the Brazilian President in public and private (which, in the end, is also turned public) contexts is also fostering other forms of linguistic reflexivity performed by social agents towards these specific official socialization forces, specially when specific texts and discourses are produced as critical responses to these forms of socialization.

Our communication intends to examine the disputes involving this kind of official cyberhate practices, more specifically, through the analysis of evaluative language produced by president Jair Bolsonaro and by specific groups that react to his statements. Evaluative language, when expressing and transmitting sociocultural values, certainly brings implications of all kinds for individuals and entire communities, among which we would highlight the speeches of hate and intolerance, stereotypes, verbal oppression, prejudice.

We intend to observe more closely a social reaction to the statement attributed to the President and made public on July 8th, 2020, saying that wearing masks and practicing social distance was a "fagot thing". Reactions with a hashtag #coisadeviado were immediate. In one of the articles published that same day, the author argued that LGBTQIA+ community was proud to be associated to the use of masks, to be associated to life and not to death. In his text, the LGBTQIA+ community took the statement not as an offense, but as something to be proud of.

As principal results, we found that social categorization and value predicates produced by President Jair Bolsonaro signaling specific social meanings attributed to those who try to protect themselves from contagion of covid-19 are entextualized in a way that reinforces pragmatic and discursive resources (the assumption of the categorization and the changing of the value predicates associated to it by President Bolsonaro) that can support alternative symbolic ways of living in society, where situations of prejudice, discrimination and violence can be finally overcome. The social impacts of these critical responsive movements to official cyberhate practices are still to be evaluated, but we can say that the actual political disputes raise questions about our capacity of reconstructing bridges in social life and communicative practices. It is also important to think about how these disputes can have consequences for the perception and the implementation of public policies related to the political and sanitary Brazilian crisis.

# De-Colonizing (Speech) Disability (Research): Social Inclusion also in Research

---

Panel contribution

---

***Dr. Ignasi Clemente<sup>1</sup>, Mr. Robert de Miguel<sup>2</sup>***

*1. Hunter College, CUNY, 2. Independent researcher*

This paper emerges from an ongoing methodological and theoretical dialog between a (speech disabled) research subject and a (speech abled) researcher on the potential pitfalls of disability research conducted by abled researchers. *Background:* Anthropology, but also many other disciplines, have a history in which researchers from a dominant group have almost exclusively studied dominated groups, in which dominated groups rarely studied themselves, and even more rarely, in which dominated groups have turned the anthropological lenses to study dominant groups. These profound research asymmetries have perpetuated inequalities of power, knowledge, and representation. These research asymmetries have been challenged by the emergence of “native” anthropologists who began to study themselves as well as to challenge the production of knowledge originating in (ex)colonial universities. As critical feminist, queer, childhood, deaf and more generally, disability scholars have argued, these asymmetries are still found across many disciplines. *Discussion:* Combining the academic knowledge of the researcher and the experiential knowledge of the research subject, this paper weighs the pros and cons of new technologies (such as speech recognition, oral-to-written technology) and new research methodologies (such as participatory action research, written interviews, auto-ethnography) as means to develop more inclusive methods to study speech disability.

# De-ritualization as management of social roles: Multimodal analysis of ritual language and bodily behavior

Panel contribution

***Dr. Tomoko Endo***<sup>1</sup>

*1. The University of Tokyo*

In addition to daily activities inside and outside the home, children occasionally participate in special events such as rituals. While ritual language differs from ordinary language in many respects (Tavarez 2014), linguistic and bodily behaviors may be modified in order to accommodate children. Using the methodology of multimodal conversation analysis, this study aims to describe the patterns of such modifications in order to capture how the social roles of adult participants (i.e., the priest and family members) are maintained and transformed. The data for this study come from video recordings of Japanese ancestral rituals conducted at home. A priest from a shrine in the neighborhood visits the home, and family members including children participate in the ritual. This study focuses on the addressing rite, one of the five sub-parts of the ritual, in which each participant prays for the ancestors and offers a jewel skewer (a small twig decorated with a white piece of paper) at the altar. The forms of instructions given by the priest to the participants during the addressing rite are the primary target of analysis.

Linguistically, when the priest gives instructions to children, he changes various aspects such as the vocabulary, the use of honorifics and vocatives, the form of directives, and the clause-chaining format. That is, whereas the priest would say to adult participants, “Please pray to the grand spirits to show your gratitude for their continued protection,” he would say to child participants, “Let’s pray. Grandpa, Grandma, thank you for protecting us always.” Thus, compared with his speech to adult participants, the priest’s style of speech to child participants becomes not only informal, but also less formulaic, more involved, and personal. These changes suggest that he assumes the role of a caregiver in addition to religious authority.

The bodily behavior of the priest, by contrast, do not change as drastically as the linguistic behavior. The features observed only in instructions to children are subtle body movements such as leaning toward a child participant, pointing at the floor to indicate where to sit, and smiling at him/her when the child’s turn of the offering is successfully completed. It was also observed that the priest does not change his seating position or touch the children, which makes a clear contrast with adult family members, especially the mother or grandmother, who sometimes touches a child’s hand to correct the direction of the skewer, or holds a baby so that s/he can also participate in the ritual. In other words, haptic communication (cf. Cekaite & Mondada 2020) is only achieved between close family members.

While the instructions to children can be a process of enskillment and socialization (Goodwin and Cekaite 2018), this study reveals a finer distinction in social roles within one participant (i.e., the priest) as well as between participants with different relations (i.e., the priest and family members). Such distinctions are achieved in multiple layers of linguistic and bodily behaviors.

# Dealing with Interactional Difficulty in Adult-Child Conversations: Children's Rights and Accountability as Selected Next Speakers in Question-Answer Sequences

Panel contribution

***Ms. Ruey-Ying Liu<sup>1</sup>***

*1. University of California, Los Angeles*

In interaction, childhood vis-à-vis adulthood is not characterized as an absolute category but rather in terms of norms that assume and reinforce asymmetries between children and adults in terms of their rights and accountability (Sacks, 1992). That is, children may be treated as having limited rights to engage in certain activities, and certain accounts that can be applied to adults may not be applied to them. This conversation analytic study focuses on how children's rights and accountability as selected next speakers are oriented to by adult co-interactants in question-answer sequences.

In conversation, when the current speaker selects a next speaker, the selected recipient has the right and is obliged to take the next turn to speak (Sacks, Schegloff & Jefferson, 1974). However, young children whose interactional competence is still under development may have difficulty providing the requested information in a timely or adequate manner. This study examines instances in which such interactional difficulty takes place while a non-selected adult co-interactant is available to intervene in the sequence. Drawing on 36 hours of naturally occurring, everyday adult-child conversational data, the analysis reveals that when the child recipient is selected, non-selected co-interactants typically withhold their participation, displaying their orientation to the child's primary right as the selected speaker. Nonetheless, when a substantial delay occurs or when the child fails to provide a satisfactory response, non-selected interactants intervene and work to solve the problem.

Dealing with children's lack of immediate response involves two conflicting preferences: the preference for answers (Schegloff, 2007) and the preference for selected speakers to respond (Sacks et al., 1974). While the preference for answers is prioritized in adult interaction (Stivers & Robinson, 2006), the current study shows that non-selected adult co-interactants do not typically answer on behalf of children. Rather, they deal with the problem and pursue children's response. This practice offers a solution for the two contrasting preferences since it promotes progressivity without compromising children's rights and accountability as selected speakers. Similarly, non-selected interactants tend to withhold corrections to children's inadequate responses and elicit children's self-repairs. When such attempts fail, non-selected interactants do provide the requested information on behalf of children; nonetheless, they also seek children's confirmation, thereby validating their status as selected speakers.

In summary, adults tend to treat children as competent interactants in everyday conversation. However, when children violate certain interactional norms, adults do extra work to invoke children's rights and accountability as interactants while guiding them to conform to the norms. In other words, as young children develop their interactional competence, they are also socialized to claim their own rights and take on accountability in interaction.

# Debating about the senses: the interactional negotiation of descriptors for expressing sensorial qualities in tasting sessions

Panel contribution

***Prof. Lorenza Mondada<sup>1</sup>***

*1. University of Basel*

This paper addresses the issue of meaning in social interaction by focusing on an activity – tasting sessions – which constitutes a perspicuous setting for investigating the way participants endogenously and locally establish and make sense of descriptors and taxonomies concerning sensorial semantic fields, like taste.

The semantic and lexical dimensions of sensoriality have been extensively studied in the linguistic and cognitive literature on the basis of eliciting protocols in which informants were asked to name odors, taste and color on the basis of a stimulus. This resulted in studies of the way the system of a language, or the language of a particular group, express odor (Majid & Burenhult, 2014), taste (Backhouse, 1994) or color (Berlin & Kay, 1969). Much less explored is the way in which participants engaged in naturally occurring social activities propose and debate about the lexical categories appropriate for that activity, their differentiations and their meaning.

This paper proposes an approach of lexical categories expressing the semantic fields referring to color, consistency, odor and taste qualities as they are locally made relevant, distinguished, and typologized by participants engaging in sensing the materiality of samples they describe. For doing so, I focus on tasting sessions (see Liberman 2013; Fele 2016; Mondada 2018, 2020; Mondada & Fele in press) as a naturalistic setting in which participants engage in finding the right word to describe the sensory quality of an object, respectively the sensations generated by it. In this search, they possibly doubt or diverge concerning which word is the most adequate to express a sensorial quality, compare different descriptors, and negotiate both the referential adequacy of lexical categories and the features covered by these categories. Tasting sessions are thus treated in this paper as a social activity in which the semantics of sensoriality is respecified (Garfinkel 1991) within the search for the right descriptor, the reference to pre-existing taxonomies for naming sensory qualities, and the disagreements between the participants.

The paper is based on video-recordings of tasting sessions targeting cheese, and beer, collected in Switzerland and Italy. It is based on a multimodal conversation analytic and ethnomethodological approach to sensoriality (Mondada, 2019, in press), as well as to the contributions of interactional semantics in conversation analysis (Deppermann 2005, 2011, Bilmes, 2011, 2015).

# Decentering monolingual white English in conversation transcription pedagogy

Panel contribution

***Dr. Sylvia Sierra<sup>1</sup>***

**1.** Syracuse University

Transcription of conversation is a cornerstone to EM/CA research, and many researchers train their students in this practice. In this talk, I discuss pedagogical practice around teaching students how to create their own conversational transcripts of their own conversational recordings. First, I will discuss how white monolingual English can be decentered by modeling transcription for current students with exemplary prior transcripts created by students of color, which also tend to highlight other language varieties besides white monolingual English. I show how the two primary transcripts that I currently use (one featuring Zimbabwean English and the other featuring African American English) to teach transcription to students not only model transcription, but also decenter white monolingual English, provide learning opportunities and discussions around code-switching, discourse markers, and use of minoritized English dialects. In addition, showing previous student transcripts that include code-switching or that are entirely in languages other than English (e.g. Hindi, Portuguese, and Mandarin Chinese) with English translations can be used in discussions around decentering monolingualism while also highlighting the realities of superdiversity and translanguaging practices where EM/CA might be used as a transcription tool.. Having described the use of these transcripts as exemplars, I will also draw from in-class data workshops, student presentations, and written assignments where students apply EM/CA analytical concepts to their own transcripts. I focus on cases where the analysis of languages and language varieties other than Standardized white American English enlightened students' understanding around EM/CA topics. Using these pedagogical methods in teaching transcription empowers students from minoritized language backgrounds to record and transcribe their own language varieties and translanguaging practices, while decentering monolingual white English linguistic practices in the process of transcription and analysis.

# Delving into suggestion speech acts in authoritative academic discourse-A social cognitive pragmatic perspective

Panel contribution

**Ms. Ke Li<sup>1</sup>, Prof. Wenyu Liu<sup>2</sup>**

**1.** Beijing Normal University, **2.** Dalian University of Technology

This paper aims to examine suggestion speech acts in authoritative academic discourse from a social cognitive pragmatic perspective. Suggestion, as a resource for attitudinal meaning in House and Kadar's speech act typology (House and Kadar, 2021), is an attempt made by the speaker or writer to have the hearer or reader perform actions to promote future events. Previous research on academic suggestions is mainly centered on academic interactions from a philosophical or interactional pragmatic perspective, without fully considering authoritative academic discourse and suggestion speech acts' underlying social cognitive mechanism. To fill these gaps, this paper conducts a case study of *Blue Book of Ecological Governance (China Ecological Governance development report 2019-2020)*, an important manifestation of authoritative academic discourse in China, to explore the use of suggestion speech act with the focus on illocutionary force indicating devices (IFIDs) and relevant strategies. The findings suggest that the illocutionary force indicating devices of suggesting in Chinese authoritative academic discourse tend to use modal verbs of obligation and inclination as well as no-subject clauses (无主句, *wu zhu ju*) to give suggestions. With respect to strategies, the most important dimensions with a focus on attention management in speech acts are explicitness/implicitness, directness/indirectness, conventionality/non-conventionality and perspective, which play a pivotal role in the attentional processing of the intended illocutionary force. We argue that these attentional differences imply degree of politeness. Accordingly, how suggestion speech acts relate to social action and socio-political context is further illustrated. The study may shed light upon speech act and politeness research in Chinese socio-political context.

# Depictive gestures in multimodal instruction sequences

---

Panel contribution

---

**Dr. Niina Lilja<sup>1</sup>, Dr. Arja Piirainen-Marsh<sup>2</sup>**

**1.** Tampere University, **2.** University of Jyväskylä

This paper investigates how depictive gestures, i.e. hand movements that depict actions, scenes or entities referred to in talk, are configured and used for furthering the accomplishment of action in second language interactions outside language classrooms. More specifically, it analyses how depictive gestures are produced embedded in constellations of other semiotic resources such as referential practices, pointing and objects in the environment, to accomplish *multimodal instructions* in a variety of everyday social activities and their material ecologies. Drawing on videorecordings of second language interactions in settings that center around concrete manual and physical tasks, such as gardening, cooking, and building, we focus is on instructions that project a certain type of complying bodily action as the relevant next action. In these situations, lack of understanding can disrupt the progressivity of the activity. The analysis shows that depictive gestures embedded within multimodal configurations of resources work to facilitate the recipients' understanding of the instruction and support the progressivity of the activity.

The analysis builds on previous conversation analytic research investigating how instructions are accomplished in different material ecologies, e.g. crafts education (e.g. Lindwall & Ekström 2012), dance classes (Keevallik 2010) and driving (De Stefani 2018), and aims to complement this research by showing how depictive gestures feature as part of multimodal instructions that are shaped by the organization of practical activities and their material ecologies in second language interaction. The findings contribute to the study of L2 learners' interactional competences as co-constructed and sensitive to the contingencies and material ecologies of different types of social activities (see e.g. Hall, Hellermann & Pekarek Doehler 2011, Pekarek Doehler & Berger 2015). They also shed new light on second language learning in contexts outside of language classrooms.

# Determining Cognitive Ability with the help of an Interpreter in Neuropsychological Assessments

Panel contribution

***Prof. Claudio Scarvaglieri<sup>1</sup>, Dr. Peter Muntigl<sup>1</sup>***

***1. Ghent University***

We present a pilot study on interpreter-mediated communication in mental health care settings. For this research, audio- and video-recorded neuropsychological assessments (e.g., of patients suspected of having dementia) that were conducted with the help of an interpreter are examined. The assessments occurred in Dutch and the patients' native languages included Arabic, Russian and Turkish. As research on interpreter-mediated doctor-patient communication has shown, interpreters do not simply convert words or sentences from one language to another, but take an active role in brokering interaction between the principal participants, e.g. by shifting the projected interactive trajectory or by initiating new interactive sequences themselves (Bolden 2000, 2019; Pöchhacker 2004; Raymond 2014a,b). Using methods from conversation analysis and discourse analysis, our talk addresses the following questions:

- How does interpreting influence interactional trajectories in neuropsychological assessments, for example, by changing the course of action as projected by one of the principal participants (cf. Plejert et al. 2015; Majlesi & Plejert 2018)? Which actions do interpreters add to the projected trajectory and which are left out or modified? What is achieved through these changes; i.e., is it possible to identify the interactive or epistemic purpose of these changes (cf. Raymond 2014a)?
- Because neuropsychological assessments aim at assessing cognitive functioning of another person via conversation, interpreting in real-time adds a special dimension to the interpreter's task. We examine how the institutional goal of the conversation (i.e. to assess the patient's neuropsychological functioning) influences the process of interpretation and whether interpreters use specific conversational practices to manage this interactive task.

We conclude by discussing clinical implications of this research.

# Development of pragmatic markers in L2 instruction: Learners' use of Japanese interactional particle *ne* in spontaneous conversation

Panel contribution

***Dr. Saori Hoshi***<sup>1</sup>

*1. University of British Columbia*

The present study examines L2 development of pragmatic markers by JFL learners, focusing on the use of Japanese interactional particle *ne* in spontaneous conversation with NS peers. While previous studies have documented the learner development of particle *ne* in study-abroad and classroom socialization contexts (Masuda, 2011; Ohta, 2001), research on student learning of *ne* in an explicitly instructed setting is rather scarce. The study investigates the role of L2 instruction in the learners' ability to use *ne* as a resource to participate in a range of assessment activities (Goodwin & Goodwin, 1992) during conversation.

To bridge the gap between the lack of textbook treatment and the highly frequent use of particle *ne* in Japanese conversation, the study implements concept-based pragmatics instruction (van Compernolle, 2015), incorporating awareness-raising activities of pragmatic functions of *ne* and conversation sessions with NS peers, in a third-semester Japanese class for one semester. To examine the instructional effectiveness for the development of pragmatic marker as evidenced by the learners' use of *ne*, the study focuses on the following perspectives: 1) learners' metapragmatic understanding of discourse functions and stances the particle *ne* can index; 2) learners' use of *ne* in ways that are consistent with what they were taught, and that potentially extend beyond their instructed learning in terms of form, function, and activity-relevant participation; and 3) the learners' demonstration of ability to deploy *ne* as a resource for joint stance taking and achieving intersubjectivity (Kärkkäinen, 2006; Morita, 2018) in conversations with NS peers.

Findings from the experimental group learners' performance from the pre- and post-tests provide evidence that they have demonstrated metalinguistic development of the pragmatic functions of *ne* in constructed discourse situations. Qualitative analysis of the conversation data evidences learners' changes in participation with *ne* over time: while *ne* was predominantly used in follow-up assessment turns at the onset, *ne* emerged in initial and extended assessments in order to invite the recipient's alignment (Pekarek Doehler, 2018) for joint assessment of the current talk, and topic shifts. These findings demonstrate a developmental trajectory in learners' use of *ne*; the mastery of initial-turn assessment *ne* appears to occur only after that of follow-up *ne*, as initial-turn *ne* requires the speaker's ability to judge whether what the assessable can be jointly relevant for co-participants' alignment, whereas a follow-up *ne* seems easier to produce where the assessable has already been shared at the time of the receipt.

This study underscores a critical role for explicit instruction in L2 development of pragmatic markers that are often impervious to the effects of input from and/or implicit socialization in the target speech community, and confirms that such a proposed instructional approach enables learners to actively pick up affordances to express their own *voice* (Bakhtin, 1981) to interact more meaningfully with their conversational partners. Furthermore, it offers pedagogical insights for language teachers to explore discourse-situated instruction of "grammar as an emergent system" (Bybee & Hopper, 2001), potentially promoting learners' ability to deal with new interactional contexts beyond the L2 classroom.

# Did you say “smart”? Reconstructing implicit meanings in the US 2020 presidential debate.

Panel contribution

**Ms. Misha Müller<sup>1</sup>**

**1. University of Neuchâtel**

During the first 2020 presidential debate, the following exchange occurred between the former vice-president Biden and President Trump, regarding the handling of the COVID-19 crisis in the US:

Joe Biden: “A lot of people died and a lot more are going to die unless he gets a lot smarter, a lot quicker”.

Donald Trump: Did you say smart? (Zurchner, 2020).

Donald Trump’s intervention is a typical conversational breakdown that follows the challenge of a presupposition (see also von Fintel’s (2004) *Hey wait a minutetest*). In the presentcase at hand, Trump challenges the presupposition that “he is not smart”, allegedly implied by Joe Biden. By doing so, Trump seeks to counter-attack what would be characterized as an *ad hominem* fallacy. However, despite a genuine intuition that the proposition has indeed been communicated, Biden’s assertion does not trigger such a presupposition.

This paper argues that Trump was at least sufficiently equipped to infer that there was indeed an implicit *ad hominem*. The identification of the fallacy requires the reconstruction of implicit arguments that can be revealed by cognitive pragmatics tools (as per Oswald 2016; Müller 2020). I argue that the proposition “Trump is not smart” is a weak implicature that can be drawn from Biden’s statement, using the highly accessible premise that “Biden does not believe Trump is capable of solving the COVID crisis”. From this belief, the conclusion that Trump is incapable of being “a lot” smarter serves as a euphemism for the proposition “Trump is not smart”. I conclude that the reason why the *ad hominem* seems to be presupposed is due to the fact that it is tangential to the question under discussion, which consisted in answering whether Trump was capable of handling the COVID (and not whether Trump was smart).

# Differences in topic initiation between primigravidas and secundigravidas during antenatal care consultations

Panel contribution

***Ms. Ina Voelker<sup>1</sup>***

***1. Universität Marburg***

Procedures of knowledge-negotiation and -display can be found in almost any kind of conversation, but particularly there, where epistemic asymmetries constitute the interaction (Heritage & Raymond 2005; Stivers et al. 2011; Sidnell 2012). These asymmetries are frequently described for physician-patient consultations, for which the exchange of biomedical and experienced-based knowledge poses a fundamental feature (Brünner 2005, p. 91). In antenatal-care-consultations this knowledge transfer and closely related aspects of mutual understanding seem to play a crucial role: First, pregnancy-experiences and -emotions as well as knowledge about the birth-procedure form the basis for wishes and ideas about the delivery. Second, providing and understanding of birth-relevant information is inevitable: it strengthens mutual trust between the pregnant woman and the medical professionals but also has a legal dimension. The pregnant woman can only give consent to the discussed procedure of birth if she received, understood and evaluated the information according to its relevance. My presentation sheds light on this object of investigation and focusses on practices of indexing knowledge in conversations between midwives and pregnant women. For this purpose, not only aspects of propositional knowledge ('knowing that') but also orientations of participants to procedural knowledge ('knowing how') will be analysed. I will investigate how interactions in obstetrics change among different participants, more precisely between primigravidas and secundigravidas, who have different access to procedural knowledge ('knowing how') of birth. Emphasis will be put on how topic initiation and (the processing of) questions reveal expertise or 'knowing how' of different participants.

The data is drawn from a corpus of 37 video-recordings of interactions between midwives (or other medical professionals) and pregnant women in the last trimester of pregnancy in an obstetric ward. For one thing the midwives collect personal data of the pregnant women during these conversations and on the other, the pregnant women get the possibility to express their desires or questions about the imminent delivery. Frequently, in addition to the pregnant woman and the midwife and/or the gynaecologist, a companion (the mother or the partner of the pregnant woman) is present.

Employing conversation analysis of selected extracts of these antenatal care consultations, I will argue that there are differences in topic initiation between (midwives), primigravidas and secundigravidas and that these differences can be traced back to knowledge-differences, more precisely differences in 'knowing how' of the birth process. This assumption derives from the fact that a secundigravida has already gained experienced-based knowledge about the process of giving birth. My talk will show that secundigravidas initiate topics more explicitly than primigravidas and have more concrete wishes regarding the birth-process.

The following questions will be addressed: Which topics do primigravidas initiate in contrast to secundigravidas during antenatal care consultations? How are these topics integrated into conversation and do the processes of topic initiation reveal any design-orientations to birth-process-knowledge ('knowing how')?

# Different teams, different norms: Shared practices and inclusivity

Panel contribution

***Prof. Meredith Marra<sup>1</sup>, Prof. Janet Holmes<sup>1</sup>***

***1. Victoria University of Wellington***

The experience of joining a new community as an outsider highlights the exclusionary impact of in-group norms and shared practices that have been developed over time. Even within the same industry, the same country, or with a shared cultural orientation, there are likely to be distinctive ways of making meaning that create barriers between those who belong and those who do not. If interconnectedness works to counter divisiveness, then understanding how we bridge different communities is an important step in the quest to establish connections and, by extension, inclusion.

To explore these transitions, we operationalise the unit of the team, and interrogate the pragmatics of belonging. As we move across boundaries, we acquire familiarity with the ongoing (re)construction of values, beliefs, and attitudes that are encoded in our verbal repertoire. Indexing these norms in our claims to membership underpins our inclusion or exclusion in the (workplace) team. Adopting a social realist position that recognises the interplay of contextual constraints and agency, we make use of a contrastive pragmatics approach to compare the ‘culture’ of different teams. Focussing on the layering of multiple shared norms, we examine how individuals negotiate these parameters. Is conformity compulsory? How far can one go in challenging established ingroup norms?

Using data from a range of blue-collar and white-collar workplaces in New Zealand, we explore instances of engagement with outgroup members. Negotiating belonging is never a straightforward process. Throwing light on the complexity involved, we see how a participant who ostensibly ‘belongs’ to a national culture can be othered by their colleagues while another can be included despite disparate cultural backgrounds. We conclude by arguing that analysts need to pay careful attention to a team’s shared practices. To this end, the case is made for investigating cross-cultural pragmatics at the more abstract level of norms.

# Differential manifestations of the impact of *ba*-based cognition on grammar: Case studies from Japanese and Korean

Panel contribution

**Prof. Kaoru Horie<sup>1</sup>**

1. Nagoya University

It has been abundantly demonstrated that *ba*-based cognition (see Hanks et al. 2019) helps shape the manner of communicative interaction in many languages including Japanese (Fujii 2018). This paper presents cross-linguistic evidence in favor of the hypotheses that (i) *ba*-based cognition even helps shape grammatical structure, and that (ii) the impact of *ba*-based cognition on grammatical structure differs considerably between languages.

Both Japanese and Korean are known to possess complex grammaticalized honorific systems (e.g. subject honorification verbal affixes) that directly reflect the normative and societal behavior of an individual relative to multiple *bas* where he is embedded. However, on closer scrutiny, Japanese and Korean honorific systems differ in terms of the degree to which they are sensitized to the immediate, contingent *ba* in which conversational interaction is undertaken, as shown in (1a) Japanese and (1b) Korean:

(1a) Visitor: Yamda butyoo-wa ima **irassyai** masu ka?

department head-TOP now be:HON POLITE Q

'Is department head Yamada in? (subject honorific form)'

Receptionist: **Yamada**-wa ima seki-o hazusite **ori** masu.

TOP now seat-ACC vacate be:HUMBLE POLITE

'Yamada is currently out of his office.' (subject humbling form)

(1b) Visitor: Kim-pwucang-nim-un cikum **kyeysi** pnikka?

department head-TOP now be:HON POLITE:Q

'Is

department head Kim in? (subject honorific form)'

Receptionist: **Pwuchang-nim**-un cikum cali-ye an **kyeysi** pnita.

department head-TOP now seat-in NEG be-HON POLITE

'The department head is currently out of his office.' (subject honorific form)

Concretely, in Japanese, the immediate, contingent *ba* (the immediate context of speech) overrides the more normative, societal *ba* (the hierarchical structure of social standing between individuals). This leads to the apparently asymmetrical use of honorification toward the department head (butyoo) between the visitor (who uses subject honorification *irassyai* 'to be') and the receptionist (who uses subject humbling form *ori* 'to be' and uses 'bare name' (Yamada) to address him).

In sharp contrast, in Korean, the immediate, contingent *ba* does not override the more normative, societal *ba*, resulting in the symmetrical use of honorification toward the department head (pwuchang) between the visitor (whose uses subject honorification *kyeysi*) and the receptionist (who also uses subject honorification and continues to use the job title (pwuchang) to address him).

This paper will further suggest that the grammatical contrast between honorification systems in Japanese and Korean, arguably reflecting differential manifestations of the impact of *ba*-based cognition on grammar, is not accidental, as evidenced by other grammatical phenomena such as noun-modifying constructions and demonstratives.

# Digital media as identity spaces – Aspects of linguistic inclusion and exclusion in German and Italian social media

Panel contribution

***Dr. Carolina Flinz<sup>1</sup>, Dr. Ruth M. Mell<sup>2</sup>***

***1. Università degli Studi di Milano, 2. Technische Universität Darmstadt / Universidade Estadual de Campinas***

Linguistic and discursive practices of inclusion and exclusion determine current social and political discourses by allowing or denying membership and participation in speaker groups (Pappert/Mell 2018; Flinz 2019). These practices can also be traced in social media, insofar as these can be understood as media identity spaces. Three are the main features of medial identity spaces (*Identitätsräume*) (Klaus/Drüeke 2010: 116):

1. Media construct geopolitical spaces;
2. Media contents are semiotic spaces, these confer or deny the assignment of meanings;
3. In the reception/appropriation of media content, intermediate spaces arise.

We want to apply this concept, which Klaus/Drüeke applies primarily to images, to social media spaces by showing the extent to which linguistic discourse practices of inclusion and exclusion open or close different identity spaces. The creation of identities goes in fact hand in hand with the definition of external and internal borders, with the inclusion of the ‘own’ and the exclusion of the ‘other’ and ‘foreign’ (Klaus/Drüeke 2010: 113).

We want to illustrate and analyze this focusing the current debates on fake news – for example in the context of the so-called corona deniers (*Corona-Leugner / negazionisti Covid*) - in German and Italy. Using the approach of a corpusbased interlingual discourse analysis (vgl. Bubenhofer/Rossi 2019) we will analyze comments in social media (among others Twitter and You Tube) around the theme, concentrating on the lexical level.

# Digital Tools in Physiotherapy Consultation: Treating Patients – Treating Tool Problems

Panel contribution

**Mrs. Anja Schmid<sup>1</sup>, Dr. Sara Keel<sup>1</sup>, Mrs. Fabienne Keller<sup>1</sup>, Prof. Veronika Schoeb<sup>1</sup>**

**1.** Haute Ecole de Santé Vaud (HESAV)

The healthcare sector has seen a growing interest in and demand for e-health solutions. Nowadays, digital technologies have become a part of healthcare professionals' practices and their interaction with patients (Ross et al. 2016).

This contribution is part of a larger project that investigates the use of a mobile application (hereafter app) in ambulatory physiotherapy. The app enables the creation and assignment of home exercise programs, the monitoring of patients' progress, remote coaching, and the distribution of educational material. Whereas patients use it on their personal mobile device (smartphone, tablet), physiotherapists operate it via an interface on a professional PC or tablet. First, we conducted ethnographic fieldwork in two physiotherapy clinics in German-speaking Switzerland in order to identify facilitators and barriers to the adoption of the app. For instance, therapists reported a reluctance to use the app because their work might be impeded by problems related to its design or to the technical infrastructure. Second, we filmed naturally occurring face-to-face physiotherapy consultations in which the app was integrated. The aim was to examine the impact of the utilisation of the app on the interaction between patient and therapist.

Adopting Conversation Analysis, this contribution is based on video-recordings and the multimodal transcription (Mondada 2018) of both the interaction in the consultation room and the physiotherapist's screen activities. In our data, problems with the interface of the app on the therapist's screen regularly occur. For example, physiotherapists might have difficulties finding the exercise they are looking for, modifications to the patient's home program are not accepted by the app, or the internet connection breaks down. Our study examines in detail how such problems are first noticed by the physiotherapist, then shared with the patient and finally solved in interaction.

Problems with the interface of the app require the physiotherapist to adopt a device-focussed posture. Generally, interlocutors orient to the focalisation of only one participant on a digital tool in face-to-face encounters as a dispreferred action (Oloff 2019). In healthcare, the disruptive character of e-health technologies to interaction has been recognized (Ross et al. 2016). Yet by exploring the embodied resources participants deploy in order to deal with tool-related problems, our paper shows that patients actively engage in problem solving. The display of trouble by the physiotherapists becomes an opportunity for patient participation (Keel & Schoeb 2017).

# Digital Tools in Physiotherapy: The Interactive Organization of a Quadrangular Configuration Involving Physiotherapists, Patients And Their Respective Devices

Panel contribution

***Mrs. Fabienne Keller<sup>1</sup>, Dr. Sara Keel<sup>1</sup>, Mrs. Anja Schmid<sup>1</sup>, Prof. Veronika Schoeb<sup>1</sup>***

*<sup>1</sup>. Haute Ecole de Santé Vaud (HESAV)*

Digital tools bring new opportunities and potentials into the field of healthcare and thus also to physiotherapists' practices, like improving therapy interventions, increasing patients' self-management or bringing better access to supervision for patients (cf Hinman et al, 2018). Yet, their introduction is challenging, and their use profoundly alters the organization of physiotherapy consultation and interaction between physiotherapists and patients (cf Blixt et al, 2019).

This contribution is part of a larger study on the use of digital technology within ambulatory physiotherapy. It is undertaken in partnership with Medbase, which owns over 50 medical and physiotherapy outpatient clinics in Switzerland. Physiotherapists are provided with the mobile health-application Physitrack™ (hereafter app), that allows creating and distributing home exercise programs, monitoring patients' progress and offering chat/video remote coaching as well as education material.

The paper focuses on physiotherapy consultations, in which physiotherapists introduce the app for the first time to their patients. It adopts multimodal conversation analysis to examine how the physiotherapist instructs the patient, e.g. to download the app on his or her smartphone, to open the app, to enter the activation code or to set the basic settings of the app, and how the latter complies with the therapist's instruction in turn. The analysis is based on synchronized video recordings of both physiotherapist-patient interaction and physiotherapists' computer screen activity, and their detailed transcription (Mondada, 2018).

In contrast to situations in which the activity at hand involves participants' orientation to a single device (Nielsen 2016), examining these introduction moments reveals participants' embodied orientation to and constitution of a quadrangular configuration: The physiotherapist's instructions involve her or his manipulation of the professional app-interface on the computer. At the same time, the latter closely monitors the patient, who realises the instructed activity via the patient app-interface on his or her smartphone. We will show how participants' embodied accomplishment of introductory instruction sequences are parsed in a way (Raunionau et al, 2016) that simultaneously reflects the technological affordances of the participants' respective interfaces and time constraints of physiotherapy consultation.

# Digitalizing the visible world: Scanning the environment using a mobile with an AI app

Panel contribution

**Mrs. Ann Merrit Rikke Nielsen<sup>1</sup>, Ms. Louise Lüchow<sup>1</sup>, Dr. Brian Due<sup>1</sup>**

***1. University of Copenhagen***

Knowledge of objects in spatial environments is obtained through multisensorial resources, such as sight, hearing, touch and smell (Mondada, 2019). For most people the visual sense takes priority in the perception of objects' spatial relation to the sensing body and the social world (e.g. Goodwin & Goodwin, 1996). Visually impaired people (VIP), however, have no or very limited access to the visual aspects of these spatial relations, when orienting towards their immediate surroundings. The emergence of computer vision and natural language processing (NLP) in accessible mainstream technology, such as smartphones, enables the device to "translate" the visual world into language descriptions.

We explore in this paper the use of the app Microsoft SeeingAI which enables VIP to receive computerized descriptions of "visual" information about objects, people and places by scanning the environment - like using a flashlight to receive information about objects in the dark. Based on a video ethnographic collection of VIP scanning the shelves when grocery shopping, we investigate how this 'digitalizing' of an everyday practice is done in situ. Through ethnomethodological multimodal conversation analysis (Streeck et al., 2011) we investigate environment scanning as a specific aspect of distributed perception (Due, 2021a), that is focusing on the co-operative actions between sense-able agents. As VIP rely on other multisensorial resources than sight alone, the question is how the practice of scanning is achieved in situ. Our analysis shows, that the practice of scanning inanimate distant objects require complex coordination of the device used to scan in relation to the object(s) being scanned with regards to both distance, angle of the device, and the location of the relevant feature of the object. This paper focuses on three particular phenomena: i) scanning nearby surroundings for the location and identification of objects, ii) scanning specific objects to obtain information about the object, and iii) scanning text on the object. This paper contributes to research into blind and visually impaired people, the senses and perception in interaction, shopping activities (Due, 2017) and interactions with non-human robotic agents (cf. Due, 2021b).

# Directives in pursuit of rules and norms in German and Polish informal interaction

Panel contribution

***Ms. Jowita Rogowska<sup>1</sup>, Dr. Matylda Weidner<sup>2</sup>***

***1. Leibniz-Institute for the German Language, 2. University of Bydgoszcz***

The presented project examines moments in informal interaction in two languages, German and Polish, in which speakers direct another to make their conduct conform to a rule or norm. The focus lies on linguistic structures that are recurring or different across the two languages. Using the methods of Conversation Analysis (CA) and multimodal interaction analysis (Deppermann 2018: 51-86), I examine video recordings of Polish and German interactions in three comparable natural settings: longer car rides, family breakfasts and board games. For illustration, consider the following short extract. The participants are playing a popular board game. At line 6, Antek directs Julek to adhere to a game rule. The conjunction *ale*(but) highlights the contrast between the expected action and the attempted rule violation. In line 9 Antek repeats and explicates the mentioned rule. Hubert and Kasia legitimise the directive by pointing out the relevant rule (lines 10-11).

PECII\_PL\_Game3\_20150919\_1\_cam1\_ale cztery owieczki

04 Julek [wymieniam]=

I'm exchanging

05 =<na:: kamienia::,>

06 Antek ale czt^e:ry owieczki.

but four sheep.

07 Julek (arm movement, hesitation)

08 Henio no:::, no ta:k. no cztery musisz °mieć°.

PART PART yes PART four must.2SG have.INF

no:::, no yes. no (you) must have four.

09 Antek czt^ery owieczki musisz da:ć.

four sheep.PL must.2SG give.INF

four sheep you must give.

((Julek inspects his cards))

10 Henio bo nie jesteś w porcie:=

cause you're not in the harbor.

11 Krysia =w banku:.

in the bank.

The questions pursued in this project are how (by which linguistic and multimodal means) ‘adherence to rules’ is organized in interaction (Stevanovic/ Peräkylä 2012: 297-321), how rules are mobilized to justify directives, and how these processes run off with diverse linguistic resources.

# Disaffiliation practices in replies to prejudiced and racial talk

Panel contribution

***Dr. Maria Eleonora Sciubba<sup>1</sup>***

**1.** Tilburg University

Racist talk is generally a dispreferred activity (in the sense of Pomerantz, 1984), however, when overt or tacit racist talk is emergent from interaction, participants are faced with the dilemma of how to treat the previous spate of (possibly) racist talk (Robles, 2015).

In this paper, I will analyze embodied and sequential resources interactants use to disaffiliate and treat previous prejudiced and racist “trouble talk”. I will show and discuss how prejudice and racial categorizations arise and are oriented to as problematic by either the recipient and/or the speaker.

Membership Categorization Analysis (MCA, Stokoe, 2012) is employed in this analysis to understand whether, and what kind of, racial categories and category bound activities are being used and emerge in the data presented.

I will draw from video recorded data from three different interactions in Italian, that occurred in different parts of Italy, and in different years (2008, 2019, 2020), and belonging to different interactional settings: a news interview (2019), a tv show interview (2020) and a consultation between a lawyer and three Senegalese clients (2008).

Three interactional strategies are employed by either the speaker and/or the recipient to address (and in some cases disaffiliate from) previous racial trouble talk:

- disaffiliation through laughter: this is employed by the host of the tv show, where the actions laughter performs change during the unfolding of this excerpt, for several turns at talk;
- other-initiated repair, coupled with laughter, later on followed by self-initiated repair and the use of external reasons for discrimination to make their talk “reasonable” (Billig 1988);
- neglect by the recipient of the “sensitive” racial topic, who selects to reply to the non-racial topic addressed in the previous extended turn.

# Disagreement in public: convincing third parties through implicit strategies

Panel contribution

***Prof. Edoardo Lombardi Vallauri<sup>1</sup>***

**1.** Roma Tre University

Disagreement can happen in private or in public. When in public, typically the aim of each speaker is not to overcome the disagreement by convincing the interlocutor, but to convince the public that the speaker her/himself is right and the opponent is wrong. For this reason, persuasive and manipulative strategies are rather targeted to the public.

The proposed talk will examine a number of television debates involving Italian politicians, where decisive disagreement positions include both divergence on specifical matters and denigration of the opponent her/himself. In both cases, it will be pointed out that a consistently adopted strategy is to convey one's point through linguistic constructions where either some questionable content (through implicatures and vague expressions) or the responsibility of the speaker for that content (presuppositions and topicalizations) is encoded in an implicit way. These strategies cause easier acceptance of doubtful arguments, due to egocentric bias (Mercier 2009, Reboul 2011), reduced epistemic vigilance (Sperber et al. 2010), distraction from cognitive flaws (Maillat & Oswald 2009), and more generally shallow processing (Sanford 2002) of what is presented as needing lesser attention (Lombardi Vallauri 2016, 2019).

In particular for face-threatening disagreement (typically, offensive contents), it will be shown that television debates parallel the patterns proposed by Brocca et al. (2016, in press) for posts by politicians in social networks, with the same distribution of implicit stategies across pragmatic functions.

To give just an example, in a debate with Mr. Renzi (*Porta a Porta*, 15.10.2019: <https://www.youtube.com/watch?v=FXtcIk0d3GQ>), Mr Salvini said the following (translated here):

(1) Spain votes in November, Poland has already voted, Austria just voted, Great Britain is going to vote: the civil world votes!

Here the disagreeing argument expressed by implicature is that Renzi's party, opposing early elections, does not belong to the civil world.

# Disagreement on Macedonian and Croatian Internet Forums

Panel contribution

**Prof. Liljana Mitkovska<sup>1</sup>, Prof. Ljiljana Saric<sup>2</sup>, Ms. Fevzudina Saračević<sup>1</sup>**

***1. American University of Europe - FON, Skopje, 2. University of Oslo***

We examine disagreement in discussions on South Slavic internet forums. The data come from posts to forum.kajgana.mk and forum.hr during spring 2020, when the forums saw significantly increased interest in topics related to the Covid-19 crisis, including conspiracy theories (CTs). Interactional sequences on such topics were extracted for analysis of the disagreement moves, paying attention to their distribution, structure, and communicative effects. This study is situated in the context of current pragmatic research on computer-mediated communication (CMC) based on the discursive approach to politeness (Locher and Graham 2010). We draw on findings by Baym (1996), Angouri and Tseliga (2010), Shum and Lee (2013), and Bolander and Locher (2017), among others, examining issues of (im)politeness and disagreement in online communication.

The forums examined allow participants to signal responsiveness via quotation, which marks what message, or part of a message, the participants (dis)agree with. The forums are moderated and direct impoliteness is discouraged, but conflicts do occur. As has been noted (e.g., Shum and Lee 2013: 55), disagreement is not always dispreferred on internet forums, and, especially in discussions about controversial issues like the one in our data, it is both likely and expected to happen.

This presentation examines how disagreement on CTs is constructed in the online communities studied, and how the participants (or “forumers”) create their online identity through disagreement, showing adherence to a particular sub-group (i.e., supporters or opponents of CTs). We focus on (im)politeness and how the contributors negotiate face in CMC, getting their opposing views across. The strategies range from regular disagreement (expressed both explicitly and implicitly) to criticism, challenges, and even confrontation. We examine the role of some frequently occurring features such as mitigation, specific lexical choices, spelling, and multimodal means; some specific phenomena include questions, informal and potentially impolite language use, forms of direct address, humor, irony, and sarcasm.

# Disclaimers: alternative perceptions of ‘meaning’ in interaction

Panel contribution

***Prof. Paul Drew<sup>1</sup>***

*1. University of York*

There are moments when people are talking with one another when a speaker ‘disclaims’ the ‘meaning’ that the other might have attributed to a remark. For instance, in this excerpt Edna and Margy are considering where Edna might take Margy out for lunch; their dissension just before this about whether or not they’ll ‘go Dutch’ surfaces again here.

[NB:VII]

1 Edn: AN IT'S chea:p,hu

2 Mar: Yehh[hahh]

3 Edn: [hihh]#h::::(h)I'm O::n ah:.ehhh=

4 Edn: =I'M ON [RETI[:RE[MENT.] .hhh

5 Mar: [.hhh[Hey[w'l y]:yer not takin' us Edna=

6 Mar: =b't I[: thin[k'd be f u n [tih go:]

7 Edn: [.hhhhh[O H : DON'T [be s::uh]hh=

8 Edn: =u-I[: did] 'n mean that ruh-ah:=

9 Mar: [N\_o- ]

10 Edn: =I:hh didn't m:mean [that [et]

When Margy replies in line 5 that Edna is ‘not taking us’ (i.e. not paying for lunch), Edna’s disclaimers in lines 8 and 10 that ‘I didn’t mean that’ seem to target a possible and unwanted implication of her references to ‘it’s cheap’ (line 1) and the fact that she is ‘on retirement’ (i.e. a pension) (lines 3/4). In her disclaimers, Edna appears to recognise and acknowledge – and to disclaim – the possible ‘meaning’ of these references to the affordability of the restaurant and her financial circumstances. She is responding to a possible attribution of ‘meaning’ by Margy to these references to ‘cheap’ and ‘on retirement’, exhibited in Margy having ‘declined’ to be treated (line 5).

In this next example Maude’s disclaimer in line 10 is not prompted by any mis-interpretation by her recipient, Bea, but rather by her own (unprompted) recognition and acknowledgement that she (Maude) might be understood as being critical of their mutual friend, Alice.

[SBL:2:1:7]

1 Mau: ↑You know something? è-li:ke (·) you take (0.2) Doris. I think

2 she has a w:onderful sense of humor.

3 Bea: Uh huh.

4 (0.8)

5 Mau: ·t 'n I mea:n ü- uh and (·) uh:: my sense of humor, and I think

6 ↑your sense of humor (·) and her sense of humor kind of ↑click

7 like this but you take Alice:. She doesn't have the same sense

8 of humor at ↑a:ll. ( ): ·t:huhh

9 (0.2)

10 Mau: chh huh huh (h)I don't mean that critically uh I mean [:hh sh-]

Bea had not responded to Maude’s comment about Alice not ‘hav(ing) the same sense of humour’ (lines 7/8), when Maude continues by disclaiming that she ‘means’ to be critical of Alice (line 10).

Such cases as these might be considered simply as cases of repair, ‘I don’t mean’ being formats for self-correction. But they stand out as instances in which speakers recognise and orient to the possible (mis)understandings of words, phrases or expressions they have used, and disclaim those (possible) meanings. In their disclaimers, speakers orient to how what they have said is susceptible to being (mis)understood, and ‘clarify’ what they really meant.

My presentation will consider the construction and special character of such disclaimers in ordinary conversation.

# Discourse analysis of “otherness” and “reality” in French online anti-migrant comments

Panel contribution

***Dr. Nadia Makouar<sup>1</sup>, Dr. Laura Ascone<sup>2</sup>***

***1. Aston University, 2. Cergy Paris Université***

The migration crisis that Europe has been facing for years has led researchers in human sciences to investigate this phenomenon (see Hart, 2010).

This study aims at investigating a specific discourse on migration, that is hate speech against migrants on both *Yahoo News* and *YouTube* in French. The reason is twofold: on the one hand, online platforms would favor the emergence and the spread of hate speech (Monnier and Seoane, 2019); on the other hand, contrary to social networks like Twitter, both *YouTube* and the media comment sections under investigation do not impose any restriction on the comments' length, which may allow users to post structured and developed comments.

Furthermore, cyberspace has placed the user at the heart of the informational process: the ordinary citizens would not be content to apply the interpretative frameworks conveyed by experts. They would rather use their own experiences and critical competences to negotiate the meaning of both political and social issues (Jackiewicz, 2016: 22). As a consequence, this analysis aims at investigating the way anti-migrant users both create and legitimise their own polarised reality by cross-referencing the dominant discourse, whether media or political (Angenot, 1989), and their personal experience.

The goal of this study is to examine the hate speech against migrants independently from any specific event. Therefore, the corpus comprises the comments from *YouTube* and articles retrieved from *Yahoo News* between October 28, 2019 and November 3, 2019. More precisely, we collected only the comments that were published in reaction to the articles and videos whose titles present the word “immigration” that we consider as a neutral-valence term.

Thus, the hypothesis that hate speech would emerge even in a non-polarised environment was advanced. A qualitative discursive analysis was conducted on the comments where the user establishes an antagonistic relationship with the other (*i.e.* the migrant), considered and presented as a public enemy.

In a first part, we will examine, from a discursive perspective, the notion of otherness (Staszak, 2008) and, therefore, the way the anti-migrant users both denounce the dominant discourse and distances themselves from the migrant. We will then analyse how these users unveil their reality, namely by denouncing the real consequences of immigration. To conclude, we will investigate the way anti-migrant users face the immigration threat by basing their discourse on arguments of authority as well as emphasizing their personal experiences.

## Discourse and the politics of covid in African contexts

---

Panel contribution

---

***Dr. Lilian Atanga<sup>1</sup>***

**1.** *University of Free State, Bloemfontein*

In 2020, the discourse of social distancing became a key prevailing discourse (Qiu 2020), articulated and applied without regard to context and actors. This discourse claimed to be vital in mitigating the spread of the novel coronavirus, also hinges on political discourse. The discourse of compliance to health norms WHO, CDC is also a key discourse, largely politically motivated with perceptions of risk along the lines of political ideologies (Barrios and Hochberg 2020). The production and consumption of such discourses within African contexts limits itself to production by political actors but the absence of consumption by social actors. The dissonance in production and consumption of COVID-19 related discourse is not only in the production of unadapted discourses according to the context of consumption, but a rejection of political discourse on COVID and a counter production of social discourses on COVID reflecting a local COVID reality not hitherto reflected in both the WHO/CDC health and political discourses.

In using a critical discursive approach to data analysis, we examine local and political discourses on COVID-19 within local and political contexts in Africa. We seek to establish why the dissonance in discourse and arguments and justifications for dissonance in the discourse between the politicians and the society.

# Discourse particle WAY ‘why’ as a delaying device in Korean conversation: Parenthetical confirmation of intersubjectivity as prioritized turn-organizational practice

Panel contribution

**Dr. Hyun-Jung Kwon<sup>1</sup>, Dr. Kyu-hyun Kim<sup>2</sup>**

**1.** University of Tsukuba, **2.** Kyung Hee University

From the perspective of conversation analysis, this paper analyzes the interactional functions of the discourse particle WAY ‘why’ in Korean conversation. The sense of WAY ‘why’ as an account-soliciting question word survives in its use as a discourse particle, deployed as a resource for prompting the recipient to retrieve shared (but latent) knowledge. This task is often facilitated by the use of other particles that frequently co-occur with WAY, such as pseudo-tags *ci* (‘committal’) or *canha* (‘committal + NEG’) ‘isn’t it?’, whose use presupposes the recipient’s epistemic access, *mwe* ‘what’, which, as a downgrader, indexes the ‘nothing-special-hence-easily-accessible’ character of the shared domain at hand, or *ku(len)* ‘(like) that’, indexically pointing to the relevance of the recipient-tilted epistemic domain (line 05 in Extract (1)).

The WAY-initiated sequence organizes the turn’s action/activity as a narrative type of telling that draws upon the participants’ shared experience and knowledge, which implicates the recipient as a potential co-teller. It thus furnishes the WAY-speaker with a basis for granularizing the description of a reported event on consensual grounds, to the effect that they can preempt, or reduce the likelihood of, the occurrence of any ‘disaffiliative’ uptake (e.g., repair initiation), or manage their mitigated dispreferred response. In Extract (1), for instance, the WAY-speaker (S), preemptively rejects T’s offer in the offing (line 03). Her rejection is qualified by her WAY-marked accounting, prompting T to confirm their shared experience (lines 05-06):

(1) [T&S Call] (English translation)

((In the preceding context, T offered to meet S at the local airport limousine bus stop.))

03 T: “There, (0.6) is {the departure time at the airport} four? (0.2) The {airport} bus?”

04 (0.4)

05 S: *yey. kunikka ku-ttay: ku mwe-ci? way cey-ka ku-ttay:*,

“Yes. I mean, at that time; that, what is it? ((=self-directed)) **why**, I, at that time:,” <-

06 “when I arrived at night, do you remember?=At around seven I arrived, and then”

07 “we went straight to a restaurant to grab something to eat {because it was late}.”

08T: “uh::uhuh.=Oh right right:[:]”

09 S: [“Yes. Probably I’ll be arriving like that at the same hour.”]

((4 lines omitted))

14 S: “.hh So don’t bother. You just stay at home.”

15 T: [hhhhh]

The recipient, on their part, orients to reciprocating the WAY-speaker’s displayed trust by signaling a successful grasp of the confirmable through repeated confirmation (line 08) or ‘demonstration’ of their shared understanding.

Digression into a within-turn-sequence parenthetically initiated by WAY has the (ostensibly paradoxical) interactional consequence of assuring the smooth turn-by-turn sequential progression. It contributes to organizing

the host sequence in a ‘preferred’ way, with its ‘preferred (or less dispreferred)’ structure being achieved at the expense of a briefer turn shape.

The crucial interactional import of the delaying practice involving WAY is revealed in cases where the participants fail to achieve a state of intersubjectivity. Failure to secure the recipient’s confirmation transforms the nature of the interaction from a camaraderie-based interaction invoking intimacy to a stale information-inculcating instructional activity, in which asymmetry in knowledge is foregrounded.

# Discourse traditionality and communicative distance: Paratactic lexical groups in the Romance Middle Ages

Panel contribution

***Prof. Santiago Del Rey Quesada<sup>1</sup>***

*1. Universidad de Sevilla*

This paper aims to describe discourse traditionality (cf. Koch 1987, Winter et al. 2015, Octavio de Toledo 2018) of paratactic lexical groups (hereafter abbreviated as PG, see Del Rey 2017 for a formal characterization) in Medieval and Early Renaissance Romance translations from Latin source texts. PGs have received the attention of many Romanists since the 19th century and have generally been considered a stylistic strategy linked to the epic rhetoric and the prose of Cicero. The corpus of this research is constituted by three French, three Italian and three Spanish translations and by two Portuguese translations together with the corresponding Latin source text for each of them. The purpose of this study is to quantify the repetition of specific PGs in this corpus and to discover traces of linguistic traditionality offered by the electronic corpora containing literary language musters in the Middle Ages. We will observe whether groups that already existed in Latin and that are perpetuated in the Romance languages appear, as well as whether, on the one hand, Latin PGs are found which have not had inheritance in Romance languages and, on the other, whether PGs in Romance languages come out even when they do not exhibit a clear link to Latin models. In this sense, correspondences between the source text and the target text will be paid attention in order to determine convergence and divergence phenomena (see Del Rey 2018) motivating the creation of PGs in the Romance languages and conditioning the effects of traditionality. Finally, we will reflect on the variational status of PGs and we will argue that these structures are the consequence of linguistic elaboration processes which contribute to the shaping of the field of communicative distance (cf. Del Rey 2020) in Romance languages, sometimes even leading to proper changes from above.

# Discourses of discrimination against sex workers: An analysis of comments on YouTube

Panel contribution

***Mr. Christos Sagredos<sup>1</sup>, Ms. Evelin Nikolova<sup>2</sup>***

*1. King's College, 2. Lancaster University*

Discrimination, stigmatisation, social exclusion and hate crimes are among the many problems faced by sex workers across the globe. Sex work is often placed at the centre of societal and academic debates, with the contrasting and conflicting discourses on sex work largely informing legislation. Some feminist discourses, for example, conceptualise sex work as a form of violence against women and argue for its global abolition while other, less conservative and heteronormative discourses associate it with the emancipation of women's sexual expression. At the same time, discourse analytical studies on the representation of sex work stress the prevalence of negative bias and stereotypical representations, which can be condensed in four key themes: (a) feminisation; i.e. the assumption that sex workers are women only and clients only men; (b) victimisation; i.e. the representation of sex workers as victims; (c) problematisation; i.e. the construction of sex work as a problem and (d) foreignisation, i.e. highlighting sex workers' different descent (Sagredos, 2019).

In light of the above, in this paper, we analyse a small corpus of 393 comments on YouTube (namely the five most 'liked' and responded to comment-threads posted in response to the BBC Channel Three video "Things Not To Say To a Sex Worker"), seeking to explore how commenters use language to discursively construct sex workers as the Other. Our preliminary findings suggest that commenters on YouTube draw on various discourses (e.g. religious discourses, patriarchal discourses) in the discursive process of othering sex workers by explicitly including them in particular social categories (e.g., on the basis of gender: 'sex worker as woman') while excluding them from others (e.g. on the basis of gender, religion or parenthood: sex worker as 'not male', 'not a good Christian' and 'not a good mother', respectively).

# Discourses of inclusion and exclusion: How do evaluations of language use construct multicultural speakers' linguistic identities?

Panel contribution

***Dr. Kaarina Hippi<sup>1</sup>, Dr. Liisa-Maria Lehto<sup>1</sup>***

*<sup>1</sup>. University of Oulu*

This study examines identity negotiations as multicultural interviewees describe how their interlocutors evaluate their language use. Identities are seen as social constructs that are negotiated in interaction (Blackledge & Pavlenko 2001). A discursive approach to identity will be applied, as, for instance, sameness and difference are constructed and emerge in intersubjective relations (Bucholtz & Hall 2005). In addition, attention will be paid to analyzing subject position, reflecting linguistic life trajectories (Busch 2017). Data is examined from a total of 20 single and pair interviews with people of different linguistic and ethnic backgrounds residing in Finland. The interviews were held in Finnish and English, and the interviewees were asked about their experiences with interacting in Finnish society. Discourse analytical tools (Fairclough 1989) relying on qualitative content analysis of the interview data will be used.

The interviewees describe occasions in which their interlocutors evaluated their language use explicitly (e.g. "you speak Finnish really well") or implicitly (e.g. by switching to English after the interviewee's attempt to speak Finnish). When interviewed, the interviewees analyze and attempt to understand the interlocutors' behaviors on past occasions. Thus, when reflecting on the categorizations and evaluations, they construct their linguistic identity. Interviewees found that interlocutors' linguistic evaluations may be triggered by their accent, "foreign" appearance or name. Equal linguistic resources appear to require an explanation from the interviewees, and judging an interviewee's skills as good shows an exclusion from the group of "original" Finnish speakers.

Some evaluations, however, were interpreted as positive and inclusive by the interviewees. One interviewee reported a Finn evaluating his language in the past negatively but with an assumption that he was from another part of the country, which delighted him. Another interviewee took a positive stance toward people correcting her language, as she assumed it would help her acquire a "correct" and acceptable style and gain full membership into the target language culture.

The interviewees' attitudes toward linguistic evaluations varied according to their linguistic position: if an interviewee identified her/himself as a language learner, s/he appreciated language negotiations and took certain comments as justified. When linguistic evaluations were based on an extra-linguistic hint of origin (ethnicity, name), some interviewees reacted to such an exclusion with frustration, some with surprise, but also with humour or even a sense of self-evidence.

# Discursive contestation in mental health rehabilitation: How Clubhouse support workers socialize clients into new discourses of work

Panel contribution

***Dr. Melisa Stevanovic<sup>1</sup>, Dr. Miira Niska<sup>2</sup>, Mr. Henri Nevalainen<sup>2</sup>, Dr. Elina Weiste<sup>3</sup>, Prof. Camilla Lindholm<sup>1</sup>, Ms. Taina Valkeapää<sup>2</sup>***

*<sup>1</sup>. Tampere University, <sup>2</sup>. University of Helsinki, <sup>3</sup>. Finnish Institute of Occupational Health*

Discourses of work continue to construct problematic social realities for individuals with mental illness. The neoliberal ideologies highlight the centrality of work to society, citizenship, well-being, success, and prosperity, while work is also discussed as a means of achieving good outcomes for individuals with mental illness. Yet, work—defined as “paid employment”—is factually out of reach for many individuals with mental illness. The Clubhouse model is an intervention program that offers people with mental illness the possibility to enjoy some social advantages of work. Membership in a Clubhouse community is open to all, while the day-to-day operation of the community involves the clients and support workers working side-by-side as colleagues to run it. The model emphasizes that every client has individual strengths to recover from the effects of their mental illness and to lead a meaningful and satisfying life. Work and work-related social relationships are seen to be a critical part of this process. However, the status of Clubhouse activities as “work” is a matter of discursive contestation—one on which our study focuses on.

In this study, we ask: (1) how the relationship between Clubhouse activities and “work” is constructed in the talk of the clients and support workers at the Clubhouse and (2) how the support workers promote the unpaid Clubhouse activities as a viable option for the clients. Drawing on 29 weekly meetings of a mental rehabilitation group as data, and conversation analysis and discourse analysis as methods, we examine how the clients and support workers compete in shaping the social realities associated with work and mental illness. We focus specifically on describing the interpretive repertoire by which the support workers challenge and give an alternative for the discourses that initially shape the clients’ understandings of themselves as potential future employees.

Two competing interpretive repertoires are systematically manifested in our data: (1) the capitalist “paid work” repertoire and (2) the more flexible “general activism” repertoire. Orientations to these two repertoires are most evident in two contexts. The first context involves the clients invoking a binary distinction between employment and non-employment, while the support workers present employment as a step-by-step process, which can be supported by the Clubhouse. The second context involves discussion about the nature of the skills that the clients can learn by engaging in the Clubhouse activities, the support workers casting what the clients refer to as basic skills of all healthy humans (e.g., tolerating the physical presence of others) as trainable “working life skills”.

The discursive contestation at the Clubhouse is thus about defining the scope of mental health rehabilitation and the ideal role of the client as an agent in his or her own rehabilitation process. From this perspective, the support workers’ central institutional task in this particular health care context is essentially of discursive and ideological nature—socializing the clients into new ways of talking about their lives with reference to work.

# Discursive cyberviolence and feminist resignification on the web 2.0

---

Panel contribution

---

**Dr. Julia Costa**<sup>1</sup>

**1.** Universidade Federal de São Carlos

Researches in language sciences, more specifically in discourse theories, commonly reflect on discursive cyberviolence from an enunciative perspective (the production of violence and the analysis of derived statements), not often mentioning the more subjective, identity, collective and militant dimension, based on the possibility of responding to this violence. Therefore, we propose to reflect upon the discursive cyberviolence, identifying "what is specific to the transgression of decency values in connected ecosystems" (2017, p. 83), that is, as axiological values that are the basis of the discourses, work in the argumentation instituting ethical limits, based on a specific doxa. Based on the notion of resignification, as proposed by Marie-Anne Paveau (2017a; 2019; 2019a), we will reflect scientifically on how discursive cyberviolence can undergo an inversion, not only semantically, but above all social and political, with regard to vulnerable groups. According to Paveau (2017a), resignification is a type of discursive practice with a strong argumentative coefficient within digital militancy and, although the notion of resignification has already been worked on in several domains of language sciences, the researcher emphasizes that the perspective she proposes has as its central point the political dimension (PAVEAU, 2019a, p. 2). We will analyze in this work, therefore, from a small corpus (Moirand, 2018) coming from social networks, the possibilities of concretizing the counter-discourse, that is, a response, on the part of the offended subject and the community to which he identifies himself, to the discourses understood as insulting and aggressive, with regard specifically to gender disparities. In this sense, we will reflect on the resignification, as "a privileged form of feminist discourse online in the web 2.0 universe" (PAVEAU, 2017, p. 8), being approached as an important part of the argument of digital militancy as identity defense based on counterargumentation. Resignification is, therefore, an argumentative form adopted by oppressed groups as a power of action and regeneration, of the wounds caused by gender relations, reinforcing the ideals of the movement and promoting, after all, the empowerment of this collectivity (BERTH, 2018).

# Discursive functions of linguistic recycling: Inter- and Intra-speaker style shifts within Standard Japanese, and between Standard Japanese and Iwate Dialect

Panel contribution

***Dr. Holly Didi-Ogren<sup>1</sup>***

***1. The College of New Jersey***

A guiding question for this panel is how and why language users save resources and create value by quoting and recontextualizing other's utterances through "linguistic recycling". In addition to addressing the panel's focus, this paper will also consider "reuse" of the same linguistic resources, wherein the same speaker uses different linguistic forms to express the same propositional content.

Data is drawn from two years of fieldwork in northeast (Tōhoku) Japan, and representative excerpts are selected from the full corpus of audio and visual data from six fieldsites. All fieldsites are built around a shared work output or activity, such as a diner that showcases dishes made from local ingredients, or a storycard-making group that incorporates the local dialect into their storytelling. Excerpts from stretches of talk that are activity oriented – e.g., where the talk is focused on a group goal or output. Central to the data analysis for this paper is the discursive function of style shifts, here defined as shifts between speech levels in Standard Japanese, and shifts between Standard Japanese and a local dialect.

Previous research on "linguistic recycling" has shown that repetition in the context of storytelling can function as an "intensifier" (Labov 1972), wherein "...the storyteller repeats key phrases to strengthen or intensify the events" (Karatsu 2014:186), and Karatsu's work has shown how this discursive function works in Standard Japanese. Research using Conversation Analysis has shown that repetition or "recycling" can also function more generally – not just in storytelling – as a means of creating "congruent understanding" (see for example Goodwin 1986, Szatrowski 2013, Koike 2009). Data analysis in this paper will draw on such previous research to demonstrate how shifts between speech levels within Standard Japanese, and between local dialect and Standard Japanese work discursively.

Intra-speaker style shifts will be shown to be linked to the discursive functions of evaluating another person's work, to introducing and closing a topic, and to mitigating the face threat of criticism.

Inter-speaker shifts will be shown to discursively function to align speakers in an evaluation of another speaker's contributions to the joint activity or goal, and in general to contribute to a "congruent understanding" of speaker position and evaluation.

The paper will contribute to work on style shifts, on pragmatic functions of local dialect, and on (im)politeness. With regard to language use in Japan, the paper will bring attention to the "language life" of local dialects. Linguistic recycling will be shown to be a useful operational principle for investigating the discursive functions of style shifts.

# Discursive Orientations to Age and Related Ideologies in Police Interviews with Suspects Aged 17 and 18

Panel contribution

**Dr. Annina Heini**<sup>1</sup>

**1.** Aston University

In England and Wales, 17- and 18-year-olds are subject to different legal provisions pertaining to their statuses as children and adults respectively. On the one hand, as suspects in police custody, children are entitled to a number of special measures. Because of their *ipso facto* status as vulnerable interviewees, they are required to have an appropriate adult (i.e. a parent, guardian, social worker or volunteer) present during questioning. Interviewers are furthermore instructed to take into account children's increased risk of suggestibility. Adult suspects, on the other hand, are expected to navigate the interview and by extension the legal system on their own. Note that the transition from child to adult happens overnight when a person turns 18. The dataset for this research consists of authentic police interviews with 17- and 18-year-old suspects conducted in England. Using a multi-method approach rooted in Conversation Analysis (CA) and Critical Discourse Analysis (CDA), it was examined how age is discursively orientated to by interview participants. In these discursive orientations, speakers reveal ideological attitudes in connection with age, such as notions of maturity, responsibility, autonomy, and vulnerability. The interview data show suspects invoking vulnerability by emphasising or downplaying their age and respective statuses as children and adults respectively in attempts to evoke a sense of compassion from interviewers. Furthermore, interviewers reveal ideological attitudes when explicitly and implicitly characterising young suspects' behaviour as immature, naïve, or ignorant. Finally, in interviews with 17-year-old suspects, appropriate adults are assigned different discursive roles when being called upon by either suspects or interviewers: suspects pass the floor to (grand)parents in order to seek corroboration of their contributions; interviewers call upon appropriate adults for them to verify suspects' statements. Both of these practices feed into the ideological notion of young people as being unreliable sources of information. These three-way negotiations are particularly revealing when approaching them from a CA perspective, for they involve suspects, interviewers, and appropriate adults, i.e. actors of a variety of different institutional and discursive statuses. In line with the data-driven and inductive CA paradigm, the discursive orientations to age and related ideologies show that age matters to the speakers in this highly institutional setting.

# Discursive Phatic Inclusion in Asymmetrical Consultative Meetings

Panel contribution

***Prof. Akin Odebunmi***<sup>1</sup>

*1. University of Ibadan*

Doctors sometimes permit short or extensive phatic communion in their interchanges with patients in spite of the dominant asymmetry that threatens rapport in Southwestern Nigerian hospital consultative meetings. The allowance, designed as an avenue for cultural acts, emotional association or strategic clinical interventions, often relaxes the typically tensive atmosphere of consultative meetings and eventuates in the discursive inclusion of patients in clinical care. Previous studies on phatic communion in Nigerian hospitals which have focused only on the adjacency features of prefatory greetings, have left unattended the inclusive role of phatic contents in the meetings. To address this lacuna, 20 sessions of taped doctor-patient consultative interactions in five hospitals in Oyo and Ondo States of Nigeria were analysed with theoretic resources from dialogical, accommodation and action theories. Additional ethnographic information to support the top-down analysis conducted was sourced from 20 doctors and 10 patients. Findings indicate that phatic communion, which occurs across all structural positions in the interactions and which can be initiated by any of the parties, derives its objects from routine/seasonal greetings, location/folk tracking and extra-consultative social relationships. The resulting intrusive or non-intrusive dimensions of the phatic expressions generate three types of discursive inclusion: code-compromise, power-reductive and face-redressive. Respectively, doctors inconveniently switch to dispreferred communicative codes to accommodate patients' participation; actively evoke shared socio-cultural experiences that neutralise physician power to sustain pre-consultative social relationships; and tactfully engage patients on assumed common agential orientations to mitigate threats earlier exchanged with patients. When intrusive phatic communion, preceded or followed by asymmetrical sequences, is initiated by doctors, it is most commonly an emotional or a strategic move to de-professionalise the doctor figure and invite the lifeworld personality of the patient to the encounter. When initiated by patients, it is usually a cultural act and consequently an extension of accustomed relational patterns inserted helplessly into consultative encounters. In most instances, doctors co-construct the designs and accommodate them as appropriate discursive cues. Non-intrusive phatic communion is perceived invariably as an institutional necessity by both parties, but when it dovetails to or meshes with the intrusive phatic communion, it sometimes presents a strategic move for specific consultative goals, which the parties sometimes do or do not negotiate satisfactorily.

# Discursive Representations of Animals in North American and Chinese Mainstream News Media: A Cross-Linguistic Corpus-Based Analysis

Panel contribution

**Ms. Ziwei Liu**<sup>1</sup>

**1.** Carleton University

As the impact of human activities grows and, consequently, climate change, marine pollution, and disease transmission, the conditions of our living environment have become less hospitable for both human life and the life of countless non-human species (Stibbe, 2012). People, however, tend to focus on how human beings are affected while ignoring animals. Animals, as an indispensable group of our ecosystem, have been variously represented from sentient beings bearing the same rights as humans to mere objects deprived of their intrinsic values. These various representations of animals reflect the ideologies (e.g., anthropocentrism and anthropomorphism) underlying the discourses, and these ideologies, in turn, influence how people perceive and treat animals.

Research into animal representation is very limited in both ecolinguistics and discourse studies (Cook & Sealey, 2018). Thus, to fill in the research gap, this study investigates the underlying ideologies associated with the discursive representation of animals in these fields of study. Given the ecological issues, such as climate change, marine pollution, and disease transmission, I chose three typical kinds of animals (i.e., polar bears, whales, and bats) relating to these circumstances in my study and ask the following research question:

How have animals been represented discursively in both the Chinese and North American mainstream news media?

Then, to address this broad research question, three subordinate research questions will be considered:

1) In what ways are animals represented under the circumstances of climate change, marine pollution, and disease transmission in North American and Chinese mainstream media (e.g., as sentient beings like humans or objects without intrinsic value)?

2) What attitudes towards the animals appear to be prevalent in the mainstream media of China and North America?

3) What underlying ideologies can be identified in these representations?

For this study, I employ both ecological discourse analysis (EDA) and corpus linguistics (CL). EDA, as a qualitative research approach, extends the traditional critical analysis of abuse, inequality, and dominance between human groups to the relationship between human groups and ecosystems, including humans' dominance of animals. CL is a quantitative research method used for language analysis (McEnery & Hardie, 2011). It requires researchers to provide empirical evidence drawn from a corpus composed of authentic discourses to support any statements made about language (Brezina, 2018). At the same time, the quantitative evidence yielded by corpus analysis can support the qualitative results of discourse analysis (Alexander & Stibbe, 2014).

This research presents a comparative analysis of two sub-corpora composed of two different languages (i.e., Mandarin Chinese and American English). The research data has been collected from both China and North America's mainstream news media (e.g., CNN news, CBC news, Xinhua news). By identifying the lexical, grammatical, and semantic language features of the discourses in the two different languages, the study will reveal the attitudes of these mainstream news media towards the animals and their relating ecological issues. At the same time, the study has implications for understanding the ideologies underlying these representations of animals.

# Dislocated in Corona Times: Narratives of Chronotopic Disruption During the Pandemic

Panel contribution

***Dr. Agnes Bolonyai<sup>1</sup>***

***1. North Carolina State University***

The COVID-19 pandemic has dramatically altered our life, including our experience of two fundamental dimensions of social life: time and space. With the lockdown and social-physical distancing measures, normal activities came to a halt and the usual temporal and spatial frames of life got disrupted—an experience widely described as ‘unprecedented’. Such rupture in mobility and flow of activities can significantly distort our perception of time, from creating a sense of timelessness to a slowing-down or speeding-up of the passage of time (Holman & Grisham 2020; Ogden 2020). This paper explores the discursive construction of people’s lived experience of spatio-temporal rupture during lockdown in pandemic narratives. Using discourse-narrative analysis and a chronotopic approach (Bakhtin 1981, Agha 2005, Blommaert & De Fina 2017, Karimzad 2019), I investigate how 1) the temporal-spatial architecture organizing the pandemic experience contrasts with the pre-pandemic chronotope of ‘normalcy’; and 2) how people’s identity formation and meaning-making practices are (re)structured within, and in relation to, the spatio-temporal disruption created by the pandemic.

I draw on discourse narratives from a larger corpus of mediatized data published on the coronavirus. Data was collected from various online media sites, with public discourses including diaries, journals, blogs, essays, reflections, and news pieces. The analysis of discourse narratives reveals that the Corona-pandemic is constructed as a ‘punctuated’ chronotope (Deleuze 2003). In this tacit spatio-temporal order of irruption, destabilization, and liminality, the experience of enforced spatial immobility, isolation, and radical localization in the ‘here’ (the ‘Big Close’, stay-at-home order and social distancing) is intertwined with a sense of temporal discontinuity, dislodgment, and/or being stuck in the ‘Long Now,’ and ‘enforced presentism’ (Guyer 2007), and an attempt to recalibrate a lost sense of grounding in space and time as ‘the new normal’. The data analysis also highlights the different ways in which an array of social roles/personas (suburban mom, high school senior, medical professional, essential person, elderly nursing home resident, business owner, anti-racism protester, etc.), ‘voices’, affective stances (fear, anxiety, boredom, confusion, anguish, uncertainty, disorientation, exhaustion, powerlessness, desperation, loneliness, stress, mourning, anger, togetherness, stillness, gratitude, etc.) and social positionings are produced in the spatio-temporal architecture of narratives of chronotopic disruption. I will argue that while Corona narratives evoke shared discursive imaginaries of the spatio-temporal disintegration caused by the pandemic, the construction of self and regimes of affect deployed also vary in significant ways depending on people’s unequal position in broader socio-economic, power, and racialized identity structures.

# Displayed monologues: Features of non-address in Aboriginal Australia

Panel contribution

***Dr. Stef Spronck***<sup>1</sup>

**1.** University of Helsinki

Many of Australia's 250+ Aboriginal cultures impose restrictions on speakers w.r.t. which members of the community they can talk to freely and under which conditions (Heath et al. 1982). Some addressees need to be actively avoided during certain life stages and in certain social contexts. For example, McConvell (1982: 93) notes that '[i]f a [taboo relative] approaches, a person should cast down his eyes, shake his head, and make a noise by sucking his lower lip or else exclaim *wartirri!*' These are strategies to signal the intention not to engage in dialogue.

In order to nevertheless signal meaning to taboo relatives in situations in which (minimal) communication needs to be established, Australian Aboriginal languages often provide elaborate avoidance registers (Fleming 2014). These registers cast the avoidance relative not as an addressee but an 'overhearer', in terms of Levinson (1988), and are spoken as short monologues, as if no other speech participant is present. I will refer to this type of speech act as 'displayed monologue'.

In this talk I discuss two concrete examples of displayed monologues, based on newly recorded and archival data from the Australian Aboriginal language Ngarinyin. The first of these is a widow register, which a recent widow adopts and a mother-in-law/son-in-law register, which is maintained in the presence of an in-law of the opposite sex.

Although it is commonly asserted that Australian avoidance styles only vary lexically and phonologically from 'regular' speech (Fleming 2014), the Ngarinyin examples also show distinct grammatical features. I place these grammatical features in a wider typological context of non-addressed (i.e. 'monologic') grammar as discussed by Hasegawa (2011), and others.

I conclude by arguing that characterising displayed monologues, and non-addressed grammar more generally, may provide an important avenue of research for connecting the study of face-to-face interaction to the increasingly common non-personal encounters with language. While I subscribe to the view that dialogue is the primary state of language (Vološinov 1973), even as a tool-for-thought (Vygotsky; Mercier & Sperber 2017), many linguistic processes today occur outside the context of embodied dialogue, e.g. in computer-mediated language. I suggest that studying Australian displayed monologue may help us understand what aspects of mediated language are 'new' and which aspects have deep origins in traditional language use.

# Displaying embarrassment in Taiwanese business negotiations

Panel contribution

**Dr. Wei-Lin Melody Chang<sup>1</sup>, Prof. Michael Haugh<sup>1</sup>**

**1.** University of Queensland

Displaying embarrassment is a complex and delicately balanced interactional practice, which involves first breakdown and then restoration of the progressivity of the ongoing social activity. Embarrassment is generally defined, following Goffman (1956), as a “moment in face-to-face interactions where an individual becomes flustered, momentarily loses self-control, and is unable to comfortably participate in the systematically organised procedures that conversation requires” (Sandlund 2004: 162), and thus embarrassment “emerges in relation to a specific action produced by a co-participant” (Heath 1988: 154), either on the part of the speaker or addressee. From a lay perspective, then, one may “embarrass” oneself through one’s own behaviour, or alternatively, one may trigger “embarrassment” in a co-interactant. From a conversation analytic point of view, however, questions remain as to what counts as a *display* of embarrassment to participants, and how such displays influence the overall trajectory of the interaction (Goodwin & Goodwin 2000).

In this paper, we explore these questions through a CA-grounded analysis of ten hours of audiovisual recordings of interactions between business people in Taiwan speaking in a mixture of Mandarin Chinese and Taiwanese. We specify displays of embarrassment analytically by first identifying different types of potential embarrassment elicitors in these business negotiations, and then characterising features of the turn design of responses to these. Two key embarrassment elicitors identified in these business interactions are teasing (Drew 1987), and topicalising unmet expectations (Chang and Haugh 2011). Responses to these potential embarrassment elicitors are characterised as displays of embarrassment when particular features of turn design are observable, namely, breakdowns in syntactic coherence, repetition in lexical choices and response tokens, prosodic elongation. We focus, in particular, on instances where involvements in multiple lines of action with different underlying preference structures for the participants, for example, accepting versus rejecting the tease, ratifying or disputing the topicalised expectations, are embodied through shifting gaze, body movements and posture. We observe that the embodied display of multiple involvements in different lines of response action also leads to a breakdown in the progressivity of the ongoing social activity that underpins these interactions, namely, negotiating and finalising business agreements. This in turn can lead to work on the part of the embarrassment instigator to restore progressivity through topic shift or topic closing interactional moves.

## Do so construction in Mandarin Chinese: at the syntax-pragmatics interface

---

Panel contribution

---

***Dr. Xiaolong Yang<sup>1</sup>***

*1. Zhejiang University of Finance and Economics*

With the recognition of incrementality and context-relativity in language parsing and production, this study explores the significance of these two concepts in Chinese *do so* (*zheme/name zuo*) construction, in which the adverb *zheme/name* ‘so’ precedes the verb *zuo* ‘do’. Within the framework of Dynamic Syntax (Kempson et al. 2001; Cann et al. 2005; Cann and Kempson 2017), it is argued that (i) Chinese *do so* construction does not have meanings independent of context: it merely serves to direct the hearer’s attention to information associated with a previous context, with the task of constructing some more determinable and relevant content for the utterance so far to reduce the processing effort between speakers and hearers; (ii) the retrieval of semantic content for *zhem/name zuo* ‘so’ is a routinised effect corresponding to the efficiency principle proposed in Hawkins (2004).

# Documents in Court: Materiality and the Strategic Authentication of a Police Transcript

Panel contribution

***Dr. Susan Ehrlich***<sup>1</sup>

1. York U

The decontextualization of text and/or talk from previous speech events in the legal system (e.g., depositions, affidavits, police interviews) and their recontextualization in trials is an ‘epistemological method’ (Matoesian 2000: 879) used by lawyers to impeach the credibility of witnesses. By juxtaposing previous and current statements made by witnesses, cross-examining lawyers are able to expose, or, in many cases, manufacture, inconsistencies in witness testimony—yet, this strategic work of lawyers is often rendered invisible. In this paper, I am interested in how the organization of a lawyer’s questioning in relation to a written transcript of an accused’s police interrogation—what Lynch and Bogen (1996: 213-214) have called a *documentary method of interrogation*—can endow the whole examination process with an aura of neutrality, obscuring the strategic work of lawyers.

The data for this paper come from an American rape trial, *Maouloud Baby v. the State of Maryland*, a trial in which the prosecuting lawyer spent much of his cross-examination of the accused (i.e., over half of the cross-examination) questioning him about lies he told in his police interrogation. Rather than confirming that the accused lied in his police interview in *one* question-answer sequence, however, as the defense lawyer did in the accused’s direct examination, the prosecutor spent an inordinate amount of time in the trial working through the transcript of the police interview, *seemingly* line-by-line. In multiple ‘accusation sequences’, the prosecutor would (1) quote a lie from the transcript that the accused had produced in the police interview, (2) contrast the lie with what really happened and (3) accuse the defendant of lying, a speech act that would then be confirmed by the accused. Important for my purposes here is the way the prosecuting lawyer would highlight the *materiality* of the police transcript as he worked through it. Before focussing on a particular lie, for example, the prosecutor would direct the accused’s attention to the relevant portion of the transcript by referring to page numbers and line numbers as shown below:

1 SE: Now: on th- the next pa:ge, page seven. [(0.6)]=

2 MB: [hhhhh]

3 SE: =uh:m: detec- on the bottom of page twen- line twenty two: (0.5)

4 detective Ri:ley says he’s tryin tuh figure out what happened.

Moreover, the lawyer would often highlight the neutrality of the exercise he was engaged in, as can be seen in line 7 below, where he is ‘simply counting up’ lies that have (supposedly) already been documented.

5 MB: Yes but like I told you I did lie to the pohlice.

6 SE: Well th- >we’re gonna<- that’s what we’re going through

7 right now. I’m simply counting up how many there is alright,

In sum, this paper investigates the discursive means by which a material object, such as a police transcript, comes to be ‘granted a certain objective standing’ (Lynch and Bogen 1996: 214) within the context of a trial and, in turn, obscures the strategic work of lawyers in their attempts to undermine the credibility of witnesses.

# Dogs receiving human utterances in interspecies interactions

Panel contribution

***Dr. Mika Simonen***<sup>1</sup>

**1.** University of Helsinki

In this study, it is investigated how dogs respond to human utterances during group dog walking sessions. Videotaped materials were collected from interactions between two dogs and their owner during their daily walking round in a park. Each dog had a GoPro videocamera attached to its body. The videotaped materials were analyzed with multimodal conversation analysis and transcribed according to the conventions of Mondada (2018), but simplified for the purposes of this study.

Extracts (1) and (2) are taken from a group dog walking session, and previously Dog 1 has offered its ball to the owner and proposed a play. The owner/speaker accepted the proposal and is now holding the ball. Dog 1 is standing in the near distance and looking at the speaker. Dog 2 has its own ball and is standing next to the speaker.

(1)

+ (0.2) + (0.3) + (0.3) +

Speaker + **a** + **las** +  
down

Speaker + looks at Dog 1->

Dog 1 + goes down-+

Dog 2 + stands->

The dog who is playing with the owner responds to the directive *alas* ("down"). The other dog standing next to the speaker is not gaze-selected and doesn't respond to the directive.

Extract (2) is taken after Dog 1 (i.e., Belu) has moved further away from the speaker and Dog 2. Dog 1 is currently laying down and watching the others.

(2)

+ (0.06) + (0.05) + (0.2) + (0.2) +

Speaker + **Be** + **lun** + **pallo** +  
*Belu's ball*

Speaker + looks at Dog 1->

Dog 1 + raises up +

Dog 2 + drops ball +

The speaker announces that she is holding Dog 1's ball. When the addressed dog hears the two first letters of its own name, it raises up as if responding to name call. Thus, the gaze-selected dog (in Extracts 1-2) can respond to human utterances as the speaker might expect.

Dog 2 is not gaze-selected by the speaker (in Extracts 1-2). The dog did not show any response to the directive (in 1), but it responds by dropping its own ball when the other dog's name is mentioned (in 2). This response is not expected by the speaker but might relate to the dog's self-play.

In sum, dogs respond to human utterances during group dog walking sessions in expected and unexpected ways. Goode (2007, 57) reported that his playing dog reacted after hearing "go." It is suggested that dogs in general can receive human utterances after hearing only one or two letters. Dog 2 was left outside of the play and its

responsive turn—dropping its ball when hearing the beginning of the other dog’s name—could be interpreted signaling discontent and offering grounds for moral considerations (e.g., of being a third wheel).

# Doing a “parenting companion” in action: Giving directives to others’ children

Panel contribution

***Dr. Tetsuri Toe<sup>1</sup>***

**1.** Kobe College

Japanese society has been caught between the “socialization” and “privatization” of child care. Matsuki (2013) reports how this dilemma is experienced by those who provide child care to families. Then, how about parents who receive child care services? How do they manage the dilemma as they seek social support in raising their children? To answer these questions, this study focuses on interactions between parents of an infant in *kosodate hiroba*. To be more specific, it focuses on how the parent of a child and other adults give directives to the child. *Kosodate hiroba* is a place where parents of an infant gather with their children. Video data of interactions there are examined by using conversation analysis. Detailed analysis of the “position and composition” (Schegloff 2007) of the directives has led to the following observations. There are two types of directives. The first is directives which explicitly treat the child’s behavior as “bad” with such negative descriptors as “dame (no good),” for instance. The second is those that control the child’s behavior by, for instance, “control touches” (Goodwin and Cekaite 2018) to the child. A child who did “problematic” behavior such as sitting on another child is controlled by the second type of directive done by a person other than the mother. She produces first type of directive to her child next. By refraining from using the first directive type, the person other than the parent orients to a norm that the first type of directive should be produced by the mother first. She produces the first type of directive only after the mother produced one. By producing this directive, she also affiliates with the moral stance to child care displayed by the parent’s directive. Thus, she is doing a “parenting companion” in action.

# Doing Detached Empathy in Service of Representing Constituent Emotions

Panel contribution

***Dr. Jessica Robles<sup>1</sup>***

***1. Loughborough University***

In any representative form of government, it is critical to understand how politicians present the concerns of those whom they are meant to serve. Petitions, which ask for change and therefore are a request for some form of service, are one important way in which the public can mobilize, through their representatives, demands on their government. However, a challenge of petitions is that they are not interactional: they are brief documents, with little context and no recourse to obtain explanations from those who have started or signed the petition. Therefore, it is the job of those representing and discussing the petition to fill in the details, to represent positions and persons, and to ascribe intentions and emotions. This presentation analyses how UK Members of Parliament reconstruct and represent the alleged positions and purported feelings of their constituents when discussing petitions in committee.

The analysis primarily examines two hours of video-recorded discussion in a hybrid online/offline meeting of the Petitions Committee (held July 15, 2020) related to the Government's easing of COVID19 lockdown restrictions. Using Jefferson (1984) and Mondada (2004) transcription notations, and discursive and conversation analysis, the data are analysed for politicians' formulations of constituents' views, identities, intentions and emotions. For example in the excerpt below, MP Ruth Jones describes and attributes a number of emotions to the category "many in our communities" and relates this description to the contrastive invocations "normal" and "new normal."

03 RJ: and from all communities. (1.0) and I can absolutely  
 04 understand the powerlessness the rage and the fear and  
 05 the general malaise that many in our communities are  
 06 experiencing .hhh and the desperate feeling of wanting  
 07 things to go back to what we knew as normal .hh but  
 08 there is going to be no quick return to normal as we  
 09 knew it .hh and our now as restrictions are eased and  
 10 our country opens up again is to reflect on how best  
 11 to mould and shape the new normal that lies ahead.

Jones refers to several emotions in this brief portion of her statement, including powerlessness, rage and fear (L04), malaise (L05), desperate feeling (L06), and wanting to go back to normal (L06-07). She positions these feelings in relation to her own role as representative with "I can absolutely understand" (L03-04), and in contrast to both "go back to what we knew" (L07) and "the new normal that lies ahead" (L11). In doing so she does not associate her own personal experience with the feelings listed, but performs an empathic stance toward them, and displays a recognition of their distance from what was previously normal (which she associates with her own experience in L07 as what "we" knew as normal). By doing this Jones accomplishes the institutionally-appropriate and role-proscribed activity of representing her constituents' views while not professing to occupy those views personally. This is marshalled in service of building toward an action that advises the government and her fellow PMs regarding future actions.

# Doing knowing-how through the particle ‘gewoon’

---

Panel contribution

---

**Ms. Paulien Harms<sup>1</sup>, Prof. Tom Koole<sup>1</sup>**

**1.** University of Groningen

This paper focuses on the use of the particle ‘gewoon’ (‘just’) in referring to actions as part of the competences of both speaker and recipient. Our data consists of two datasets; classroom interactions at a lower level of secondary education and handover interactions at the intensive care unit (ICU). In both interactions, the distribution of knowledge and redressing of imbalance has a central role. We analyzed these interactions by videotaping them and analyzing these including the corresponding written-out transcriptions. In these two utterances

- Student: maar moet ik dan gewoon (.) hier vier dan zeg maar vijf en dan zes

*but do I have to just (.) here four then say five and then six*

- Physician: verder zul je (.) gewoon op geleide van eh kijken (.) moeten kijken hoe het

gaat,

*further you will have to (.) just by uh looking (.) see how it goes.*

the particle ‘just’ implicates some sort of obviousness or implies something as common knowledge and we found that in both of our data sets, the particle displays an orientation to the (shared) procedural knowledge of both speaker and recipient.

We want to answer the question how, by characterizing actions or procedures through the use of the particle ‘just’, the professional competence of both interaction participants is brought about and what actions are accomplished by claiming mutual competence. Additionally, we want to discuss our findings in the light of recent studies of the role of epistemics in interaction (e.g. Heritage 2012; Stivers et al. 2011): in how far can this oriented-to competence or knowing-how be considered as part of epistemics. We will use conversation analysis as a method to analyze our data.

Heritage, John (2012) Epistemics in action: Action formation and territories of knowledge, *Research on Language and Social Interaction*, 45:1, 1-29

Stivers, Tanya, Lorenza Mondada & Jakob Steensig (eds.) (2011) *The Morality of Knowledge in Conversation*, Cambridge: Cambridge University Press

# Don't touch – negotiating the boundaries of acceptable touching in classrooms

Panel contribution

**Dr. Sara Routarinne**<sup>1</sup>, **Dr. Ulla Karvonen**<sup>2</sup>

**1.** University of Turku, **2.** University of Helsinki

Human-to-human touch has various important functions in many institutional settings, including schools (e.g Burdelski, Tainio & Routarinne 2020). Earlier research on classroom interaction has indicated that teachers and classroom assistants use physical contact - often, but not always accompanied by talk or other modes of communication – to control students' conduct, to manage their participation and attention and regulate their emotional states (e.g. Cekaite 2016; Routarinne et al. 2020). In peer interaction, students are shown to touch each other in order to gain attention as well as to display affection and build a sense of togetherness through playful teasing and different forms of physical closeness (Karvonen, Heinonen & Tainio 2018). While some of the tactile practices in classrooms seem to be fairly conventionalized (e.g. Cekaite 2016; Heinonen, Karvonen & Tainio 2020), all touches are situated (see Mondada 2016), and the participants negotiate locally their meanings and functions as well as their appropriateness and acceptability.

Persons involved in tactile interactions do not always experience touch positively. Also in classrooms, embodied acts can be physically forceful, embarrassing, or otherwise feel uncomfortable. In this presentation, we ask how boundaries of acceptable touch are locally negotiated in the interactional activities that constitute the everyday social world of classrooms. Our data consists of over 100 hours of video-recorded classroom interaction in Finnish schools with students aged between 7 and 15 years. In analyzing the data, we make use of multimodal conversation analysis (e.g. Mondada 2016). For the purposes of this presentation, we have collected instances in which one participant rejects or displays disapproval of touch initiated by another participant. Our analytical focus is on the interactional uptake of touch, displayed through the publicly visible and hearable actions of the participants. In our analysis, we pay attention to the

- 1) verbal and non-verbal resources/practices participants use in order to display their orientation to touch as problematic
- 2) moral rules and norms participants (more or less explicitly) invoke in displaying their orientation to touch as problematic.

Our analyses emphasizes how touch is multimodally negotiated in interaction. Firstly, the receiving party may pull lean back from the approaching hand or body, and thereby adjusting his or her body outside the anticipated trajectory of movement. Secondly, various vocal means are mobilized in a temporal sequences synchronized with the embodied withdrawal. The vocal means make use of response cries (i.e. *a:h::*) and symbolic language (i.e. *no..; don't touch*). Among students, rejection of touch from the other party, may lead to the self's counterattacks of hitting back – especially if the other managed to extend a touch that is taken up as hostile or otherwise unwelcome. In these cases, the teacher may intervene in student conduct. Mainly between peers in classrooms, the subtle line between teasing and bullying is balanced dynamically through the force, pace and rhythm of approaches and responses. The moral norms are oriented to in verbal formulations. The findings contribute to the overall systematics of tactile interaction in classrooms.

# Downgraded epistemic stance-taking by teachers in whole-class discussions

Panel contribution

***Mrs. Sofie van der Meij<sup>1</sup>, Dr. Myrte Gosen<sup>1</sup>, Dr. Annerose Willemse<sup>2</sup>***

*<sup>1</sup>. University of Groningen, <sup>2</sup>. Linköping university*

In whole-class discussions, teachers are advised to take on a facilitating role, with the goal of stimulating a discussion framework where students and teacher collaboratively construct knowledge. In this role, the teacher shows various types of conduct that facilitate discussions (Willemse, 2019). Our data from whole-class discussions in upper primary school show that teachers occasionally explicitly take downgraded epistemic stances (e.g. 'I don't know'), which contrasts with their institutionally assigned epistemic authority and is therefore possibly another type of facilitating conduct.

In the current study, we have collected utterances in which these downgraded epistemic stance markers occur, and analysed them using Conversation Analysis. In our analyses, we focused on the positions of the utterances in which these downgraded epistemic stances occur, and on the varying ways in which this practice influences the participation framework (Goffman, 1981). We made a collection of utterances that contained the use of 'I don't know' or similar strongly downgraded epistemic stance markers, including non-verbal conduct that clearly conveyed low epistemic stance taking.

Previously, Houen et al. (2019) studied teachers' 'I wonder...' formulations and found that these downgraded epistemic stance utterances can stimulate student participation. Our analyses of utterances that contain downgraded epistemic stance markers nuance these findings, as the instances in our data do not only occur in initiating utterances, facilitating discussion or student participation, but also in responsive utterances. In the latter cases, the teacher moves away from explicitly responding to a student's statement or question by claiming a lack of knowledge. These utterances function in the interactions in different ways. In some cases, the teacher takes a downgraded epistemic stance while passing on the student contribution or question to the rest of the class (Willemse et al., 2020), whereas in other cases the teacher questions the student contribution or marks it as irrelevant and steers toward topic closure. While the former type is quite similar to the initiating utterances, as it welcomes students' contributions, the latter type shows that teachers' utterances that show a downgraded epistemic stance may also affect the course of the interaction and the participation framework in a very different way.

This study demonstrates that the short utterances in which teachers take a downgraded epistemic stance can occur in different positions and have different functions in the interaction, that are not equally stimulating and thus each affect the participation framework during the whole-class discussion in different ways.

# Drawing an occasioned map on the hand in Locomotion and Orientation courses for visually-disabled persons

Panel contribution

***Prof. Marc Relieu<sup>1</sup>***

*1. Telecom Paris*

In this communication, based on video recordings of Locomotion and Orientation courses for visually-disabled students, we will examine how occasioned maps (Psathas, 1979, Garfinkel, 2012), drawn in the student's palm are interactionally traced and noticed in order to represent a crossing for all practical purposes.

We will begin to show how such hand-drawing maps sequences occur during those courses. After the teacher has initiated the sequence, the co-participants establish a mutual bodily position, which will facilitate the making of the drawing. After moving close together, one of the co-participants stretches one of his palms, turning it into a surface to be drawn on. The palm's limits "furnishes the maker with the"edges" of the map, the "scale" which can be used within the boundaries provided" (Psathas, 1979, p.207). The co-participants also have to choose who will draw and with whose hand. In the following fragment, the teacher holds one of the student's hand while drawing on it with the student's another hand finger.

Map drawing is constituted from lines and stops which are neither evanescent, nor permanent. Their "persistence" is not an intrinsic feature, but a mutual accomplishment. In the following fragment, lines and stops marked on the palm are embedded into the accompanying talk they index occasionally. Saying "Vaugirard" (Translator's Note: *the street of Vaugirard in Paris*) with a prospective indexical ("ça - that", Goodwin, 1996) prefacing the drawing itself (l. 1). Then, the drawing begins with a "tap" on the palm, which makes sensitive the point of departure. She draws a line which provides a first sensible description of this boulevard. As the students acknowledges the drawn line as a depiction of the street (l. 4), the teacher draws the same line back (l. 5). As this second gesture reaches the previous point of departure, the teacher produces a confirmation query ("d'accord? - okay?") and moves the finger down again. As the gesture reaches its objective, the student produces a confirmation receipt (line 8, "ouais ouais - yeah, yeah"). The situated meaning of the street and the local sense of "the lived drawn line" with its limits elaborate each other. The conventional, wordy representation (the name) is produced and understood in and through its unique correspondence with the drawn line (Garfinkel, 2002, p.202).

1. T: et en \*fait, vaugirard elle est comme\*ça.

*and in fact, vaugirard she is like that*

2. \*TLH grasps Y's hand and stretches it \*Presses->

# Dynamic patterns of age-related change in Chinese-Speaking Seniors' speech

Panel contribution

***Ms. Minli Wang<sup>1</sup>, Ms. Min Wang<sup>1</sup>***

***1. Xi'an Jiaotong University***

**Background:** Empirical studies on aging and language have documented that older adults exhibit reliable age-related declines across many aspects of language production, in comparison with younger adults. However, existing studies have mostly treated the “older adults” as a homogenous group and compared their language use with that of the young people. Thereby, it remains underexplored how language changes among the seniors at different stages of aging, and yet addressing this issue is crucial to our understanding of developmental trajectory of speech production of adults in general and seniors in particular.

**Aims:** From a Dynamic System Theory (DST) perspective, this study aims to describe dynamic linguistic patterns emerging *within* the older adult group, from young-old, middle-old to old-old in a Chinese-speaking society. Specifically, 1) it reveals the developmental trajectory of fluency, complexity and idea density, respectively, in seniors’ oral speech; and 2) it explores how relationships among the three subsystems of speech production (i.e., fluency, complexity and idea density as “connected growers” supporting each other’s growth, or as “competitive growers” inhibiting other’s growth) vary with different age groups.

**Methods:** A group of 90 normally ageing individuals (aged 60-90 years) participated in the study (45 women and 45 men). Participants were divided into three age groups: 60-69, 70-79 and 80-90 years old. Spontaneous oral speech data were elicited by having participants describe the person/event that most influenced their lives. A minimum of 400 words was elicited from each participant. Linguistic patterns are still under examination in light of fluency, complexity and idea density, with DST techniques such as linear and polynomial trend lines, min-max graphs.

**Expected Results:** 1) Chinese-speaking seniors’ speech follows a non-linear developmental pattern. That is, fluency, complexity and idea density remain stable or increase until middle-old ages (i.e., 70) and then decline, with the very oldest adults presenting a pessimistic picture about speech production. 2) With age ascending, relationships among fluency, complexity and idea density shift from support to competition. That is, seniors at earlier stage of aging have relatively enough cognitive resources to sustain co-development of the three subsystems, whereas among the very oldest adults higher level of complexity and idea density are associated with lower level of fluency due to age-related declines in cognitive capacity.

**Implications:** Extending a DST perspective on aging and language, this work indicates that the relationship between age and verbal communication is complex. Normally aging individuals are a non-homogeneous group in terms of speech production. At different stages of aging, various aspects of speech production change at various rate and interact in various way.

# Easy-to-read German: Comprehensibility and applicability in different contexts

---

Panel contribution

---

***Dr. Bettina M. Bock<sup>1</sup>***

*1. Universität zu Köln*

When inclusive communication is discussed, easy-to-read is one form of accessible communication that is repeatedly mentioned. However, it often remains vague, in which way and in which contexts it should be applied in the field of tertiary education, and which goals can be tied to this approach of text simplification. On the one hand, this is due to the heterogeneity of target groups that are associated with easy-to-read. On the other hand, the effectiveness and appropriateness of easy-to-read principles are subject of vivid debates. That means that it is not self-explanatory, how ‘good’ practices of easy-to-read could look like in tertiary education contexts. Easy-to-read German aims at making (primarily) texts easier to understand and most often uses a rigid rule-based practice, that is not sensitive to context, addressee or text type. There are several rulebooks with general directives and prohibitions regarding linguistic and typographic features that have shaped the understanding of what easy-to-read German is. Meanwhile, there are both theoretical linguistic considerations as well as empirical studies putting the intelligibility and appropriateness of common easy-to-read principles to the test. In the LeiSA project (University of Leipzig, 2014-2018) linguists conducted several empirical studies, working with two target groups (adults with so-called intellectual disability (ID), so-called functional illiterates). Some of the key results will be presented in the talk. Based on these empirical findings, we developed an alternative concept of producing easy-to-read texts: Instead of rules and rulebooks, the concept of appropriateness has been emphasized. It has been elaborated an orientation framework for the process of text production in easy-to-read German, that is sensitive to different contexts, text types and target groups. This framework will be used to reflect quality criteria of easy-to-understand communication in the context of tertiary education. Moreover, possible fields of application in university/tertiary education are discussed (e.g. participatory research with its specific communicative challenges).

# Economy or Solidarity: Exclusion and Inclusion of Older Persons in the Discourse on Covid-19

Panel contribution

***Ms. Milena Belosevic<sup>1</sup>***

***1. University of Trier***

In April 2020, German politician Boris Palmer made a controversial statement about older corona patients, “We might be saving people who would be dead anyway in half a year - because of their age and their previous illness” and raised the question of which social groups should be primarily included in the measures against the coronavirus.

This paper examines 2900 YouTube-comments concerning the German talk show “Markus Lanz”, in which Boris Palmer, among other politicians, discussed his statement. To reconstruct the patterns of collective thinking (Busse 1987) about the above-mentioned question, the analysis of argumentation patterns or topoi (Wengeler 2003) for and against curfew rules will be carried out. More precisely, the focus lies on the question of whether and to what extent the age-based restrictions are justified or not.

The first findings show that the online commenters both support and disapprove of the differential treatment based on age. For instance, the argumentation in favor of measures taken to protect older persons such as social exclusion is based on the economy topoi, which can be defined as follows: To protect the economy, restrictions for other social groups who are not at a high risk of coronavirus should be released. Further, the topoi of high-risk groups contains argumentation in favor of safety measures because It's not only older persons who are at greater risk of dying but also children and people with chronic illnesses who are at higher risk too. On the other hand, the age-topos is based on the uncertainty about the question of what age is considered old.

However, online commenters also reject the exclusion of older persons from safety measures and public life by arguing that they must decide for themselves whether and how they want to be protected (topos of free decision), by mentioning other factors such as pre-existing health conditions, which are rather to cause death than the coronavirus (topos of other dangers) or by reinforcing Palmer’s argumentation through the topoi of low life expectancy. Similarly to the topoi of low life expectancy, the stereotype knowledge about the limited healthcare resources is of central importance in the topoi of priority (favoring young over old in treatment is justifiable because older persons are less likely to recover). At the same time, online commenters draw on the solidarity with older persons to approve the lockdown measures for the whole society (topos of solidarity).

Therefore, the topos analysis provides insights about the age-based collective knowledge regarding both the inclusive health protection and exclusion of older persons from public life in the coronavirus debate.

# Effects of Spanish gender-inclusive language on sentence processing

Panel contribution

***Mrs. Ana Zarwanitzer<sup>1</sup>, Dr. Carlos Gelormini-Lezama<sup>1</sup>***

***1. Universidad de San Andrés***

In response to traditional Spanish, gender-inclusive morphemes have recently been introduced in River Plate Spanish as a way to include women and non-binary identities. Gender morphemes *-e* and *-x* have become available as a way to replace the masculine gender morpheme *-o* to refer to mixed groups.

Our study aims to compare the effects of gender-inclusive language and traditional language on sentence processing. Thus, we carried out a sentence-by-sentence self-paced reading experiment to examine the difference in reading times in milliseconds for sentences containing animate nouns referring to mixed groups with the traditional masculine morpheme *-o*, or the new morphemes, either *-e* or *-x*.

Our main hypotheses are:

- (1) reading times for sentences containing gender-inclusive morphemes *-e* and *-x* should be longer than for those containing gender-specific *-o* because as a very recent language change, readers have not had the same exposure to these forms;
- (2) reading times for sentences containing the gender-inclusive morpheme *-x* should be longer than for those with *-e* as they alter Spanish phonotactic rules and generate unpronounceable words;
- (3) young adults will favor gender-inclusive words more than older adults as they have been more exposed to these;
- (4) women will favor gender-inclusive options more than men because they participate more actively in the feminist movement that encourages their use.

The experiment was tested in 69 monolingual speakers of River Plate Spanish, 38 young adults and 31 older adults, 35 women and 34 men. A set of 18 written experimental items, as the one shown in Table 1, and 18 filler items were introduced to each participant. Each item consisted of two sentences and a comprehension question. The experimental items had three versions, which were identical except for the gender morpheme of Sentence 2. Each item was presented to each participant in only one condition, though all three conditions were tested across participants.

We conducted a mixed ANOVA with a Bonferroni correction with Morphological Gender (*-o*, *-e* and *-x*) as a within variable, and Age (young adult or older adult) and Gender Identification (women or men) as a between variable. The ANOVA revealed: (a) a main effect of Morphological Gender,  $F(2,130)=23.497$ ,  $MSE=5764441$ ,  $p<0.001$ ; (b) a main effect of Age,  $F(1,65)=22.976$ ,  $MSE=2.53E+7$ ,  $p<0.001$ ; (c) no significant effect of Gender Identification,  $F(1,65)=0.034$ ,  $MSE=36992.16$ , *n.s.*; (d) no interaction effects between variables.

Pairwise Comparisons showed: (a) a significant difference between *-o* ( $M=2079.5$ ,  $SD=652.13$ ) and *-e* ( $M=2651.623$ ,  $SD=880.49$ );  $t(130)=6.12$ ,  $p<0.001$ ; (b) a significant difference between *-o* ( $M=2079.5$ ,  $SD=652.13$ ) and *-x* ( $M=2547.788$ ,  $SD=866.49$ );  $t(130)=5.54$ ,  $p<0.001$ ; (c) no significant difference between *-e* ( $M=2651.623$ ,  $SD=880.49$ ) and *-x* ( $M=2547.788$ ,  $SD=866.49$ );  $t(130)=0.909$ , *n.s.*

Surprisingly, people of different ages and gender are going through this process in a similar way. A longer exposure to gender-inclusive words or the fact that these are closely linked to feminist movements and offer an alternative in language that involves women to a greater extent than men, do not appear to affect its processing. Results show a slight difference between both gender groups, but with men rather than women favoring inclusive language.

# ELF disagreement as an Interactional Resource for Doing Interculturality

Panel contribution

**Dr. Qing Yang<sup>1</sup>**

**1.** *Guangdong Ocean University*

This study aims to investigate the discourse process of managing intercultural differences through the lens of disagreement among speakers with heterogeneous linguacultural backgrounds using English as a lingua franca (ELF hereby). It questions the traditional paradigm of approaching intercultural differences as a hinderance to intercultural communication. The collected data were eight hours of audio-recordings from 13 casual conversation sessions of various lengths from five ELF participant groups. The focal segment of data analysis was placed on interactional sequences of disagreement starting from the initial disagreeing turn on an arguable topic and ending with the decay or closure of the arguable topic. Twenty-three disagreement episodes were identified and analyzed, which demonstrated how intercultural differences were made relevant, mobilized and managed in and through interactional sequences of disagreement. The sequential analysis reveals that disagreements are strategically exploited to purport asymmetries in participants' knowledge that is structured on "L1-dominated conceptual base" (Kecske 2013:67) and to prompt the unfolding sequences for co-creating an *ad hoc* "interculture" (Koole & ten Thije 1994; Kecske 2013, 2019) as the common conceptual base for mutual understanding. In addition, the linguistic analysis is triangulated by retrospective interviews which verify the constructive role of disagreement in pursuit of intercultural understanding. Therefore, it is argued that disagreement is used as an interactional resource for doing interculturality by modifying ELF participants' priori background knowledge and creating common knowledge in situ. This finding can provide some insights into L2 interactional competence in culturally diverse ELF context by reconsidering the creative use of disagreement as the result of the interplay of societal interaction and individual cognition.

# Elicitation techniques in content-based language teaching – forms, features and impacts on participation

Panel contribution

***Ms. Karin Aguado Padilla<sup>1</sup>, Ms. Kathrin Siebold<sup>2</sup>***

*<sup>1</sup> Universität Kassel, <sup>2</sup> Universität Marburg*

Classroom interaction and, in particular, learners' active participation are considered important procedures for successful foreign language acquisition (cf. Seedhouse / Walsh 2010). In order to promote high-quality classroom interaction, teachers need a pronounced level of interactive competences (cf. García García 2016) which can be trained through awareness raising and practical activities in teacher education (cf. Kupetz 2018). In favor of giving empirical support to this kind of interaction-oriented teacher training, genuine classroom interaction research is indispensable.

We analyze systematically selected aspects of interactional competences of novice teachers, with a special focus on identifying and describing elicitation techniques and their interactive effectiveness. The main questions are the following: What kind of effects do the teachers' linguistic elicitation prompts (like questions, imperatives, etc.) have on the active participation of foreign language learners in content-based teaching phases? Which forms of prompts generate active discourse involvement, which ones rather inhibit participation? In addition to explicit verbal elicitations, we also take into account the role of multimodal resources in interaction, like facial expressions, head gestures, gaze, pointing and body orientation, and seek to reveal whether and to what extent they accompany, reinforce or even replace them (Sert 2015).

The data consist of videotaped and transcribed German language lessons of several novice teachers (= students at the Philipps University in Marburg) who teach Spanish-speaking learners of German (= students at Pablo de Olavide in Seville) in an online teaching and learning environment at level B1.

Our first findings indicate, on the one hand, that different novice teachers intuitively fall back on very heterogeneous, but idiosyncratically preferred communication patterns and do not exploit the great linguistic range they have at their disposal for encouraging learners' participation (one of the prospective teachers, for instance, almost exclusively uses polar questions as prompts). On the other hand, certain factors (such as the placement of a prompt after a long phase of complex input) seem to inhibit participation. A first attempt to filter out recommendations for elicitation techniques that enable active participation from the analyzed data and a didactic outlook on the potential of using case analyses to develop reflexivity and practical interactional skills in teacher training complete this paper.

# Eliciting student collaborative production through syntax, prosody, body, and the surroundings in Chinese-as-a-Second-Language Classrooms

Panel contribution

**Ms. Xiaoyun Wang<sup>1</sup>, Ms. Shui Li<sup>2</sup>, Prof. Xiaoting Li<sup>1</sup>**

***1. University of Alberta, 2. Peking University***

The development of L2 interactional competence (IC) can be viewed as a process where L2 speakers constantly adapt interactional practices to act jointly with others as do L1 speakers (Pekarek Doehler, 2018). Through constantly co-participating in classroom interaction and closely monitoring their teachers' interactional practices, L2 students may get to understand how language structures are employed to accommodate interactional needs such as projecting the next linguistic element and relevant social actions (Auer, 2005). Yet little attention has been paid to how teachers assist L2 students to be interactionally competent in projecting the next linguistic element and relevant actions through syntactic and pragmatic co-completion. The present study investigates how L2 teachers mobilize semiotic resources (such as morphosyntax, prosody, bodily-visual movement, and objects) to project trajectories of temporally unfolding linguistic structures and involve students in accomplishing various interactional and pedagogical tasks collaboratively.

The data for the study are 18.5 hours of video recordings of Chinese-as-a-second-language classroom interactions between Mandarin native speaker teachers and adult Chinese language learners from various native language backgrounds at a university in Beijing, China. An examination of the data shows that teachers use two types of syntactically incomplete utterances (SIUs) with differing syntactic hierarchies and projection strengths in two distinct types of pedagogical, interactional, and sequential environments. First, after teachers ask students a *specifyingquestion* (e.g., What is the administrative level below autonomous region in China?) which is used to create the foundation for presentation of new next content and receive no response, teachers initiate the response on behalf of students and promote them to collaboratively produce target linguistic structures. These SIUs contain a flat concatenation of constituents on the same hierarchical level with a *local strong* projection force, such as the [Numeral+Classifier+(NP)] structure (with the NP unproduced) in Mandarin. This type of SIUs are used as a practice that can quickly and efficiently lead to a sequence closure, thereby promoting the progressivity of pedagogical tasks. Second, when teachers engage students in providing a non-predetermined answer (e.g., describing an item and telling a story; also see Mercer, 1995), they utilize SIUs that contain structures with a global projection to prompt students to produce utterances with deeper hierarchical structures. These SIUs are routinely used as the main body of reviewing and production tasks. Given the minimal syntactic constrain of these SIUs, they require greater agency on the part of the students to produce a longer stretch of talk. These two types of SIUs are constructed with different prosodic patterns combined with bodily-visual resources and objects (e.g., gaze, gesture, posture shift; and Chinese characters and drawings on the blackboard).

Given that teachers mobilize SIUs with different projection forces to either make their questions more accessible to students or to facilitate them to develop a longer stretch of talk, this study will contribute to the understanding of how both the types of pedagogical tasks and goals shape the design of teachers' talk, and also how teachers' utterances give students the opportunity to collaboratively complete the task-in-progress.

# Embodied practices of spectating in video gaming

Panel contribution

***Ms. Isabel Colon de Carvajal<sup>1</sup>, Ms. Heike Baldauf-quilliatre<sup>2</sup>***

*1. ICAR Laboratory, ENS of Lyon, 2. ICAR Laboratory, Lyon 2 University*

Our contribution investigates the role of non-players in videogame sessions. Research dealing with technology in interaction mostly focuses on those who “use” the technological device in an “active” way. We will draw attention to the role of those who are often considered as “less active”, more precisely, to the role of spectators. One of the main points of conversation analysis is to show that interaction is always co-constructed by all participants. Within the last decade, different studies have detailed this co-construction with regard to technology use in interaction: concerning the use of mobile phones, tablets, voice interfaces or videogames. Research on videogames, however, focuses essentially on the players’ activities (Reeves et al. 2017; Baldauf-Quilliatre/Colon de Carvajal 2020; Rusk/Stahl 2020) even if in numerous situations other people - non-players - are physically present and participate in different ways in the interaction and in the gaming (Tekin/Reeves 2017; Olbertz-Siitonens/Piirainen-Marsh/Siitonens subm.). Drawing on video-recorded playing sessions with Kinect, Tekin/Reeves (2017) have shown in a pioneering study “in which [ways] those watching play conduct their participation in the game in a range of interactionally coordinated, interwoven, and organised ways.” (2017, 2). Olbertz-Siitonens/Piirainen-Marsh/Siitonens (subm.) highlight the role of co-players as “potential resource” (subm., 35).

Our analysis is based on audiovisual data of French videogame sessions involving different configurations (different types of games, different number of participants, different gaming devices). By looking more closely at what the non-players do, we have explored what spectating can mean in these different cases and how it can be related to gaming activity and social relationships (Baldauf-Quilliatre/Colon de Carvajal in press). We would like to explore the relationship between gaming configuration and practices of spectating: 1) non-players who engage in gaming by spectating use different embodied practices to construct spectatorship ; 2) these practices are related to the gaming configuration as well as to the construction of social relationships.

We aim to contribute to a better understanding of technology use with regard to videogaming, especially concerning non-playing participants. By drawing on the dynamic participation framework between players and non-players, we will first argue spectating is not a pre-defined role but an interactional achievement. Secondly, we claim that practices of spectating are part of practices of membership categorisation.

# Embodiment, learning and social action: The case of requesting in L2 emergence.

Panel contribution

***Prof. Søren Wind Eskildsen<sup>1</sup>***

**1.** University of Southern Denmark

L2 learning, teaching, and explaining are accomplished in ways that are embodied, socially co-constructed and irreducible to any one constituent turn-at-talk. Using conversation analysis and usage-based linguistics (UBL), I focus on a beginning L2 user in an ESL classroom and trace, over 30 months, L2 development along two dimensions of embodied L2 learning, namely development of pragmatics as interactional competence, i.e. the deployment of specific expressions to accomplish specific actions, and development of L2 linguistic resources as seen through the construction-based lens of UBL.

In a recent study (Eskildsen & Kasper, 2019), we investigated the same L2 speaker's linguistic means of accomplishing requests over time. Our focus then was on the development of 'can you + verb?' which he used to ask varying co-participants to carry out particular actions. Other recurring expressions for accomplishing requests were identified (e.g., 'one more time' used to ask for repetitions in repair sequences) and an idiosyncratic constructional template, 'you + verb (thing) + a [person's name]', was identified as this L2 speaker's method to instruct fellow students toward task accomplishment (cf. also Eskildsen & Wagner, 2018). We noted an extremely high degree of correlation between interactional environment and request format; that is, different formats were used to accomplish different types of request. The main purpose of this paper is to get to the core of this relation between type of request and the request format while also examining the embodied conduct that plays into request accomplishments.

I show how the L2 speaker's orientation to concrete instantiations of the request formats as 'learnables' (Majlesi & Broth, 2012) is fundamentally embodied, and how he builds his request-making repertoire in an exemplar-based, locally contextualized manner that is concretely rooted in social experience and hinges on the local configurations of space and the physical proximity of objects involved in the action of requesting. The data show that his learning trajectory undergoes both routinization and diversification processes. He routinizes specific expressions in recurring environments as he uses them to accomplish the same specific type of request over time (e.g. 'can you write (for me please)?', 'can you spell (for me please)?'). In these instances, he co-employs alongside the talk recycled embodied work that elaborates the deictic references of the talk and the relation of the roles among them (e.g., requester, requestee and object being requested). At the same time, the linguistic patterns for requesting evolve from their exemplar-based origins to become permeable constructions with open slots for an increasing array of lexical material (e.g., 'can you write/spell' => 'can you help/show/repeat'), enabling him to accomplish requests in a wider assortment of environments. In and through this diversification, his embodied conduct changes, especially in the form of other types of deictic gestures. This paper analyzes details of this development with respect to embodied conduct, linguistic resources and achievement of social actions.

# Emergent pragmatic conventions in spoken interaction: Micro-diachronic analysis of inclusive vs. exclusive multilingual practices in three TIGs

Panel contribution

***Dr. Marie-Luise Pitzl<sup>1</sup>***

*1. Austrian Centre for Digital Humanities and Cultura Heritage, Austrian Academy of Sciences*

Whenever groups of speakers meet for the first time, linguistic practices and pragmatic conventions cannot necessarily be taken for granted and might be adapted, (re-)negotiated and changed by means of and throughout interaction. This holds true for all situations in which interlocutors are unacquainted, but is heightened when groups are linguistically and/or culturally heterogeneous. A prime example are interactions in which speakers use English as a lingua franca (ELF). In these situations, interactants have individual multilingual repertoires that comprise a situational multilingual resource pool. Thus, languages available, but also pragmatic conventions will be more diversified in these contexts – which provides us with a prime opportunity to study how they might emerge, evolve and change.

Due to its inherent orientation towards multilingualism, ELF research has examined code-switching and multilingual practices for quite some time. Many existing studies (e.g. Cogo 2012) offer interesting insights into which elements of which languages might be used for which purposes in different (E)LF contexts. There has, however, been relatively little engagement with how particular linguistic and multilingual practices actually come about, i.e. how they are first initiated and subsequently negotiated in real time in groups of (unacquainted multilingual) speakers. Producing more sophisticated empirical descriptions of such ‘micro-diachronic’ developments might contribute not only to our understanding of ELF use, but also to understanding the emergence of new/specific pragmatic conventions more generally.

Contributing to the study of pragmatics in spoken language, this talk describes emergent multilingual practices in three Transient International Groups (TIGs, Pitzl 2018). For this purpose, it analyzes transcribed spoken ELF data from the Vienna-Oxford International Corpus of English (VOICE) and provides detailed micro-diachronic portraits of how three TIGs (Malta-TIG, student-TIG, BELF-TIG) develop group-specific multilingual practices. Qualitative and quantitative evidence indicates that the initial use of non-English elements as code-switches may evolve towards multilingual practices that can be either more inclusive (Malta-TIG, student-TIG) vs. more exclusive (BELF-TIG). Crucially, both inclusive as well as exclusive multilingual practices are indicative of the emergence of more general pragmatic group conventions that are closely tied to processes like rapport management, facework and accommodation.

# Emerging Identities. Constructing Self-hood over Time and Space by Persons with Dysarthria

Panel contribution

***Prof. Melissa Moyer<sup>1</sup>***

*1. Universitat Autònoma de Barcelona*

This presentation reports on the complex issue of the self-construction and representation of identity in adults with a speech impairment resulting from an acquired brain injury. Current approaches to identity (Bucholtz 2009; Bucholtz and Hall 2005) typically focus on the role of language in the dynamics of social interactions but when a person has a speech impairment (i.e. dysarthria or aphasia) alternative modes and modalities of communication gain importance for constructing meanings intended to convey a person's presentation of the self (Goffman 1963, 1959). Research on disability and identity has focused on more fixed notions of identity involving either personal narrative accounts (Watson 2002) or societal perceptions of disability that are categorizing (Shakespeare 1996). The current proposal is informed by a view of language as a key element for dynamically negotiating identity and it extends this focus to the examination of materiality (Strang 2013), place, and time in the construction of selfhood (Guerrero-Arias et al. 2020). The embodiment of meaning-making strategies in specific contexts involves multiple forms of realizing agency, stance, emotions, gestures, and multimodal language expressions (Goodwin, M. et al. 2012; Jaffe 2009; Ahearn 2001; Goodwin, C. 2003). Persons with dysarthria typically must engage with their past, prior to their brain injury, their present where they must face the limitations imposed by their acquired physical conditions in their everyday interactions, and, finally with the imposed societal categorizations associated with their disability. This presentation draws on video, audio and participant observation data of two participants who took part in an ethnographic study that was carried out over nine months in 2017-2018 on the communication of identity by persons with dysarthria. The time, plac, meaning-making focus on identity shows how the complex conjunction of constructed self-identity, materiality, and agency challenges the societal contexts (Flynn 2021) and interactions where disability is treated as a dysfunction that produces social exclusion in society.

# Emoji as translinguistic discourse markers - findings from a multilingual corpus and their pedagogical applications

Panel contribution

**Dr. Judith Purkarthofer**<sup>1</sup>, **Dr. Heike Wiese**<sup>2</sup>

**1.** University of Duisburg-Essen, **2.** Humboldt-University Berlin

In our paper, we present emoji as discourse markers, based on findings from a multilingual corpus, and discuss pedagogical applications for this domain.

Emoji are a fairly recent phenomenon, and we are lacking systematic studies of discourse-pragmatic meanings for different emoji (cf. Dürscheid 2020a on this gap). However, research on these digital innovations is a vibrant new field, and there is a number of first studies that can provide background for our investigation (see Bai et al. 2019 for a transdisciplinary overview).

We understand discourse markers as pragmatic markers that operate on the level of discourse and contribute subjective, intersubjective, or textual meanings. We show that emoji can be subsumed under this concept, drawing on data from the open-access multilingual RUEG corpus (Wiese et al. 2020; DOI: 10.5281/zenodo.3236069). This corpus provides closely parallel elicited, but naturalistic language productions along different dimensions (written vs. spoken mode, (in-)formality, adolescent vs. adult age groups, languages, and language constellations) that supports systematic comparisons. The corpus covers data from speakers in five countries (Germany, US, Turkey, Russia, Greece), including monolingual speakers in all countries as well as both languages of bilingual speakers with heritage languages Greek, Russian and Turkish in Germany and the US. The corpus is linguistically rich and deeply annotated, supporting systematic comparisons along the different dimensions including cross-linguistic comparisons, majority vs. heritage language use, and monolingual vs. bilingual speakers.

For the investigation of emoji, we focus on the informal-written data, consisting of WhatsApp messages written on the same topic in five languages. We argue that approaching emoji as discourse markers can help us understand and systematise their functional and positional distributions (cf. Wiese & Labrenz *to appear*). What makes emoji special is their “translinguistic” status: they are not bound to a single language, but transcend language boundaries and hence can act as bridges between languages. Furthermore, even though they are conventionalised markers, they carry a strong iconic element. Taken together, this makes them particularly easy to understand, which sets them in contrast to other pragmatic markers (cf. Bruti 2019).

Against this background, we present transfer activities using emojis in the classroom. Patterns in the use of emoji as discourse markers shed light on the rules governing non-standard language use and bring attention to register and register knowledge. Teachers and students can explore their own use of emoji and compare them with findings from the multilingual RUEG corpus. Corpus data has proven extremely attractive for students and teenage learners, as they can make their own observations leading to potentially new findings. By drawing on multilingual examples from majority and heritage language contexts, students and teachers can reflect on current phenomena of language variation and change. As emojis are used across languages, they can also serve as ways into new texts and new languages.

Taken together, our paper shows how the special status of emoji as translinguistic discourse markers can be used pedagogically to support the recognition of speech patterns, foster language awareness and ultimately challenge standard language ideologies of teachers and learners.

## Emojis as Pragmatic Markers

---

Panel contribution

---

**Dr. Xinjia Peng<sup>1</sup>**

**1.** Nanjing University

Emojis—the smiley faces, the hearts and the thumbs-up icons one can easily tap and insert into the text on your mobile device—have been conceived of as paralinguistic elements. In the past, they were considered as a kind of nonverbal cues similar to facial expressions and gestures, as language proxy and indicators of emotions. Only in more recent studies it is shown that emojis (as well as emoticons) serve pragmatic functions (Dresner & Herring, 2010; Al Rashdi, 2018; Sampietro, 2019 *inter alias*), which follows that they should be understood in linguistic, rather than extralinguistic terms. The current study proposes to examine emojis as pragmatic markers, similar to lexical items that serve pragmatic functions but only with a pictographic representation. Evidence comes from emoji use in a ten-year Weibo corpus (Weibo is Twitter-like microblogging service in China).

The panel presentation will focus on several high-frequency emojis on the platform. The use of these emojis, along with the development trend of general emoji use on the platform shows that the platform and its users have together selected and defined the use of emojis as pragmatic markers that construe agreement and minimize conflicts, as markers of identity and affiliation. Contrary to the common understanding that pragmatic markers exhibit high-degree of variability and are context-dependent, it is observed that these digital pragmatic markers are highly homogeneous in terms of their pragmatic meanings and distributional patterns. Such homogeneity, countering to linguistic creativity of autonomous language users also opens up criticism to the reification and digital categorization of personal emotions and expressions in the digital age.

# Emotion and disclosures of domestic violence in social insurance service calls

Panel contribution

***Dr. Marie Flinkfeldt<sup>1</sup>, Dr. Helena Tegler<sup>2</sup>, Dr. Stina Fernqvist<sup>2</sup>***

***1. Uppsala University, Department of Sociology, Centre for Social Work (CESAR), 2. Department of Sociology, Centre for Social Work (CESAR), Uppsala University***

In this paper, we use conversation analysis to examine how emotion features in interactions where the possible occurrence of domestic violence is raised, in an institutional setting which does not regularly deal with such issues. The database consists of 671 phone calls to the Swedish Social Insurance Agency's (SSIA) customer service, recorded in 2016 and 2017. At this time, a new rule was being implemented in Sweden, according to which separated parents themselves must sort out maintenance for children. One reason for the SSIA to intervene as an intermediary, however, is if there is a history of violence or threats in the family that makes it problematic or dangerous for the parents to be in contact. Parents who have experienced domestic violence therefore need to disclose this to support requests for maintenance support through the SSIA.

Previous CA research on disclosures of domestic violence in other settings has shown that victims typically do not refer directly to experiences of violence, but tend to rely on references to place (e.g. jail) and person (e.g. ex-husband), on the basis of which such inferences can be made (Tennant & Weatherall, 2019). The current study supports these findings but also examines the use of another resource by which callers can make violence inferentially available, namely emotion. We examine emotion in three ways: a) the caller's displays of emotion (e.g. crying, prosodic variations, and voice quality); b) the caller's formulations of their own emotions in descriptions of the relationship with the other parent (e.g. "I'd be afraid to ask him"); and c) the caller's formulations of the other parent's emotions (e.g. "he'll be very angry"). Previous research has shown how displayed or formulated emotion can be used for building and undermining the sensibility of action (e.g. Edwards, 1999) and how, in institutional settings, emotion can provide or support a basis for service-seeking while leaving the issue's institutional relevance to the institution to unpack and assess (Potter & Hepburn, 2003). Drawing on this research, we show how both formulations and displays of emotion can be used to tacitly raise a history of violence, without explicitly describing violent acts. By such means, the callers in our data provide an opportunity for call-takers to more explicitly topicalize violence on their behalf (e.g. by asking if violence has been an issue, which is not a routine question). When call-takers do not treat emotional displays or formulations as possible indications of violence, callers instead need to provide more explicit descriptions to account for their requests for support, placing additional burden on them to progress service and receive maintenance to which they are entitled. We conclude by discussing implications for training of case officers.

## Emotion in storytelling interaction

---

Panel contribution

---

**Dr. Chris Rühlemann**<sup>1</sup>

1. University of Freiburg

Storytelling is driven by emotion. The recognition of this fact started with Labov's assessment that evaluation is storytelling's "raison d'être" (Labov 1972: 366) and has been elaborated in interactional terms more recently by Stivers (2008), who conceptualizes storytelling as "an activity that both takes a stance toward what is being reported and makes the taking of a stance by the recipient relevant" (Stivers 2008: 32). Preferably, the stance taken by the recipient supports the stance taken by the teller, thus creating emotive affiliation, typically occurring at the climax of the story where the most intensive display of affiliation is expected (cf. Kupetz 2014; Selting 2010). Even more recently, research in the psychobiology of emotion in interaction has shown that affiliation is correlated with storyteller's and story recipient's arousal, that is, the intensifying activation of the autonomic nervous system associated with emotion (Peräkylä et al. 2015: 302) as evidenced by changes in galvanic skin conductance. In line with emotional contagion theory (Hatfield et al. 1994), Peräkylä et al. (2015) have discovered that displays of affiliation by recipients have the effect of decreasing the storyteller's arousal and increasing arousal in the story recipient while non-displays of affiliation lead to increased arousal in the storyteller (Peräkylä et al. 2015: 302).

This paper is based on selected data from the Freiburg Multimodal Interaction Corpus (FreMIC) currently under construction at Freiburg University. Drawing on the human voice's sensitivity to emotion (Liebenthal et al. 2016, Goodwin et al. 2012) and previous research that has shown that emotion display in storytelling is multimodal, playing out not only verbally, but also prosodically and gesturally (e.g., Couper-Kuhlen 2012; Selting 2010, 2012) including gaze behavior (Rühlemann et al. 2019), the paper seeks to extend previous research by approaching emotion and emotion display in storytelling both through psychobiological measures such as galvanic skin response and multimodal measures such as acoustic analysis (pitch and intensity measured in Praat), gesture analysis, and eye tracking analysis. Based on qualitative and quantitative analyses, the paper examines and compares story sequences in full psychobiological and multimodal detail.

The analyses suggest the crescendo hypothesis, which posits that the story recipients' emotional contagion and emotion display, or lack thereof, depends on a number of factors including prominently the storyteller's intensifying use of prosodic and gestural resources toward the story climax.

# Empathy and emotions when exchanging advice

---

Panel contribution

---

***Dr. Carolina Figueras<sup>1</sup>***

***1. University of Barcelona***

Empathy is a key component of social cognition and prosocial behavior. It concerns the faculty to understand and identify the mental states of others, as well as the potential to simulate their affective states. Empathy is usually separated into two major components: cognitive and affective. The former refers to the recognition of the other person's emotions, a process that likely requires perspective taking. The latter, instead, is related to the capacity to share the emotional experience felt by others, that is to say, the ability of appropriating the emotions sustained by the other person. Affective empathy not only requires recognizing the other person's emotion but also adopting that emotion. The embodiment of emotion, therefore, does not account for all types of empathic experience.

Against this backdrop, the focus of the present contribution is how emotions and empathy are conversationally managed in the speech event of exchanging advice in two mental health online support groups: one was a chat dedicated to eating disorders and the other was an anorexia nervosa recovery forum. The analysis was conducted within a psychological paradigm that highlighted the role of cognition and emotion in the advice-giving act. The examination of the different affective practices deployed in the advice seeking and the advice provision posts revealed that advisees tended to use emotional language as a mitigation mechanism to tune the illocutionary force of their requests to the audience, to modulate their self-presentation agenda to the forum normative requirements (framework) and to cope with the stressor of the illness. Advisors, in contrast, produced a comprehensive body of mitigating strategies related to the notions of (cognitive) empathy and perspective-taking, two cognitive constructs that were negotiated, represented and handled in interaction.

# Empathy Training During Joint Picture Book Reading in Japan and the United States

Panel contribution

**Ms. Moeko Ozaki**<sup>1</sup>

1. Keio University

It is often claimed that Japanese people value interpersonal relationships while Americans are more information-oriented. However, it has not been fully elucidated how and when children acquire such culture-specific ways of speech based on statistical and cross-sectional evidence. The present study examined how Japanese and American parents conduct empathy training to their children, and the process in which such communicative skills are acquired by their children. 179 American and 107 Japanese parents to 0 – 4 year-olds were videotaped reading *The Very Hungry Caterpillar* to their children in home settings. All videos were transcribed and coded based on conversational function and linguistic feature.

The results revealed that Japanese parents consistently use empathetic speech for 25-50% of their utterances regardless of their children's age but the frequency of such utterances gradually decreased. The Japanese children started using empathetic speech for 10% of their utterances immediately after 24 months, which doubled by the age of four. On the other hand, American parents used significantly less empathetic speech compared to that of Japanese parents, and gradually increased the ratio of empathetic speech according to their children's development from approximately 3% at 2 months to 18% at 4 years old. American children rarely used empathetic speech.

A further inspection of the content of their empathetic speech revealed that Japanese parents begin by using assimilations such as "paku paku paku" ("nom nom nom") and gradually switch to using assertions such as "kawaii-ne" ("It's cute, isn't it"), while American parents start using both simultaneously once the children become verbal. Another key finding is that American parents use empathetic speech in combination with questions and utterances regarding personal opinions, while the Japanese parents used them to describe physical situations in the book.

These results suggest that while in both languages parents provide scaffolding for empathetic speech, Japanese parents generally place more emphasis on empathetic speech even for infants, but gradually decrease the amount of scaffolding and also shift the content from directly assimilating with other characters to more implicit forms of empathy training as the children show signs of acquiring said conversation skills. On the other hand, American parents provide phased scaffolding for empathetic speech as their children develop cognitively and become more verbal. The American parents also tend to use empathetic speech as a means for interactive communication by combining them with questions and utterances regarding opinions, whereas the Japanese parents use empathetic speech also as an unidirectional utterance to explain the content of the book.

# Enabling participation in joint drumming within organizational workshops

Panel contribution

***Dr. Ulla Karvonen<sup>1</sup>, Dr. Riikka Nissi<sup>2</sup>***

***1. University of Helsinki, 2. University of Jyväskylä***

When making music together, participants have to simultaneously orient to the temporal production of rhythm and sound through instruments and/or their bodies and to the interpretation of such production by their co-performers (Schutz, 1951). In larger groups, this is often accomplished with the help of a 'leader' who aims at synchronizing the actions of the performers, for example, by various embodied means (Paalanen, 2019). However, while joint music-making itself requires a special kind of organization of participation in order to be viewed as 'music', it is also embedded in broader activity contexts which may bring forth further institutional constraints and expectations for joint action. In this paper, we investigate joint music-making in one specific institutional setting, a workshop provided by new kinds of creative professionals who use art-based methods for the purposes of organizational training and development. Unlike many other workplace situations, such workshops are not institutionalized to a large extent and the way in which they proceed is usually not transparent to the participants (see Mikkola & Nissi, 2020). However, as organizational practice, the core goal of the workshops is to enhance employee engagement and inclusion in the workplace, thus bringing *participation* in workshop activities into the spotlight. The aim of the paper is to examine how the creative professional who instructs the workshop enables participation in joint music-making in a situation that lacks wider cultural recognizability and urges the participants to use their bodies and instruments in ways that differ from usual workplace activities.

By using multimodal conversation analysis as a method, we analyze the organization of joint music-making sequences in workshops that utilize various kinds of percussion instruments, especially drums. In particular, we focus on a sequence where the creative professional initiates a joint drumming session for the first time by dividing the participants into four groups. In terms of participation, this requires both synchronous and sequential organization of action as the group members are at first instructed to play together by synchronizing their mutual actions according to one collective rhythm and then to enroll in joint drumming one group at a time.

The results show how the creative professional employs different linguistic and embodied means that are applied during the music-making sequence in order to make the 'rules' for participation transparent and to encourage engagement and immersion in the activity. These include linguistic formulations (e.g. directives), embodied demonstrations as well as various lexical and non-lexical vocalizations that are used, for example, to mimic the expected rhythm and address instructions to individual instrument groups (*pam pam pam, tsa tsa tsa*), to repair the established rhythm (*hei, ha, haa*), to evaluate joint drumming (*yeeea, yes yes*), to close the instructive sequence (*go go*) and to organize the transition to the next group (*okei*). In conclusion, we discuss our results with regard to the boundaries of workplace situations and roles and reflect on the possibilities and consequences of non-participation.

# Encouraging students' participation in the Spanish as a Foreign Language Classroom

Panel contribution

***Dr. Marta García<sup>1</sup>***

***1. Georg-August-Universität Göttingen***

Many classroom activities, like warm-up rounds, homework feedback, activation of students' previous knowledge or reports of group work results, are usually conducted as teacher-led whole-class interaction. Ensuring high student participation in this setting is considered crucial for the lesson's success and ultimately for the learning process. Of course, the quality of the students' contributions is much more important than the level of participation; the challenge for teachers, therefore, involves not so much getting students to say something, but rather encouraging them to make relevant contributions and to really engage in classroom talk. Previous research in this area has highlighted the importance of addressing the students' transportable identities (Richards 2006) and a skillful navigation between control and connection (Waring 2014). While these studies were conducted within the context of adult (English) second language learning, there still remains the question concerning learners' engagement at school, where control issues are much more relevant and young learners' commitment cannot be taken for granted.

The following contribution addresses this gap and analyzes, from a conversation analytical perspective, different excerpts of whole-class activities in the Spanish as a foreign language classroom. Data were taken from a corpus of audio and/or video recorded practical school trainings and illustrate typical sequences of teacher-led plenary discussions. While the interaction is teacher-led most of the time and follows a traditional question-answer pattern, there are some moments when this participation structure is challenged by an unexpected student contribution. This inverts the institutional roles of teacher-as-an-expert and student-as-a-novice. By analysing instructor's and students' subsequent turns that these unexpected contributions trigger, the argument is made that (future) language teachers need to become aware of these moments in order to harness the learning potential they offer.

# Enforcing rules and norms in everyday family interactions: A cross-linguistic study

Panel contribution

**Dr. Uwe-Alexander Küttner<sup>1</sup>, Dr. Anna Vatanen<sup>2</sup>, Dr. Jörg Zinken<sup>1</sup>**

***1. Leibniz-Institute for the German Language, 2. University of Oulu***

Humans are a ‘normative’ species (Bergmann, 1998; Rakoczy & Schmidt, 2013): We always have an eye to what we and others can, should, or must (and mustn’t) do. In other words, we are sensitive to the deontic dimension of action. The family is a site where children are socialized into the rules, norms and proper procedures of various activities (e.g., Keel, 2016; Ochs & Kremer-Sadlik, 2007; Sterponi, 2009). In this presentation, we take a cross-linguistic look at how children are socialized into what is normatively and morally expectable and appropriate behavior in social interaction. Using the methods of Conversation Analysis, we examine video data from English, Finnish, German and Polish families.

The focus is on verbal turns that adults (parents or caregivers) direct to children and in which they formulate, enforce or otherwise invoke rules or norms in order to change the child(ren)’s current behavior. We describe the sequential placement of these turns as well as the linguistic and multi-modal resources that participants employ in them. Our aim is to explore both the commonalities that these turns exhibit across the languages in our sample as well as the various language-specific resources that participants mobilize in producing them. This will allow us to discuss what may be considered ‘more generic features of norm/rule enforcements’, and how diverse sets of linguistic means can be used to instantiate them in different ways.

# Engaging students in classroom discussions: A micro analytic view on teachers' interactive practices and learners' changing participation

Panel contribution

***Prof. Vivien Heller<sup>1</sup>, Prof. Miriam Morek<sup>2</sup>, Ms. Noelle Kinalzik<sup>1</sup>, Mr. Valentin Schneider<sup>2</sup>***

*<sup>1</sup> University of Wuppertal, <sup>2</sup> University of Duisburg-Essen*

While various approaches have been proposed to develop “academically productive”, “dialogic” or “accountable” classroom talk, the question of how to involve students with diverse learning needs is still largely unanswered. Both quantitative and qualitative studies demonstrate that academically productive classroom talk is not automatically associated with broader student participation (Clarke 2015; O’Connor et al. 2017). Particularly in diverse classrooms, it seems to be crucial to interactively involve students who may be not familiar with the discursive practices of constructing and transmitting knowledge (Quasthoff, Heller & Morek 2017). However, we still lack empirical findings on what constitutes such interactive engagement practices.

Addressing this gap, our study investigates interactive engagement practices from a micro-analytic perspective. Our study is based on a long-term (1,5 years) videography of whole class discussions in twelve inclusive classes in secondary schools. Drawing on multimodal interaction analysis, we first reconstruct engagement practices that teachers use to engage students who usually do not proactively engage in classroom talk. Such practices include explicitly addressing questions to individual students, reducing discursive demands through explicating or modifying communicative expectations (in CA terms: conditional relevancies), embodying a questioning and curious stance, and embodied revoicings. By also taking into account how students respond in the next turn, we discuss what potential the different practices might entail for engaging students in whole class discussions. Thereby we aim at contributing to the panel’s question how learner participation can best be encouraged in heterogeneous learning environments.

# Enregistering Lisa

---

Panel contribution

---

**Prof. Theresa Heyd<sup>1</sup>**

1. Universität Greifswald

In exploring the concept of enregisterment since the foundational work by Agha (2003) and others, sociolinguists have examined linguistic material ranging from fine sociophonetic detail to macro semiotic categories. In this contribution, I want to engage with one underexplored linguistic resource, namely first names and the language ideologies that are constructed around them. In formal semantic/pragmatic approaches, debates around if and how names mean are a traditionally difficult topic. Sociolinguistically speaking, it appears straightforward that first names are closely tied to the making and managing of social meaning – indeed, they are almost organically linked to the construction of what Agha (2003) calls “characterological figures”. This is evident, for example, in experimental evidence of name-based discrimination against marginalized groups (e.g. based on race and ethnicity, but also along lines of gender or social class) in sectors such as the job and housing markets (e.g. Carpusor and Loges 2006).

Here, I examine a specific linguistic practice in the use of first names for stylistic moves of exclusion, namely the attribution of fictitious first names to individuals or groups. I argue that these symbolic acts of naming are instrumental in moves of inclusion and exclusion. For example, North American public discourse has focused on the linguistic construction of *Karen*, as a White middle-class woman performing sociopragmatic moves of overstepping and linguistic acts of everyday racism. Similarly, such characterological figures based on imagined names and their social meanings are widespread in incel discourse (e.g. *Stacy*, *Becky*, and *Chad* – see Menzie 2020).

I present further evidence for this linguistic practice by analyzing the persona *Lisa* in German student discourse. Based on data from global and local social media platforms, as well as interview data, Lisa emerges as a young, shallow female persona perceived as entitled and annoying. In her incarnation as *Lisa aus Australien* (Lisa from Australia), Lisa is a gap year returnee who self-styles as mobile and linguistically fluid. I analyze the mediated material that goes into the construction of the social persona of *Lisa*, and I discuss some of the implications of this kind of social commentary on linguistic mobility. In particular, I argue that the fine detail of the parody – including its gendered trope of the shallow girl – enables the voicing of purist and territorial stances which are at odds with contemporary ideals of cosmopolitanism and mobility, and which point to uneasy debates about eliteness (Thurlow and Jaworski 2017) in late-modern publics (Heyd and Schneider 2019).

# Entextualisation of 18th and 19th century witness and suspect depositions by legal scribes in the historical Witnesses corpus

Panel contribution

***Ms. Magda Serwadczak<sup>1</sup>, Prof. Mieke Vandenbroucke<sup>2</sup>, Prof. Rik Vosters<sup>1</sup>***

*1. Vrije Universiteit Brussel, 2. University Antwerp*

Court proceedings typically rely on depositions of witnesses and interrogations of suspects for the discovery of evidence and case decision-making. In the case of earlier depositions prior to the trial, the witnesses' or suspects' statements are usually presented and incorporated in the trial in written entextualised form and become as such recontextualised in the trial's discursive environment. During the trial, courtroom depositions and interrogations are also typically simultaneously committed to paper by courtroom scribes. As such, witness and suspect statements are of crucial importance and omnipresent in courtroom cases, and this is the case for both historical and contemporary court proceedings.

In this paper, we introduce the historical *Witnesses* corpus gathered at the Vrije Universiteit Brussel ([www.getuigenissen.org](http://www.getuigenissen.org)), which encompasses eighteenth and nineteenth century witness depositions and suspect interrogations used in trial cases held at Flemish courts. In doing so, we will present examples from the corpus to illustrate both the practice of disposition and interrogation as well as the legal scribes' practices of entextualisation in historical Flemish courtrooms, with an empirical focus on documents from the Bruges region and cases related to violent crimes (e.g. (attempted) murder, arson and sexual assault).

In addition to an introduction to the *Witnesses* corpus, we will also present initial results of a case study of 152 documents in sexual assault cases. The presented analysis is part of a PhD project which aims to shed more light on the language of legal proceedings and the institutional discourse from a diachronic perspective. Adopting both a qualitative and quantitative approach, we investigate the general structure of the depositions (including examples of formulaic language which are displayed throughout the documents as well as the depositions' distinctive features and the components they consist of). Additionally, we aim to address the basic questions regarding the written sources' credibility in reflecting the spoken interaction of the actual interrogation. In order to do that, we focus on (among others) orality markers, implicit meanings and questioning strategies (understood as ways of introducing questions and information). The results of this analysis will be framed against the background of the entextualisation process during the trial case's proceeding.

# Epistemics and conversational humour in intercultural initial interactions

Panel contribution

***Prof. Michael Haugh<sup>1</sup>, Mr. Amir Sheikhan<sup>1</sup>***

***1. University of Queensland***

Theories of conversational humour to date have generally assumed speakers have access to similar cultural frames and can recognise incongruities based on their shared linguacultural backgrounds (see e.g. Attardo & Raskin 2017). This assumption raises questions, however, as to what happens with respect to conversational humour in intercultural settings (Davies 2015; Marra & Holmes 2007) or in initial interactions (Haugh 2011; Haugh & Weinglass 2018; Mullan 2020) where shared knowledge or common ground is less assured. In this paper, we examine conversational humour in intercultural initial interactions, in which participants not only do not know each other, but also come from different cultural backgrounds, through the lens of epistemics (Heritage 2012; cf. Sperber et al. 2010). Our analysis examines episodes of conversational humour identified in the Video-Mediated English as a Lingua Franca Conversations (ViMELF) corpus (REF), comprising 20 dyadic intercultural initial interactions conducted through Skype, and a collection of a further 10 recordings of dyadic intercultural initial interactions collected by Zoom. The analysis focuses on the design of these humour episodes, the negotiation of shared knowledge prior to and during these episodes, and responses to humour bids. Preliminary results indicate that whether and how an attempt at humour is responded to reflects the epistemic stance/status of participants in that conversation. When the speaker assumes K- status for the recipient or there is no local negotiation of relevant knowledge, the laughable is generally disattended. On the other hand, when K+ status is assumed for the recipient or the laughable is based on locally co-constructed shared knowledge and/or knowledge is negotiated, the humour episode is expanded upon by the recipient. We conclude that the role of epistemics needs to be more explicitly attended to in the theorisation of humour more broadly.

## Establishing joint attention in Virtual Reality

---

Panel contribution

---

***Ms. Liliana Lovallo<sup>1</sup>***

***1. University of Lausanne***

Technology mediates an increasingly larger part of our interactions with others. Virtual Reality (VR) technologies are pushing the limits of digitally mediated communication, allowing participants to inhabit and share an immersive digital environment in which they can move, manipulate objects, and engage in joint activities. The simulation of presence in the VR environment (e.g. the sense of “being there” and of occupying a body in the virtual world, cf. Jerald 2015: 46) as well as of co-presence with other participants makes Virtual Reality a unique platform for social interaction in the digital era.

This contribution focuses on interactions between participants playing videogames together in VR. Participants playing in the same VR environment are faced with the problem of making sense of their spatial surroundings and of coordinating with each other in order to organise their shared play activity. Establishing a common spatial and referential frame in the game environment through joint attention is thus an essential task to secure smooth playing – a task the players need to accomplish over and over again in the ever-changing, fast-paced setting of the videogame (Mondada 2013). Participants playing together need to organise their actions so that they are visually accessible for their teammate and in general attuned to the on-going game activity and relevant game objectives. In order to ensure mutual orientation and achieve joint attention, participants mobilise an array of different resources such as deictic expressions, response cries, and gestures. Gaming sequences in which these resources are deployed are analysed with attention to the problem of handling the complex temporality of play activity while managing the affordances and restrictions to which interaction in VR is subjected.

The study is carried out using video recordings of videogaming sessions at German Virtual Reality arcades. Player activity in the VR environment – the first-person view of what participants perceive in VR – was recorded directly from the computer-generated feed stemming from each player’s VR device. Two cameras were placed near the play area in order to supply an external perspective of the players’ bodily conduct in the real world. A multimodal CA approach was adopted for the transcription and analysis of the data.

# Establishing the interactive roles of the helper and the help recipient in educational peer talk – epistemic stance-taking in instructive help interactions

Panel contribution

**Ms. Denise Wakke<sup>1</sup>**

**1.** University of Wuppertal

The negotiation of ‘knowing how’ is of great relevance in teaching and learning contexts and an essential part of educational help interactions. Students orient to the anticipated ‘knowing how’ of their fellow students in order to receive or provide help in the processing of tasks and thus ensure their and their fellow students’ capacity to solve academic assignments. Within the scope of these peer interactions, the students are faced with the challenge of taking on the interactive roles of helper and help recipient.

Previous conversation-analytical studies that focused on teacher/tutor-student-interaction have shown that a structural and an epistemic asymmetry is constitutive for help interactions in educational settings (Koole 2012; Svahn/Bowden, 2019). Coping with this epistemic gradient is particularly demanding for students in their interaction with peers, sometimes resulting in oppositional stances (Newman, 2002). However, the role of epistemics in the establishment of the interactive roles of the helper and the help recipient and the sequential organization of help interactions has not yet been investigated.

Addressing this research gap, this contribution examines the students’ *epistemic stance* (Heritage, 2013) in self- and other-initiated instructive help interactions. It focuses on how the interactants position themselves and each other while orienting to and negotiating the ‘knowing how’ of their interlocutor and exposes how epistemic stance-taking and positioning unfold in the course of interaction. The data is based on twenty-two video-taped lessons of two fifth grades. The help interactions of interest were transcribed and analysed using ethnomethodological conversation analysis.

The results confirm existing findings and show that the majority of all successful help interactions are self-initiated by the help recipient through a self-establishment as being in need of help. Beyond that, a contrastive qualitative analysis of the participants’ orientations to ‘knowing how’ in self- and other-initiated help interactions displays that the ascription of an *unknowing epistemic status (K-)* (Heritage, 2013) by the helper may lead to its negotiation, since at first the help recipient too takes a knowing epistemic stance. Hence, a *preference* (Pomerantz, 1984) for self-initiation of help interactions becomes evident.

# Estarías estando un poco alcoholizado. constructions as understating expressions in Rioplatense Spanish

Panel contribution

**Mr. Pedro Díaz Lammertyn<sup>1</sup>, Prof. María Sol Sansiñena<sup>1</sup>**

**1. KU Leuven**

The Spanish conditional (e.g. *cantaría*‘I would sing’) is a major inflectional category with a well-described set of modal and evidential meanings, such as the expression of indirect evidentiality, either inferential or reportative (Vatrican 2015, a.o.). However, the past two decades have seen the rise of a set of virtually undescribed constructions, particularly in Rioplatense Spanish, and in online contexts. In these recent uses the conditional, often in combination with progressive marking (Cond + Pr) and stative verbs, gives rise to an ironic effect by pragmatic inferences (Díaz Lammertyn & Sansiñena 2020). One might express the pragmatic features of (1) in English by “It seems as if you are a bit drunk”, which suggests having to pass via an inferential path to become aware of it. The interactional turn illustrated in (1) functions as the second part of an adjacency pair and counts as a dispreferred response which expresses subjective judgement: a previous behaviour is criticized.

(1) *Esta-rí-as esta-ndo un poco alcoholizado.* (Twitter)

be-cond-2sg be-prog a bit drunk

‘It seems as if you are (lit. would be being) a bit drunk.’

The use in (1) pragmatically conveys the opposite of the attenuated meaning associated with the conditional and the interlocutor has to infer this. In this sense, (1) can be viewed as an instance of an *understating expression* (Colston & O’Brien 2000). In the cases described here, the invited inferences are a pragmatic constant of the semantics-pragmatics of the expressions (Díaz Lammertyn & Sansiñena, 2020). Moreover, the predicate with progressive marking is often a state predicate, as in *estando*‘being’ (1). The features ‘state’ and ‘progressive’ have often been considered incompatible (Yllera, 1999, p. 3411); however, we will argue that the dynamic aspectual configuration of the periphrasis overrides the state lexical aspect of the predicates.

This paper aims to contribute to the study of the conditional through the thorough description of (Cond + Pr) constructions. We will answer the following questions: What are the semantic and pragmatic extensions of the conditional in present-day Spanish and how do the different meanings relate to each other? What are the lexical-grammatical features of these constructions? How does the grammatical aspect of the progressive periphrases influence the aspectual configuration of the constructions? The analysis is based on a sample of 1,000 Tweets selected at random from a purpose-built Twitter corpus (2010-2020) and annotated for a variety of grammatical, semantic-pragmatic and discourse-interactional features.

# Ethics and Morality in News Interviews: A Contrastive Discourse Analysis

Panel contribution

***Prof. Zohar Kampf<sup>1</sup>***

*1. The Hebrew University of Jerusalem*

In this presentation we take a contrastive perspective in order to examine the pragmatics of ethical and moral discourses in two journalists' cultures: Israel and the United States. By studying the ways Israeli and American interviewers formulate the epideictic accountability question (Kampf & Katriel, 2016) 'do you / condemn?' and interviewees' respective answers, we aim to underline both ethical and moral differences in the two cultures. On the ethical level, we examine how far journalists from different political cultures are willing to go in order to fulfill their traditional role society as norms enforcers (Lazersfeld & Merton, 1948). By studying the level of assertiveness in formulating epideictic questions (Clayman & Heritage, 2002a), we look for differences in how interviewers balance between the ethical codes guiding their professional conduct (e.g. neutrality, objectivity, etc. Clayman & Heritage, 2002b; Montgomery, 2007), and their aspiration to achieve their interactional goal, namely getting an unequivocal and quotable answer to their question.

On the moral level, we examine the interactional negotiation between interviewers and interviewees on the questions of what is condemnable in Israeli and US political cultures. Applying a contrastive discourse analysis, we aim to find differences in the norms and values that are cherished in each society and in the moral boundaries suggested by the interlocutors for 'proper' political behavior and in-group membership (Glasser & Ettema, 1989).

Accountability questions will be identified on the basis of keyword searches in Israeli and US news databases which archive data from a range of media outlets. We will look for utterances that include the performative marker 'condemn' (Beale, 1978; Kampf & Katriel, 2016) embedded within yes/no assertive questions (Clayman & Heritage, 2002a). We conclude by discussing the benefit of applying a contrastive discourse analytic approach, using epideictic markers as a tool for studying differences in journalistic and political cultures.

# Ethnically motivated slurs against Ecuadorian indigenous leaders on Twitter

Panel contribution

***Dr. Maria Placencia<sup>1</sup>***

**1.** *Birkbeck, University of London*

This paper explores the use of ethnically motivated slurs against Ecuadorian indigenous community leaders and representatives on Twitter. Ecuador has a history of discrimination against its indigenous population dating back to the colonial period (Gómez Nadal 2017). The indigenous uprisings of the 1990s led by CONAIE (Confederation of Indigenous Nationalities of Ecuador) brought about important changes, with indigenous peoples gradually gaining increased social and political representation, as well as the recognition of Ecuador as a pluri-national state in the 2008 Constitution. However, despite the gains they have made over the past few decades, ethnically based discrimination still seems to persist. How such discrimination is enacted through language in face-to-face interethnic interactions in the Ecuadorian Andes has received some attention from anthropologists and sociologists, in particular (see, e.g., Cervone 1999; Carrillo Salgado 2002). A critical pragmatics perspective on this topic is offered by Placencia (2008).

Building on the works above and studies on slurs (e.g., Jucker 2000; Croom 2013) and insults (e.g., Guimarães 2003; Stokoe and Edwards 2007; Mateo and Yus 2013), in this paper I examine a sample of slurs on Twitter against a selected number of indigenous leaders. I analyze the design of such slurs and the stereotypes that they invoke through which ethnic prejudice is (re)created. My ultimate aim is to bring to light this kind of discursive racism perpetrated online. While studies on face-to-face interaction in the late 1990s and the 2000s have shown the use of *veiled* racism (see, e.g., Cervone 1999), Twitter (and possibly other social media) offers a space where blatant verbal abuse appears to have resurfaced, aided by the anonymity that Twitter can afford. It is also behaviour that appears to go hand in hand with the increased political polarization of Ecuadorian society within the past 15 years.

# Evaluated Reference Terms and Impression Management in Courtroom Closing Statements

Panel contribution

*Prof. Krisda Chaemsathong<sup>1</sup>*

*1. Hanyang University*

In line with the well-established notion of identity as fluid, contingently-occasioned and discursively constructed and negotiated, research has shown that social identity is at stake in the courtroom and can affect the outcome of a trial, for all participants involved (Fuller 1993; Matoesian 2001; Hobbs 2003, 2008; McKinlay and McVittie 2011; Vartiainen 2017; Chaemsathong 2011, 2019). This paper sets out to explore reference terms as evaluative resources that allow lawyers to construct and deconstruct the identities of social actors in their narratives, thereby (dis)establishing the credibility and authority of these individuals. The study draws upon present-day high-profile American trials and attends to the under-theorized genre of the closing statement—an uninterrupted monologic speech addressed to the jury before deliberation on the guilt of the defendant, hence the last chance for “impression management” (Hobbs 2003, 2008) of the person on trial and witnesses. The findings explicate how reference terms, including personal names and identification and function descriptions, can be explicitly or implicitly evaluated, which in turn serve to manage impression for the referents by differentiation and exclusion. It is also found that the two sides attribute polarized identities to the same characters in a systemic fashion.

# Evaluation in Chinese celebrities' child-father interactions

---

Panel contribution

---

**Dr. Yi An**<sup>1</sup>, **Prof. Hang Su**<sup>2</sup>

1. Beijing University of Posts and Telecommunications, 2. Sichuan International Studies University

This study investigates evaluation in Chinese celebrities' child-father interactions, using data taken from a highly acclaimed Chinese reality TV show, *Dad Where Are We Going*. Drawing on Martin and White's (2005) Appraisal framework, the investigation examines how fathers and children express their feelings (i.e. Affect), judge other people (i.e. Judgement), and assess things (i.e. Appreciation), and further explores the social values and ideologies reflected in, and in turn reinforced, by their use of evaluative language. The examination shows that Judgement made up the largest proportion of evaluation made by parents, whereas Affect accounted for a much higher percentage in children's use of evaluation. Moreover, while fathers' judgements of children were predominantly negative, their judgements of themselves were mostly positive. By contrast, in children's data, the rates of positive judgement were equally high for themselves and for fathers. The results are discussed in relation to socialization (Schieffelin and Ochs, 1986). In addition, it is found that conformity to the group, harmonious relationships, deference to and respect for the elders, opportunity education (Fung et al., 2004; Miller et al., 2008), and implicit expression of love, are valued in Chinese celebrities' child-father interactions. Finally, the implications and impacts of Chinese celebrities' values and ideologies on the public are discussed.

# Evasive Responses in Political Ritual Interaction: A Speech Act Point of View

---

Lecture

---

***Ms. Shiyu Liu<sup>1</sup>, Prof. Fengguang Liu<sup>1</sup>, Prof. Daniel Kadar<sup>1</sup>***

***1. Dalian University of Foreign Languages***

In the present talk, we examine the pragmatic strategies and ritual functions of ‘evasive response’ behaviour, by approaching such behaviour through the lens of speech acts. Evasive response behaviour is a discourse strategy which is often adopted by politicians and their spokespersons to encounter questions that they perceive as ‘threatening’. The speech act patterns through which evasive responses are realised have been understudied in pragmatics. The current study aims to fill this knowledge gap. We believe that studying data drawn from the realm of language and politics is particularly worthwhile to study because compared to daily verbal interactions the participation structure of political events tends to be more complex, which in turn influences the way in which pragmatic evasion is realised in such ritual settings. In the analysis of speech acts we use the typology of House & Kadar (2021), which divides speech act categories into ‘Substantive’ and ‘Structural’ speech acts. This classification of speech acts helps us to systematize our data in a replicable way, by considering which are those speech act types that can be used to describe evasion in any data type. Our data is based on transcribed data drawn from press conferences held by the Chinese Ministry of Foreign Affairs.

# Evidential/focus markers and discourse connectors in Southern Peruvian Quechua

Panel contribution

***Prof. Liliana Sanchez<sup>1</sup>, Prof. Luis Andrade Ciudad<sup>2</sup>, Prof. Roger Gonzalo Segura<sup>2</sup>***

*<sup>1</sup> University of Illinois Chicago, <sup>2</sup> Pontifical Catholic University of Peru*

Evidentiality has been extensively studied across languages from the morphosyntactic perspective (Aikhenvald 2004), the semantic perspective (Faller 2004), and more recently from the discourse perspective (Fetzer & Oishi 2014). Fetzer and Oishi (2014) identify E1 languages that obligatorily mark evidentiality through grammaticalized means (evidential morphemes, tense, etc) and E2 languages that optionally mark evidentiality through lexical or non-verbal means. The relationship between evidential markers and discourse connectors in E1 languages has been less explored (Muysken 1995). In this study, we focus on the distribution of Southern Peruvian Quechua (SQ) evidential/focus markers such as -mi (attested) or -si (unattested) and discourse connectors such as hina ‘like’ (Muysken 2015) and chaymanta ‘then’ and we explore the role that evidential suffixes have on the way in which discourse units are structured. This interaction is exemplified in the following excerpt from a Southern Peruvian Quechua narrative:

[1] chaymanta warmacha caja-pi apa-mu-sqa rana-cha-ta.

Then boy-DIM box-LOC bring-DIR-PST.REP frog-DIM-ACC

“Then the boy brought the frog in the box”

[2] hina-spa chura-n wakin animal-cha-n-pa ladu-n-man

Then-SS put-3.S some animal-DIM-3.S-GEN side-3.S-ABLA

“Then (same subject) (he) put it next to some of his animals.”

[3] hina-pti-n chay sapu chiqni-ku-spa-m

Then-DS-3.S that toad hate-REF-SPA-FOC/EVID

chaki-cha-n-ta foot-DIM-3.S-ACC

kachurpari-n.

let go-3.S

“Then the toad, hating it (the frog), let its leg go”

[4] hina-pti-n-mi warmacha saputa qaqcha-n.

Then-DS-3.SFOC/EVID boy toad-ACC tell off-3S

“Then, the boy told off the toad (attested)”

This discourse fragment from an elicited frog-story narrated by an adult speaker shows a sequence in which the discourse connector chaymanta in [1] is unmarked, followed in [2] by hina marked with the same subject marker -spa. In [3], the subject changes and hina receives the different subject marker -pti and in [4] the subject changes back to the boy and hina is marked with -pti and the attested evidential/focus marker -mi. This last utterance breaks the sequence of events in which the boy introduces the frog to the animals and initiates a new sequence in which the boy chastises the toad. To confirm this is a regular pattern in SQ discourse, we analyzed 18 frog stories produced by adult Quechua-Spanish bilingual speakers in order to understand a) the distribution of evidential marking of discourse connectors, and b) the extent to which it is required to start a perceived new sequence of events in discourse. Our findings revealed that while evidential markers may appear on discourse connectors, only a third of the speakers have a preference for marking them on connectors indicating different patterns of text structure development among these bilinguals. Among those who produce them on discourse connectors, the use is frequent and the pattern in [4] holds for some speakers. The data indicates that the marking of evidentiality on discourse connectors is optional and the distribution of evidential/focus markers depends on the perceived sequence of the events.

# Evocation and tautologies: varieties and constraints (joint work with Natalia Zevakhina)

Panel contribution

***Dr. Elena Vilinbakhova<sup>1</sup>, Dr. Victoria Escandell-Vidal<sup>2</sup>***

*1. St Petersburg University, 2. Universidad Complutense de Madrid*

Our talk is concerned with the human capacity to interpret utterances which do not provide enough information on the level of sentence meaning. More specifically, we look at nominal tautologies, as in (1b). In the literature it is standardly assumed that nominal tautologies are used to evoke a piece of shared knowledge: in this case, *John is John* conveys that being late is something built in in John's nature (Wierzbicka 1987; Fraser 1988; Gibbs and McCarrell 1990; Miki 1996; Bulhof and Gimbel 2001; Meibauer 2008).

(1) a. -John has missed his plane!

b. -No wonder! John is John.

It can be noted, however, that the interpretation of the tautology in (1b) does not fully depend on the fact that both speaker and hearer actually share the assumption that John is always late. Any passer-by, not knowing who John is, would arrive at the same interpretation effortlessly. Hence, the role of shared knowledge is not crucial, as most of the previous literature assumes.

The main claim we argue for in this talk is that shared knowledge is neither a necessary nor a sufficient condition for the interpretation of tautologies. Specifically, (i) when the hearer does not have previous knowledge about the entity referred to in the tautology, the occurrence of the tautology itself induces the accommodation of a relevant assumption that can make the use of the tautology legitimate in the discourse context; (ii) only permanent properties can be invoked as premises conveyed by tautologies; transitory states are rejected, even if they constitute shared knowledge and are supported by the context.

In order to test these assumptions, we conducted a survey with sixty participants recruited from Amazon Mechanical Turk with IP-addresses from the US and reportedly speaking English at home.

We created 26 dialogues such as (2a) with two possible interpretations for a tautological expression in each dialogue. The conveyed messages involved either ILP, referring to the permanent property such as (2b), or SLP, indicating a transitory state, such as (2c), and were followed by a question (2d).

(2) a. ANN: Jill bought a Louis Vuitton bag!

BILL: No wonder! Jill is Jill.

b. Conveyed message: She is a spendthrift.

c. Conveyed message: She won the lottery yesterday.

d. Can Bill's reply convey the indicated message?

We created two lists with 26 critical items and 26 fillers. Along with 26 fillers, each participant read 13 dialogues with SLP and other 13 dialogues with ILP interpretations, and had to answer the question in (2d). Statistical analyses conducted with JASP software (JASP team, 2019) confirmed our claims: the participants were significantly more likely to accept the conveyed messages with permanent properties than messages with transitory states.

# Excluding the immigrant ‘Other’ via resistance and inclusion: The case of the Greek anti-racist short film Jafar

Panel contribution

***Dr. Rania Karachalioú<sup>1</sup>***

*1. University of Patras*

Contrary to a great amount of research concentrating on explicit discriminatory practices and the overt demonization of the immigrant ‘Other’, this study places emphasis on antiracist discourse/s, which officially aim(s) to resist xenophobia and social inequalities (see also relevant works: Archakis et al. 2018, Tsakona et al. 2020). Combining Bamberg’s three-level model of narrative positioning (1997, 2004) with methodological tools of Critical Discourse Analysis (van Leeuwen 2008, Reisigl & Wodak 2001), I investigate otherness in the Greek antiracist short film *Jafar*(2013), which went viral the year it was launched. Focusing on Jafar’s character, I argue that although the film appears to denounce racism, it simultaneously reproduces practices of discrimination.

In the film, a racist Greek family enters a hospital waiting room, where a dark-skinned man in a bowed stance is silently sitting, only to realise a few moments later that Jafar is their daughter’s bone marrow donor. With relation to the *story world* (level 1), the visual analysis reveals that, in most of the scenes, Jafar’s representation follows the strategies of distanciation, disempowerment, and objectivation, which are commonly used for excluding the ‘Other’ (van Leeuwen 2008: 141). Interestingly, Jafar’s bowed stance is transformed into a direct gaze and a smile only when the doctor announces his ‘true’ identity. This concurrence implies that certain eligibility conditions apply for Jafar’s visibility. In other words, the immigrant ‘Other’ is accepted when he becomes the ‘beneficiary Other’. As far as the *act of narration* (level 2) is concerned, YouTube comments range from solidarity-driven to xenophobic. By means of topoi, i.e. «content-related argument schemes used in argumentation for and against discrimination» (Reisigl & Wodak 2001: 75), I analyse comments related to the topoi of humanitarianism and advantage, which confirm the controversial reception of the film.

With respect to the *socio-ideological macro-level* (level 3), my analysis shows that the film allows two different representations of otherness: i) the caring ‘Other’, which resists the stereotype of the ‘violent’, ‘criminal’ immigrant and ii) the beneficiary ‘Other’, which regulates immigrant inclusion via eligibility criteria of usefulness. Given the above findings, otherness seems to be a rather delicate matter, even when it comes to antiracist discourse/s.

This research work is supported by the Hellenic Foundation for Research and Innovation (HFRI). It is part of the research project “TRACE: Tracing Racism in Anti-raCist discoursE: A critical approach to European public speech on the migrant and refugee crisis” (HFRI-FM17-42, HFRI 2019–2022).

# Exclusion and Inclusion in Peer Groups: The Construction of Exclusionary Acts by Hearing and Deaf Youth

Panel contribution

***Dr. Sara Goico<sup>1</sup>, Dr. Marjorie Harness Goodwin<sup>1</sup>***

*<sup>1</sup>. University of California, Los Angeles*

In this talk, we bring together findings from ethnographic research on a girls' peer group of mixed ethnicities and social classes in an elementary school in Southern California and a mainstream elementary classroom with three deaf students in Iquitos, Peru. In the latter field site, the deaf youth have grown up without acquiring either Spanish or Peruvian Sign Language and, therefore, communicate using local signs that they have developed over the course of their own lifetime. Despite the cultural, socioeconomic, and stark linguistic differences between the youth in these school settings, we find that the children are similarly engaged in reinforcing bonds of solidarity within their peer groups through explicit acts of classmate exclusion. We approach our work with children concerned with people's lived experiences, asking: What does it mean to inhabit the world of a group of peers? and How is exclusion achieved in peer interaction? In addressing these questions, we begin from the premise that "a primordial site for the organization of human action, cognition, language, and social organization consists of a situation within which multiple participants are building in concert with each other the actions that define and shape their lifeworld" (Goodwin & Goodwin 2004, 223). Thus, we use video recordings of naturally occurring interactions from our distinct ethnographic contexts to look at how practices of exclusion and ridicule are constructed in moments of situated interaction among peers working co-operatively with one another. In doing so, we focus our discussion on the bodily organization, multiparty participation frameworks, multimodal semiotic resources, and sequential organization that constitute exclusionary acts. The similarities in the construction of exclusionary acts between our sites is particularly noteworthy given that the deaf youth are accomplishing similar social work without the linguistic resources of the Southern California girls. This comparison provides an important site to investigate the abilities that underlie human sociality.

# Exegesis: Interpreting a text to support a position

---

Panel contribution

---

**Dr. Eric Hauser**<sup>1</sup>

1. University of Electro-Communications

Drawing on data from telephone conversations between former U.S. President Johnson and subordinates, I use Conversation Analysis and Occasioned Semantics to analyze cases of *exegesis*, that is, the interpretation of a written text within interaction. It is shown that exegesis is used in local contexts of disagreement or disalignment to support a position and to pursue an adequate response to the articulation of that position. Exegesis involves the referencing and possible reading of a written text followed by an interpretation of the text. The interpretation may be prefaced by expressions such as “what he was saying is ...” or “what he comes out and says is ...” which explicitly indicate that what will come next is an interpretation of the intentions of the writer or of the upshot of the written text. When a recipient does not respond, a response may be pursued through further exegesis or through other means to support and possibly mitigate the speaker’s (i.e., the text interpreter’s) previously articulated position.

In each case of exegesis in the data, the writer of the text is a third party, neither the text interpreter nor the recipient. For comparison, I look at a case from the same dataset in which participants interpret what a non-present third party has said, rather than a written text. Instead of reading or referring to a text, the speaker first uses indirect reported speech to indicate what the third party has said. However, this is then followed by a lack of uptake from the recipient, indicating possible disalignment. Uptake is then pursued through an interpretation of what this party has said, prefaced with “what he’s saying is ...” The similarities between interpretation of what a third party has said and exegesis indicate that the latter may be a subtype of a more general phenomenon, that is, interpretation of spoken or written discourse/text produced by a non-present other. This bears some similarity to formulations (Garfinkel & Sacks, 1986; Heritage & Watson, 1979) which involve interpretation of prior talk. What makes this phenomenon distinct from formulations (or perhaps better, reformulations) is that the person who originally produced the discourse/text is not part of the current interaction, which results in the person whose words are being interpreted not being available either to contest or confirm the interpretation. Based on these cases of exegesis and the comparison case, consideration is given to the situated nature of interpretation of another’s words. Specifically, the meaning attributed to another’s words and/or intentions is a meaning which is relevant for these participants at this particular time. In addition, interpretation is interested, in that it is used in support of a position in a context of disagreement or disalignment.

# Exercising the right to remain silent in Japanese trials

Panel contribution

**Dr. Ikuko Nakane**<sup>1</sup>

1. University of Melbourne

Defendants in criminal trials in Japan have a right to remain silent, and cannot be obliged to testify against themselves. As in other jurisdictions where the right to silence is guaranteed, the defendant cannot be disadvantaged because of their silence. In other words, the defendant's lack of responses to questions in court cannot be interpreted negatively. However, Grice's cooperative principle (1975) and key insights from Conversation Analysis, especially the theory of preference organization (Pomeranz 1984) have demonstrated that silence is a 'dispreferred' response to a question that would be non-cooperative. The paradoxical relationship between the norm of communication in everyday conversation and the institutionally constrained (non-)interpretation of silence has led to judges' meticulous attention to wordings used in jury instructions on the defendant's silence in some jurisdictions (e.g. Biber 2012).

This paper examines divergent interpretations of the defendant's silence in three high-profile homicide cases in Japan, based on media reports and other relevant material. It discusses how those divergent interpretations collide with each other in the courtroom context and in the public discourse domain. To this end, I draw on Kurzon's (2011: 2276) three types of participants in relation to silence: the silent person, the addresser, and the observer. For the silent person, the defendant, the silence, to which the law ascribes no interpretable meaning in the trial context, is used strategically to avoid self-incrimination. For the addresser, in this study the prosecutor, the silence needs to be presented as the defendant's failure to respond to the allegations against them. This stance aligns with normative negative interpretation of non-response to addressee-specific questions. Here, we see what Heffer (2005: 23) calls 'paradigmatic' and 'narrative modes of reasoning' in conflict over the interpretation of the defendant's silence.

The judge, an 'observer', is bound by the rules of the law in presiding over the trial, and cannot attribute negative meanings to the defendant's silence. Nevertheless, the cases in this study suggest that it is challenging for Japanese judges to apply and maintain the 'paradigmatic' approach to the defendant's silence in regulating trial communication and evidence. The 'observers' also include the victim's family and friends, and the media. In this study, the media not only reported the victim's family's desperate plea to the defendant for 'the truth', and in some cases expressed critical views on the right to silence. The study highlights the challenges that institutional constraints on meaning and pragmatic forces pose on the integrity of the defendant's right, especially where capital punishment is still practiced.

# Experimental pragmatics and the law – Examples of legal interpretation

Panel contribution

***Dr. Benedikt Pirker<sup>1</sup>, Mrs. Jennifer Smolka<sup>1</sup>, Dr. Izabela Skoczen<sup>2</sup>***

*1. University of Fribourg, 2. Jagiellonian University*

1. Context: Recently, experimental pragmatics has begun to be applied in the sphere of legal language. Interpretation is an essential and omnipresent activity in law and can be understood as a process of language comprehension. Legal norms – so-called maxims, canons or rules of interpretation – typically prescribe (among other things) that a legal norm or legal notion is to be interpreted in accordance with its ‘ordinary meaning’. This allows to rely on experimental methods to test various predictions about such ‘ordinary meaning’. The presentation features two different projects that implement such experimental research.
2. Project IntLLEX (Pirker, Skoczeń): Can the legislature, which, in international law, corresponds to the parties to a treaty, convey more than it said or wrote? Can a(n international) judge or arbitrator add content to a legal rule without being accused of judicial activism? When is non explicit content part of the ordinary meaning of a legal rule? Do the answers differ for moral or political content? We explore these questions in experiments based on real cases from the international legal-interpretive practice. We find that: (i) the level of explicitness of a legal rule has an influence on the confidence in truth judgments (higher for higher levels of explicitness), (ii) the level of explicitness of a legal rule has an influence on deniability judgments (lower for higher levels of explicitness), (iii) moral content of a legal rule influences the direction of the aforementioned interactions (morally uncontroversial content requires considerably lower levels of explicitness). In our experimental setting, participants (experts and laypersons) were first presented with different formulations of legal provisions and then evaluated a statement of a lawyer describing what the legal rule conveys. We tested four levels of explicitness: linguistic meaning, explicature, strong implicature and weak implicature. We asked how confident participants were in their truth judgments and to what extent would they allow the speaker to later deny what he or she claimed. In the morally neutral cases that we tested the difference between weak and strong pragmatic effects was pronounced. By contrast, in cases with a strong moral valence the difference was mitigated. We also manipulated the level of moral agreement: morally controversial cases generated substantially higher falsity ratings. We take this as primary evidence that moral considerations directly impact the notion of ordinary meaning.
3. PhD project (Smolka): The project deals with the relevance-theoretic and (selected) neo-Gricean accounts of pragmatic enrichment and examines which of these prominent pragmatic theories may be best suited to account for pragmatic enrichment in international law and experimentally test the developed claims. The linguistic item chosen to test these claims in order to develop a future experimental setting is the word ‘or’ and its interpretation in selected international legal contexts. In the real world, the interpretation of ‘or’ determines whether e.g. the International Court of Justice has jurisdiction in ongoing proceedings between the Russian Federation and Ukraine.

# Expertise of experience in co-development of social and health care services: Self-promotion and self-dismission as interactional strategies

Panel contribution

***Dr. Elina Weiste<sup>1</sup>, Dr. Melisa Stevanovic<sup>2</sup>, Mrs. Lise-Lotte Uusitalo<sup>2</sup>***

*1. Finnish Institute of Occupational Health, 2. Tampere University*

Contemporary social and healthcare services exhibit a major cultural change toward increasing client involvement in the development of services. This trend has given rise for a new group of experts who are invited to bring forward their experiential knowledge as client representatives in ministerial committees and service co-development groups, where they are expected to work side-by-side with clinical professionals. In the co-development processes, the client representatives are given the role to bring experiential knowledge into the joint discussion. Still, despite their equal right to participate in the service development with professionals, the possibilities of the client representatives to contribute to the actual decision-making has been noted to be restricted.

In this presentation, we have three main goals. First, we ask how the client representatives in the workshops aiming at the co-development of social and health care services design their contributions to the ongoing joint decision-making activity and how their contributions are responded to by the professionals. Second, we specifically probe the conditions in which the clients' tellings of personal experiences are treated by the professionals as deontically relevant or otherwise applaudable. Third, we compare the ways in which "ordinary" clients and experts-by-experience design their interactional contributions, asking how professionals differentiated responses to the client contributions could be best accounted for.

Our data consist of four audio and video-recorded co-development workshops (16 hours of interaction) held in three large communal social and healthcare organizations in Finland. The aim of these workshops was to promote work practices that would enhance clients' involvement in their own care, as well as in the planning and development of the social and healthcare services. In each workshop, there were approximately 15 participants involving professionals, managers, clients, experts-by-experience, and facilitators. The workshop interaction was analysed by means of conversation analysis.

Our data exhibits a systematic pattern linking the self-promoting and self-dismissing turns-at-talk by the client representatives to specific types of responses by the professionals. When the client representatives promote their expertise in experiential knowledge as relevant for making decisions, their contributions are disregarded by the professionals. If, however, the client representatives dismiss their experiential knowledge to be irrelevant for the decision-making activity at hand, that knowledge is subsequently treated as important and even applaudable by the professionals. Thus, paradoxically, in order to gain relevance for their views, the client representatives need to dismiss themselves from their position as experts of experience.

# Explanation of technical terms as textual interaction in popular science books

Panel contribution

***Mr. Henri Satokangas<sup>1</sup>***

**1.** University of Helsinki

This paper examines the explanation of technical terms in popular science books as sequentially organized interaction, where diverse semiotic resources are employed in the construction of conceptual knowledge. The aim is to bring clarity to the actual linguistic and other semiotic features of popularization discourse in general and the recontextualization of technical vocabulary in particular.

Informed by dialogistic approach to the analysis of text construction (e.g. Hoey 2001; Thompson 2001) and particularly the organization of texts constructing specialized, technical knowledge (Halliday & Martin 1993), I study term explanation sequences as gradually unfolding interaction between writer-in-the-text and reader-in-the-text, positions construed through the linguistic features of the text. Within the discourse of popular science, these positions are created throughout the text by, among other means, the use of field-specific lexicon. My data consist of four Finnish popular science books written by academic scholars from different fields. The selection of books was based on their representativeness of different areas of research and different stylistic strategies (e.g., narrative vs. expository style).

In this paper, I will first map the general rhetorical patterns used in the explanation of technical terms in the popular science books, such as elaboration patterns and naming patterns, and explore the construction of these patterns by identifying their specialized lexical and grammatical features, such as identifying intensive clauses (Halliday & Matthiessen 2014). Then, I focus on two specific semiotic resources that are utilized in the popular presentation of technical information: verbal narratives and visual images. The sequential organization of knowledge construction via narrativity and multimodality is analyzed in terms of relationship between different passages of verbal text as well as visual images. The categorization of text passages and images is based on systemic-functional genre theory (Martin & Rose 2008) and social semiotic framework on visual design (Kress & van Leeuwen 1996).

Finally, narrativity and multimodality are placed within the scheme of explanation patterns. My overall aim is to show how, throughout the data, specific patterns can be identified in the explanation sequences utilizing different semiotic resources of popularization. The identified patterns organize the structure of the interaction between the writer-in-the-text and reader-in-the-text of popular science. The patterns function as frames that direct both the production and the interpretation of popularization texts.

# Exploiting metaphor in disagreement

---

Panel contribution

---

***Dr. Lotte van Poppel<sup>1</sup>, Dr. Roosmaryn Pilgram<sup>2</sup>***

*<sup>1</sup> University of Groningen, <sup>2</sup> Leiden University*

The use of metaphors is a common strategy in argumentative discourse supporting a particular claim or promoting behavioural change. Recent studies have drawn attention to the potential harm an inappropriate metaphor could cause on the audience and even on society (e.g. Hauser & Schwarz 2015; Al-Saleem 2007). Problematic metaphors in public discourse, for instance military metaphors in communicating about Covid-19, have therefore been criticized a great deal, both in academia and in public discussions (e.g., Sabucedo, Alzate & Hur 2020). Active resistance to problematic metaphors can occur in various ways. In the current study, we focus on the way criticism is expressed by investigating one particular type of resistance, namely when an antagonist exploits the protagonist's commitment to a particular metaphor by using it for their own attack. We use the pragma-dialectical theory of argumentation and Krabbe and van Laar's (2011) typology of critical reactions to characterize this type of resistance, and we present several case studies.

A recent example occurred in response to the press conference by the Dutch government on September 28<sup>th</sup> 2020, in which Prime Minister Rutte and Minister of Health De Jonge announced new measures to contain Covid-19. De Jonge argued that it will take some time before the effects of the announced measures will be observable, because "This virus is like a mammoth tanker. It takes time to correct its course and to slow it down" (our translation of "Dit virus is als een mammoettanker. Het kost tijd om bij te sturen en af te remmen."). In the many responses to this metaphor on social media like Twitter, a common criticism was that not the virus, but the government was like a mammoth tanker: slow in responding to the situation.

This type of resistance is of particular interest because of its complexity and its potential risk to the protagonist's position: it involves a particular critical reaction to the metaphor to which the protagonist is committed and that needs to be addressed, and it also involves a move with an additional attack on the protagonist's claim. Also, although the shifting of metaphors has received attention in the literature (e.g. Cameron 2008), this strategy has not been viewed from an argumentative perspective or in relation to resistance. The current study aims to fill this gap by unravelling the mechanism of resistance through exploiting metaphors.

# Exploring Dangran ‘Of course’ Responses to Polar Questions in Taiwan Mandarin Talk-in-Interaction

Panel contribution

**Ms. Yu-Han Lin<sup>1</sup>, Ms. Shu-Yu Huang<sup>1</sup>**

***1. University of Hawaii-Manoa***

Responses to polar questions can be designed to go beyond affirmative/negative. For instance, Stivers (2011) shows that responses containing ‘of course’ in English, and equivalent response tokens in Dutch, Italian and Japanese, problematize the askability of the question. Drawing on 160 cases from two published corpora—“CallFriend - Taiwan Mandarin Corpus” and “Taiwan Mandarin Corpus”—and the TV talk show Kanxi Laile ‘Kangxi Coming’ aired in 2015, this study explores the use of Taiwan Mandarin *dangran* ‘of course’ in response to polar questions with conversation analysis. We also take multimodality into account when available.

We have found two types of *dangran*: stand-alone and syntactically-integrated *dangran*. Echoing previous findings, both types contest the askability of the question due to the answer being self-evident and counterchallenge the morally problematic assumption within the question. In contrast, 53% *dangran*-responses are suffixed with an utterance final particle a; a treats the question as inapposite and counter-expected. When a is present, it augments the challenging force compared to *dangran*-responses without a. The difference is evidently shown in the speaker’s vocal and bodily design (Excerpts 1 and 2).

(1) Inferring from P’s previous comment, T asks if P means that he would win the competition of “the charmest man” if they hold the competition again after twenty years.

09 T ni jiu hui diyi ming dui bu dui,=  
you then will first rank right N right  
You will be in first place, right?

+nods  
10 P =+↓dangrang.  
Of.course  
Of course.

(2) C asserts that when a guy in an ambiguous relationship gives a vague answer “I treat you as a special friend”, it is necessary to ask “what kind of special friend am I” for clarification.

08 T HAI YAO ZAI WEN MA-  
still will again ask Q  
Are you gonna keep asking?!  
+turns away +turns back and frowns

09 C +DANGRAN +A:  
of.course PRT  
Of course!

Specifically, speakers have achieved various interactional work with syntactically-integrated *dangran* depending on the kinds of response. *Dangran*-embedded transformative responses are more delayed and hesitant than other types of responses, treating the matter addressed in the questions as delicate. In repetitional answers, full repetitions more strongly assert respondent’s agency than partial repetitions. *Dangran* in multiple responses shows that the majority of respondents prioritize confirmation/affirmation before uttering *dangran* in their responses.

In conclusion, we have shown the similarities and differences between *dangran* in Mandarin and the equivalents in other languages in literature, extending cross-language research on answers beyond question design. We further explicate how *dangran* interplays with different types of resistant responses. Substantial and various

kinds of data enable us to have systematic context-free and context-sensitive examinations. Furthermore, this study contributes to multimodal CA examination since participants' bodily conduct provides strong evidence for our analysis on the difference between *dangran* and *dangran a*. Moreover, information can be inferred from visual conduct, which may or may not be observable from talk itself. Future work will include Mainland Chinese talk-in-interaction to expand the research scope.

# Exploring interspecies communication through discourse analytic theory: An analysis of human-goat communication at a petting farm

Panel contribution

***Prof. Leonie Cornips<sup>1</sup>, Ms. Fien De Malsche<sup>2</sup>***

**1.** NL-Lab, Humanities Cluster (KNAW) & Maastricht University, **2.** University of Antwerp

Our contribution will examine how applied linguistic research can further contribute to the burgeoning field of interspecies studies, leaving behind an anthropocentric mindset in our general worldview and our conceptions of language and communication (Cornips & van den Hengel, 2021; Milstein, 2013; Pennycook, 2018). To this end, we will address two research questions: (i) whether traditional discourse analytic linguistic theory can be used to analyze non-human communication, and (ii) whether the genre-specific concepts of communicative events, communicative purposes, and move structure as defined by Bhatia (1993; 2002) and Swales (1990) can be applied to interspecies interactions. To answer these questions, we conducted a linguistic ethnographic case study on human-goat communication within the discursive context of the petting farm with a specific focus on feeding interactions in order to better understand how these social actions are co-constructed and achieved through communication between the human and goat participants.

The dataset consists of 6000 words of field notes, 42 photographs, and 29 videos collected during 6 visits (14 hours of observation in 2019) at a petting farm in the Netherlands. The data show that the different key concepts of genre theory affect communication between human and non-human animals in ways that are similar to how they affect human-human communication. Additionally, the data provide more insight into how both goats and humans exert agency, revealing the strongly anthropocentric ways in which humans interact with goats at the farm. Even though the power relations observed in the data showed that the human participants do not expect or want the goats to do exert agency, the goats often do, and we suggest that the humans and goats both display intentional communication as they co-produce meaning by means of changes in body orientation and directing their gaze towards the receiving participant (Sievers et al., 2017). Consequently, the results illustrate the possibility and need for applying traditional linguistic theory to non-human contexts, and we argue that this type of posthumanist research can lead to new insights in general communicative paradigms and as such could contribute further to the understanding and welfare of (farm) animals.

# Exploring language ideologies of silence through the study of metadiscourse

Panel contribution

***Dr. Melani Schroeter<sup>1</sup>***

***1. University of Reading***

Silence is a notoriously difficult object of empirical analysis. This paper discusses the benefits of investigating silence and silencing through the lens of metadiscourse. Studying metadiscourse about silence not only helps to empirically 'localise' (perceived) silences, but also to carve out language attitudes, norms and ideologies that underpin attitudes about silence, including contexts and purposes for which it is (not) acceptable. Studies based on metadiscourse that deal with changing or culture-specific communicative norms can also indirectly inform us about silence. For example, studies that demonstrate the increasing value of well-managed communication, openness, discussion, debate and deliberation point towards an increasing problematisation of silence, especially in the public sphere.

With this methodological concern in mind, the paper will be based on evidence from previous studies that indicate an increasing problematisation of silence and silencing in the public sphere in post-war Germany. Taking these findings as a starting point, the paper will provide an analysis of the discourse of the New Right in Germany, arguing that this political movement strategically exploits the value put on communication and the problematisation of silence and silencing in public discourse that goes along with it.

The paper will demonstrate that in line with the New Right's metapolitical approach, much of their discourse involves a metadiscourse about public discourse in Germany. Notions such as the existence of a silent majority, of artificially drawn and heavily guarded borders of discourse, silencing of dissent as well as tabooing of vital topics and concerns are frequently perpetuated in this metadiscourse while drawing on a widely shared social consensus that silence and silencing are in conflict with sustaining a democratic society.

The contribution will conclude that it is important to understand language ideologies of silence and silencing as well as their change through time and through changing communicative configurations, such as the emergence of a 'digital public sphere'. Such an understanding is important because helps to explain the uses and acceptability of silence across domains and contexts and to carve out strategic aims that may be involved when silence and silencing is put out for debate.

# Exploring the pragmatics of inclusion and exclusion in an amateur netball team. The case of emergent leadership

Panel contribution

*Dr. Kieran File<sup>1</sup>, Dr. Stephanie Schnurr<sup>1</sup>, Ms. Solvejg Wolfers-Pommerenke<sup>1</sup>, Dr. Daniel Clayton<sup>2</sup>,*

*Ms. Anastasia Stavridou<sup>3</sup>*

*1. University of Warwick, 2. Warwick Uni, 3. University of War*

In line with the panel's focus on the pragmatics of inclusion and exclusion in team sports, this paper explores how leadership emerges among the players of a netball team, paying particular attention to which players are included in and excluded from this process.

Drawing on over ten hours of naturally occurring interactions among the players of a women's amateur netball team in the UK, and applying the concepts of deontic and epistemic status and stance, we identify and describe some of the specific pragmatic features and processes through which leadership is claimed and assigned, as well as contested, rejected, passed on, and eventually accepted by different team members at different points throughout an interaction.

Findings illustrate that the pragmatics of inclusion and exclusion are closely intertwined with each other, and that while several players are included in the processes of negotiating leadership, others remain marginalised and excluded.

This paper makes several contributions: i) it provides empirical evidence to currently largely theoretical debates around emergent leadership, and ii) it illustrates some of the benefits of approaching the notions of inclusion and exclusion in team sports from a pragmatic angle.

# Exploring the pragmatics of inclusion in examples of leadership and followership practices in a basketball team.

Panel contribution

***Ms. Anastasia Stavridou<sup>1</sup>***

***1. University of War***

Sports is a research site with rich resources of interactional data, and thus, for the study of contemporary social issues, such as the phenomena of inclusion and exclusion in (team) sports. However, only recently has the study of these phenomena from a sociolinguistic perspective reached scholarly attentions (File, 2018, File & Schnurr, 2019, Wolfers et al., 2017).

This paper aims to address how various players of a basketball team are included in communicative activities during time-outs due to the absence of an officially assigned coach, by critically examining the interactions in the microlevel. Drawing on more than 20 hours of video-recorded data collected from a university-level men's basketball team during their league games, the paper explores the pragmatics of inclusion in and exclusion from leadership practices, and what discourse analytical tools players employ when making leadership claims and taking over leadership responsibilities.

Adopting an ethnographic design, the study follows the approach of Discursive Leadership (Fairhurst, 2007, 2008) in order to explore the how inclusion and exclusion are discursively accomplished in examples of leadership and followership performance. More specifically, the study utilises the methodological tools of Interactional Sociolinguistics (Goffman, 1974; Gumperz, 1982, 2001; Schiffrin, 1994) in order to unpack how various players are included in or excluded from communicative activities during the team's time-outs.

Preliminary findings suggest that with the absence of a coach, various players step up and take over leadership responsibilities at different points during the games. By contrast to mainstream conceptualisations of leadership which tend to agree on one established leader involved in leadership practices, usually the coach or the team captain, the analysis of data illustrates that leadership in action can be a "muddy" practice as different players are involved in different instances. Consequently, the study questions traditional ideas about leadership and provides empirical data to unpack the processes of inclusion leadership practices.

# Exploring the ‘dark side’ of sociability: what can the pragmatics of flattery teach us about hypocrisy?

Panel contribution

***Ms. Roni Danziger<sup>1</sup>***

*1. The Hebrew University of Jerusalem*

Participants in an interaction use language in order to achieve social goals (Goffman, 1967). A compliment that encourages desired behavior arguably offers a positive evaluation with an interactional goal in mind. However, when that compliment is labeled as flattery, it implies that participants in an interaction evaluated the conventionally coded language as having strategic or manipulative intent. This fine line between what is considered acceptable and unacceptable positive social behavior is at the center of this presentation. This presentation will argue that like flattery, hypocrisy is also a label of socially unacceptable intentions expressed by language in interaction. Placing both social phenomena as representations of the ‘dark side’ of sociability, i.e., the possibility of positive conventional language to be judged as socially unacceptable, permits the comparison between the two labels.

In a recent meta-pragmatic study of Hebrew speakers, a data-driven definition of flattery was suggested, positing that flattery is a “*marked communicative action; it is intended to be face-pleasing to the recipient, an effect that mediates one of three interactional goals of the flatterer: transactional, self-promotional, or relational. The action is perceived by at least one participant in an interaction as instrumental after evaluating textual cues and contextual clues.*” (Danziger, 2020: 423). This definition clarifies that flattery is an interpretive construct; participants in an interaction interpret conventional actions as having strategic or manipulative intent and meta-pragmatically label them as flattery. Specifically, suspected solidarity-oriented actions are judged as flattery (a) if the addresser is perceived as having something to gain from an act, (b) if unequal power relations affect contextual expectations, (c) when the action is deemed exaggerated or hyperbolic, (d) when there is a recurrence or a change in the addresser’s behavioral patterns, (e) if the direct addressee is judged as underserving or (f) if the action is performed publicly.

Hypothesizing that the meta-pragmatic label of hypocrisy is given when participants in an interaction detect socially unacceptable mismatch between previous behavior and a current one, this presentation will suggest a framework for studying the perception and use of hypocrisy by presenting the pragmatics of flattery, and the meta-pragmatic methodology used to study it. Building on relational work theory (Locher and Watts, 2005), which puts emphasis on judgements of language in interaction, a meta-pragmatic methodology can outline the specific cues and clues (Weizman and Dascal, 1991) participants in an interaction evaluate in order to arrive at a judgement of language as hypocritical. This presentation will suggest a methodological path to discover when does an otherwise acceptable behavior receive a negative label that encapsulates an evaluation of inconsistent moral behavior.

# Expressing and addressing customer dissatisfaction on Instagram

Panel contribution

***Prof. Stefan Diemer<sup>1</sup>, Ms. Marie-Louise Brunner<sup>1</sup>***

***1. Trier University of Applied Sciences***

Our paper investigates the pragmatics of webcare interactions surrounding expressions of customer dissatisfaction in an international business context through Instagram. We follow a corpus-driven approach specifically optimized for multimodal data, providing an interdisciplinary, applied perspective. The basis for the study is a collection of Instagram posts and comments by 60 European companies from different sectors in 2018-20. In the context of the panel, we investigate in particular the discursive dynamics and interactional strategies in this public webcare setting when customers voice their dissatisfaction: How is the discourse framed linguistically and paralinguistically, how do companies react, how do other customers react and interact.

Instagram has become a key medium for companies that address an international and young customer base. Companies have been shown to use Instagram mainly as a marketing and customer engagement tool (Brunner & Diemer 2019), but also for webcare, particularly since the introduction of a thread structure in 2019. In order to analyze the discourse surrounding dissatisfaction in our dataset, we carry out a multimodal analysis of salient interactions (Instagram posts and comments) to illustrate key discourse strategies, examine paralinguistic aspects and identify individual, cross-cultural and sector-specific patterns.

Our results indicate that companies used a range of strategies when addressing customer dissatisfaction, focusing on personal, brief messages that specifically and individually address the respective issues (cf. also Zhang & Vásquez 2014, Einwiller & Steilen 2015) and extensively use the affordances of the medium, including paralinguistic means such as emojis, links, and strategic hashtags. In cases of continued dissatisfaction expressed by followers, webcare can be moved into the private sphere (via direct message). Similar to other social media, complainants expect fast reactions and comment on lack of responses, illustrating the need to manage content. We also find frequent occurrence of ‘peer-to-peer webcare’, where other followers answer/comment on the initial complaint/issue. The webcare interactions show classical webcare sequences and strategies such as apology, explanation, or offers to remedy the situation. In contrast to other social media such as facebook, tonality is generally positive, and criticism or complaints are frequently phrased humorously or in a face-saving manner.

In sum, our study illustrates that Instagram is an increasingly interesting and attractive medium for webcare. Companies can strengthen customer engagement considerably through managing and showcasing brief instances of successful, fast webcare. Due to its positive tonality even in expressing and addressing dissatisfaction, Instagram provides a more forgiving and less critical webcare medium both for newer and smaller companies and for companies that want to strengthen customer engagement through successful public webcare.

# Expressing sympathy in Luganda: Interjections and cultural practice

Panel contribution

***Ms. Laura Seel<sup>1</sup>, Prof. Nico Nassenstein<sup>2</sup>***

**1. GU Frankfurt, 2. JGU Mainz**

*Pole* is a conventionalized linguistic expression of sympathy in Swahili (Bantu G42). It is an expression of compassion for the discomfort or pain of another. It encompasses “the entire semantic range of the English word ‘sorry’” (Eastman 1983: 168, see Fig. 1), whereby it refers exclusively to what happened to another person and is not to be understood as an excuse for one’s own actions. The form *pole* is derived from the Swahili subjunctive verb form *upoe* ‘may you get well’ (Eastman 1992: 279). Interjections like *pole* are part of the culture-bound vocabulary of a language and are necessary to communicate effectively in a society. Such expressions link language to its cultural context and reveal the idea of a social system shared by speakers – basically, they communicate social structure (Eastman 1992: 273).

“HEALTH”:

- SYMPATHY -> general: pole! / -> strong self: ole!
- BLESS -> afya!
- CURE -> hekol!

**Figure 1:** Symbolic exclamations in Swahili (adapted from Eastman 1983: 170)

Based on expressions for sympathy in Swahili, we look at analogies and divergent patterns found in Luganda (Bantu JE15, [lug]), the most widespread language in Central Uganda. Pursuing a linguistic anthropological approach, this talk seeks to differentiate linguistic strategies in their cultural context, with a specific focus on the interjection *bambi* (sometimes loosely translated as ‘please’, ‘sorry’ or ‘what a pity’), a modal particle expressing empathy and pity (Nassenstein & Tacke-Köster 2019: 90) – and also sympathy. We intend to show that while *bambi* and *pole* have a specific semantic intersection, their range of affective expression seems to diverge with regard to specific contextual readings. Methodologically based both on conversation analysis and ethnography, we analyze Luganda interactions between host and guests in a weekly talk show (*Mwasuze mutya?*) and build upon ethnographic fieldnotes from extensive fieldwork periods conducted in Kampala (2012-2019). By trying to apply Eastman’s (1983: 170) Swahili model of cultural encodings of sympathy to Luganda, we intend to make a contribution to the (understudied) description of ritualized speech in Luganda and to (underrepresented) research topics on expressive speech acts in Bantu languages.

# Expressing Sympathy in Yorùbá Discourse

---

Panel contribution

---

**Mr. Victor Alabi**<sup>1</sup>

**1.** Indiana University

Bach & Harnish (1979:51) observe that *acknowledgments*, which Searle (1969) refers to as *expressives*, and Austin (1962) as *behabitives*, express “certain feelings towards the hearer. These feelings and their expression are appropriate to particular sorts of occasions”. In the context of expressing sympathy, these feelings motivate expressions that orient to the situation of an individual who has lost either a loved one like a grandfather or a nonhuman entity, like a job. In this study, I employ Searle’s (1969) expressive speech act of condoling, to examine the forms and functions of the act of expressing sympathy in Yorùbá discourse. The Yorùbá people of about forty million native speakers (Unuabonah et al., 2021) live primarily in Southwest Nigeria. Data was obtained from a hundred sampled scenarios in Yorùbá films directed by Mike Bamiloye, Tunde Kelani, and Olanrewaju Abiodun. These films were produced between 1990 and 2020. Films by these directors were considered first because they depict real-life situations relevant to speech acts theory, second, these directors have been consistently directing films since the 1990s, and third, several of these films have won various awards. Insight was drawn from both Pragmatic Acts Theory (Mey, 2001), and Brown & Levinson’s (1987) Politeness Theory to first, investigate the verbal (e.g. prosody, grammar) and nonverbal (e.g. gestures, touch) communicative strategies that participants employ and how they are used to express sympathy, second, to examine how the expression of sympathy in Yorùbá discourse has evolved over the years, third, to explore the functions of variables like age, gender, familiarity and power relations, and finally, to explore the response strategies that individuals use. The study will not only contribute significantly to speech acts in Yorùbá discourse but will also motivate studies in speech acts and pragmatics in African discourse.

# Eye-catching and eye-tracking: Methods to analyse and optimize informational behaviour

Panel contribution

***Prof. Matthias Ballod<sup>1</sup>***

***1. Martin-Luther University Halle-Wittenberg***

There is extensive and long research, established analysis approaches and tried and tested rules on scientific and practical questions, such as how experts express themselves in an understandable manner to laypeople. In terms of communication, successful expert-lay communication is based on an intended, targeted transfer of knowledge, which must begin with the didactic design of information. Because: Not least against the background of changed media and modal communicative settings, the view must be shifted from ‘understandable factual texts’ to ‘accessible and understandable information’. Texts are already complex linguistic and media structures, the shape of which has changed and expanded, in particular as a result of advancing digitization. In and through applications of the Internet, new types of text (tweets, posts ...) have emerged, as well as new linguistic forms of expression (acronyms, hashtags ...) and new semiotic means (emoticons, emojis ...). The design of this interaction is subject to the premises of ‘usability’ and ‘usefulness’. Separate research and application areas have been established in various disciplines, such as text design, information architecture and information design. In addition, the areas of design thinking and visual design experience dynamic developments. In this article, the focus is on a methodical approach to capturing comprehensibility that combines conventional and modern approaches to usability research. For this purpose, the project ‘start-klar’ is presented and how employees in administrations are to be enabled to formulate better, target-group-oriented administrative texts.

# Face and face-work in broadcast political interviews in Spain: a diachronic approach

Panel contribution

***Mrs. Raquel Downing<sup>1</sup>***

**1.** Universidad Complutense de Madrid

Political interview in Europe, and Spain in particular, does not have a great tradition; it is a relatively recent genre, no more than forty years old. However, it has spread and imposed itself in such a way that today it competes in importance with parliamentary debate (Chilton 2004); for some linguists it is better framed as “a subgenre of political discourse than as a type of informative discourse”(Chilton 2004: 72), since it constitutes a vehicle of great importance for the transmission of politicians’ messages. In addition, the subgenre incorporates contextual references to institutions and political agents, as well as recent political history, thus reflecting the linguistic uses and socio-cultural values of the historical moment. The study carried out here draws the analysis from a compiled corpus of televised political interviews carried out in Spain, from the democratic transition to the present day, and therefore covers the legislatures of all the presidents of Spanish democracy, from 1977 to the present. The corpus will serve to trace the evolution of televised political interviews, observe the dynamism of the genre over time, the political issues and interests, the level of control or access of the communication media with respect to politicians and citizens, and how face-work and (im)politeness forms are managed over time and are conditioned by the socio-historical context. In particular, in order to narrow the focus of the analysis here, we analyse questions in interviews, establishing a functional typology and a description of questions as devices to manage face and face-work. The analysis selects interviews from different periods of the compiled corpus.

# Face and facework in online interactions: a case study on the use of mitigation and intensification strategies in Spanish

Panel contribution

***Ms. Laetitia Aulit<sup>1</sup>***

**1.** Université catholique de Louvain

Online interactions are nowadays part of the daily communications of many people. Graham and Hardaker (2017) highlighted that their situational features have an influence on the interaction, leading, among others, to specific participatory frameworks. In this respect, as stressed by Hernández Flores (2013), facework is affected by the social effect of the communication and the social continuum between interlocutors' face. This author then argues that every communicative conduct affects the participants' face somehow (positively, negatively or in a neutral way), which supports Arundale's conception of face as a relational and interactional concept (2006). In this context, this contribution aims to analyse how facework is realised in Spanish online controversies through the use of mitigation and intensification strategies. From a rhetorical-pragmatic perspective, mitigation is used for reducing or compensating for threatening acts that challenge the speaker's or interlocutor's face whereas intensification is used argumentatively for strengthening the propositional content or the speaker's intention (Albelda & Briz 2020).

To this end, this research analyses online interactions in Spanish that include the expression of opinion on news topics (comments on digital press forums and Twitter) about two Spanish traditions (the Moors and Christians festival and the Cobijada, a traditional black garment that only shows one eye of the woman who wears it) contested for their treatment of human societal groups (respectively the Muslim community and women).

The analysis is based on the methodology developed by Albelda et al (2014) for the pragmatic analysis of mitigation and aims at answering the following questions. To whom are the acts of facework most often directed, the speaker or other interlocutor(s) involved in the polylogue that often develops in press comments or on Twitter? Which mitigation and intensification strategies are used? Do they occur to express agreement or disagreement, and concerning which topics? Preliminary results suggest that facework would be more frequently directed to the speaker's face, predominantly by means of intensification strategies. Moreover, mitigation strategies would be used rather to protect the identified interlocutor's face in a context of disagreement, whereas intensification strategies would be used as face-enhancing in a context of strong agreement.

# Face in compliments

Panel contribution

**Prof. Giovanna Alfonzetti<sup>1</sup>**

1. Department of Humanities

The notion of *face* will be analyzed in relation to compliments, within which it plays a central role (cf. Alfonzetti 2009, 2013). In the bibliography, opposed conceptions of compliments in connection with face are to be found:

- *Acts that intrinsically threaten the addressee's negative face* (Brown/Levinson 1987);
- *face-enhancing acts* (Sifianou 2001), produced in compliance with Leech's approbation maxim (1983). This view is implied in their definitions as *verbal gifts or caresses; supportive actions; etc.*;
- *acts that enhance the author's positive face*, because s/he will be evaluated as a person who fulfills social expectations (Ruhi 2006);
- *positive politeness strategies* (Brown/Levinson 1987);
- *redressive acts* aimed at mitigating FTAs (Brown/Levinson 1987).

Two are the main issues dealt with in my paper:

- on a theoretical level, Brown and Levinson's notion of *face* can be useful in studying compliments provided that one accepts O'Driscoll's (1996) proposal to distinguish between *wants dualism* (intended to capture the contrast between attraction and repulsion, partially shared by all the higher animals, and derived from pre-theoretical deductive reasoning); *face dualism*, i.e. *positive and negative face*, inherent in the human condition, which represent the need for some symbolic recognition by others of the desire for association and for independence, respectively; and a *culture-specific face*, whose consciously perceived constituents are culturally variable, as they exist by virtue of the value-judgements of others;
- only analyzing compliments as sequences of utterances in talk-in-interaction (cf. Arundale 2010), we can understand their relationship with face. In other words, compliments (as any other speech act) cannot be defined as acts intrinsically damaging or enhancing face if they are studied as decontextualized acts. Consistently with a major postulate of the discursive approach to politeness, this crucially depends on the specific cultural, conversational and situational context, and above all on the recipient's response, which reveals his/her subjective interpretations. This approach also allows to verify whether compliments tend to be mitigated (like FTAs are) or reinforced, as it usually happens with face-enhancing acts (cf. Held 1989). Effects on face are therefore radically situational and not intrinsic properties of illocutions (Terkourafi:2005)

# Face(s) and facework(s) in a corpus of Italian and German compliments

Panel contribution

***Prof. Miriam Ravetto<sup>1</sup>, Prof. Marina Castagneto<sup>1</sup>***

***1. Università del Piemonte Orientale***

Since its first appearance into academic discourse it has been quite clear that face is to be considered a relational construct (Goffman 1955: 213). Following this definition, the attribution of social values depends on the other interactants, and it is constrained by the line of others' interpretation of the communicative behaviour of an individual. Arundale (2006) goes further, describing face as "an emergent property of relationships, and therefore a relational phenomenon, as opposed to a social and psychological one" (Arundale 2006: 201). Arundale's face theory represents a useful frame to understand facework managing in our multilingual corpus of compliments (Co.Cor Compliment Corpus, [www.cocor.eu](http://www.cocor.eu)). The compliments elicited in Italy as well as in Germany show how face is a matter of interpreting of persons-in-relationship; both faces and relationships are conjointly constituted.

The kind of act itself, its illocutionary force, needs to be negotiated among the interactants working as a social group and, in performing the compliments, the face of each participant is co-constructed and approved by the others. This is particularly evident in the Italian compliments elicited in Southern Italy, where every interactant intervenes, lengthening the act of the compliment and contributing with her/his opinion to the emerging of a collective face-support strategy.

The German sub-corpus displays different features: the act is often short, and rarely performed by more than two interactants (the complimenter and the complimentee). A lot of German compliment responses are *Re-assurance Requests* (Castagneto & Ravetto 2015: 399), often realized as direct questions to the complimenter (*denkst du das wirklich?* "do you really think that?"). The scope of this response type seems to be oriented to verify the truth-values and the sincerity of the complimenter (Ravetto 2012: 107). Once more, this management of facework in the compliments is well-accepted among participants, so we can conclude that the faces of both complimenters and complimentees, as well as the act itself, flow from a joint interpretation.

Moreover, comparing the compliment management across the two cultures allow us to enlarge our view from micro- to macro-contexts, to culture-specific face-managing procedures. The different ways by which the image of the self is reproduced and modified show how interactions are "polycentric and stratified environment where people continuously need to observe norms" (Blommaert 2007: 2) and such norms are presupposed as a part of the interpretative frame of the interaction. Face, then, is not only co-constituted in the interaction, but also constitutive of it.

# Face- and Facework-related Expressions and Their Use in the Minnan Dialect

Panel contribution

***Ms. Jiejun Chen<sup>1</sup>, Prof. Daniel Kadar<sup>2</sup>, Prof. Juliane House<sup>3</sup>***

*1. Research Institute for Linguistics, Hungarian Academy of Sciences, 2. Dalian University of Foreign Languages & Hungarian Academy of Sciences, 3. University of Hamburg*

In this talk, we will provide a systematic overview of various face- and facework-related expressions and idioms in the Minnan Dialect. Along with Mandarin, Minnan is the main language spoken in China's Fujian province, and it is also spoken by a large number of Chinese migrants, especially in the U.S. and the UK. Minnan, which is completely unintelligible for the Mandarin speaker, has often been referred to as a 'conservative' dialect in Chinese linguistics: it preserves many archaic expressions and also uses many 'local' expressions. Due to various historical pragmatic reasons, in particular that the Fujianese society is a very closed one, the Minnan Dialect has developed a particularly rich inventory for face and facework, which is largely different from the standard 'lian' and 'mianzi' terms, and idioms including these terms, in standard Mandarin. To mention some representative examples, in the Minnan Dialect, 'face' is an entity that can be constructed and reconstructed, rather than be given or lost. Furthermore, 'face' is very often referred to as an entity to be 'washed', i.e. it is used in the context of an action which someone does for another person. It is a noteworthy knowledge gap that, to date 'face' and 'facework' in the Minnan dialect has received minimal attention. We aim to this knowledge gap, by systematically examining the use of Minnan face- and facework-related terms in transcripts of audiorecorded data.

## Facework by Chinese celebrities on Weibo and Facebook

---

Panel contribution

---

**Prof. Doreen Wu<sup>1</sup>, Dr. Minfen Lin<sup>1</sup>**

**1.** *The Hong Kong Polytechnic University*

Integrating insights from cross-cultural psychology and interactional linguistics, the paper examines how Chinese celebrities perform facework on social media, with a comparison between the Chinese mainland (on Weibo) and Hong Kong (on Facebook) celebrities. Twelve months of postings by twelve most-followed Weibo and Facebook celebrities from the Chinese mainland and Hong Kong have been retrieved and analyzed. It is found that contrary to the propositions by cross-cultural psychologists, both self-oriented and other-oriented positive facework are performed by Weibo and Facebook celebrities. Nonetheless, significant differences also exist in that while Weibo celebrities tend to use more acts of showing stance, Facebook celebrities use more acts of showing appreciation. While Weibo celebrities tend to use more humor and Netspeak, Facebook celebrities tend to use more codemixing and vernacular expressions.

## Facing Differences in Understanding “Face”

---

Panel contribution

---

**Dr. Robert Arundale**<sup>1</sup>

**1.** University of Alaska Fairbanks

Since Goffman examined “face” in social interaction sixty-five years ago, researchers in socio-linguistics and language pragmatics have employed the concept in many ways, and have adopted a number of different positions on what the concept entails and on how to study it. Revisiting these conceptualizations of face and their implications for examining it in social interaction makes apparent that the concept is not yet ready to be retired. Recognizing the diversity in their underlying assumptions, this overview characterizes current conceptualizations of face, and provides researchers with bases for choosing a conceptualization that will be productive in addressing their particular research questions regarding face in everyday interacting.

As is the case for the concept of politeness, “face” is a first order/emic concept employed by individuals in many cultural groups to describe and explain features of their relationships with one another in everyday situations. “Face” is also a second order/etic concept employed by theorists/researchers in scholarly research in accounting for a range of social phenomena. One finds important differences not only across cultural groups in how they understand face in everyday interaction, but also across theorists/researchers in how they conceptualize face in constructing accounts of social interaction. First order concepts must be examined in inquiry, but the concern here is with the second order conceptualizations that frame all aspects of both theorizing and empirical research. Despite their use of the single term “face,” different scholar’s understandings and accounts do not necessarily index the same phenomena, nor are they necessarily conceptually or methodologically compatible with one another.

Diversity in understandings and accounts of face is understandable given the complexity of the social phenomena being examined, and multiple models and theories are to be expected and encouraged as providing different perspectives. Yet countenancing a wide range of models and theories of face requires not only awareness of the distinctions among them, but also care in choosing a particular model or theory from among the alternatives, given that doing so is consequential both in the conduct of inquiry, and in understanding face phenomena in everyday social interaction. I address the issues of awareness of distinctions and care in choosing by drawing on three broad dimensions for comparing current models and theories of the sociopragmatics of relating, and by using those dimensions in examining several representative conceptualizations of face. The three dimensions enable one to make productive comparisons between alternative models and theories by identifying not only basic, underlying assumptive commitments, but also key concepts and entailments. Comparing assumptions, concepts, and entailments is fundamental to choosing a conceptual framework to guide one’s inquiry, as well as to combining compatible theoretical frameworks where useful, and to engaging in constructive critique. Models and theories of face in everyday interaction are diverse: several focus on face as a matter of identity, but there are viable alternatives. Failing to recognize and make use of that diversity can stifle inquiry, whereas recognizing and engaging it can generate productive new research on face in everyday interacting.

# Family socialization as a digital practice

---

Panel contribution

---

***Dr. Andreas Candefors Stæhr<sup>1</sup>, Dr. Thomas Rørbeck Nørreby<sup>1</sup>***

***1. University of Copenhagen***

Studies of family socialization have traditionally focused on social situations in which family members spend time together engaging in common face-to-face activities. One example is dinnertime, which is often ideologically constructed as a unique temporal, spatial, and social moment where family members come together after being apart throughout the day (Ochs et al. 1992:69). The acts of socialization that take place during dinnertime are both related to the *present* moment (e.g. the interactional order and distribution of speaker roles) and to family members' *previous* experiences and *future* expectations of how to behave as a member of the family and as a member of society. Today, such traditional (and physical) spaces of family socialization are supplemented by those afforded by social media and similar digital communication technologies.

In this presentation, we focus on such digital spaces of socialization and the digitally mediated acts of *here-and-now socialization* they afford. By doing so, we explore how parents and teenagers engage in family socialization practices when texting, snapchatting and writing together on Facebook Messenger. We analyze how parents dictate the rules for where to go in the city and how to behave after dark and how teenagers try to negotiate the curfew and bend the family rules while being on the move. Our analysis of such digital parent-teen interactions provide an insight into how behavioral norms are constructed and media ideologies (Gershon 2010) negotiated while the teenagers engage in away-from-home activities. This further enables a discussion of how digital family socialization practices share similarities with or differ from their face-to-face counterparts.

The presentation draws on data collected as part of a multi-sited online and offline linguistic ethnographic study called *SoMeFamily*. The data consist of social media data, media go-along conversations (Jørgensen 2016), sound recordings of and interviews with parents and teenagers in 14 Copenhagen families.

# Feeding animals: the creation of a common focus of attention in interspecies interaction

Panel contribution

***Dr. Chloe Mondeme<sup>1</sup>, Prof. Dominique Guillo<sup>2</sup>***

*1. CNRS, Ecole Normale Supérieure, 2. Mohammed IV Polytechnic University*

Feeding animals is a millenary practice, associated with domestication processes. Social sciences and anthropology have largely studied the relation of dependency between pets and their owners, precisely created by the act of feeding and being fed, and insisted upon the link between feeding, eating together and being part of a same community of beings (Cormier, 2003). It raises issues related to the role played by food, in its symbolic as well as material properties, in the creation and the maintenance of an interspecies connection.

So far, this topic has been investigated in two main directions: first, in the long run, behavioral ecologists have insisted upon the role of commensalism in domestication (see e.g. Coppinger & Coppinger (2000) for dogs). On the other hand, cultural anthropology (Costa, 2017; Cormier, 2003) has demonstrated how eating and living with tame animals was a practical way to achieve mutuality, and might operate a shift from the category of “forest animal” to that of family member. If indeed “pets are created through acts of feeding” (Costa, 2017, 40), it implies that their survival is directly linked to the relation of dependency they have with their owner.

However, two dimensions have been relatively neglected so far: (i) feeding an animal not owned by anybody (e.g. a wild animal in a natural reserve), during an ephemeral moment of interaction without projecting the creation of any specific long-term bond; and (ii) giving a piece of food to an animal to reward him for his behavior, with no orientation towards any vital necessity.

Inspired by multimodal analysis of sequence organization (Mondada, 2009; Goodwin, Streeck & LeBaron, 2011; Mondada, 2016), this contribution will examine these two dimensions. It will draw on three different data-sets: video-recordings of naturally occurring interactions involving barbary macaques and Moroccan people in a natural reserve in the Atlas Mountain; and two different settings of dog training in France (one for future guide-dogs and the other for pet dogs trained, as a recreational activity, to perform various tricks).

Although both cases feature very different practices, the detailed analysis of sequences of action aims to show how pieces of food, in their visual and olfactory materiality, are first pragmatically created as a common focus of attention, allowing for engaging in interaction (at a minimal level), or for co-acting together and achieving complex actions (in contexts of training). Feeding here is not just a matter of eating, it is a matter of giving, sharing and of creating a common space of interactional attention.

# Finding balance. Creating meaning with gestures in the temporal unfolding of a dance class

Panel contribution

***Dr. Silva Ladewig<sup>1</sup>***

***1. European University Viadrina***

This paper addresses the question of what makes gestures particularly apt at communicating new and specialized knowledge to students in teaching contexts. To explore this issue dance lessons are investigated in which the students practiced how to achieve balance. The study is based on 180min of ballet and tango lessons and on 120min of interviews conducted with each participant after the classes (Müller & Ladewig 2013). The data were analyzed by applying a method that makes it possible to document the interactive elaboration of metaphoricity and emergence of inter-affectivity (Horst et. al 2014; Müller & Kappelhoff, 2018; Müller & Ladewig, 2013).

Two aspects will be fleshed out. First, it will be shown that meaning cannot be conceived of as isolated elements that are used now and then in the discourse. Instead, it emerges and unfolds in the course of time and interaction during the dance class. Second, it will be demonstrated that meaning is substantially shaped by the medium it is expressed in. While traditional views have established an understanding of a medium as a mere packaging and transmitting device of meaningful ‘content’ (Koch & Oesterreicher, 1994; Lakoff & Johnson, 1980), we conceive of a medium as giving rise to meaning in the temporal and interactive unfolding of a discourse (cf. Horst, 2018; Schneider, 2017). To explore this idea, particular attention will be paid to the media-specific properties of gestural movements, to the ecologies (Streeck, 2009) they are embedded in and to different stages of communicating knowledge. With this media-focused approach the current study aims at contributing to the current debate of how media and their role in communication are understood best.

# Finding someone to blame - A diachronic perspective on scapegoating in times of crisis

Panel contribution

***Dr. Maria Stopfner<sup>1</sup>***

**1.** University of Innsbruck/Eurac Research

The last two decades have been marked by a series of global crises: the financial crisis, the refugee crisis, the climate crisis, not to mention the Corona crisis. A number of incidents on the national level, such as the Ibiza scandal in Austria or the killing of George Floyd in the United States, were the starting point for crisis situations which also resonated outside the national borders. It seems as if we were living in a time of crises.

In my presentation, I will take a look back into history and compare different economic and/or political „times of crises“ in view of how authorities and the (counter-)public conceptualize and re-conceptualize responsibility for these crisis situations. Within these justification discourses, denying and blaming constitute typical discursive patterns that serve to protect the positive self/ingroup image (van Dijk 1992; Wodak 2006; Hood 2011; Hansson 2015). In order to avoid and redirect blame, different argumentative moves can be deployed of which scapegoating is presumably the most notorious. The scapegoat strategy can be defined as a causal fallacy that is based on the assumption that „one and only one ethnic, social or political group is responsible for certain large-scale political problems and dangers“ (Posch/Stopfner/Kienpointner 2013: 116). For this strategy to work, the respective scapegoat needs to be constructed as blameworthy and also needs to be perceived as a plausible candidate for a given audience, i.e. in politics for the relevant electorate. Going back in time to different periods of economic and/or political crisis in Europe and the United States, I will try to find patterns in the „blame game“ (Hood 2011) by which certain groups become instrumentalized as scapegoats, based on a pragma-rhetorical approach (a.o. Ilie 2018) that combines the pragmatic analysis of person deixis and reference with the analysis of causal argumentation schemes and ethotic arguments. Respective data will be gathered from print and online media as well as election campaigns in Austria and Germany as well as Great Britain and the US. Where possible, special attention will be given not only to scapegoating practices of parties and politicians, but also to the subsequent reaction of the (counter-)public, i.e. the way in which they accept or refuse the manipulative move.

# First come, first served? Establishing the order of service when entering a service related setting

Panel contribution

**Ms. Federica D'Antoni<sup>1</sup>, Mr. Thomas Debois<sup>1</sup>**

**1. KU Leuven**

Service settings are a locus in which individuals orient to rules in order to guarantee the accessibility to the service itself. These rules can be tacitly shared, such as “first come, first served”, or they can be institutionally organised (e.g., by providing numbered tickets or dividing the space into different paths for different services). Individuals recognisably display what kind of rule they are following in order to make sure that the order of service is collectively established among individuals waiting to be served. One of the solutions they may come up with to make the order of service visible is queuing. While queues have been described as a “locally-produced social phenomenon, as an *in situ* accomplishment of its constituents” (Ball and Smith, 1986: 27), they may not always be visible (as persons lined up in space). Hence, participants entering a service area have to make sense of the place they discover, which includes deciding what kind of rules need to be followed to organise the service encounter in socially acceptable ways (Maynard and Clayman, 2003).

Drawing upon ethnomethodology and conversation analysis, in this talk, we examine how participants interactionally establish the order of service in service related settings. Based on 7 hours of video data recorded in a doctors’ waiting room in Friuli Venezia Giulia (Italy), 15 hours of data recorded in tourism offices in Belgium, and a corpus of 8 hours with interactions at market stalls, we analyse the different ways in which individuals orient to rules in organising the order of service. How do participants achieve the order of service in seemingly unorganised environments (such as waiting rooms, where people are seated rather than queued up in a line)? How do newly arriving individuals make sense of the order and find their place in the (invisible) queue? How are breaches to the rule treated by (co-)present participants? And what is the role of the service provider in light of their deontic rights (Stevanovic, 2013) to modify the order of service?

The analysis shows that the rule “first come, first served” is sensitive to multiple local contingencies, and that breaching the rule may be done in socially more or less acceptable ways. Hence, this contribution shows how “waiting” for one’s turn at a service desk is a practical accomplishment involving continuous monitoring of others’ activities and their allegiance to the rule that has collectively been agreed upon. In other words, individuals do “waiting” in accountable ways, even when “queues” are not physically embodied.

# First-person pronouns in the construction of group identity in PRC televised confessions

Panel contribution

**Ms. Liz Carter**<sup>1</sup>

1. University of California, Los Angeles

This study examines the construction of the self, group, and other identities in five televised confession news segments broadcast over the past four years by PRC state-affiliated media. Lexical grammar patterns are identified across this mini-corpus as they are used to position subjects as being included in certain groups and excluding others. In particular, this study focuses on the use of first-person pronouns such as *wo* and *zan* to index the language ideology of the media broadcaster. Functioning as both nouns and adjectives, these pronouns serve discourse functions such as ratifying audiences, indexing speaker nationality, and asserting agency.

Previous research has examined lexical grammar as site for the indexing of language ideology in PRC media (Fang 1994, Fang 2001, Renwick and Cao 1999), while research on first-person pronouns as a way to include or exclude also abounds (Bull and Fetzer 2006). However, very few studies have, as yet, focused on how pronominal forms of Mandarin Chinese can define identity and group membership in mass media discourse. Informed by research into the discourse functions of Mandarin pronouns (Biq 1991, Li and Thompson 1989, Zhao 1987, etc.), this study seeks to analyze their uses in the indexing of language ideology in mass media broadcasts.

# Football, racism and media discourse: a corpus-based Systemic-Functional Linguistics approach to look at sociological aspects and ideology in language

---

Panel contribution

---

***Ms. Izadora Pimenta<sup>1</sup>***

*1. Technische Universität Darmstadt / Universidade Estadual de Campinas*

This work analyzes patterns of Judgement and racism representations from lexical choices in media discourse about racism in football in two different contexts: Brazil and England. With the help of the Transitivity System (HALLIDAY. MATTHIESSEN, 2014) and the Appraisal System (MARTIN. WHITE, 2005) and resources from the Corpus Linguistics, the main goal is to analyse some sociological aspects of football and its culture through language, especially considering the field of ideology (LUKIN, 2019). It also relies on the perspectives of the Critical Race Theory (GILLBORN, LADSON-BILLINGS, 2020. DELGADO; STEFANCIC, 2013), since there is an effort to understand the little instant ions of racism in a scenario where the imagined categories of races create effects in the formation of identities, social relations and the society as a whole. It means that this can influence directly the language in use, as well as the language influences society at the same time. The first findings show that it is possible to assume that the language in use can bring us a portrait of how a specific society deals with the theme of racism in football.

# Fostering interdisciplinary knowledge translation at the interface between healthcare communication and pragmatics

Panel contribution

***Dr. Sarah Bigi<sup>1</sup>, Dr. Maria Grazia Rossi<sup>2</sup>***

*<sup>1</sup> Università Cattolica del Sacro Cuore, <sup>2</sup> Universidade Nova de Lisboa*

Many studies on healthcare communication focus on the interactional challenges deriving from the asymmetry of knowledge and social roles (among others, Ainsworth-Vaugh 1998; Beisecker 1990; Heritage and Greatbatch 1991; Rossi 2016; Thesen 2005), indicating such asymmetry as one of the primary causes of frequent suboptimal outcomes of professional-patient interactions. Rather than seeing asymmetry in itself as a problem (Dingwall & Pilnick 2020), we consider it as the inevitable fact that turns ‘knowledge translation’ into the biggest effort healthcare professionals have to make. In the field of healthcare communication, various studies have tried to outline the dynamics underlying knowledge translation (e.g., Epstein & Street 2011; Street, Elwyn & Epstein 2012; Politi & Street 2011). However, these approaches do not use pragmatic categories to explain the interactional phenomena they observe, which are interesting and relevant. Therefore, in this paper we look at these approaches from the perspective of pragmatics, hoping to foster a process of knowledge translation also between these two disciplinary domains (Bigi 2016). In particular, we focus on the crucial role of implicit communication both in the creation of common ground and in the frequent misunderstandings reported in clinical contexts.

# Framing ‘disability’ in online political discourses in the German-speaking countries

Panel contribution

***Prof. Igor Trost<sup>1</sup>***

**1.** University of Passau

Only few studies have been written on ‘disability’ and ‘illness’ (eg. Gwyn, 2002; Devlin, MacAskill & Stead, 2007; Grue, 2014) in respect to evaluative strategies in public discourses.

My lecture will cover the representation and framing of ‘disability’ and of humans living with disability in Austrian, German and Swiss political parties’ statements and the reactions to these in digital media.

My sample shows on the one hand the striving for inclusion by the most political parties and their followers. On the other hand, stigmatization still plays a role in talking about inclusion for example in regular schools and in the job market by populists. They often characterize handicapped people as “distracting” the majority society. My leading hypothesis is that populists show a lack of differentiation in language use as there is no accurate reference considerable to the different types of disabilities. Additionally, they mix the discourse on disability with their exclusive discourses on other social minorities and immigration. Therefore, they exclude disabled members of social minorities twice.

This talk will pursue an integrative approach which combines methods of discourse analysis (eg. Reisigl & Wodak, 2001; Fairclough, 2003; Hart, 2019), corpus linguistics, frame semantics and cognitive grammar (e.g. deep cases, information structure).

# Free NPs and copula clauses as grammatical resources in Finnish low transitivity predications

Panel contribution

***Prof. Marja-Liisa Helasvuo<sup>1</sup>, Prof. Ritva Laury<sup>2</sup>***

***1. University of Turku, 2. University of Helsinki***

The Finnish verb *olla*‘to be’ can be used in a number of clause types, including copula clauses and existential and habitive clauses. Low transitivity predictions that involve assessment and categorization are typically done with copula clauses, but they can also be made without a verb, with free NPs (Helasvuo 2001, 2019; see also Ono & Thompson 1994; Tao 1992, 1996) and other free nominals such as adjectives. In this paper, we will discuss the contexts in which speakers of Finnish use *olla* as a linking verb and ones where predictions are made without it, as free nominals (NPs and APs). Consider ex. 1 where the participants are discussing a wine they are tasting.

(1)

1 Lauri: *sitä täytyy kaataa tollej noi (.) varovasti.*

DEM-PAR must-3SG pour-INF DEM-ADV DEM-ADV careful-ADV  
(you) have to pour it kind of like that (.) carefully

2 Taavi: *(0.3) totta kai se on italialaista.*

true-PAR PTC DEM be.3SG Italian-PAR

of course it's Italian (0.5)

3 *(0.5) @monte pulci#a:no#@.*

NAME NAME

Monte Pulciano

4 *(0.4) loistava viini.*

brilliant wine

an outstanding wine

In his response to Lauri, Taavi uses a copula clause (l. 2) with the categorizing predicate nominal *italialaista* ‘Italian’. After a pause, in l. 3, he adds an identification, this time using a free NP naming the variety and, in l. 4, with another free NP, assesses the wine as *loistava* ‘brilliant, outstanding’.

For this paper, our data come from the Arkisyn corpus of conversational Finnish. We show that in these data, predicate nominals in copula clauses and free nominals serve partly overlapping functions. Both are, for example, used for characterizing, categorizing, and identifying referents, but at different rates. Well over half of the predicate nominals in our data characterized a referent, whereas fewer than 27% of free nominals served this function. Furthermore, free nominals were used in many functions that were not available for predicate nominals in copula clauses. For example, only free NPs were used as vocatives. Our study also indicates that free nominals and predicate nominals differ in terms of their sequential positions and initiation of actions: the verbless formats are more likely than formats with the copula to be used in non-initial positions in sequences of talk and less likely to initiate new actions. The formats with *olla* are more likely than verbless formats to be used in initial position and may initiate actions.

# Free-standing ‘parce-que’ (because)-clauses in talk-in-interaction: a multimodal analysis

Panel contribution

***Dr. Ioana Stoenica<sup>1</sup>, Prof. Simona Pekarek Doepler<sup>1</sup>***

***1. University of Neuchâtel***

This contribution is part of a work-in-progress on speakers’ use of ‘parce que’ (*because*)-introduced clauses in French talk-in-interaction. Traditionally defined as subordinate clauses, research on oral and conversational data has documented the use of such clauses across a range of different languages as independent clauses (‘in-subordinate clauses’, i.e., “the conventionalized main-clause use of what [...] appear to be formally subordinate clauses” (Evans 2007: 367; cf. Debaisieux 1994, 2002; Diessel & Hetterle 2011), and has shown that these accomplish conversational actions on their own, such pursuing agreement or accounting for a dispreferred response (Ford & Mori 1994; Couper-Kuhlen 2011, 2012; Günthner 1996).

Based on multimodal conversation analysis, this paper investigates two not yet systematically documented social actions that speakers perform by using ‘parce que’-clauses in French, namely: accounting for an assessment and making a clarification request. The latter case is illustrated in the following excerpt, taken from our data comprising 9 hrs. of video-recorded ordinary conversations:

01 JOA: il a pas une tête du:: de Moutier je trouve.

‘he doesn’t have the looks of Moutier((=village name)) I find’

02 (1.3)

03 JOA: j’sais pas trop ce que c’est euh

‘I don’t know much what it means’

04 avoir une tête de Moutiers,

‘having the looks of Moutier’

05 mais il a pas une tête de Moutier.

‘but he doesn’t have the looks of Moutier’

06 (0.3)

07 EKT: **parce que:: les gens du Jura**

‘because the people from the Jura((=name of a region))’

08 ils ont une tête du Jura?

‘they have the looks of the Jura’

09 (0.5)

10 JOA: ↗mhm ↗mhm.

Joanna’s negatively valanced assessment (l.01) is met with a lack of verbal response from Ekti (l.02), foreshadowing a potential disagreement on her part. Joanna then extends her turn (l.03-05), redoing her assessment in pursuit of an agreement. Ekti, however, instead of responding in either an agreeing or a disagreeing way to the assessment, produces a clarification request, formatted as a ‘parce que’-clause (l. 07-08). Thereby, Ekti pinpoints what she infers to be the reason underlying Joanna’s assessment, namely that people from a given region (or city) will have the looks of that region. Hence, in this sequential position, Ekti mobilizes a free-standing ‘parce que’-clause that accomplishes an action on its own (a clarification request) thereby withholding, once again, her potential disagreement (Pomerantz 1984).

In this paper, we document the recurrent use of free-standing ‘parce-que’-clauses for the two abovementioned actions. While much existing research associates insubordination with intersubjective alignment between speaker and hearer, and with epistemic and evidential meanings (Evans & Watanabe 2016), we stress the interaction-organizational role of insubordinate clauses (cf. Couper-Kuhlen 1996; Lindström et al. 2019). Fur-

thermore, we add to existing research by showing how participants' multimodal conduct, and in particular their gaze orientation, plays a crucial role in how they use these clauses and how co-participants interpret them. Thereby, we hope to contribute to the growing body of research on the emergent character of grammar and on its interface with embodied semiotic resources.

# French and German equivalents of ‘I thought’: an interactional and multimodal analysis

Panel contribution

**Mrs. Sophia Fiedler<sup>1</sup>**

1. University of Neuchâtel & University of Hamburg

This paper examines cross-linguistically the interactional functioning of complex syntactic patterns involving complement talking predicates (CTPs) of the type *I think* in the past tense (Jefferson 2004, Kärkkäinen 2012). The past forms of *I think* in French and German – respectively ‘je pensais’ / ‘j’ai pensé’ and ‘ich dachte’ / ‘ich habe gedacht’ – significantly differ in their frequency. While speakers of German make ample use of past forms (n=393 in 15h of data), these are infrequent in French (n=34 in 12h of data). How can this difference in frequency be explained?

In this paper I show that affective stance-taking, which German can carry out with ‘ich dachte’ / ‘ich habe gedacht’ *I (have) thought* (Deppermann/Reineke 2017), is done with different verbs in French: ‘je me suis dit (que)’ *I told myself(that)* (n=45) and especially ‘j’étais là’ *I was there* (n=59). I present a multimodal analysis drawing on 15 hours of German and 12 hours of French video-recorded ordinary conversations, contributing to already existing research in two ways: (i) I examine the functional uses of different CTP-constructions in French and German to mark affective stance in specific sequential environments; (ii) I demonstrate that complex syntactic patterns are well coordinated with multiple bodily resources such as gaze, posture or prosody.

An initial comparison of the abovementioned constructions in their sequential environments reveals that, in both French and German, these occur mostly in assessment sequences or storytellings. The stance-taking itself is usually done through direct reported speech or thought (Clift 2007), a recurrent practice to mark the climax of a storytelling (Holt 2000). In German, the direct reported speech is introduced by the pattern *x + ‘ich dachte’ / ‘ich habe gedacht’ + particle + complement clause*. In French, by contrast, speakers use the syntactic pattern *‘je me suis dit (que)’ / ‘j’étais là’ + (complement) clause*. In both languages, this format of direct reported speech or thought entails a frequent bodily enactment through which the speaker ‘stages’ his or her utterance (Yule/Mathis 1992).

The multimodal features, however, vary between the different constructions, especially in French. ‘J’étais là’ *I was there* is followed by exaggerated facial expressions or gestures and a change in voice quality in order to emphasize the (mostly negative) stance-taking. ‘Je me suis dit (que)’ *I told myself(that)* mostly introduces only prosodically enacted talk through which speakers make available a rationalization process. German ‘ich dachte’ / ‘ich habe gedacht’ *I (have) thought* can be followed by both multimodal conducts.

Adopting an interactional linguistic approach, this study contributes to ongoing research on grammar-in-interaction. It shows that complex clause combinations across two languages draw on multimodal packaging for action formation in everyday talk.

# From climate change to climate crisis: (un)certainty and risk in climate change discourse

---

Panel contribution

---

***Prof. Hermine Penz***<sup>1</sup>

*1. University of Graz*

Climate change and the risks connected with it have received increasing attention over the last few decades. The effects of climate change have been projected in the successive reports of the Intergovernmental Panel on Climate Change of the United Nations (IPCC) which in turn have been communicated by the media and other institutions to the general public. The successive IPCC reports have stated with increasing certainty that climate change is human made. In addition, they have made prediction regarding the consequences and risks of climate change on the basis of different scenarios of temperature rise. The growing threat of climate change has been acknowledged recently by concerned scientists, various organisations and media by the adoption of the term ‘climate crisis’. For example, in May 2019 The Guardian decided to use the term ‘climate crisis’ instead of ‘climate change’ in its reporting. Similarly, other terms which express the urgency of the issue have entered the climate change debate.

As in many other areas of science and technology, the discussion of climate change has to deal with uncertainty, risk and probability when reporting scientific knowledge. With respect to communication on climate change the issue of (un)certainty has occupied a central role, in particular with regard to how uncertainties and the risks connected to climate change are represented in texts by different authors (IPCC, media, activists) addressing various audiences. In view of the growing conviction of the seriousness of the issue, this paper will focus on how (un)certainty, probability and risk have been communicated by various actors in the last two years during which the frame of climate crisis has been gaining momentum.

The analysis will focus on the most recent IPCC Assessment Reports, media discourses and texts of various institutions on climate change. The data will be analysed by means of qualitative discourse analysis.

# From Connective to Final Particle: On the development of Korean *ultheyntey* into a marker of wish and worry

Panel contribution

***Dr. Minju Kim***<sup>1</sup>

1. Claremont McKenna College

Recent studies have demonstrated that across different languages, connectives can develop into final particles that perform interactional functions (e.g., turn-final use of English *but*, *or*; “(inter)subjectification” Traugott 2014; “insubordination” Evans and Watanabe 2016). Using a corpus of 129 natural conversations, I demonstrate that the Korean connective *ultheyntey* (‘conjecture + but/so’), which derived from the combination of *ulthey* (conjecture ‘would’) and *ntey* (‘so’, ‘but’), has developed into a final particle marking the speaker’s stance of wish or worry. The literature only discusses the connective use of *ultheyntey*. In my data, however, out of 134 total tokens, 68% are stand-alone final particles which express wish, worry, and polite hedging.

In my data, 86% of connective *ultheyntey* occur in negative contexts. I argue that through its frequent use in negative contexts, *ultheyntey* obtained the meanings of ‘worry’ and ‘wish’ (“subjectification” Traugott 2010). The contrastive use (‘but’) engendered the meaning of wish, whereas the causal use (‘so’) engendered the meaning of worry.

**Emergence of Wish:** 51% of total *ultheyntey* tokens are used with the conditional ‘if’ or the deontic modal ‘should’. This combination is frequently used to present an ideal situation that stands in contrast with an undesirable present situation (1a). Since ‘but’ implies a contrasting undesirable present situation, the speaker does not have to state the second clause (1b); the combination of an ideal situation and the use of ‘but’ engenders the sense of wish. Eventually, used with ‘if X, good’ or ‘should’, *ultheyntey* comes to signify ‘wish’, including counterfactual regrets, and developed into a final particle (1c).

1. (a) *cha-lul sa-myen coh-ultheyntey, (mos sa)*.

If I can buy a car, it **would** be great **but**, (I can’t buy it).

(b) If I can buy a car, it **would** be great **but...**

(c) **I wish** I could buy a car.

**Emergence of Worry:** *Ultheyntey* is often used as a hedging device when providing a negative response. To be polite and indirect, the speaker can just provide the reason for the negative response, without stating the second clause (2a). In negative contexts, *ultheyntey* also often expresses the reason for worry (3a). Eventually, *ultheyntey* itself obtained the meaning of worry and turned into a final particle (2b, 3b).

2. (a) A: I can leave later.

B: The traffic **would** be bad later **so**, (please leave now.)

(b) **I’m afraid** the traffic would be bad later.

3. (a) If I don’t go, he **would** be mad **so**, (I am worried).

(b) **I’m afraid** if I don’t go, he would be mad.

Lastly, using phonetic analysis employing Praat, I demonstrate that the final particle *ultheyntey* tends to have an elongation of the last syllable *-tey* and a fluctuating contour much more than its connective use. As the final particle indicates speaker’s stance of wish and worry, it carries more prosodic emphasis than its connective counterpart does.

# From connective to rhetoric: Utterance-final *tteyuu* in Japanese conversation and storytelling

Panel contribution

***Dr. Michiko Kaneyasu***<sup>1</sup>

**1.** Old Dominion University

*Tteyuu* (and its variants *toyuu* and *toi*) is a lexicalized combination of the quotative marker *tte* (*to*) and the verb *yuu* (*iu*) ‘say’. It is considered a nominal complementizer linking a head noun and its modifier describing the content or attribute of the head noun (see (1) and (2)).

(1) *nan-nan tteyuu uta* ‘a song called nan-nan’

(2) *nihon ni kaetta tteyuu uwasa* ‘a rumor that (he) went back to Japan’

In ordinary speech, however, *tteyuu*, but not its variants, also occurs utterance finally without a head noun. Preference for one form over the others suggests a grammaticalization process may be underway (Rysová 2017). Using audio- and video-recorded conversation and storytelling as data, I will demonstrate how the utterance-final *tteyuu* is used as a discourse-pragmatic connective, which expresses the relation of an utterance to the immediate discourse context. I will also address how the core semantics of the connective and the characteristics of the Japanese language may have affected the functional shift.

The development of an intra-sentential connector into a discourse one at the utterance-final position is also reported for the noun-modifying form *mitai-na* in Japanese (Suzuki 1995). The utterance-final *mitai-na* elaborates on the prior unit of talk noncommittally (Suzuki 1995). Preliminary analyses indicate that the utterance-final *tteyuu* explicates what is under question via description, clarification, or exemplification. Their functional divergence may be attributed to different semantics of *mitai(na)* and *tteyuu*. The former is an auxiliary that expresses similarity or speculation. The latter marks the noun or clause preceding it as a quasi-quote representing the whole content of what is denoted by the head noun (Matsumoto 1997).

A successful interpretation of the head-less *tteyuu*-utterance relies on a shared understanding of and expectations for what the utterance-in-progress may concern. In conversation, a *tteyuu*-utterance often directly relates to the immediately prior contribution. (3), for example, is given in response to a request for once-known information (Hayashi 2012) regarding the topic of the interlocutors’ earlier conversation.

(3) *nanka [school-name] ga imeeji to chigatta kara yokatta tteyuu.*

‘Like you were glad because the school differed from what you had imagined *tteyuu*.’

In non-conversational storytelling, what a *tteyuu*-utterance relates to is sometimes not in the prior discourse. When storytelling is a solicited or presentational activity, there is a strong expectation for the delivery of a climax or upshot of the story. In such a context, the utterance-final *tteyuu* can be used to link the current utterance to the context-specific expectation. (4) is an example from a solicited telling of a funny story.

(4) *oshiri ni sekken o nutte, ano: tsurun tte deta tteyuu.* (laughter)

‘He lathered soap on his butt, and u:m slid out (of the small window) *tteyuu*.’ (laughter)

The *tteyuu*-utterance is understood as the climax of the story, evidenced by the ensuing laughter. The utterance-final *tteyuu* focuses the recipients’ attention on the depiction of the scene and further involves them as active participants in discerning the reportability of the story.

# From Distance to Immediacy: asyndetic complements in Classical and Present-day Spanish

Panel contribution

***Ms. Giulia Mazzola<sup>1</sup>***

**1. KU Leuven**

One of the most distinctive syntactic features of (pre)classical Spanish is asyndetic complementation, i.e. without complementizer *que*‘that’. Previous research considered it as a stylistic variant, either belonging to formal legal-administrative language (Girón 2005), or to the language of communicative immediacy (Blas & Porcar 2016). However, AUTHOR et al. (2020) showed that, in (pre)classical documents, asyndeton was typically found in deferential requests addressed to prestigious interlocutors, as shown in 1). Hence, the asyndetic variant is probably a marker of language elaboration borrowed from Latin.

1) *Suplico<sub>v1</sub>a vuestra mercedØmande<sub>v2</sub>recibir essa criatura.*

‘I beg Your Mercy you order to welcome this child’ (CODEA-1705)

According to contemporary grammars, asyndeton is typical of formulaic, formal language. Yet, Yoon (2015) suggests that the stylistic distribution depends largely on the verb semantic class. The aim of this paper is twofold: (i) to explore whether, diachronically, asyndetic complements entered the pole of communicative immediacy from the pole of communicative distance; and (ii) to understand the correlation of stylistic parameters with main verb semantics.

The data come from the CORPES corpus and consist of finite syndetic and asyndetic complement clauses with verbs of different semantic classes. The effect of register and degree of formality on the selection of *que* or Ø was evaluated with logistic regression. The results indicate that the alternation in Present-day Spanish is not affected by register or formality unless one considers their interaction with the main verb semantics. Asyndetic complements are favored by request verbs in written formal registers, indeed, but in informal spoken varieties, asyndeton is promoted by cognition and communication verbs.

A comparison with the results of AUTHOR et al.’s (2020) data shows that asyndetic complements spread from communicative distance to communicative immediacy. Diachronically, asyndetic complementation increased its frequency with cognition and communication verbs, which caused a discourse-pragmatic change: the subjectification of these verbs as parenthetical epistemic markers, as in 2).

2) *pero tan importante como eso creo<sub>v1</sub> Øeran<sub>v2</sub>los malos profesores*

‘but as important as that I think were the bad professors’ (CORPES, oral/internet)

This study identifies a double linguistic and stylistic distribution of Spanish asyndetic clauses: they represent a syntactic variant of the language of distance with request verbs; in the language of immediacy, asyndeton caused the reanalysis of some cognition/communication verbs as epistemic markers. Thus, a bidirectional diachronic change can be observed: not only vernacular expressions acquire a higher degree of scripturalness, but grammatical markers of the communicative distance also shift to the pole of immediacy, developing pragmatic and subjective functions.

# From Intersubjective to Textual Function: A Case of General Extenders in American English

Panel contribution

***Dr. Noriko Onodera<sup>1</sup>***

**1.** Aoyama Gakuin University

This presentation will show that the case of development of General Extenders (GEs) in American English supports our panel's suggested tendency "From Intersubjective to Textual Function". GEs are short expressions frequently used utterance-/clause-/phrase-finally in spoken English such as *and stuff*, *and things*, *and everything*, *and all that*, and *or anything*, etc.

My analysis of COCA (Corpus of Contemporary American English) has revealed that GEs are overwhelmingly used most frequently in 'Spoken' language among all the five genres (Spoken, Fiction, Popular Magazines, Newspapers, and Academic Journals) (Onodera 2020: 284-285). It found that only 12.5 to 33.3 % of GE uses yield the next turn. That is, only a subset of GEs contributes to "turn-taking". The question is why a particular set of GEs yields the next speaker's turn and the other set does not. From my observation, it is because the turn-yielding GEs implement "expressive function", in other words, intersubjective function.

I will exemplify the basic "referential function" of GEs as well as their "expressive (intersubjective)" function. GE's intersubjective functions are further specified as 'involvement' to share the speaker's evaluation/emotion with the hearer, 'dismissive' and 'hesitation', etc.

Other linguistic devices endowed with a high-degree of intersubjectivity can be suggested to be questions in question-answer adjacency pairs, tag-questions, understanding-checks (Levinson 1983: 298), and imperatives (Narrog 2012 in English, Japanese, Lithuanian; Shinzato 2002 in Japanese; Zhu and Horie 2020 in Chinese, Japanese, and Russian). All these intersubjective devices promote/trigger the addressee's reaction/next turn. The addressee's taking the next turn, i.e. turn-taking, is what contributes to textual function in spoken language, connecting what is prior and what is upcoming. In conversations, textual function weaves discourse. Thus, it will be shown that the intersubjective function in spoken language motivates textual function in several ways, which can be the trigger for the rise of discourse markers/conjunctions and other pragmatic elements. In our panel, from the observation of GEs above, together with more cases found in other panelists' works, we will propose that "from intersubjective to textual" be another quite common tendency in functional change.

# From Intersubjective to Textual Meaning: Examples from Russian

Panel contribution

***Dr. Elena Graf<sup>1</sup>***

**1. Ludwig-Maximilians-Universität München**

The current contribution discusses various examples of semantic-pragmatic changes undergone by some grammatical and lexical items in Russian, attesting shifts from intersubjective to textual meaning. In accordance to Narrog (2012: 30), textual meaning is understood as “orientation towards speech, i.e. discourse or text, itself”. One prominent example, in this respect, is the semantic change accompanying the grammaticalization of the Old Russian (Old East Slavic) reflexive pronoun *ca* (*sya* ‘self’). On the one hand, *ca* (*sya* ‘self’) illustrates the development in East Slavic from a clitic in Old East Slavic, cf. (1), to an affix (postfix) *-sya/s'* in contemporary Russian (e.g. *ca>-sya/s'*), which means its morphologization and grammaticalization in the function of the ‘identifying-self’ (cf. Traugott 1982: 256), coding thus the ‘textual situation’, e.g. ‘situation of text-construction’ (Traugott 1989: 35). In this function, *-sya/s'* designates a reflexive relationship with its self-identical antecedent, cf. (1) and (2).

On the other hand, the dative of *sebe* ‘self’ (*ca>sebe<sub>DAT</sub>*), like *datus ethicus* (the dative of the person making the judgment), is in contemporary Russian typically used as a particle in a postposition to a verb or a pronoun, marking a course of an action as being independent of other things, cf. (3). Thus, we observe here a shift from a textual (or metalinguistic) function to a subjective one: while the prime function of the reflexive pronoun *ca>sya* ‘self’ is to designate a reflexive relationship with its self-identical antecedent, that of the particle ‘*sebe<sub>DAT</sub>*’ is to mark the speaker’s attitude toward the proposition.

(1) ORuss. *и покланяю ти ся братъче moi то си хотѧ мълчи*

*i poklanyayu ti sya brat'če moi to si xotya m-lvi*

Russ. transl. I [vse že] klanyayus’ tebe, bratec moi, xot’ ty i takoe gorovi  
‘And I bow to you, my brother, even though you say such things.’

(Novgorod birch-bark letter №605, about 1100-1120 century) [<http://gramota.ru/birchbark/document/show/novgorod/605/>]

(2) *Nizkim poklonom klanyayus’ Vam.*

(with) deep.ADJ.INSTR bow.INSTR (I) bow.IPFV.PRS.REFL.1SG (myself) (to) you.2PL.DAT

‘I bow deeply to you.’

(3) *Vy sebe sidite, otdyxajte.*

you.2PL.NOM yourself.DAT sit (and) calm

‘(Please), stay (calmly) seated, relax’.

Furthermore, in recent contemporary Russian, a new tendency can be observed to use the reflexive affix *-sja* with perfective Verb<sub>1PL</sub> (e.g. *uvidimsja<sub>SEE:REFL.PFV.1PL</sub>* ‘we’ll see each other’) to mark intersubjectification, from one side, but, from the other side, these uses are bound to one particular sort of text or discourse situation, namely newscast. As a farewell, the Russian perfective reflexive verb *uvidet’sja* ‘see each other’ loses its verb valency and is used in the 1PL form as a sign-off for news anchors or meteorologists to mark the end of the discourse. Simultaneously, this salutation also ensures a casual atmosphere at the end of a newscast, as seen in a familiar conversation.

The current contribution, thus, touches on some cases of change in the direction “from intersubjective to textual” based on the examples of the development of discourse markers, particles and pragmatic constructions in Russian.

# From intersubjective to textual meaning: On the development of the connectives derived from prohibitives in Mandarin Chinese

Panel contribution

***Dr. Bing Zhu<sup>1</sup>***

**1.** Kyushu University

Cross-linguistically, imperatives can serve to form subordinate clauses such as conditionals and concessives (e.g. Heine et al. 1991: 191, Narrog 2012). For example, the imperative form of the Japanese verb *suru* ‘do’, i.e., *seyo* in (1), functions as a concessive connective conveying the meaning of ‘whether it is X or Y’.

(1) Neko ni **seyo**, inu ni **seyo**, okoru taimingu ga muzukashii.

cat DAT do.IMP dog DAT do.IMP get angry.NPST timing NOM difficult.NPST

‘Whether cats or dogs, the right timing for getting angry with them is difficult.’

(Narrog 2012: 43; translation by the original author)

*Seyo* has lost their typical directive meaning and has obtained the text-building function of creating textual coherence (Narrog 2012).

Similarly, in Mandarin Chinese the combinations of the prohibitive (or negative imperative) marker *bié* (別) with the verb *shuō* ‘say’ and the verb *kàn* ‘look’, which literally means ‘don’t say’ and ‘don’t look’, have grammaticalized into connectives. *Biéshuō* conveys a scalar additive meaning, similar to ‘let alone’ or ‘not to mention’, as in (2), and *biékàn* functions as a concessive connective, as in (3).

(2) **Biéshuō**měitiān pǎo 1000 mǐ, jiùshì pǎo 3000 mǐ duìtā-éryán yě shì xiǎocài-yīdié.

PROH-say every day run 1000 meter even run 3000 meter for him also COP a piece of cake

‘Even running 3000m every day is just a piece of cake for him, *let alone* 1000m.’ (by the author)

(3) **Biékàn** tā niánjì xiǎo, dàn shuǐping hěn gǎo.

PROH-look he age young but level very high

‘Although he is young, he is excellent.’ (by the author)

Both imperatives and prohibitives convey conspicuous intersubjective meanings as they involve speaker’s attention to addressee as a participant in the speech event (Traugott 2003). According to Traugott (2003)’s hypothesis of (inter)subjectification, there is a unidirectional tendency of semantic-pragmatic change, i.e. “from non-subjective meaning to subjective meaning and further to some intersubjective meaning” (*ibid.*: 134), but not vice versa. However, the tendency cannot adequately explain the examples above which illustrate some further changes beyond intersubjective meaning.

As an alternative, Ghesquière et al. (2012) divide the intersubjective meaning into three subtypes, i.e. attitudinal intersubjectivity, responsive intersubjectivity and textual intersubjectivity. Based on the concept of joint attention, Ghesquière et al. (2012) argue that textual elements such as connectives can be considered as intersubjective as they “steer the interpretation of the hearer by pointing his attention to a particular discourse referent intended by the speaker” (*ibid.*: 134). The typology of intersubjectivity seems to provide a plausible explanation to the development of the connectives derived from prohibitives in Mandarin Chinese. Whether the scalar additive meaning of *biéshuō* or the concessive meaning of *biékàn*, the hearer is steered to pay more attention to the proposition in another clause instead of the one introduced by the connective. Furthermore, as pointed out by the authors, textual intersubjective items may develop from responsively intersubjective ones (e.g. imperative) diachronically.

# Functions of ingratiation in technology-mediated sales interaction

Panel contribution

**Dr. Jarkko Niemi<sup>1</sup>, Ms. Hanna Timonen<sup>2</sup>, Dr. Johanna Vuori<sup>1</sup>**

*1. Haaga-Helia University of Applied Sciences, 2. Aalto University*

This paper studies salesperson's ingratiation tactics such as opinion conformity and flattery in technology-mediated interactions. Ingratiation is defined as actions that aim to increase the likeability of the speaker, enacted in a manner that goes beyond the implicit social norms of interaction (Jones 1964). People are typically willing to accept positive statements about themselves (Vonk 2002), and ingratiation can have a positive influence on the evaluation we make of our conversation partner (Gordon 1996). However, such behaviors can also result in other than intended outcomes (Vonk 2001), and be interpreted negatively.

We study ingratiation in a context where it is stereotypically presented in a negative light, namely sales. In sales research, ingratiation has been discussed as a seller influence tactic (McFarland, Challagalla & Shervani 2006), designed to enhance the salesperson's attractiveness. Research has been mostly interested in the external outcomes of ingratiation such as increased tipping (Seiter & Dutson 2007), and increased customer satisfaction and loyalty (Medler-Liraz & Yagil 2013). Less attention has been directed towards the conversational functions of ingratiation.

This paper fills this research gap and investigates ingratiation in sales interaction. Our study is based on 10 technology-mediated business-to-business sales calls. In these calls, the salesperson and the buyer hear but do not see each other, as visually they only share a computer screen view of the software solution that is being sold. We argue that this technology-mediated context is particularly suitable for the study of ingratiation, as ingratiatory behaviors are expected to be plentiful in sales, and verbally clearly displayed due to the missing visual connection. Drawing on the method of conversation analysis, we preliminary distinguish between three functions of ingratiation. Ingratiation is used in connection to salesperson's 1) requests for action or information, 2) offering new services, and 3) building social connection (or rapport) with the customer. Arguably, all these functions can be connected under the umbrella of making salesperson actions more acceptable for the customer, and thus increasing the likelihood of sales. We end by reflecting on the importance of ingratiation in technologically-mediated interaction.

# Funny story... Reasoning and perspective taking in humorous interaction

Panel contribution

Mr. Vladislav Maraev<sup>1</sup>, Dr. Ellen Breitholtz<sup>1</sup>, Dr. Christine Howes<sup>1</sup>

<sup>1</sup>. University of Gothenburg

Humour is inherently dialogical, even in canned joke tellings and contexts such as social media, as example (1) shows.

(from Twitter:<https://twitter.com/andrealongchu/status/1246445034792239106>)

@andrealongchu: guys will stand 5'8" from you and call it 6 feet

@chodedc: Most guys can't tell what six inches look like let alone six feet. . .

Interpreting humour requires multiple perspective taking, which has been described using the notion of different “story worlds” in the analysis of jokes (Ritchie, 2018). This perspective taking is inherent in a dialogical approach to interaction in general (Linell, 2009), and involves us making inferences based on topoi, principles of reasoning recognised within a socio-cultural community (Breitholtz, 2020).

One important consequence of the dialogicity of humour is the possibility that interlocutors might interpret the same piece of discourse in distinct ways, and the source of humour is often a play on this potential for multiple interpretations. We argue that it is the juxtaposition of contrasting topoi which creates the humorous effect. For example, (1) relies on two contrasting topoi: a corona-specific “safe-distance” *topos* that people should stay 6 feet apart and a “dating website” *topos* that men who are 5'8" tall often claim to be 6", with “6 feet” as a point of overlap between the two.

In this talk we show how a dialogical account of humour using dialogue semantics (Cooper and Ginzburg, 2015; Ginzburg, 2012) and topoi allows us to account for written jokes with an idealised audience (Breitholtz and Maraev, 2019) as well as joke tellings in interaction (Maraev et al., 2020) using examples from the British National Corpus and social media examples such as (1). Our account gives a fine-grained precise formal definition of the notions of script compatibility and opposition from theories of humour (Raskin, 1985; Attardo and Raskin, 1991) whilst also taking the incremental processing of jokes into account (Ritchie, 2018).

# Gaze and turn-taking management in remote dialogue interpreting

Panel contribution

***Dr. Esther de Boe<sup>1</sup>, Dr. Jelena Vranjes<sup>2</sup>***

*<sup>1</sup> University Antwerp, <sup>2</sup> UGent*

In interpreter-mediated communication, interpreters play an important part in enabling smooth turn-taking. However, the smoothness of the interaction does not solely depend on the interpreters' actions, but rather on successful collaboration between all participants involved. To achieve mutual understanding, participants coordinate their communication by combining verbal utterances and embodied backchannelling resources such as gaze, gesture and body posture. By means of a subtle interplay of verbal utterances and backchannelling tokens, participants continuously express and monitor mutual understanding. In this process, gaze plays a central role (Mason, 2012; Vranjes et al., 2018).

In remote interpreting (by telephone and video), access to embodied communication, especially gaze, is extremely limited or lacking altogether. As a result, the interplay between verbal and embodied communication is affected. This can severely compromise smooth turn-taking and may lead to reduced mutual understanding or even communication breakdown (De Boe, 2020).

In this presentation, we analyse two studies on the role of gaze in turn-taking management in remote dialogue interpreting: (1) a series of nine doctor-patient simulations using face-to-face interpreting (F2F), telephone interpreting (TI) and video interpreting (VI); and (2) a data set of six naturalistic interpreter-mediated counselling sessions by means of video interpreting (VI), recorded with eye-tracking technology.

The analyses of both studies, which draw on a multimodal discourse-analytical framework, demonstrate substantial differences in gaze behaviour in remote interpreting compared with face-to-face interpreting. In the first study, gaze was a key element in achieving smooth turn-taking in F2F interpreting, whereas in VI, the participants appeared to rely rather on verbal information than on gaze. In TI, where gaze is obviously impossible between the primary participants and the remote interpreter, the interpreter slowed down the communication pace as a strategy for ensuring smooth turn-transitions. The second study, which focuses on the role of gaze in the management of turn-transitions between the primary speakers and the remote interpreter, shows how interpreting via video link affects both the interpreter's and the primary participants' gaze behaviour during turn-transitions and how interpreters display sensitivity to primary participants' gaze orientations at turn transitions. Both case studies confirm that the interpreter's gaze performs a less coordinative role when interpreting via video link than in face-to-face settings. These insights will contribute to our understanding of the interactional dynamics in remote dialogue interpreting and are useful to the training of users of remote interpreting services.

# Gender construction and heteronormative masculinity in U.S. Latin-American radio: the ase of 100.3 FM in Providence, Rhode Island

Panel contribution

***Ms. Angela Pitassi<sup>1</sup>***

**1.** University of Connecticut

In non-face-to-face interactions, media discourse presents ‘one-sidedness’ (Fairclough 2006). On the radio, although designed for mass audiences, the host controls the discourse as s/he ratifies, contests, or ignores caller’s ideas/interventions. Radio discourse hybridity allows the host to adapt to the idea of the “ideal subject,” and choose whether or not to “constrain content” proposed by callers. and place limits on the callers’ access to contest radio hosts’ stance. Likewise, when topics related to gender roles are discussed, hosts, as public figures can hold great power in deciding on how much space is given to heteronormative discourse. Their intervention influences these topics and purports ideologies in support of said discourse. However, once broached on air by the host, heteronormative discourse can become a point of contestation for some of these callers. Hosts can utilize strategies such as code switching, authentication of one’s self, and terms that are ideologically charged to support or reject hegemonic discourse in radio talk (Tseng 2011).

In this presentation, I examine hosts’ and callers’ gender ideologies about Heteronormativity in the Spanish language radio program on WKKB FM Latina 100.3 (USA). My methodology draws from critical discourse analysis considering gender identity performance and gender ideologies construction as sites of power struggle (Fairclough 2006). To this aim, I contrast the interventions of hosts and the callers during two different periods: 2016-2017, hosted by Dj Gato, a male in his 50s and Spring 2017-present where a team of two male and two female younger are the co-hosts. ,I look at how top-down strategies (of the radio host, DJ Gato, and then the other hosts) and bottom-up strategies (in the case of callers) to compare identity-building strategies (De Fina 2013). I pay special attention to gender identity performance and the reproduction of Hegemonic gender-roles and ideologies in these interactions. Additionally, I contrast the two periods to explore possible discourse modifications in how the current hosts address heteronormative discourse compared to when DJ Gato was the host.

My preliminary analysis shows gender identity is constructed significantly in explication and implicature. Also, the current polyphonic team of radio hosts, (two are male and two are female) allows greater contestation in terms of hegemonic gender ideologies. The discourse about heteronormative masculinity is not openly accepted, and when callers intend to assert it, the topic is evaded using code switching and avoidance of ideologically charged words compared to the DJ Gato’s former discourse.

# Gender Differences in Politeness in Task-Based Conversation

---

Panel contribution

---

***Prof. Myung-Hee Kim<sup>1</sup>***

***1. Hanyang University, ERICA***

This study aims to explore some gender differences in politeness strategies using the Expanded Korean O-Corpus (EKO). O-Corpus consists of task-based conversations, where two speakers work together to construct a story by arranging one of two particular sets of 15 cards. The Korean O-Corpus has been expanded recently, with male student and teacher speakers added, making it possible to examine the same- and cross-gender interactions. The Expanded Korean O-Corpus (EKO) consists of 70 same- and cross-gender student-student and student-teacher pairs. The present study examines part of the corpus, that is, 10 Male Teacher (TM)-Male Student (SM) pairs, 10 TM-SF, 10 TF-SM, and 10 TF-SF pairs, giving a total of 40 pairs. This study examines the 40 teacher-student pairs of the same- and cross-gender to find out how gender and power affect their use of politeness strategies. Based on the EKO, this pilot study attempts to investigate the way how men and women interact each other in the same-gender and cross-gender pairs.

# German ‘also’ as a discourse marker across registers and speaker groups

Panel contribution

***Ms. Annika Labrenz<sup>1</sup>***

**1. Humboldt-University Berlin**

Discourse markers (DM) as a subset of pragmatic markers (cf. Fraser 2009) are often considered to have homonyms in other word classes (e.g. Blühdorn 2017). This is also the case for German ‘also’. As an adverbial connector, it is syntactically integrated and typically signals a consequence within a proposition. As a DM, ‘also’ is located at the left periphery of sentences and is semantically bleached, contributing only on discourse level. In addition, ‘also’ can introduce a specification or a correction. In these functions, ‘also’ still carries semantic meaning, and is still syntactically integrated despite losing its original semantics of signaling a consequence. These four different usages of ‘also’ provide an interesting ground to investigate variation in use across different communicative situations and speaker groups.

In this paper, I present a corpus study, exploring the loci of variation among the functions of ‘also’. I investigate the distributional differences (1) in different communicative situations, targeting register variation, and (2) between mono- and bilingual speakers, targeting dynamics in multilingual contexts. The empirical basis of the study is the German sub-corpus of the RUEG corpus (Wiese et al. 2019). It includes linguistic productions of different speaker groups (mono- and bilingual speakers of German in Germany, and heritage speakers of German in the US) in four communicative situations targeting different registers (informal-spoken, formal-spoken, informal-written, and formal-written).

The data indicate that the functions of ‘also’ vary systematically depending on the communicative situations and the speaker groups: mono- and bilingual speakers in Germany use ‘also’ as a DM predominantly in the informal-spoken situation. Bilingual German speakers in Germany additionally use it as a DM in the informal-written context, pointing to interesting dynamics in this speaker group. In the formal-spoken productions of those mono- and bilingual speakers ‘also’ does occur as a DM, but it is also frequently used as a connector with the meaning of “specification” in this register. Interestingly, the data show a different pattern for heritage speakers in the US. Here, ‘also’ as a DM is used more frequently in formal-spoken than in informal-spoken registers. In contrast, the use of ‘also’ as signaling a specification only occurs in the formal-spoken situation. I argue that these differences might be due to the diverging communicative situations speakers in a majority vs. minority context might be exposed to. This might lead to different discursive strategies reflected by the variation in use of discourse markers.

# Gestures use in the practice of politeness in Persian

Panel contribution

**Mr. Farbod Farahandouz<sup>1</sup>, Dr. Shima Moallemi<sup>2</sup>**

**1.** National Institute for Oriental Languages and Civilizations (PLIDAM Lab.) Alliance Sorbonne-Paris-Cité, **2.** Sorbonne Nouvelle University

The politeness ritual of “ta’ârof” is essential in interpersonal interactions in Persian. In the absence of a French or English equivalent, researchers who have worked on the *ta’ârof* phenomenon have defined it as “ritual courtesy” (Beeman, 1986: 56), “expressed courtesy” (Bateson et al., 1977: 270) or “verbal polite wrestling” (Rafiee, 1992: 96). According to Beeman, “the essence of the language of *ta’arof* is the symbolic social elevation (other-raising) of the addressee and the symbolic lowering of one’s self (self-lowering)” (2020: 205). Sharifian (2011) also underlines the interactional purpose of *ta’ârof* and its role in the “negotiation” and “lubrication” of social relations.

Previous studies on *ta’ârof* focus mainly on the ritualized verbal expressions used in interaction. In this research, we are interested in the nonverbal aspect of *ta’ârof*. As greetings and leave takings are very likely to include *ta’ârof* (Miller et al. 2014), we will study opening and closing interaction sequences in an Iranian talk-show (*Dorehami*) to illustrate how gesture is used to express self-lowering and other-raising strategies between the host of the show and his guest. To enrich our corpora, we will also take into consideration mid-conversation sequences that include these two strategies.

In order to analyze our corpus of 10 hours recorded video of this talk-show we used NEUROGES coding system for gesture analysis (Lausberg 2013a, 2013b, 2019) as well as McNeill (1992) classification and ELAN for gesture annotation. We found out that deictic gestures are used the most to express non-verbal forms of *ta’ârof* when they are done simultaneously with speech or without speech.

# Giving and receiving information in meetings between nurses and family members of people with dementia during COVID19 pandemic

Panel contribution

**Dr. Jenny Paananen<sup>1</sup>, Prof. Camilla Lindholm<sup>2</sup>**

<sup>1</sup>. University of Turku, <sup>2</sup>. Tampere University

Interaction between health care practitioners and family members of people with dementia is crucial for the care, especially when dementia begins to limit the autonomy of the care recipient and the need for professional care increases. The transition phase when the person with dementia moves from home to a nursing home is emotionally burdening for the family members (Alzheimer's Society 2017), but collaboration with nursing home personnel can reduce their stress (Maas et al. 2004). Reciprocal sharing of information between the family members and the nursing personnel is known to increase family members' trust in care as well as improve the quality of care (see e.g. Lau et al. 2008). The family members possess valuable information on the residents' life, medical history and wishes, whereas the nurses have information on the residents' current behavior and medical issues as well as information on the everyday care.

Despite the benefits of sharing information, only little is known about its interactional dynamics in a nursing home context. In this study, we employ conversation analysis to study giving and receiving information in annual meetings between nurses and residents' family members. In our data of video/audio recorded meetings, the family members are in charge of the affairs of the resident in question due to the resident's dementia. The data was collected during the Covid-19 pandemic, and therefore it depicts a particularly interesting situation in terms of communicating information, as family members' visits to the nursing homes were restricted in various ways at the time. In our analysis, we examine what kind of knowledge the nurses and the family members introduce in the meetings, and whether the increased distance between the family members and care recipients is addressed somehow in the conversation. In particular, we investigate how the family members and the nurses construct the resident's *life world*, i.e. how they describe the resident's experiences, wellbeing, and everyday life (see Mishler 1984).

The study is part of the research project *Alongside Dementia*. The project is funded by the Academy of Finland and qualified by the Ethics Committee of the University of Turku.

# Graphicons as a vehicle for displaying emotions in digital workplace interaction

Panel contribution

***Dr. Elina Salomaa<sup>1</sup>, Prof. Esa Lehtinen<sup>1</sup>***

***1. University of Jyväskylä***

Digital platforms have given rise to novel forms of communicative practices, which are increasingly visual or multimodal by nature. In online interaction, people use e.g. emojis, images and GIFs – i.e. *graphicons* (Herring & Dainas 2017) – to accomplish different kinds of interactional tasks. Earlier research has shown that they are used, in particular, as responses that display affect (Tolins & Samermit, 2016). Previously, graphicons have been studied in the context of everyday interaction between friends, but in our presentation, we show how graphicons are used in an organization to display emotions.

Our data come from a development project in an organization. It includes a video-recording of a virtual workshop and screenshots from a digital platform used in two assignments, in which employees are encouraged to reflect on their work and express their feelings about and around it. The assignments are produced with the help of GIFs and images, and participants are expected to comment on these graphicons both textually and orally. Using conversation analysis, we will analyze both the graphicon-comment sequences on the platform as well as sequences where participants discuss their comments orally. Our research questions are as follows:

- How are graphicons used to organize emotion talk?
- How do the participants use affordances of different media to display their emotional stances?
- How is the sequential structure of emotion talk organized across different media?

We will show that graphicons in a virtual meeting are not used as responses but as initiating actions that encourage employees to express their emotions. Through graphicons, the members of the team orient to a specific emotional order (Stevanovic & Peräkylä 2014) that shows their shared expectations regarding expressing emotions in that particular organization. With this study, we contribute to discussions about the display of emotions in organizations. We will show how graphicons facilitate displaying negative and thus potentially delicate emotions and how these emotive states are further elaborated through typed comments and oral discussion.

We will also contribute to the discussion about the application of conversation analysis to complex digital interaction. First of all, we will tackle the question of how to analyze contexts where more than one digital medium is used at the same time. Secondly, we will discuss how graphicons can be approached as communicative actions in their own right, rather than, for example, substitutes for bodily behavior (cf. Tolins & Samermit 2016).

# Greentext and Shitposting as Discursive Violence within 4chan's "/pol/" Board

---

Panel contribution

---

***Mr. Dillon Ludemann<sup>1</sup>***

**1.** Binghamton University–SUNY

This paper outlines the process by which “greentext,” a common narrative method within the popular anonymous image board website 4chan, is used to circulate and reconfigure racist discourses and offensive language into joking registers. Greentext is a highlighting feature on 4chan, initiated with the use of the “>” character, that has become iconic both within 4chan and among other online communities. Often, the use of greentext is associated with humorous, stream of consciousness styled storytelling and narrative practices, in addition to other uses. This paper aligns this narrative style within the infamous 4chan board, “Politically Incorrect,” more commonly known as “/pol/.” In this specific context and structure, I will demonstrate how the use of greentext within this politically incorrect space, as a tool to structure a narrative, is used to further diminish the often violent and racist discourses that users on /pol/ engage with. Indeed, combined with attitudes of contempt, users mobilize this narrative style to create an “unmarked” category of joking, allowing not only for an increased level of deniability by those who voice these discourses, but framing resistances against these opinions as disruptions to community understandings of these phenomenon. I contextualize these practices within the broader cultural and digital discourse of “shitposting,” a phenomenon of banter and joke-making that, while aligned in some ways with the often more violent discursive process of trolling, is crucial to the process by which these widely regarded violent and racist discourses are reduced to joking banter and small stories. I then argue that this diminishment furthers ideologies of white nationalism and racial violence within this digital space. This process of voicing unmarked, racist ideologies within a humorous narrative style is thus framed as a practice that is beyond reproach, as “only a joke”. Further, I highlight the ways in which these processes provide insight into how users on /pol/ participate in the active construction and understanding of pragmatic affordances through the linguistic ideologies and practices they embrace, reject, and evaluate within their everyday practices.

# Grounding emergent common ground: Detecting markers of emergent common ground in online discussions

Panel contribution

***Dr. Elke Diedrichsen<sup>1</sup>***

**1.** Technical University Dublin

A new socio-cognitive approach (Kecske and Zhang 2009, Kecske 2014) integrates two approaches to common ground by considering its two dimensions: Core common ground is the portion of knowledge and intention shared among interlocutors and acting as a basis for the interaction, whereas emergent common ground is dynamically built out of knowledge and intention portions that the interacting parties bring into the ongoing conversation. These portions may be divergent and contradictory, as they originate from each interlocutor's own background. They may be influenced by the current situation. Their appearance in the particular interaction may be motivated by the interlocutors' attention, their respective understanding of the topic, but also personal interest, mood and sentiment towards the discussed topic, and personal communicative experience with the topic itself and/or the terminology used for it. The proportion of emergent common ground may be higher in interactions where the cultural background of the interlocutors is not shared (Kecske 2014). In this paper, I will discuss how portions of emergent common ground in internet-based communication can be identified. The material will include discussions of culture-specific topics. I will argue that there are recurrent markers of emergent common ground in conversation, for example in negotiations concerning the topic area, its definition and denomination. These may include expressions of personal opinion and sentiment regarding the topic area, the discussion and the interactants. The discussion style may (or may not) be polite, inclusive and constructive. For any kind of discussion style, there are lexical, typographical and pragmatic markers of emergent common ground, which will be identified and discussed in the paper.

# Harmony and common ground: aikido principles for intercultural training

Panel contribution

***Ms. Greet De Baets<sup>1</sup>, Prof. Ellen Van Praet<sup>1</sup>***

***1. Ghent University***

Aikido, a martial art, is practiced globally and aims to turn opponents into partners, even when the odds are against harmony. Typically, aikido stands for seeking harmony, common ground and nonviolence instead of the combat in most other martial arts. In many parts of the world, it is also applied as a metaphor or an embodiment method in fields such as therapy and communication training. In the field of intercultural business communication training, for instance, it may be argued that aikido meets a need for experimental training approaches with experiential discovery rather than conventional didactic expository (Waxin & Panaccio, 2005; Treven, 2003; Graf, 2004; Díaz & Moore, 2018).

In this paper we investigate how and to what extent aikido may be beneficial to intercultural business communication training: we report on a benchmarking study in which we identify what interviewed aikido experts consider to be core principles of aikido on and off the mat. Relying on NVivo software, we performed a qualitative content analysis of the interview data. The findings showed that the way people learn, teach, understand and perceive aikido has fundamental similarities. The respondents referred to aikido principles with the same core meaning, however, with some local or individual nuances: building common ground in interactions and discovering the power of harmony through self-development. The curriculum of aikido consists of movement practice that illustrates and teaches common ground and harmony in challenging interactions: unification and circulation based on an attitude of tranquility, openness and curiosity. Because aikido movements are not meant to react to an attack but to create a win-win outcome, neither the attacker nor the attacked is a victim. This is similar to interculturality, the communicative process in intercultural interaction which emerges from the situation (Kecskés, 2020).

We conclude that aikido has potential in an embodied learning process of intercultural communication skills. The hands-on style of learning involves aikido movements simulating intercultural interactions followed by feedback and discussions. In this way, learners discover insights into the other person's sensitivities and an emergent common ground framework to add to their intercultural competence repertoires. This embodied approach aims to be an example of experiential discovery that strives to equip employees with a broad range of skills that will help them act appropriately in different international business contexts (Graf, 2005).

# HEAL'D – Health Emotions in Australia: Language and Discourse (a corpus-based study)

Panel contribution

***Dr. Francesco De Toni***<sup>1</sup>

**1.** *The University of Western Australia*

The ways in which emotions are named and expressed through language play a key role in several areas of health, such as patients' description of their symptoms, doctors' diagnoses and treatment of illness, peer-support among patients, health-promotion communication campaigns, and collective reactions to health-care crisis. Emotions are cultural objects as much as physiological ones. While emotions have often emerged as an underlying component in sociopragmatic studies of language in health-related contexts (Gygax & Locher 2015), the role of cultural models of emotion language in health is still largely unexplored. Furthermore, sociopragmatic research on emotions, language and health has mainly focused on qualitative case studies (Locher 2006). At present, we do not have a clear understanding of how models of emotion language about health and illness emerge and circulate across genres and pragmatic contexts through social interactions and through the influence of cultural references.

HEAL'D (Health Emotions in Australia: Language and Discourse) is a sociopragmatic project that will contribute to fill the knowledge gap in our understanding of large-scale sociopragmatic dynamics in the use of emotion language in health-related discourse. Focusing on Australia as an example of multicultural society, the project aims to answer the following research questions. 1) What macro-models of emotion language are used in Australian society to discuss health and illness? 2) How do these models emerge and circulate across genres and pragmatic contexts? 3) How these models affect people's ability to talk about health and illness?

The project adopts a corpus-based and systemic-functional approach, investigating variation in the use of emotion language in a multi-genre corpus of texts. The project is developed within the 'appraisal' framework (Bednarek 2008) and it investigates both models of *emotion talk* (terms that denote emotions, e.g. *pain*) and *emotional talk* (linguistic behaviour that signals emotions without denoting them; e.g. evaluative terms other than emotion terms). The project uses a combination of standard corpus-linguistic methods (e.g. collocations) and semi supervised word-distributional modelling (vector space modelling) to analyse functional variation in emotion language across selected topics (e.g. chronic illness, mental health, pandemic) and pragmatic contexts (e.g. advising, reporting). By capturing latent semantic and pragmatic relations between words and functional tags, word-distributional methods enable the automatic identification and clustering of covert instances of *emotional talk*.

The results of this quantitative study will provide a baseline for future qualitative analyses of emotion language in doctor-patient interactions, will inform the design of educational resources targeted at health professionals, and will support public-health initiatives directed at raising awareness about the impact of emotions on health. This presentation will introduce the framework and methods of the HEAL'D project and will present preliminary results. Specifically, the presentation will focus on emotion language about health in news and online discourse, which provide an ideal domain for the application of corpus-based methods.

# Heav'n has no rage, like love to hatred turn'd, Nor hell a fury, like an affronted smart mob: Canceling Influencers in an age of outrage

Panel contribution

**Prof. Pilar Garces-Conejos Blitvich<sup>1</sup>**

*1. University of North Carolina at Charlotte*

Within the context of outrage/cancel culture in the USA (Romano, 2019), this presentation will focus on *canceling*: the virtual shaming and boycotting of a celebrity or personality accused of doing/saying something (racist, misogynistic, homo/transphobic, etc.) that so outrages their fans/followers/social media users, they “cancel” the person to take attention away from them and damage his/her career. Canceling is seen either as the indiscriminate attack of a raging smart mob or as a form of social justice and empowerment of those, usually members of minorities, who lack the social, political, or professional power to establish new ethical and social norms or to respond effectively when those norms are violated (Nakamura, 2015).

Academic research on canceling from pragmatics or other related fields is lagging and no micro-level, theory-based descriptions of what constitutes *canceling* have yet been provided.

To help fill in this void, this presentation offers a qualitative analysis of the *canceling* genre, the hallmark of cancel culture. It focuses on a case study: the cancelation of influencer Chiche Eburu, creator and owner of Juvia’s place, for perceived slights to other African-American beauty influencers, but draws from a larger reference corpus which includes five other cases. It applies a multidisciplinary theoretical framework and methodology that explore *genre practices* (Swales, 1990), the functionality of hashtags (Bonilla & Rosa, 2015; Matley, 2018; Scott, 2015), *receipts*,memes (Duchscherer & Dovidio, 2016; Williams et al. 2016), aggressive language (Blitvich, 2018; Culpeper, 2011), and apology videos, among others, in the cancelation process.

Results show the cancelling genre is composed of five moves: **Trigger** (a non/verbal action by the *cancelee* that is perceived as racist, homophobic, misogynistic, or otherwise offensive); **Doing canceling** (the collection/sharing of *receipts* –incriminatory texts such as videos, posts, pictures that prove the offensive behavior occurred; the developing of condemnatory memes/ hashtags that index, archive, and bring together the smart mob that aggressively targets the *cancelee* through the use of various semiotic modes; the disseminating role, in the case of YouTube, of *drama* and *tea* channels that concentrate on influencer news and see their goal as keeping influencers accountable, etc.); **Results of cancellation** the *cancelee* loses followers, endorsements; support; contracts; job; the *cancelee* suffers serious damage to their reputation; **Avowal** a stage during which the disgraced influencer apologizes and asks for clemency, usually by the issuing of an apology video; **Reinstitution** follows if the apology is accepted, the boycott lifted, as followers return to the influencers’ channel, “re”like their profile pages, and buy/recommend their services and products again.

Canceling emerges as a genre aimed group exclusion (Williams et al., 2016). This exclusion is justified by reducing the multifaceted identity (Bucholtz & Hall, 2005; Joseph, 2013) of the *cancelee* to one single defining position, that of racist, misogynistic, homo/transphobic, etc., thereby constructing them as the embodiment of those systems of oppression that need to be denounced and fought against (Ahmad, 2015).

# Hebrew stance-taking gasps between language and the body

Panel contribution

***Mr. Yotam Ben Moshe***<sup>1</sup>

*1. University of Haifa*

This paper describes “gasps” - ingressive vowels, and rarer ingressive nasals and sharp inbreaths - expressing stance in Hebrew conversation. These are investigated using interactional linguistic methods (Couper-Kuhlen & Selting 2018) in audio and video recordings from the Haifa Corpus of Spoken Hebrew (Maschler et al. 2021a & 2021b).

Conversation Analytic literature describes gasps in pain displays (Heath 1989, La 2018), which differ in context and articulation (unvoiced, through clenched teeth). Stance-taking gasps have been mentioned in linguistic literature (Eklund 2008, Wilkinson & Kitzinger 2006), but this is the first in-depth description.

A sharp intake of breath may well be an automatic response, part of the physiology of surprise. This paper will show however that gasps are “not merely a physiological act with psychological correlates, but [...] also a legitimate resource in, and a delicate component of human social activity” (Hoey 2014).

In the following family dinner excerpt, the father recounts his first day at a new job, at the quality control lab in a sugar factory. He is describing the investigation of a baby formula manufacturer’s complaint, about black specks in a consignment of starch; the chemists are using a magnet to check whether the speck is metal.

01 Roni: ?aval ?im ze lo barzel?

“but if it isn’t metal?”

02 Father: ...?az zehu.

“so that’s it.”

03 ..?az,

“so,”

04 ..?im ze lo barzel,

“if it isn’t metal,”

05 ?az ze lo nora.

“then it’s not terrible.”

06 ?aval ?im ze barzel?,

“but if it’s metal?,”

07 ..ze nora.

“it’s terrible.”

08 ve?az,

“and then,”

09 ..hi-,

“she-,”

10 kerva ?elav,

“moved [the magnet] close to it,”

11 vetik!

“and tick!”

12 haxele ḥk ha-katan haze,

“thi-| s little piece,”

|

13 Mother: | (gasp)

↳{eyes wide, eyebrows raised}

14 Father: ...nidbak lamagnet,  
“stuck to the magnet,”

The son interrupts the narrative with a question (1). This is one of several, showing that the stakes of this lab procedure are not obvious to any of the participants but the father - e.g., later the mother asks what might have happened if the specks weren't noticed. The father clarifies that a positive result would be “terrible” (2-7).

Returning to the narrative, the father describes the moment of the positive result (8-14). This dramatic climax is constructed using involvement strategies (Tannen 2007): Specifically, the father uses sound imagery, “tick!” (12), drawing a gasp from the mother (13). Like other liminal signs, gasps “display a tight fit of form to function” (Dingemanse 2020): ingressive phonation is difficult to maintain, allowing the mother to invoke the trope of aposiopesis - as if rendered speechless by emotion. Her stance emerges as part of the interactional achievement of storytelling.

Eklund (2007) demonstrated that pulmonic ingressive speech is spread across continents and language groups, and seems to have a universal basis. Research has focused on languages featuring ingressive discourse particles or short phrases. This study accounts for what may be this universal basis, tracing the recruitment of a bodily action into the toolbox of social interaction.

# Hindering disagreement: Miranda adjectives in a Swiss political debate

Panel contribution

***Prof. Thierry Herman<sup>1</sup>***

*1. Universities of Neuchâtel and Lausanne*

Four times in a year, Swiss citizens are voting on a national issue. Two groups, either in favor or against the object of the vote, create websites rather quickly, with an argumentative content which tries to justify their opposite standpoints. In the context of a vote whose goal is to build affordable housing (campaign from October 2019 until February 2020), these websites do not seem to dialogue in a balanced and comparable way. Indeed, the choice of certain qualifying adjectives make both parties sometimes appear to prevent interaction between them, using adjectives that cannot provoke disagreement.

In the studied case, three categories with different pragmatic effects can be made. Firstly, questionable qualifiers: this category includes adjectives defended by one party and whose opposite is supported by the other party ('necessary' vs. 'useless'): a standard disagreement. Second, certain qualifying adjectives ('bureaucratic', 'statist vision', etc.) can be considered as 'flag words' or as ideological stigmatizing words for one party only (Strauss & Zifonun, 1983). In this case, the opponents have no interest in participating in the debate since it would weaken their own argument, which illustrates a disagreement avoidance. Finally, some adjectives are so appraised or rejected in a community of speech that their opposites cannot be publicly endorsed by the opponents: they can be considered as Miranda (or Anti-miranda) words (Dieckmann, 1975; Girnth, 2015). I contend that these words are "hindering a disagreement" which is nonetheless inherent of a debate in such polarized issues. In my case, those who want a 'no' vote cannot legitimately plead for 'unaffordable' rents. My objective is to study rhetorical strategies used to impose and circumvent Miranda and Anti-miranda adjectives, in a theoretical framework which is sensitive to linguistic markers and their pragmatic effects.

# Hippies, Haoles, and Real People: Membership Categorization Practices in Interaction Involving Elder Hawaiian Speakers

Panel contribution

***Dr. Scott Saft<sup>1</sup>***

**1.** University of Hawaii at Hilo

The Hawaiian language was the primary language spoken in the Hawaiian Islands prior to sustained western contact that began in 1778. This contact not only introduced Hawaiian speakers to new languages but also sparked widespread usage of category terms for different types of people, including but not limited to *haole* (general term for ‘white person’), *hapa* (person of mixed blood), and *kanaka maoli* (literally, ‘real people’), with *kanaka maoli* serving as a term that was and is still used to refer to people of Native Hawaiian blood. Although western contact eventually led to severe endangerment of the Hawaiian language, the usage of these and other categories can be observed in Hawaiian language newspapers published in the 1800s and early 1900s and also in interviews with elder native speakers recorded in the 1970s.

Through a membership categorization analysis that focuses on the interviews with elder speakers, this presentation attempts to discern the reasoning behind the deployment of categories by people who grew up speaking Hawaiian. As Schegloff (2007: 469) notes, “categories are the store house and the filing system for the common-sense knowledge that ordinary people—that means ALL people in their capacity as ordinary people—have about what people are like, how they behave, etc.” The analysis begins with a reference by one of the speakers to hippies and then focuses on the usage of *haole* and categories used to refer to ‘Native Hawaiian as part of an effort to understand the common sense knowledge used by the Hawaiian elders to divide people into categories.

Discussion of the analysis notes that the traditional Hawaiian view of the self centers on interconnectivity and non-separation between individual bodies and a surrounding context that includes familial and ancestral relations, the spiritual world, and also the land. The analysis, therefore, provides insight into the category practices employed by elder Hawaiian speakers in communication that works to dissolve a non-separation with certain types of people (i.e., hippies and haoles) and also to construct interconnectivity with others (*kanaka maoli*). Finally, the discussion relates the findings to *ba*-theory, an approach to context as “a single integrated whole” that is based on non-separation, interdependence, and impermanence (Hanks et al 2019). Based on the data, this presentation suggests that *ba*-theory provides a dynamic approach to context that has the potential to elucidate how taken-for-granted distinctions in the social world, such as types of people, are constructed maintained, and dissolved in social interaction.

# Historical Approaches to Indirect Complaints and Indirect Complaint Responses

Panel contribution

***Dr. Sofia Rüdiger***<sup>1</sup>

**1.** University of Bayreuth

Both direct and indirect complaints form an inherent part of our social life. On a typical day, we may complain to friends about the weather (= indirect complaint), but also to the waiter in the restaurant about the overly salty food (= direct complaint). Previous research on complaints has focused heavily on direct complaints in general (e.g., Trosborg 1994, Decock & Spiessens 2017), contrastive studies of direct complaint strategies (e.g., Tokano 1997, Mulumba 2009), and conversation analytical (CA) studies of indirect complaints (e.g., D'Amico-Reisner 1985, Jefferson 1988, Edwards 2005). Outside of CA, however, indirect complaints have largely been neglected, despite their ubiquity in (present-day) conversational English (Boxer 1993: 110) and importance in establishing rapport and a connection to the interlocutor (*ibid.*). This study sets out to remedy this gap from a historical corpus linguistic perspective.

In this talk, I evaluate the suitability of different historical corpora for the analysis of complaint strategies from the 15<sup>th</sup> century onwards (e.g., the *Corpus of Early English Correspondence Sampler* (CEECS), the letter subcorpus of the *Representative Corpus of Historical English Registers* (ARCHER), the Electronic Enlightenment database, and the *Corpus of English Dialogues*). At the core of this talk lies the question, whether, and if yes, how, the realization and components of indirect complaints and indirect complaint responses can be investigated diachronically. I will focus on complaint components and strategies as attested for present-day English complaints, such as objectification strategies, hedges, and extreme case formulations (see, e.g., Drew & Holt 1988: 405), and exemplify their use with the historical data. Furthermore, I will point out the advantages and drawbacks of the adopted methodology.

# Hola hermanos, bonjour la famille: A case study of politeness strategies in an African online affinity group on WhatsApp

Panel contribution

**Dr. Carmen Pérez-Sabater<sup>1</sup>, Dr. Ginette Maguelouk Moffo<sup>1</sup>**

***1. Universitat Politècnica de València***

We are now witnessing the spread of code-switching (CS) and language mixing practices in online discourse on an unprecedented scale (Androutsopoulos, 2013; Pérez-Sabater & Maguelouk-Moffo, 2019); as Wentker (2019) states, pervasive CS seems to be the unmarked choice in many online communities. However, academic research on multilingual online exchanges has almost exclusively focused on Anglophone and Northern European speakers. To fill this research gap, this abstract proposal forms part of an ongoing line of research which examines how individuals in the Global South and non-Anglophone fora establish in-group solidarity and cohesion today through language mixing strategies. This research pays particular attention to the strategic use of CS as a politeness norm in communities on Instant Messaging that constitute translanguaging spaces (Pérez-Sabater, 2021) for ‘relational work’ (Watts & Locher, 2005). To this end, by means of a quantitative and Computer-mediated Communication Discourse Analysis, we examine the naturally-occurring interactions on WhatsApp of a group of 74 former university classmates, 54 women and 20 men, who studied Spanish Philology in the mid-2000s at a Cameroonian university. The group members, most of them now teachers of Spanish, communicate frequently using this technical medium to socialise and stay in contact. The close observation of the group’s interactional strategies and relational work over the last 2 years shows that members construct their online ‘famille’, their new social space for self-presentation and negotiation (Garcés-Conejos Blitvich & Bou-Franch, 2019), by means of the following: (1) kinship terms as forms of address, often in Spanish and English in utterances principally in French; (2) code-switching to Spanish in structural and verbal politeness markers; and (3) the inclusion of religious terms as a politeness strategy.

The results of this case study reveal some interesting normativities developed in this community. On the one hand, Anchimbe (2011) explains that in Cameroonian English and French, as part of the process of nativisation or indigenisation of the two official languages of the country, kinship terms to address people who are not family are politeness indicators to show respect and be polite, carrying social and pragmatic significance. Code-switching to Spanish for these family names is an attempt to establish even closer links between members of the group. Apart from naming, these code-switching practices reinforce community identity in this translanguaging space for teachers of Spanish. On the other hand, references to religion are present in many of these online texts to show solidarity, respect and compassion, as religion is strongly embedded in African culture and language practices (Chiluwa, 2013).

On balance we can say that, in this particular case study of African online discourse, patterns of politeness, as Anchimbe sustains (2011), are clearly culture and region specific. As a novelty, the analysis identifies the insertion of Spanish as a crucial strategy serving to establish in-group solidarity and familiarity and to create the particular identity of the community.

Anchimbe, E. A. (2011). On not calling people by their names: Pragmatic undertones of sociocultural relationships in a postcolony. *Journal of Pragmatics*, 43(6), 1472-1483.

# Horses as healers: psychotherapists and coachees using horses' conduct in working on human issues in Equine Assisted Psychotherapy encounters

Panel contribution

***Dr. Nynke van Schepen<sup>1</sup>***

**1. Rijksuniversiteit Groningen**

The present paper strives to study question-answer sequences in Equine Assisted Psychotherapy (hereafter EAP) encounters, drawing on the analytic framework offered by multimodal Conversation Analysis (Sacks, Schegloff & Jefferson, 1974; Mondada, 2014). Conversation Analysis has a longstanding interest in exploring therapeutic or mental health encounters and different forms of counselling (see, for example, Peräkylä, 2013; Svinhufvud, Voutilainen & Weiste, 2017), studying naturally occurring interactions between psychotherapists and patients, or between coaches and coachees. Animal-assisted forms of psychotherapy occupy a particular place within psychotherapy and counselling.

Typically, in an EAP session, the coach or psychotherapist requests that the coachee performs specific equine-assisted activities, to then integrate the process and outcomes within their broader theoretical psychotherapeutic framework, whereby coachees are invited to reflect on personal issues, cognitions and emotions. More specifically, coachees participate in activities that are specially designed for them, with the help of a horse. Outcomes of the activities may be used and picked up by both the psychotherapist and the coachee for raising awareness of personal human issues. During these activities, the actions of the horse are explained and interpreted by the coach and offered to the coachee for comments and feedback, with the aim of decreasing psychological distress. At the same time, the coachee in response uses the horses' conduct to explain human issues. In so doing, both psychotherapist and coachee often attribute certain human capacities or mental states, a certain desire, wish or emotion to the horse (see also Mondémé, 2018).

In this paper, I focus on question-answer sequences, with a particular focus on how the horses' actions are explained, interpreted and used by both the coach and coachee for explaining human actions. An example at hand is the following question of the therapist: "Hoe voelt dat nou dat de paarden tussen ons in komen staan?" ["how do you like it that the horses are standing between us now?"]. In response, explanations of the conduct of the horse are used to reflect on personal issues in the interaction between coach and coachee.

The analyses are based on an emerging corpus of video- and audio-recordings of Equine Assisted Psychotherapy encounters recorded in The Netherlands.

# How (not) to communicate health-related information during a pandemic crisis: a speech-act theoretical perspective

Panel contribution

***Dr. Paolo Labinaz<sup>1</sup>***

***1. University of Trieste***

The goal of this paper is to investigate from a speech-act theoretical perspective the consequences and potential risks of certain styles of communication used (more or less consciously) by healthcare experts when speaking publicly about the evolution of the COVID-19 pandemic in Italy. It is widely agreed that this pandemic has been accompanied by an unprecedented “infodemic”, because of which people have found it difficult to rely on trustworthy sources and reliable guidance when needed (WHO 2020). However, it seems to me that in the attempt to identify the reasons for the infodemic, too much attention has been paid to the issue of misinformation, and what has been underestimated are the negative side effects on people’s understanding (of the situation) caused by the often-conflicting statements made by healthcare experts in public discourse.

While it is certainly a good thing that expert knowledge should be placed at centre-stage during a health crisis, what is needed is a rethinking of the communicative styles employed by healthcare experts so as to foster a mutual understanding of the situation. To this end, I analyze the communicative styles employed by healthcare experts through the lens of an Austin-inspired speech act theory, with a special focus on the illocutionary dynamics of assertive speech acts (Sbisà 2020).

When communicating with others, we can convey the same piece of information in slightly different ways, which amount to performing different speech acts, such as assertions, claims, conjectures, or guesses (Labinaz, Sbisà 2014). When an expert speaks publicly about health-related matters, she is normally expected to convey the information she wants to communicate to the audience by using plain assertions, and not weaker assertive speech acts. This is because the audience expects to be told how things are, and not how they might be, and what they should or should not do, and not what they could or could not do, in relation to the health-related matter at issue. Since the expert’s acknowledged reliability is supposed to guarantee the truth of what she asserts, the audience feels entitled to rely upon the contents of the expert’s assertions in their subsequent verbal and non-verbal behavior: for example, by re-asserting those contents or using them as a premise in reasoning or as a ground for decisions. However, when more than one expert makes conflicting assertions on the same issue, this usually causes confusion and bewilderment among non-experts, leading to forms of extreme polarization (as has happened in Italy), and this is what I try to illustrate, using a sample of social network discussions.

# How big is your family?: The extended use of kinship terms in Korean

Panel contribution

**Dr. Narah Lee**<sup>1</sup>

1. University of Queensland

The address practice in Korean is understood as extensively complicated, corresponding to the delicately developed speech styles and honorifics based on the social recognition of the hierarchical interpersonal relationships (Park, 1997; Sohn, 1999; Wang, 2005). As noted in the literature, the linguistic reflection of the social relationships is closely related to the substantial influence of the Confucius ideology for centuries. While Confucianism becomes the common ground for the understanding of Northeast Asian cultures and their languages, what is particularly distinctive in Korean is the use of kinship terms in extended settings, i.e. outside kinship, as well as the strict restriction on the use of personal names. In this study, we explore the address practice in Korean by conducting a survey asking the participants how they address their family members, friends, colleagues and acquaintances. We also analyse TV shows in which people with no pre-established social relationship meet and try to converse in the process of finding appropriate terms of address.

The survey results show that the address practice within a family is clear and rigid: the younger use a kinship term to address the elder, and the elder use a name to address the younger, with relatively more variants from the respondents of younger age. When addressing their elder coworkers, parents' friends or their elder siblings' friends, the respondents answered that they use kinship terms unless using a professional title. The survey also includes the respondents' explanation on the reasons for their use of certain address terms or no use of any, such as their perception of (im)politeness and intimacy in regard with the address practice. The analysis of the TV shows supports the extended use of kinship terms in Korean as well as the speakers' sociolinguistic strategies in determining how to address their collocutors. Since the address practice in Korean heavily relies on the social relationship between the discourse participants that is again primarily decided by their relative ages if outside kinship, it is extremely difficult to address a person with no information about their age. Closely related to the fact that a subject in a sentence can be easily unexpressed and there is no second person pronoun that can be generally used in Korean, the speakers in the TV shows used a variety of address terms, including names when they were informed that the addressee was younger than the speakers themselves, honorific titles like *sensayngnim* (lit. teacher) 'Sir/Madame' or *yesanim* 'Madame' when the addressee was obviously much older than the speakers, and kinship terms when the speakers meet with whom they already have a social relationship established and wanted to express intimacy.

# How Can a Somewhat Evasive Answer in Online Medical Consultation Embody Shared Understanding? Toward a Cognitive-Pragmatic Account

Panel contribution

***Prof. Ming-Yu Tseng<sup>1</sup>***

**1.** National Sun Yat-sen University

This study adopts a cognitive-pragmatic approach to addressing online medical consultation (OMC hereafter). It specifically addresses a problem facing health professionals when offering consultation in the online context: they are caught in the dilemma between the need to fulfill professional obligations and the potential difficulty of answering questions that cannot be answered due to the online environment. Therefore, they sometimes provide a somewhat evasive reply. Data in traditional Chinese were collected from a government-funded site because of its official status, its provision of publicly accessible medical questions and answers, and its design of the medical consultations that allows inquirers to rate the replies they have received in terms of satisfaction level from one to five stars. Three criteria were set up for data selection. All of them needed to be met in order for an example to be collected: (1) the reply was rated by the inquirer as four- or five-star; (2) the reply had at least one question totally or somehow dodged; (3) a short reply that said nothing more than *Please see a doctor in person* was excluded as it does not help reveal what constitutes a good medical reply. For the purpose of this study, 100 cases of OMC that met the above three criteria were collected. An additional 20 cases were also collected, those being largely rated one- or two-star, with only several cases receiving a three-star rating. The twenty cases are used to serve a contrastive purpose only. The 100 cases were examined in terms of the exploitation of four metonymic schemes of thought. The result shows that PART FOR WHOLE is the most frequently used metonymic scheme, followed by CONDITIONAL FOR UNKNOWN/FUTURE and POTENTIALITY FOR ACTION, with CAUSE FOR EFFECT in the fourth place. The metonymic schemes of thought constitute a type of cognitive force, which collaborates with three other forces in shaping language use (Schmid 2015, 2020): emotive-affective forces (e.g., egocentrism, emotion, empathy), pragmatic forces (settings, goals, intentions), and social forces (identity, solidarity, legal aspects). The collaboration of the four types of cognitive-pragmatic forces lays the foundation for elucidating the production and reception of high-performance cases of OMC, thus facilitating shared understanding in the healthcare context. As will be argued, one way of understanding why a somewhat evasive reply can still satisfactorily perform an act of offering medical consultation is that the evasiveness can be amended by providing part of the medical knowledge relevant to the question, by describing possible conditions as a way of handling the unknown situation, by telling the advice seeker what s/he can or may do as a way of suggesting action, and by explaining the reason for a health issue. By examining new OMC data using the fresh approach, this study aims to shed light on the value of pragmatic research on health communication.

# How can governments be prevented from manipulating statistics about Covid-19? An example from UK politics

Panel contribution

***Dr. Cristina Marinho<sup>1</sup>, Prof. Michael Billig<sup>2</sup>***

*1. The University of Edinburgh, 2. Loughborough University*

In a modern, highly quantified society, governments possess large powers to produce, interpret and manipulate statistics for their own political advantages. In the UK these include constructing statistics about Covid-19, designed to show that the government has pursued successful policies. The UK Statistics Authority is a statutory body established by parliament to ensure the proper use of statistics in British public life. In May 2020 the Authority's chair, Sir David Norgrove, initiated a formal, public exchange of letters with the Minister of Health about the government's statistics for conducting tests for Covid-19: he was concerned that the government was knowingly overestimating the number of tests carried out. The question addressed here is: How can the UK Statistics Authority ensure the government's adequate use of statistics? To answer this question, we examine Norgrove's use of language in this public exchange, as well as newspaper reports of the letters. The approach adopted is Discursive Psychology as we look at what actions are discursively accomplished by Norgrove and how they are reported by the press. Norgrove used diplomatic language in his first letter, leaving unclear why he is writing this public letter and implicit his criticism of government's use of statistics. In his second letter, Norgrove used less diplomatic features: he amplified his previous points, making his criticism more explicit. The analysis of newspaper reports of the letters, which will be the main focus of this talk, shows that there are differences in the way left-wing and right-wing newspapers covered the letters. Left-wing newspapers tended to go beyond Norgrove's use of diplomatic language by interpreting the meaning behind it, whereas right-wing newspapers reporting on Norgrove's second letter left his statements as they were. The analysis of the letters and newspaper reports reveals that by itself the sort of diplomatic language initially used by the chair of the UK Statistics Authority may have little effect upon a powerful politician. However, if the 'diplomat' uses language to catch the attention of the press, which may publicise the possibility that the government is manipulating statistics, then this has greater likelihood of changing the manipulation.

# How can the interpreter achieve accuracy in complex psychiatric consultations? The need for flexibility as an important professional standard

Panel contribution

***Prof. Leona Van Vaerenbergh<sup>1</sup>***

*1. University of Antwerp*

The complexity I refer to in this contribution has to do with the participants in the consultation and the communication medium. Most of the studies start from the assumption that an interpreter mediated consultation is a triadic form of communication between health care provider and patient with an interpreter as mediator. My field research at UPC KU Leuven (Psychiatric Center of the University of Louvain) has drawn my attention to settings that are much more complex. Both on the patient's side as on the health care provider's side, it may happen that more than one person participates in the conversation, e.g. adolescents with their parents or a psychologist with a trainee psychologist. The complexity increases when one or more participants are not present in the consultation room but are communicated with remotely via Skype or another communication tool. The main questions in this contribution relate to the interpreter. What does such a complex setting mean to the interpreter? What is the position of the interpreter in such a setting? How does he/she put the learned deontological principles into practice? How does he/she for example apply the positioning rule “[the interpreter] will sit in a triadic position in order to express his/her neutrality”? And is it possible for the interpreter to translate “faithfully everything that is said, without additions, omission and alterations”? (Agentschap Integratie & Inburgering 2017)

Based on the audio and video recordings I have made at the UPC KU Leuven, I will describe some multi-person settings in psychiatric consultations with adolescents, e.g. consultations in which the patient doesn't need an interpreter but the accompanying parent(s) do, and in which depending on the circumstances the interpreter interprets consecutively or simultaneously.

One of the recorded consultations will be transcribed and analysed with focus on the interpreter's position and renderings. In this consultation five persons plus the interpreter participate. Four persons are present in the consultation room: the patient (an adolescent girl of ca 17 years old), the psychologist, a trainee psychologist (who is only observing) and the interpreter. The father and the stepmother of the patient who live in Germany participate via Skype. The patient sometimes speaks very rapidly and in a monotonous way, sometimes agitated and loudly. Moreover the sound quality of the Skype connection is not optimal and there is frequently overlap of turns. The interpreter is confronted with a very difficult situation. She is trying to translate everything and that's why her rendition loses *accuracy*. It is clear that the acquired deontological principles don't help her and she is missing the *flexibility* to make context based decisions as described by Dean and Pollard (2011).

# How did media treat the COVID-19 pandemic on Diamond Princess?

---

Panel contribution

---

***Dr. Akira Satoh<sup>1</sup>***

***1. Osaka University***

This study investigates how foreign media treated the Japanese government's management of the COVID-19 pandemic on a cruise ship called Diamond Princess, which is registered in the UK, owned and operated by a British-American company.

On 1 February, Hong Kong's Department of Health contacted the agent of the ship's operating company to inform that a man disembarked in HK tested positive for COVID-19, but the ship did not immediately tell the fact to the passengers and had shows and dance parties as usual and also continued to open public facilities that attract large crowds. After the ship returned to Yokohama Port, on 4 February, tests revealed infections of 10 out of 31 people tested, and on the following day, the Japanese authorities announced the positive test results, the cancellation of the cruise, and that the ship was entering quarantine for 14 days based on WHO guidelines.

Regarding the quarantine, foreign governments, initially at least, just watched over the progress: the UK and the US were reluctant to repatriate their nationals unless it was certain there would not be a spread to their homelands. For example, the US government initially asked Japan to keep them on board for 14 days despite the proposal by the Japanese government to bring American passengers back home early. CDC even stated that "We are deeply grateful to the government of Japan for their extraordinary care and hospitality and their assistance facilitating the care and return of our citizens" and "We commend the extraordinary efforts by the government of Japan to institute quarantine measures onboard the Diamond Princess."

On the other hand, the media in the UK and the US severely criticized Japan's epidemic prevention measures of the ship quarantine using various metaphors: the Guardian reported that the vessel had become an "incubator" for the coronavirus, and the quarantine measure was an experiment carried out in real-time, and that it had turned the ship into "a boiling pot of transmission"; the New York Times, on the other hand, repeatedly used the word "petri dish" in the headlines. Furthermore, the Guardian blamed the quarantine conditions as "both morally dubious and appear counterproductive," and Bloomberg declared that Japan was "emerging as one of the riskiest places for the spread of the coronavirus."

However, Czech media dismissed the condemnation, saying that the British-American operating company and the relevant countries, namely, the UK and the US, should "accept responsibility for the fiasco". This study shows that different ideologies are reflected in the various views on the same incident.

# How do children orient to turn-taking rules? Children's self-repeated summonses as a practice for securing the adults' attention

Panel contribution

***Ms. Tiina Eilitä<sup>1</sup>***

*1. University of Oulu*

This paper studies multimodal practices that children employ when their parents breach the sequential relevance rules by not providing a second pair part to the children's first pair part. Drawing on the principles of conversation analysis, as well as over 19 hours of Finnish and English video recorded naturally occurring family interactions, the focus of this study is on moments when children try to secure the parents' attention with the social action of summons (Schegloff, 1968). The expected next turn to a summons is an answer (e.g., Sacks, 1995), a go-ahead (Schegloff, 1990), and the lack of an answer to a summons can be seen as a breach of the turn-taking rules, and thus as socially sanctionable. This can lead to the speaker repeating and/or upgrading/downgrading their initial summons turn (e.g., McTear, 1985; Sikveland, 2019).

The analysis of this paper is based on a collection of examples where a child summons their parent, but where the parent does not provide an answer to the child's initial summons turn, thus breaching the implicit social rules of turn-taking where a second pair-part follows a first pair-part. The analysis shows, first, that children of varying ages orient to conditional relevance and hold their parents accountable for not providing an answer to their initial summons. This is visible in the way children respond to these rule breaches by repeating their own summons turn at least once after the adult has not responded to the initial summons. Second, children's self-repeated summonses are in most cases vocally and multimodally either upgraded or downgraded. Vocally children may do this by manipulating the loudness of their voice, lengthening or shortening the duration of the repeated summons, or by pairing the summons with another social action within the same turn-constructional unit. Children may also use their body and the surrounding space for mobilizing the adults' attention, e.g., by moving closer to the summoned adult. The practices children use for mobilizing the adults' response reveal that children treat the lack of an answer to their summons turn as sanctionable. Children's mobilizing practices also show their interpretations to the possible reasons for the adult's non-response. For example, children increasing their voice and walking closer to the adult suggests that they interpret the reason for the lack of an answer to be about the adult not hearing and seeing the child.

The findings of this paper contribute to conversation analytic research on children's talk and their understandings of conditional relevance as well as sequentiality and reciprocity of interaction.

# How do the immigrants negotiate and attune their identities in the new circumstances with the COVID-19?: A case study of Japanese immigrants in the UK

Panel contribution

***Prof. Hata Kaori<sup>1</sup>***

**1.** *Osaka University*

This study aims to investigate 1) how the immigrants negotiate and attune their identities in the new circumstances with the COVID-19, and 2) how the structure of potential racial discrimination has come up to the surface after the new circumstances in the UK. For these purposes, this study analyses the interview narratives of Japanese women living in London by applying positioning theory (Bamberg 1997) and small stories (Georgakopoulou 2007).

This study is part of a longitudinal research that I have conducted since 2010 to 30 Japanese women living in London. The survey includes semi-structured interviews that were audio and video-recorded, transcribed, and analysed. In this study, pulling from the interview corpus, I focus on a specific pair of interviewees, two Japanese immigrant women living in Southeast London, which was conducted in 2020.

Since the beginning of 2020, the potential discrimination against Asian people has been revealed which caused various hate crimes. As Asian immigrants, the participants of this study narrated their efforts how they pay careful attention for reducing the probability to be a target of hate crimes. In their narratives, the conflicted two identities have occurred. One is the awareness as the victims of discriminations; the other is the Japanese identity which differentiates from the other Asian countries, especially from China, in order to escape from the hate crimes based on the spread of COVID-19. For example, in their small stories about COVID-19, they positioned themselves as quasi-victims of discrimination in their narratives that makes it possible to victimize themselves even if they haven't experienced any discrimination directly. On the other hand, they insisted the differences from Chinese people to explain the small stories that Chinese people were discriminated but "we" weren't. In sum, from their narratives, they identify their position as the people who are "potentially discriminated but relatively in the safer area."

During these small stories, various multimodal resources (e.g. linguistic expressions, gestures, dysfluency, laughter) have been observed. Especially, it is important that laughter was frequently used even in the serious small stories. It functions to construct the attunement of the participants to co-construct the identity above. This would be a case study that people adjust their identity when they face the social change to survive under the new environment.

# How does a dissatisfied customer sound like on Twitter? The role of the complainable and the reference to the offender

Panel contribution

***Prof. Sofie Decock<sup>1</sup>, Dr. Nicolas Ruytenbeek<sup>1</sup>, Prof. Ilse Depraetere<sup>2</sup>***

***1. Ghent University, 2. Université de Lille***

While (im)politeness in online communication has received quite some scholarly attention in recent years,<sup>1</sup>, how people perceive and evaluate speech acts online remains largely unexplored. This paper attempts to remedy this shortcoming by addressing the issue of how different realizations of complaints shape face-threat perceptions.

A complaint situation consists of four components: the “complainable” (component A), the expression of dissatisfaction with respect to the complainable (component B), an entity considered to be responsible for the complainable (component C), and the wish for the complainable to be remedied (component D).<sup>2</sup> In a previous experimental study, we have shown that both the number of constitutive components and the type of component that is linguistically expressed influence third parties’ complaint perception.<sup>3</sup> In the same study, we also found that certain linguistic markers of dissatisfaction, such as negative evaluative adjectives and adverbs, increase the perceived dissatisfaction of the customer, while others, such as emoji and irony, decrease perceived dissatisfaction and make the complaint sound more polite. These results indicate that the particular realization of a complaint component can influence how the complaint is perceived.

Here, we present two additional experiments in which we test the impact of the realization of the complainable (Component A; Experiment 1) and the entity responsible for the complainable (Component C; Experiment 2), on complaint perception. Our experimental stimuli are designed on the basis of French-language complaint interactions posted on the official Twitter page of the French and Belgian national railway companies.<sup>4</sup> In these experiments, we use different realizations of Components A and C. Participants are asked to read complaint stimuli and, using 7-point scales, to assess them in terms of strength, customer dissatisfaction, (im)politeness, offensiveness, and expected likelihood that the railway company will respond. We predict that adding a pictorial realization of Component A will make the complaint stronger but not necessarily less polite, and that expressing Component A as a question instead of a statement will make the complaint weaker and more polite (Exp. 1). Concerning Component C (Exp. 2), we compare tweets in which C is not realized to those in which C takes the form of a lexical NP, a personal pronoun and an interjection. We predict that the latter two realizations increase complaint strength, perceived dissatisfaction, and impoliteness, and decrease the perceived likelihood that the railway company will respond. We will also discuss methodological issues related to the operationalization of face-threat and the theoretical implications of our research for the study of “speech act sets”.

# How stances towards high-calorie foods are co-constructed using laughter in Japanese Dairy Taster Brunches

Panel contribution

***Dr. Polly Szatrowski*** <sup>1</sup>

*1. University of Minnesota*

In this presentation I investigate how Japanese participants use laughter to co-construct their stances toward eating high-calorie foods in a corpus of 9 Dairy Taster Brunch conversations among triads of friends. I address the following questions: What triggers talk about high-calorie foods, what verbal and nonverbal devices are used to create, monitor, and accept/resist stances in the interaction, and how does laughter contribute to the co-construction of eating norms in talk about food?

Following Du Bois (2007) I view stance as dialogic and intersubjective, and centered around evaluation through which participants position themselves vis-à-vis one another and the object(s) of evaluation to align with or against other participants. Building on C. Goodwin (1981, 1986, 2000, 2018), Pomerantz (1984), C. Goodwin and M. Goodwin (1987), M. Goodwin (1990, 1997, 2007), M. Goodwin and C. Goodwin (2000, 2001), I view evaluation (assessment) as not merely a private internal experience of the speaker, but as a dynamic embodied multimodal performance using language, prosody, gesture, body posture, timing, etc. that is continually monitored and adjusted moment-by-moment in the conversational interaction.

Wiggins (2009) points out that although overweight patients may be held accountable, blame receives little attention in medical accounts. By demonstrating how blame is managed as a collaborative production in patient-advisor interaction, she underscores the importance of examining these processes in turn-by-turn interaction. Fuller, Briggs & Dillon-Sumner (2013) show that the themes of “women eat for weight loss” and “men eat for muscle” prevail in health magazines for men and women, respectively. Building on these studies, I analyze how participants co-construct their dietary worries, practices and preferences in turn-by-turn talk during the Dairy Taster Brunch.

In my analysis I identified humorous sequences based on the content, laughing voice, and laughter. Then I characterized the humor and analyzed how participants used verbal and nonverbal behavior to co-construct stances in sequences on high-calorie foods. Participants constructed stances on their ability to eat all 7 courses, overeating, eating butter or whip cream à la carte, the abundance of calories in the Dairy Brunch, weight management of different body parts, etc. They repeated their own and others’ utterances and gestures, used onomatopoeia to heighten their emotion and sensory involvement, and varied their laughter, and adjusted the speed and largeness of (mirrored) gestures to reflect their involvement and commitment to developing food attitudes. Furthermore, they showed varying degrees of alignment using *yo ne'isn't it'*, and *ne 'isn't it'*, pointing and co-construction to agree and pursue affiliation, and indicated lack of understanding and used *zyan* ‘Isn’t it...’, and *yo* ‘I tell you’ to resist affiliation. They also used onomatopoeia, loanwords and laughter to create humor as well as disagree indirectly.

Results show that participants constructed multi-modal stances on high-calorie foods using gestures and verbal devices including evidential(epistemic forms, final particles, onomatopoeia, loanwords, back channel and laughter. This study contributes to research on contextualized social and cognitive activity, the socio-psychological construction of food norms, and research on the linguistics of food (Gerhardt, Frobenius, & Ley 2013, Szatrowski 2014, and others).

# How to be corporate employees: An examination of identity at a Japanese business training camp

Panel contribution

***Dr. Junko Saito<sup>1</sup>***

***1. Temple University, Japan Campus***

This paper explores ways in which new employees are instructed in how to become competent members of the business world at a Japanese business training camp.

In Japanese society, there is a clear boundary between students and *shakaijin*, “mature, contributing adult(s)” who have completed formal education; thus, when new graduates are hired for their first full-time jobs, they are undergoing an important life transition (Cook, 2018, p. 37). Nevertheless, only a handful of sociolinguistic research (e.g., Cook, 2018; Dunn, 2013) has investigated this transition process in Japanese workplace contexts, partly due to the difficulty of collecting naturally occurring data. Building on the few prior studies, this paper addresses the following research question: How does an instructor at a business training camp educate new employees to become competent corporate workers? I utilize the framework of *tactics of intersubjectivity* in sociocultural linguistics (Bucholtz & Hall, 2005) to describe how one instructor positions himself and trainees during sessions. This study illustrates how the instructor uses the trainees’ identity as a resource to teach norms and ideologies of the Japanese corporate world.

The data are approximately 27 hours of video-recordings from a four-day-three-night business training camp. The participants are one male instructor and 22 new male and female employees. The study focuses on the instructor, and the analysis finds that he teaches the trainees values, attitudes, and practices in the business world by categorizing and not categorizing them as students. In other words, manipulating contrastive social categories of students and *shakaijin/corporate employees*, the instructor shapes the new employees’ identity as corporate workers by creating intersubjective relations of adequation/distinction and authentication/denaturalization (Bucholtz & Hall, 2005). The analysis also shows that the instructor’s aim is for the trainees to fully take on new identities as not just corporate employees but a specific type of employees, built on the ideal of corporate warrior *sararīman* (salaried men) who dedicate themselves to their companies, even to the point of self-sacrifice through overwork (e.g., Charlebois, 2014; Kanai, 2009). The corporate warrior model has been problematized in social and governmental discourses (e.g., Kanai, 2009). Nevertheless, as this analysis demonstrates, this business training course partially reinforces the ideal and encourages new employees to take on a corporate warrior identity. This study therefore suggests that a societal shift towards valuing work-life balance will by no means be complete in Japan until ideologies and expectations in the business world change.

# How to do things with gestures: The im/politeness of gestures as pragmatic acts

---

Panel contribution

---

***Prof. Andreas Jucker<sup>1</sup>***

**1. UZH Zürich**

The investigation of pragmatic acts goes back to the work by the language philosophers Austin and Searle, who investigated the different ways in which actions can be performed by uttering words. Their work had a fundamental impact on generations of pragmaticists who investigated the way in which utterances perform pragmatic acts with an exclusive focus on verbal pragmatic acts, i.e. speech acts. In this contribution, I want to draw attention to the way in which gestures are used to silently perform pragmatic acts or to accompany verbal ones and what kind of impact this has on the im/politeness potential of the pragmatic act itself. In an earlier paper, I looked at the different gestures that can be used to accompany verbal apologies or to perform them silently, and I argued that gestures reduce speaker commitment and, therefore, the inherent face threat. The data was drawn from the fiction part of the Corpus of Contemporary American English (COCA), where fictional narrators often describe gestures as apologetic and thus provide an interpretation of their illocutionary intent. In this contribution, I use the same corpus to extend the analysis to other pragmatic acts that are also regularly accompanied or replaced by gestures. The analysis starts with a corpus search for the collocates of gesture expressions and focuses on those collocates that refer to pragmatic acts. In a second step, representative samples of such collocations are inspected to find out what kind of pragmatic acts are regularly accompanied or silently performed by what kind of gestures and to what extent the gesture influences the im/politeness potential of the pragmatic act itself. The analysis has important implications for a theory of pragmatic acts in general. It suggests that speech acts should be seen from a prototype perspective. While some have a clear illocutionary force and can be clearly identified, others are (accidentally or intentionally) fuzzy and indeterminate, leaving it to the addressee or to discursive negotiations to assign specific illocutionary values to them.

# How to express disagreement in verbal interaction? Results from a contrastive study in French and Mandarin language

Panel contribution

***Ms. Rou Chen<sup>1</sup>, Prof. Juliette Delahaie<sup>1</sup>, Prof. Emmanuelle Canut<sup>1</sup>***

***1. Université de Lille, CNRS-STL-UMR 8163***

It is well-known that Chinese and French speakers interact in a different way within their respective communities. For instance, in Chinese culture, disagreements have a tendency to destroy the harmony in a conversation and as such is avoided. On the other hand, in French culture, it is considered as a common and less unpleasant phenomenon (Pu, 2003). Previous studies have examined aspects of disagreements within one language system (Kerbrat-Orecchioni, 2016; Scott, 2002). Disagreements have also been studied in a contrastive way in two different language systems, such as debates in French and in Korean (Kim, 2001), and argumentative writings in Chinese and in French (Thominette, 2017). However, previous research has not systematically compared French oral corpora with Chinese oral corpora in daily exchanges. Therefore, the purposes of this study are to see disagreements in daily conversations in mandarin and in French in a contrastive approach, and to move beyond some common ideas associated with the formulation of disagreement in Mandarin and French, which can be viewed, at the first sight, as completely opposite.

This research draws on a bottom-up approach and uses theories of (im)politeness(Brown & Levinson, 1987) and speech act(Austin, 1970) within the framework of conversational analysis and cross-cultural pragmatics. The analysis is based on a comparative oral corpus made up for spontaneous conversations. 12 pairs of Chinese and French native speakers aged from 18 to 30 years were invited to participate in three interrelated conversations without prior preparation: they chose a movie together before watching it, review it and debate on a topic related to this movie.

The results of the data analysis show, first, that Chinese and French speakers both prefer formulating their disagreements indirectly, as disagreement is a face-threatening and dispreferred act in casual conversation setting, in France and in China. Second, we found that whereas negative discourse markers can be found in both languages, such as *but* (*mais* in French, 但是, 可是 in Chinese), *no*, *not* (*non*, *ne pas* in French, 不, 没有 in Chinese), French and Mandarin differ when disagreement needs to be less explicitly formulated. Finally, this bottom-up study allows us to discuss the very relative notion of disagreement from a cross-cultural and pragmatic perspective.

# How to get emergency help from the police without asking for it: The case of domestic violence

Panel contribution

***Dr. Emma Richardson<sup>1</sup>, Prof. Elizabeth Stokoe<sup>2</sup>***

*1. Aston University, 2. Loughborough University*

During the COVID-19 pandemic, police, media, and charities reported a sharp increase in reports of domestic abuse internationally (Bradbury-Jones & Isham, 2020). In the UK, the national domestic violence charity, Refuge, reported a 25% increase in requests for help in the first week of the UK lockdown in March 2020 (BBC, 2020). However, as police forces note, most increases in reporting occurred in the third sector, than to police. The increased attention paid to domestic violence during the pandemic has provided an opportunity to understand how incoming reports of domestic abuse are made directly to the police, and how call-takers respond to and progress them.

Telephoning the police emergency services to ask for help when one's life maybe in danger can be especially challenging in cases of domestic violence, and during periods of lockdown, when the perpetrator may be in close proximity to overhear the victim's call. Separately, a key challenge for all emergency services call-takers (and helplines, more generally) is how to respond to so-called 'silent' calls; where people are in immediate danger but unable to speak (IOPC, 2020), hoax or prank calls (Emmison & Danby 2007) or accidental dials. In this paper we focus on how callers accomplish the action of requesting help without asking for it explicitly. To do this, we collected a corpus of 200 telephone calls to UK police services (999 and 101, both of which handle domestic violence cases) prior to and during the first COVID-19 'lockdown' in England. We transcribed the calls for conversation analysis using the Jefferson system, paying particular attention to features that comprise non-lexical turns that may, nevertheless, be important for the actions being done in this environment.

We found that, in addition to direct requests for the police, callers accomplished the same action using other practices: 1) saying nothing; that is, making 'silent' calls, which call-takers may or may not treat as calls for help, 2) responding in such a way that call-takers use yes/no interrogative formats to enable one-word responses from callers, and 3) asking for something else (e.g., "I'd like a pizza for delivery"), in which call-takers and callers collaboratively deploy the constraints of grammar, turn design, and sequence to nevertheless request emergency help - while ensuring that the 'literal' content of the requests are hearable as such by potentially overhearing assailants. The possibility of both types of call being treated as 'time-wasting' or a 'hoax' is high, however, and we show that even direct requests that articulate a threat to kill may be treated as such.

We chart the interactional features that make a call to the police hearable as a possible domestic incident when neither party overtly categorizes it as such. We note the practices of callers, operators and call handlers to collaboratively, tacitly, identify a request for help. We consider our findings in the context of potential barriers to calling the police and to provide rapid input to the promotion of police services to support victims of domestic abuse.

# How to make the castle talk: Reconstructing affordances and ecologies of power

Panel contribution

***Prof. Susanne Tienken<sup>1</sup>***

***1. Stockholm University***

When entering Skokloster Castle, a Swedish baroque castle at the shores of the lake Mälaren, visitors are struck by the impressive architecture and the exquisite collections. As all castles and historic monuments, Skokloster castle makes the past visible in our contemporary landscape and it is intimately tied to a ‘timespace’ in a Bakhtinian sense. Furthermore, the castle is also a place where power, social roles and cultural identity were constantly negotiated in interaction. Today, these interactions are lost and the castle remains silent. However, Skokloster castle has been preserved almost as if closed in a time-capsule since the middle of the 17th-century. This unique setting allows the access to the castle’s well-preserved semiotic resources and spaces (Nordin 2013). The paper discusses Gibson’s (1977) notion of *affordances* as a dynamic concept and argues that investigating space, place, things and people as interrelated, as suggested by Pennycook (2019), lead to a better understanding of early modern being-in-the-world and historical meaning-making. Furthermore, it is shown how the analysis of the castle’s interactional architecture and social topography (Hausendorf et al. 2016) allows us to reconstruct affordances and to explore historical ecologies of power.

# How Universal are Considerate Expressions?

Panel contribution

***Dr. Masaki Yamaoka***<sup>1</sup>

1. Soka University

In current research of Japanese linguistics, our interests in a category called “considerate expressions” are increasing. This topic is closely related to politeness. As is well known, politeness is a context-dependent interpersonal regulative act that is not inherently fixed to specific linguistic forms. In Japanese linguistics, however, it has been pointed out that specific words and phrases seem to perform politeness function as a second or third sense of the words.

For example, a well-known phrase “*tsumaranai-mono-desu-ga*” (This item is a low value. An address when giving a gift) is one of the considerate expressions which are conventionalized as a kind of negative politeness to avoid condescending.

Are the considerate expressions a linguistic phenomenon observed only in Japanese? Ide (2006) described the deference expressions, which almost overlap with the considerate expressions, rooted in customs unique to Japanese culture, such as the normative consciousness called *wakimae* (discernment) to the “*ba*” (a kind of comprehensive situation) or the virtues of humility. She listed deference expressions such as “*ojama-shimasu*” (I interrupt you. An address when visiting others) and “*sen’etsu-desuga*” (I am not humble. An address when in public situations like wedding ceremony). She pointed out that a fixed phrase with no choice was used along with it, and argued that it could not be explained by B&L’s politeness strategy, which considers that language behavior is selected depending on contexts such as interpersonal relationships. This also questioned the universality of politeness theory.

On the other hand, in Yamaoka (2019), the notion of *wakimae* which Ide pointed out is a phenomenon that seems to be non-strategic because the context and the corresponding expressions of politeness are integrated into conventionalization. It assumes that the same linguistic phenomenon can be observed in other languages than Japanese.

As a result, it is considered that language use allows for universal considerate expressions that can be observed inter-linguistically as well as considerate expressions that are unique to each language.

We can observe some universal phenomena regarding considerate expressions beyond individual languages. As a first example, in English the phrase “Can you~?” means originally a question about the hearer’s ability, but is generally recognized as a request expression. It seems that a conventionalized politeness expression to avoid direct request as an FTA. Similarly, the Chinese request expression “Néng bùnéng~?” (Can you~?) is also a considerate expression derived from a question about the hearer’s ability. In Japanese also, one of the conventionalized request forms “-te-itadake-masu-ka?” includes the possible form of the verb and the interrogative particle, which means politeness for changing request into the question about whether the addressee can do that or not.

Therefore, it is necessary to describe “considerate expressions” as a universal phenomenon that transcends individual languages. On the other hand, each individual language has specific considerate expressions such as “*tsumaranai-mono-desu-ga*” in Japanese. We should observe both of universal and specific expressions for the contrastive study of considerate expressions.

# Humor and multimodality in Eric J. García's portraits of U.S. hypocrisy

Panel contribution

***Dr. Marta Aguero Guerra<sup>1</sup>***

**1.** Binghamton University–SUNY

From a cognitive-pragmatic approach, the interpretation of humor lies in the presupposition of optimal relevance. The inferential strategies interlocutors perform to find a relevant interpretation need to be discarded in search for the addresser's less salient incongruous message, which will provoke the humorous effect (Yus 2016). This process involves the identification of a dissonant blend between two mental spaces. To solve that incongruity, the decoders need to map back to the input spaces to analyze the new association that the blend has constructed between them (Marín-Arrese 2008). However, the nature of the information elicited in the input spaces varies depending on the type of humorous manifestation being decoded.

Cartoons are narrative monomodal and multimodal ensembles whose incongruous message is produced by two input spaces that are constructed by pictorial and multimodal metaphors. Thus, the appreciation of humor in cartoons requires specific competences from their recipients. As with other humorous genres, cartoon readers must identify the linguistic components of the joke (Attardo and Raskin 1991). Because humor is local and highly context-specific (Critchley 2002), cartoon appreciation also relies on readers' intertextual and background knowledge (Tsakona 2020 and Pinar-Sanz 2020) as well as on a certain complicity with the author's ideology. I argue that, in addition to these competences, to appreciate a cartoon the decoders must be able to read the visual and multimodal grammar of the genre. To support my point, I will offer an analysis of Chicano artist Eric J. García's cartoons in which he gives voice to the Latinx community in the U.S., portraying everyday injustices such as unfair immigration policies, racism, and power abuse. The analysis will show that it is the readers' familiarity with the language of comics that allows them to find the definitive cues to decipher García's humorous message and accompanying denunciations.

# **Humor in German teacher-parent-conferences: Interaction analysis of funny stories and informal opening sequences**

## **Helga Kotthoff, Freiburg, Germany**

---

Panel contribution

---

***Prof. Helga Kotthoff<sup>1</sup>***

**1. Freiburg, Germany**

My presentation is based on a research project on teacher-parent-conferences in Germany (Kotthoff 2017). In this serious institutional setting humor and laughter sometime play a role (Leonhard/Röhrs 2020). I am going to analyse two activity types: Parents and teachers frame some of the stories they tell about the absent child as amusing. I am going to discuss forms and functions of some of these funny stories.

In nearly a quarter of the 80 conferences of all school types , the opening sequences contain laughter and humorous remarks, with one party mentioning aspects of the situation that lie outside the institutional setting and which create amusement (Adelswärt 1989). In one recording, for example, the teacher ostentatiously searches in a jumble of commentary cards about the students for the card for the upcoming conversation and wittily jokes about this jumble. The mother jokes along in solidarity. Self-joking reduces distance (Holmes 2000, Kotthoff 2000), which would be functional for a possibly delicate conversation. According to Brown&Levinson (1978/1987), “joking” is one of the strategies of positive politeness. In the available data one can actually see it that way. With Holmes (2000) we can analyze the joking in this institutional context primarily as a social lubricant. I am going to point out an interactional sociolinguistics of the humor in these talks.

# Humorous effects from Covid-19 memes. The role of multimodal combinations

Panel contribution

**Dr. Francisco Yus Ramos<sup>1</sup>, Dr. Carmen Maiz-Arevalo<sup>2</sup>**

**1. UNIVERSITY OF ALICANTE, 2. Universidad Complutense de Madrid**

When Spain was under strict lockdown between March and June 2020, covid-19 memes flooded social media and messaging applications. They were meant to generate humorous effects (Chioldo et al. 2020; Stefani 2020), but also to emphasise connection in times of physical distancing and isolation and to cheer up friends and acquaintances in those uncertain times (MacDonald, in press). Jensen et al. (2020: 59) further propose that “the motivations for sharing and creating memes range from personal involvement in the crisis situation to acts of resistance to creative self-realization.”

This paper analyses the specificity of multimodality in memes and the role of text and image within the meme in the eventual humorous effects generated out of their processing. In previous research regarding the common “image macro meme,” it has been argued that text and image may play a number of roles in the eventual meaning communicated from memes (Yus, 2019) and that the specific incongruity-resolution humorous pattern used in memes may be achieved through a number of these text-image combinations (Yus, 2021). In this paper, we will analyse not only the generation of humorous effects from these multimodal combinations in covid-19 memes, but also, and crucially, the quality and quantity of information that end users are expected to be able to retrieve from context in order to successfully achieve these humorous effects as initially intended by the “sender user.” For the analysis, a dataset of around 250 memes obtained from social media and the messaging app *WhatsApp* was collected and then analysed with an emphasis on the kind of effect obtained, role of expected context and the role text-image combinations in these multimodal discourses.

# Humorous irony and the discursive construction of feminine identity in stand-up comedy

Panel contribution

***Dr. Esther Linares-Bernabéu<sup>1</sup>***

**1. UNIVERSITY OF NAVARRA**

This paper employs a sociopragmatic and discursive analysis to examine how humorous irony influences on the discursive construction of the feminine gender identity in subversive stand-up comedy. We have attempted to show that irony could be used as a device available to be harnessed for challenging expectations about feminine behaviour and labels in planned discourse (Holmes & Marra, 2002; Chiaro & Baccolini, 2014; Yus, 2016; Linares Bernabéu, 2020). Accordingly, we have analysed the FEMMES-UP corpus that includes a total of 15 stand-up acts, collected during 2017 and 2018. In particular, these stand-up performances were represented by 15 female Spanish comedians. Each one of these stand-up performances has been divided into humorous sequences, which are understood as a series of jab lines and punchlines, which revolve around a specific topic and which are interrupted by laughter, applause and even, comments from the public (Ruiz Gurillo, 2019). In this respect, the corpus FEMMES-UP consists of 504 sequences. This comes to a total of 805 minutes of recording and 97.749 words.

The quantitative and qualitative analysis of the corpus show that humorous irony is a tool for the comedian to distance herself from the message and achieve a comic effect thanks to the feelings that are shown together with her dissociative attitude. Data shows that the use of humorous irony in this type of discourse implies a negative evaluation about something or someone and, at the same time, promotes solidarity with the in-group. This has been exemplified in the analysis of the humorous sequences in which we have seen that, despite the implicit criticism in irony, the audience is able to infer the comedian's positive attitude and humorous intention. In sum, our study shows that stand-ups use humorous irony to disassociate themselves with certain gender-based behavioural norms, to construct alternative identities and to question some heteronormative norms in a creative humorous fashion.

# Humour in small bars and cafés in Seville: age-motivated variation in evening service encounters

Panel contribution

***Dr. Manuel Padilla Cruz<sup>1</sup>***

**1.** Universidad de Sevilla

Humour appears essential in many service encounters. It often facilitates a nice and friendly atmosphere, and impacts on customer satisfaction, repurchase intention and loyalty (Bergeron and Vachon 2008; Slåtten, Svensson and Sværi 2011). Many baristas are aware of this, but not all of them (can) resort to humour when attending to customers. In addition to individual skills and sense of humour, a number of factors favour or hinder the appearance of humour in bars and cafés, such as time availability, regularity at the establishment, familiarity with customers, customer affluence, etc.

This presentation will report on a study examining barista-customer interaction. The study centres on evening service encounters. Additionally, it focuses on two types of establishments in Seville: near-campus cafés and small tapas bars in the city centre. Hence, it targets two age groups: young people in their late teens and twenties, and people over forty. Thus, the study seeks to ascertain the influence of the variable age on the use of humour in small establishments at a time when customers may not have significant temporal pressures. More specifically, the study seeks to find out if humour appears in the encounters under scrutiny, the encounter phase(s) where it (mainly) occurs, its forms and producers, the functions it serves, and possible differences between the two age groups. Relying on unobtrusive observation and field notes made in eight establishments of each type, the study will show that, although the two targeted age groups employ humour, there are considerable differences in terms of the amount and types of humorous tokens. Finally, the results will be compared to those of another study exploring humour and age during morning service encounters (Padilla Cruz 2020). In addition to contributing to humour studies, the reported study also aims to contribute to the areas of variational pragmatics (Schneider and Barron 2008) and service encounters (Félix-Brasdefer and Placencia 2019).

# Hypocrisy and the media coverage of poverty

---

Panel contribution

---

**Dr. Radoslava Trnavac<sup>1</sup>**

**1.** University of Belgrade, Faculty of Philology

The objective of the research presented in this paper is to demonstrate the interplay between hypocrisy, construction of news values, and evaluation in the newspaper coverage of poverty. Hypocrisy is a complex, multi-faceted concept, but most investigators agree that hypocrisy involves some sort of inconsistency between attitudes and behaviors. Decisions about which behaviors actually contradict the actor's attitudes are likely to be strongly influenced by the value system that belongs to the actor (Alicke et al. 2013: 678). Since the media fulfills an important role in shaping public attitudes toward poverty, in this paper, we would like to compare representations of poverty in two broadsheet newspapers in English and Russian: *The New York Times* and *Nezavisimaja Gazeta*.

Based on the observations of Thompson and Hunston (2000: 6–7) that one of the three functions of evaluation is to reflect a value system, we turn to the framework for a linguistic analysis of news discourse presented in Bednarek (2006) and Bednarek and Caple (2017). The above methodology provides the means to find out what values are emphasized (foregrounded), rare or absent (backgrounded). The objective of the paper is threefold. Firstly, we investigate whether some attitudes expressed in the newspapers reflect hypocrisy and whether this hypocrisy is repeatedly associated with particular news values, such as Negative, Novel, etc., and, if so, what the effect of this may be. Secondly, we analyze attitudinal expressions that are employed to express the hypocrisy (Bednarek 2006, Martin and White 2005). Thirdly, we use qualitative discourse analysis presented in Baker and Vessey (2018) to determine how hypocrisy in media coverage of poverty in two languages draws upon similar and distinct discursive themes and language resources. In order to fulfill our goals, we implement the following techniques: analysis of the frequency of word forms and clusters, analysis of keywords, collocation analysis, and concordancing.

Our preliminary corpus analysis shows that the news values that can be construed by linguistic devices associated with hypocrisy, Negativity, Impact, and Consonance appear to be foregrounded in both languages. In accordance with that, the linguistic devices that are mostly used are the ones that have reference to the negative aspects of events with real, important, and relevant consequences, and the ones that indicate stereotypes that people may hold about the portrayed people/events.

# I have seen it all before: How Filmic Horror Discourses Help Us Disentangle Reality

Panel contribution

***Dr. Monica Cantero-Exojo<sup>1</sup>***

**1.** Drew University

The Washington Post published an article on March 6<sup>th</sup>, 2020 stating that “Faced with fear and uncertainty about a dangerous virus spreading quickly and potentially becoming a pandemic, many people are turning to movies and TV shows that depict a dangerous virus spreading quickly and definitely becoming a pandemic.” With the ability to operate at the level of the abjection, and subvert the category of what it is considered conventional, horror/apocalyptic narratives allow the unknown to challenge and understand normativity. Moreover, filmic horror narratives encapsulate the visual construction of fear and its mirroring effect in the audience’s emotional response (Carroll 1990). As asserted in the Washington Post article, it is clear that it is within this realm of the horrific imaginary that society thinks about unrelenting issues that need to be answered by unearthing and placing them into reality through cultural categories.

Drawing from the works on Conceptual Metaphor Theory (CMT) (Lakoff and Johnson, 1980) and conceptual metaphors in filmic discourse (Fahlenbrach, 2016; Eggerstson & Forceville 2009; Forceville 2006; Coëgnarts and Kravanja, 2012; Carroll 1990) this presentation explores horror filmic narratives that use monsters/disasters as catalysts for metaphors. Thus, monsters are studied as a source domain for human’s fears over societal changes and challenges. I argue that these types of characters are cultural symbols that trigger structural-conceptual metaphors for society’s fears. For instance, I argue that the zombie metaphor articulates metaphorical expressions of HUMAN IS SUBHUMAN. This representation embodies humanity’s worst fears: spreading of viruses, dying, human identity, corporal violation, biological and chemical disease, capitalism, wars, hunger, etc. on the basis of the abject. This metaphor has transcended the visual to enter the lexicon as a source of evidence of how a visual metaphorical thinking has replicated itself as a “unit of cultural transmission” (Dawkins, 1976) and it is relevant in processing language structures that embody a given meaning (zombie economy understood and evaluated in terms of threat and repulsion.

# Identidades de género y disidencias discursivas. Un análisis del lenguaje inclusivo en la Argentina

Panel contribution

**Prof. Carolina Tosi<sup>1</sup>**

**1. Universidad de Buenos Aires**

Desde hace varias décadas, los estudios de género han cuestionado el androcentrismo y el carácter patriarcal del lenguaje. En lo que se refiere específicamente al idioma español, este ha sido catalogado como *sexista*, ya que le otorga al varón ya su punto de vista una posición central en el mundo –por ejemplo, a través del uso del masculino genérico o universal–, que invisibiliza a las mujeres ya las disidencias sexuales.

En contraposición al sexismo en el lenguaje, el lenguaje inclusivo de género apunta a la igualdad de géneros y, además, objeta el sistema binario del español (femenino-masculino). Si bien en la mayoría de los países de habla hispana el lenguaje inclusivo se ha limitado a los ámbitos de militancia, a los estudios de géneros ya ciertos sectores de la administración pública, en la Argentina se ha extendido a diversos ámbitos sociales, generalmente urbanos. A partir de los movimientos de Ni Una Menos (2015) y los que apoyaron el Proyecto de Ley de Interrupción Voluntaria del Embarazo (2018), el lenguaje inclusivo irrumpió en las voces de los manifestantes e hizo visibles identidades hasta ese entonces soterradas. De este modo, el discurso, entendido como el espacio en el que se articulan lenguaje, historia e ideología (Arnoux, 2006), puso en foco aspectos silenciados que se valieron de la materialidad de la palabra para hacerse ostensibles. A partir de tal encuadre, en el marco del *Enfoque dialógico de la argumentación y de la polifonía (EDAP)* (García Negroni, 2017 y 2018), y sobre la base de la concepción de heterogeneidades enunciativas de Authier-Revuz (1984), me ocupo de caracterizar el lenguaje inclusivo y caracterizo sus recursos como marcas lingüísticas de conflicto que señalan disidencias históricamente negadas y son huellas de identidades hostigadas. El análisis revela que las palabras o expresiones intervenidas con algunos de los recursos del lenguaje inclusivo (@, x, -e) manifiestan un comentario del locutor sobre su propia enunciación, que pueden aludir a diferentes puntos de vista (Authier-Revuz, 1984). Se concluye, así, que el lenguaje inclusivo de género contiene marcas de subjetividad y polifonía de diferente tipo, que permiten mostrar la reconfiguración de las identidades de género.

# Im/politeness and aggression in Greek political discourse in the years of the economic crisis and political transitions (2009-2019)

Panel contribution

***Prof. Marianthi Georgalidou<sup>1</sup>***

*1. University of the Aegean, Department of Mediterranean Studies*

In the context of the Greek economic crisis during the years 2009-2019, the aim of the present study is to discuss im/politeness, aggression and derogatory forms of speech attested in political discourse and computer-mediated communication networks. Within the framework of im/politeness research (Garcés-Conejos Blitvich 2010; Culpeper 2011; Lorenzo-Dus, et al. 2011; Erjavec and Kovačić 2012; Mitchell and Haugh 2015), I investigate the correlation between impoliteness and abusive verbal discourse in both domains, i.e. political and social media communities of practice. I explore their potential to establish a common ground in viewing political issues and determining ideological polarizations. I also examine the instrumentalization of direct and indirect derogatory references to Greek political personnel and swear vocabularies for the division of the community into those who support and those who oppose different political agendas (Georgalidou et al. 2020). Data are sourced from a) a corpus of transcripts of parliamentary sittings (2008-2019), b) selected video-recordings of political and parliamentary discourse uploaded on YouTube and c) abusive user comments attached to the video uploads. The study brings together ethnographic, interactional and critical approaches to institutional and digital communities of political practice. The analytic approach is emic, based on the analysis of discourse units as there and then social actions. Episodes of oral and digital aggressive discourse are analyzed for the sequential organization of turns-in-interaction. Moreover, a combination of interactional and critical frameworks is applied so that complicated distinctions between expected political rivalry and verbal abuse can be approached.

## Impoliteness and being #offended

---

Panel contribution

---

***Dr. Vahid Parvaresh<sup>1</sup>***

**1. Anglia Ruskin University**

Research findings have already demonstrated that impoliteness is not always an ‘intention’ the speaker intends to convey to the hearer (Haugh, 2003). On the contrary, it is the hearer who may perceive certain language as impolite (Parvaresh & Tayebi, 2021). However, the latter phenomenon, i.e. ‘taking offence’, is not straightforward and may have far-reaching consequences. It is not straightforward because we do not yet know what triggers perceptions of offence (cf. Tayebi, 2016). It has far-reaching consequences because, by perceiving certain language (or conduct) as offensive, the hearer might feel entitled to try to “restore” what they think to be the “right” way of doing things (Kádár 2017; Parvaresh, 2019; Parvaresh & Tayebi, 2018). One possible way to determine how and why people are offended would be to closely examine occasions in which people ‘sanction’ (Haugh, 2015) their taking of offence by claiming that a transgression has been committed by others (Haugh & Sinkeviciute, 2019).

The current study will therefore explore those occasions when the so-called offenders make intuitive judgments as to why they have felt *offended*. Drawing on a corpus of online Twitter posts featuring *#offended*, this study discusses some of the judgments and reasons that offenders most frequently refer to when ‘sanctioning’ their taking of offence. In this respect, it is claimed that interactants appear to possess a moral predisposition which they draw upon when making these evaluative judgments. The findings of the study shed light on some hitherto hidden aspects of culture which are of significance in moving the research on the topic forward.

# Impoliteness in Aviation English: Aggression in Intercultural Radiotelephony Communications

Panel contribution

***Dr. Noriko Ishihara<sup>1</sup>***

***1. Hosei University***

This study explores the discursive construction of (im)politeness in Aviation English, negotiated in radiotelephony (R/T) communications. Aviation English is a lingua franca serving as a working language among those who do not necessarily share their first languages (Estival, Farris, & Molesworth, 2016). The language of RT communications is also a highly restricted English mandated to maximize accuracy, conciseness, and clarity of communication, which all contribute to air safety. Aviators must use specific phraseology with unique syntax and discourse organizations. In the phraseology of routine R/T communications, politeness is typically considered superfluous and unnecessary. However, in emergency situations, clear and concise “plain English” is also used, allowing negotiation of (im)politeness to emerge (Ishihara & Prado, *in press*).

While the discourse of R/T communications has recently been investigated empirically in relation to its instruction and testing (e.g., Estival, *et al.*, 2016; Friginal, Mathews, & Roberts, 2020; McNamara, 2011), pragmatic concerns—of impoliteness in particular—are underexplored. Air traffic controllers’ short-temperedness, for example at New York’s John F. Kennedy Airport, is well known as typical of language aggression often found in large, extremely busy international airports (Bieswanger, 2016; Friginal, 2018). Yet, the negotiation of impoliteness has rarely been studied empirically in the specific aviation context. Based on Locher (2012), Culpeper (2011), and Spencer-Oartey’s (2007) theories of face, (im)politeness, and relational work, this study explores how (im)politeness is negotiated in R/T communications and how aviation specialists jointly fulfill their transactional and interactional needs.

Two repositories of AE (Godfrey, 1994; Wyss-Bühlmann, 2005) along with a small but evolving collection of current R/T samples (Ishihara & Lee, *in progress*) were used initially to identify excerpts in which negotiations of (im)politeness appeared. Then, the selected excerpts were closely analyzed for discursive construction (Kádár and Haugh, 2013; van der Bom & Mills, 2015), of (im)politeness. In addition, four pilots with a range of experience were interviewed for expert interpretation of the excerpts in order to triangulate their expert interpretation of the data with the researcher’s interpretation.

The findings revealed that non-prescribed mitigating devices and politeness markers were commonly used assisting pilots in conveying their interactional needs effectively despite the common belief that politeness is superfluous in AE. However, pilot interviews suggested that when used outside of the constraints of the specific aviation context, politeness, which would be perceived as face-enhancing in non-aviation contexts, could be considered excessive and undesirable. Furthermore, pilot’s frequent requests for clarification due to his unfulfilled duties eventually contributed to controller’s emotional outbursts, which was further bolstered by his irony (mock politeness), leading us to doubt the success of the interaction even though the pilot transactionally obtained all necessary information and clearances. The degree to which aviators fulfill their rights and obligations appears to have influenced the perceived offense in these discourses. In turn, failure to fulfill relational needs further aggravated transactional effectiveness. The study has implications for interactional training and testing for aviators and air traffic controllers that incorporate pragmatic and intercultural competence.

# In favor of and against women's rights: Before the parliamentary abortion debate in Argentina

Panel contribution

***Dr. Silvia Ramirez<sup>1</sup>***

1. Universidad de San Andrés

## In favor of and against women's rights: Before the parliamentary abortion debate in Argentina

Silvia Ramirez Gelbes

*Universidad de San Andrés – UBA*

For Maingueneau (1999, 2002, 2010), every discourse presupposes an enunciative scene in which it takes place, i.e., the scenario that helps to configure the discursive image of the discourse author or ethos. Furthermore, divergent behaviors within the same community may obey to a deep coherence and their systematic description shall detach the ethos of the groups constituting that community (Kerbrat-Orecchioni 1996).

After a bill to decriminalize abortion was announced in Argentina in 2018, the national deputies scheduled an agenda of 738 expositions made by ordinary citizens, each one clearly oriented in favor of and against the law. They were meant to give input to the parliamentary debate.

An earlier paper (Ramirez Gelbes 2018), analyzed tweets posted in Argentina in favor of and against the abortion bill to distinguish each group's ethos: the one of a citizen (tweets in favor) and the one of a judge (tweets against). A second paper (Di Virgilio/Ramirez Gelbes forthcoming) analyzed this bill's debate parliamentary interventions to study the discursive construction of the image of women who seek abortions while shaping specific ethoi for each group.

Assuming that recognizing this type of features will deepen the knowledge of groups in favor of and against women's rights, this paper analyzes the various means that collaborate in discourse with the configuration of distinguishable ethoi in a corpus of 50 (25 each group) randomly selected transcripts of those pre-voting expositions in the House of Deputies.

Discourses in favor of decriminalization provide personal narratives supported by the first person singular and the resort to own memories. Discourses against decriminalization construct (quasi)academic scenes that allude to biology and law and recur to a sentential tone. These discourses depict scenarios that shape ethoi evoking, respectively, the image of a woman who seeks abortion and the one of a judge who condemns her. Compared to the tweets of Ramírez Gelbes 2018 the former show a clear approach to this specific women's right while the latter constitute a whole with the corresponding tweets. Compared to the parliamentary interventions in Di Virgilio/Ramirez Gelbes (forthcoming) they represent, respectively, the passage from the alter to the self and the same (wise, sentencing) judge.

# In search of FACE in English and Chinese

Panel contribution

**Prof. Rong Chen<sup>1</sup>, Dr. Lin He<sup>2</sup>, Dr. Ming Dong<sup>2</sup>**

**1.** Xi'an International Studies University; CSU San Bernardino, **2.** Xi'an International Studies University

The notion of FACE traveled from Chinese to English via Goffman (1959, 1967) and, combined with the English folksy notion of *saving/losing face*, to form the fulcrum of Brown and Levinson's (1987) theory of politeness. Other theories of politeness—whether in consonance or competition with Brown and Levinson—have also relied on *face* as a foundation (Leech 1983; Spencer-Oatey 2007; Watts 2003).

English has one leximeme, *face*, for FACE. Chinese has three: 脸 “face1”, approximately “morality”; 面 “face2”, approximately “image”; and 情面 “face3”; approximately “relational obligation” (Chen 2018; Gu 1990; Kádár and Keith 2012). The meaning of each of these labels has long been a matter of debate. We enter this debate by presenting a search for what FACE means to and by the ordinary language speakers of both languages.

Our methodology will be online search: Google for English and Baidu (the equivalent of Google in China) for Chinese. For English, we will search the phrases *face*, *saving face*, *losing face*, and *about face*. For Chinese, the keywords for searching are 脸 “face1”, 丢脸 “losing face1”, 打脸, “hitting face1”; 面子 “face2”, 丢面子 “losing face2”, 留面子 “saving face2”; and 情面 “Face3”, 留情面 “save face3” (Ran and Zhao 2018). Our data will be composed of webpages, online blogs, and social media posts that include one (or more) of these keywords. Pilot studies have informed us that these key words are often used to comment or label events. In English, for example, a politician changing his or her position on an issue would be called an *about face*. In Chinese, a person's prediction turning out to be false is often dubbed as an act of *having his/her face hit/beaten*. Therefore, the data will offer us a list of events/speech acts for each of the key words. We believe that these results will help us better understand what FACE is taken to mean by ordinary speakers and, in turn, inform research in pragmatics.

# In the unlikely event: Conditional constructions and the language of instructions in the face of hazard

Panel contribution

***Dr. Bracha Nir<sup>1</sup>***

***1. University of Haifa***

Catastrophe is a constant looming threat. Whether the potential emergency involves an earthquake or a volcanic eruption, a fire or a plane crash, authorities do their best to communicate the risks and the recommended protective response. Bulletins, protocols, signs, and online messages are a fixture in the public arena, serving to notify people in advance about how they should behave when disaster strikes. The aim of these texts is to support the decisions we make in cases of emergency (Ullman et al., 2006), and to help us remember how to act (Iba & Furukawazono, 2015).

To date, only a handful of studies have examined the linguistic features of official instructions for evacuation, focusing mainly on the type of wording that may influence the public's compliance (Sutton et al., 2018). The current paper explores the context of survival discourse in Hebrew and English from the perspective of Construction Discourse (Östman, 2005), describing the unique characteristics of the common text-types used in evacuation instructions and procedures on the one hand, and the particular grammatical devices that function in the genre, on the other (Nir, 2015).

Evacuation procedures have several functions: to warn against a disastrous event, to persuade people to let go of their optimism bias (Sharot, 2011), to educate, help prepare, and to facilitate response. These texts are thus required to provide information while at the same time motivate to action. As a specific type of instructional text, they are also designed to evoke heightened levels of alert but also to reduce levels of anxiety. As the analyses of evacuation procedures in the two languages will show, these functions promote the use of implicit warnings (in contrast, for example, to safety signs that explicitly refer to the consequences of any failure to act) in the form of conditional texts. These are meant to convey the hypothetical conditions and the preferred outcomes accurately, with certainty and with a sense of calm, while cognitively and emotionally engaging the reader (Sutton et al., 2018).

A lexical analysis will be used to show how the tension between alertness and calm is reflected in the word choices of these conditional texts. The study will discuss cases such as the juxtapositioning of reference to life-threatening danger with markers of politeness ('In case of emergency please call 911'), the use of metonymy as a distancing device ('If you hear a fire bell sounding, please follow these instructions'), or the use of a qualifying adjective referring to the low probability of the danger ('In the unlikely event of an emergency evacuation, leave everything behind'). In addition, a syntactic analysis will show that a common syntactic construction in evacuation instructions in both languages is a set of conditional constructions that feature unique relations between the protasis and apodosis (Dancygier & Sweetser, 2005). The study thus considers the interaction between genre, text-type, and syntactic constructions to show how the particular context licenses and in fact requires the use of a-typical constructions (Nikiforidou, in press).

# Including or excluding? Language teachers' classroom practices in the creation of interactional participation

Panel contribution

***Dr. Karen Glaser<sup>1</sup>***

***1. Universität Leipzig***

This study applies a micro-analytical perspective to the analysis of classroom interaction in young, beginning English as a Foreign Language (EFL) classrooms in Germany. It is based on the assumption that language learning is contingent upon both participation in meaningful interaction (e.g., Gardner, 2019; Long, 1996) and on opportunities to produce target language (L2) output (e.g., Swain, 2005; Philp & Iwashita, 2013). Accordingly, the teacher holds a key role in the creation of L2 interaction and output opportunities and thus of learning contexts (Hall, 2020). Consequently, teachers need to be aware of the hindering or furthering impact of their interaction practices and the degree to which these potentially obstruct learner output (Walsh, 2002) and, by extension, interactional participation. This awareness-raising is especially important in the training of future teachers for beginning learner classrooms, in which the students are often relegated to a passive, receptive role to begin with due to their limited L2 proficiency. Drawing on a corpus of authentic classroom videos from primary EFL classes held by pre-service teachers, the study analyzes the extent to and ways in which the learners are given opportunities to engage in interaction, how the instructional formats (fail to) elicit learner output, and how interactional trajectories are initiated and mediated by the teachers (turn-allocation, pass-on practices, question types etc.). The comparison of lessons with higher and lower degrees of student inclusion seeks to identify interactional practices that encourage learner participation and, ultimately, language learning. Knowledge about such practices can help increase language teachers' classroom interactional competence (CIC, Walsh, 2011); accordingly, some implications for teacher education are derived.

# Including patient's perspective in research: pragmatic implications of Patient Reported Outcomes

Panel contribution

***Mr. Marco Annoni<sup>1</sup>, Ms. Roberta Martina Zagarella<sup>1</sup>***

*<sup>1</sup> Consiglio Nazionale delle Ricerche*

In the last decades, patients' inclusion and active participation in healthcare have been increasingly recognised not only as an important socio-political issue but also as a crucial clinical and research topic. Patients' perspective has been acknowledged as pivotal both at the macro-level of institutional and policy plans for building inclusive healthcare systems and at the micro-level of the relationship between professionals and patients. Patients (especially those affected by chronic or rare conditions) are considered "expert" of their own disease because they acquire unique experience and significant knowledge of their individual condition in addition to self-management skills. Diverse domains of expertise have been examined in the literature. In the clinical context, patients' narratives have now become essential for (i) fostering knowledge sharing, and (ii) clarifying patients' values and priorities, which in turn may better inform clinical decision-making with respect to ethical dilemmas. Moreover, (iii) patients have acquired the opportunity to act as educators for other patients and provide feedback on care delivery; (iv) and they may lobby health care authorities and participate in various committees or activities of patients' associations. In the research domain, (v) they can give input on a wide variety of meaningful topics and choices regarding research questions in clinical trials, inclusion/exclusion criteria, drop-out risks, informed consent, identification of unknown/unmet patient needs, quality of life, etc. (Boulet, 2016; Cordier, 2014; Forsythe et al., 2014; Zagarella & Mancini 2020).

This presentation addresses questions about the inclusion of patients' perspective in clinical research, focusing on the design and implementation of Patient-Reported Outcomes (PROs). PROs are outcome assessments (OAs) used to define endpoints that can provide direct evidence of treatment benefit on how patients feel or function (Doward & McKenna, 2004; Calvert et al. 2018; Mancini & Zagarella 2018). These tools allow assessing the effect of treatments and procedures on patients' health and quality of life. These outcomes cannot be evaluated with laboratory tests, empirical findings, or data gathered independently from patients' perceptions and voice. Rather, they rely on patients' subjective experience and reports.

The design of valid PRO instruments requires appropriate procedures for scale development as well as pragmatic considerations, which are crucial for accelerating the incorporation of PROs into clinical research. Furthermore, having better PROs in clinical settings may lead to an improvement in patients' symptoms management and quality of life. Examples of pragmatic characteristics recommended for a well-designed PRO tool include actionability, setting-appropriateness, universality, self-administration, item features, response options, scoring, and accessibility (Kroenke et al., 2015). However, to date, the development of effective methods to design and implement PROs has only been tentative. For instance, so far linguistic approaches have focused more on the linguistic validation of existing PROs rather than on their pragmatic features.

The aim of the presentation is to discuss how to ensure appropriate and effective integration of pragmatic considerations in the development of better PROs, showing how language sciences may effectively contribute to further include patients' perspectives in biomedical research settings.

# Including the bystanders – language teachers' practices in mediating between individual speakers and the whole class

Panel contribution

***Dr. Carmen Konzett-Firth<sup>1</sup>***

*1. University of Innsbruck*

Teachers in whole-class interactions are engaged in a type of communication that has been labelled as “risky” (Hausendorf, 2008), since they face participation management in a challenging setting. Teachers’ tasks include the elicitation of responses (Duran & Jacknick, 2020), the allocation of speakership (e.g. Kääntä, 2015), dealing with student initiatives (Waring, 2011) and creating learning opportunities, for instance by shaping student contributions (e.g. Daşkin, 2015) or by utilizing locally appropriate repair practices (e.g. Sert, 2017). All of these are part of teachers’ Classroom Interactional Competence (Walsh, 2012) and have been extensively studied in CA-SLA. One aspect that has received comparatively little attention is the need to negotiate between eliciting individual learner productions and maintaining the interest and engagement of the class as a whole. An exception is Reddington (2018) who investigates engagement and exit practices into and out of dyadic exchanges with students in a whole-class EFL context. My study adds to these findings by describing how a teacher in a foreign language class transitions not directly from one speaker to the next but between individual speakers who they have been engaged in a verbal exchange with and the class as a whole. Non-speaking participants in class are usually co-present as listeners and sometimes vocally engaged but have limited means to contribute verbally due to the restricted opportunities for speaker self-selection. It is therefore part and parcel of ‘doing instructing’, particularly in contexts in which learnable contents (rather than skills) are foregrounded, that the teacher regularly mediates between the individual and the whole group. Teachers do this by making relevant the whole class as a participating party in the interaction. These teacher practices can therefore be seen as a way of enabling inclusion. Among the multimodal resources they employ are reformulations, body and spatial movements, smiles, laughter and gaze. The analyses are based on a collection of 17 different video recorded lessons by two different teachers in two French as a foreign language classes at a secondary school, taken from a longitudinal corpus covering five years of instruction.

**1.** Nanyang Technological University

The existence of ‘inclusive’ and ‘exclusive’ first-person plural pronouns is well documented in the world’s languages (Filimonova 2005). However, the *uses* of these pronouns in social interaction (and, more generally, of other linguistic and communicative devices relevant to inclusion and exclusion) are less well understood.

Harvey Sacks shows early on (in the 1960s) that ‘we’ has multiple uses that have escaped analytical attention by virtue of the “seen but unnoticed” work that they do in everyday conversation. For example, Sacks observes how the use of ‘we’ by participants of a group therapy session in talking to a newcomer serves to *both* exclude him (as a non-member of the group) *and* invite him (as a new member to join the group) (Sacks 1992, vol 1: 148-9).

In this paper, we apply this insight of Sacks’ to a set of video-recordings of medical consultations taken from two clinics in Singapore. Our aim is to explore the variety of participant-role configurations (Goffman 1981) that arise out of conversations that involve not just the doctor and the patient, but also other parties on either side of the ‘formula’ (e.g., nurses and assistants of the physicians and family and friends of the patients). Employing an EMCA approach, in-depth analyses of a number of data excerpts from this corpus will be presented in explication of the ways in which the trajectory of medical history taking, diagnosis and treatment recommendations may be affected by the inclusion and/or exclusion of patients in these consultations.

# Inclusion of Majority—Discursive Dynamics of Responsibility during the COVID-19 Pandemic

Panel contribution

***Dr. Julia Krasselt<sup>1</sup>, Dr. Philipp Dreesen<sup>1</sup>***

***1. ZHAW School of Applied Linguistics***

Protecting and ensuring the health of weaker and vulnerable members of the society is one guiding ethical principle during the COVID-19 pandemic. The communication of public health measures, a mediatized public discourse, and the perception as well as the discursive practices of sense-making among relevant audiences are crucial for the containment of the virus. Early on in the pandemic, the role of young adults (age 15-34) in the transmission of the virus became evident: due to their high level of mobility, widespread social contacts their lower risk of attracting severe COVID-19, they contribute significantly to a high transmission rate (Casella et al. 2020). Adequate communicative strategies of public health authorities are thus crucial in order to address and *include* young adults. As the typical vector population, they need to adopt new and socially isolating behaviors for the greater social and public health good.

From an epidemiological perspective, practices of inclusion must focus less on marginalized groups and more on a large, socially well represented population. The deontic ethic of recognizing marginalized groups during the pandemic shifts to the ethics of consequentialism, choosing the factor with the greatest impact (Powers/Faden 2006). In the COVID-19 discourse, such a decision is made from public health authorities and is likely in opposition to the interests of the marginalized and their representatives (Bernheim 2016). However, addressing the vector population only makes sense if young adults can act responsibly, especially with regard to risk groups. The paper focuses on the discursive construction of responsibility from the beginning of the pandemic, during lockdown and summer. Corpus linguistic and NLP methods (e.g., word embeddings) are applied to a corpus of 44k texts from Swiss mass media and public health authorities. Collective responsibility is operationalized via (1) collective identifiers (e.g., ‘we’, ‘the society’, ‘young adults’ or ‘chronically ill people’, (2) modal verbs (e.g., ‘should’ and ‘need to’) and (3) words denoting practices of responsibility (e.g., ‘solidarity’ and ‘thoughtfulness’) First results show that the vector population is denoted with a broad range of verbalizations, making it hard to address this group in a unified way. Thus, the construction of the vector population in the discourse remains fuzzy. ‘Solidarity’ becomes a keyword early on in the pandemic, peaks in frequency at the beginning of the lockdown and declines in frequency over summer. However, solidarity towards the weaker is a less frequent pattern. Instead, solidarity dominates in the context of cantonal, international and economic cooperation, indicating that collective responsibility is constructed as a means of minimizing negative economic and public health related consequences rather than of protecting vulnerable members of the society.

# Inclusion/exclusion with epistemic asymmetries: Citizens' participation in local public affairs in mainland China

Panel contribution

**Ms. Yan Zhou**<sup>1</sup>

1. 1. UCLA

Inclusion and exclusion in interaction can be marked with various verbal and on-verbal resources, such as pronoun system (e.g. La Polla 2005) and the shifting of gaze direction (Goodwin 1979, Tao 1999). The current study investigates another dimension, epistemic asymmetries as a means of including or excluding participants in interaction, specifically in the case of citizens' participation in local public affairs in mainland China.

Participating in discussions on public affairs requires a certain level of expert knowledge, which is a professional expertise for government officials and staff in the relevant offices but not an everyday repertoire for many ordinary people. The interaction between citizens and these officials therefore is a variety of expert-laypeople interaction. Previous studies on expert-laypeople interaction have mainly focused on epistemic asymmetries in medical communication where epistemic authority is highlighted as resources to negotiate diagnoses and treatments in doctor-patient interactions (e.g. Heritage 2006). In courtroom interactions, epistemic incongruencies and evidential resources are often focused (e.g. Pollner 1987, Drew 1992). Little attention has been given to other settings of expert-laypeople interactions, and fewer studies have discussed the inclusion/exclusion aspect of the interaction.

The present study adopts interactional linguistic approaches, which is informed by methods such as discourse analysis and conversation analysis to investigate how citizens are included or excluded from the discussions of public affairs with the means of epistemic asymmetries on a live broadcast government-accountability television program, Dianshi Wenzheng (DSWZ) 'questioning officials on TV'. Expressions of knowing and unknowing in Mandarin (e.g. (bu) zhidao, (bu) qingchu) and the interpretation of knowledge (e.g. 'that means', yisi shi) are investigated with the focus of their functions of inclusion and exclusion. My data set includes 20 episodes (each episode is 1.5-2 hours long) of DSWZ featuring local Chinese government officials being questioned by journalists, experts, and ordinary audiences. Note hosts/journalists often shift footings to laypeople, and they are categorized as laypeople in those situations.

Based on the ideas of common ground and joint action (Clark 1996), I argue that SPEAKERS mobilize linguistic expressions of epistemic asymmetries to include and exclude other participants as well as themselves to serve their interactional agendas. Five types of epistemic asymmetry related inclusive and exclusive practices are identified: 1) journalists/laypeople request for knowledge to be included, which includes both authentic and pseudo requests; 2) officials/journalists offer knowledge to include laypeople; 3) journalists/laypeople sanction officials for excluding laypeople; 4) journalists/laypeople exclude themselves by displaying no interested in expert knowledge but only the solutions of problems; 5) officials exclude themselves by directing information-seeking questions to other officials or subordinators.

The present study contributes to the discussion of inclusion and exclusion by expanding it to the new aspect of epistemic asymmetries and in the less studied interactional setting of citizens -government officials' interaction on public affairs.

# Inclusive practices in work safety education: The co-creation of accident stories

Panel contribution

***Dr. Nathalie Schümchen<sup>1</sup>***

**1.** Faculty of Information Technology and Communication Sciences, Tampere University

Work safety education is an obligatory part of many high-risk professions such as, for instance, electricians working with live (energized) lines. In Denmark, professional electricians are required to partake in regular safety education courses to ensure safe work practices. In practice, however, these courses are often described as little more than a formality with teacher-centered lectures and minimal active participant engagement. In order to create a more inclusive learning environment that takes the participants' knowledge and experience into account, an alternative teaching approach, adding an empathic dimension to work safety education, was pilot-tested in March 2020. The course format was designed to create a space where participants readily share personal experiences with safety-related situations in the workplace (on the role of storytelling in safety education, see, e.g., Hayes & Maslen, 2015; Rae, 2016; Sanne, 2008).

The data was collected as part of the above-mentioned intervention in so-called "L-AUS undervisning", a recurring, obligatory course of safety regulations for professional electricians' work on live lines. The course participants were presented with an audio story in which an electrician recounts a fatal accident that he witnessed, enhanced by context specific ambient sound, followed by facilitated group- and plenary discussions. The focus of the present multimodal conversation analysis (Mondada, 2015; Sacks, Schegloff, & Jefferson, 1974) is on the interaction between the facilitator and the course participants during the plenary discussion. I describe the interactional resources the facilitator uses to include the course participants in the sharing and discussion of personal stories (Goodwin, 1986; Mondada, 2015; Sacks & Jefferson, 1995) and describe how individual participants take agency over their stories and other contributions. Furthermore, I look at the role of bodily orientation as well as facilitator-initiated question-answer sequences in which I demonstrate the power of second-pair part formatting on the unfolding of the interaction.

This analysis contributes to a better understanding of facilitated work safety education and how an inclusive approach to work safety education may open up new opportunities to design education in professional contexts.

# Indicating difficulty in verbally describing medical phenomena: the use of hesitator *koo* in Japanese medical consultations

Panel contribution

***Dr. Shuya Kushida<sup>1</sup>***

**1.** *Osaka Kyoiku University*

In Japanese, there are several lexical objects used to display hesitation in constructing a turn-at-talk (e.g., *eeto* “well,” *ano* “that over there,” *sono* “that,” and *koo* “like this”). Though there are a few previous studies that have explored how these lexical hesitators are differentially used in talk-in-interaction (e.g., Morita & Takagi 2018, 2020), little research has been done about their use in formulating something (e.g., a person, an object, an action, a state of affairs). Furthermore, we know relatively little about how hesitations when formulating something are tailored for the action in the service of which the formulation is produced. This study attempts to fill this gap by exploring how *koo* is used in medical consultations in Japan. It demonstrates that *koo* alerts the recipient to the speaker’s difficulty in verbally describing something: it is typically (but not exclusively) used with a depicting gesture in face-to-face interaction, and indicates that the speaker is “vividly imagining” something in order to work out an appropriate descriptive term for it. In support of this claim, while the other lexical hesitators (e.g., *eeto*, *ano*, and *sono*) are used to retrieve a name or other type of “ready-made” item, *koo* is never used for this type of word search. Furthermore, when speakers hesitate with *koo* in formulating something, they frequently display difficulty in putting the matter into words by using “non-straightforward” expressions (e.g., a reported speech or reported thought, a mimetic word, a figurative expression) and by marking the expression as suboptimal (e.g., by self-repairing it). After developing this general argument, the present study describes some ways in which *koo* is used in formulating medical phenomena. Patients repeatedly use *koo* in formulating their symptoms: by indicating difficulty in verbally describing their symptoms, patients can add to a claim of the “doctorability” (Heritage & Robinson 2006) of their problems. Doctors frequently deploy *koo* when empathetically reformulating the patient’s problems, probing into possible symptoms the patient might be experiencing, and producing a medical description of the patient’s condition in an easy-to-understand manner. By indicating their difficulty in verbally describing these matters, doctors appear to assume a less authoritative stance toward the patient. In conclusion, this study argues that lexical hesitator *koo* does not simply delay the progressivity of a turn-at-talk but also displays the speaker’s stance toward the matter being formulated, and works to tailor a formulation of something to the action the speaker is implementing.

# Indirect Refusal in Interpersonal Communication in Mandarin Chinese

---

Panel contribution

---

**Prof. Ling Zhou<sup>1</sup>**

**1.** *School of Foreign Languages, Northeast Normal University*

This paper explores the conventional speech act ‘Refuse’ (cf. House and Kádár 2021) from an alternative way: it examines how the addressee turns the addresser down indirectly in interpersonal interaction when he or she feels embarrassed, challenged or irritated. The data studied in the paper is drawn from life documentary reality shows. The findings show that speakers often deploy indirect refusal strategies whenever they intend to attack the other’s face. This study reveals that indirect refusal is not always conventionally polite, but can be impolite in mandarin Chinese.

# Individual Differences in Children's Developing Participation Frameworks

Panel contribution

***Prof. Stefan Pfaender<sup>1</sup>***

***1. University of Freiburg***

We will present a multimodal analysis of a longitudinal corpus (age 1 to 5) of child-mother interactions, with a focus on the child's recruitment of the mother's attention and support. In particular, we are interested in the influence of emergent interactional routines on the richness, complexity, and synchronicity of verbal and bodily interaction.

The data were assessed in a longitudinal project on mother-child attachment (TRANS-GEN

“Stress resilience in the transgenerational transmission of childhood maltreatment”

at the University of Ulm, see Köhler-Dauner et al., 2019). In the present collaborative analyses, synchronization processes between child and caregiver are of major interest (Feldman, 2007; Göritz & Rennung 2016). We add to the analytical repertoire used in the medical and psychological research literature with a fine-grained multimodal-analysis of two selected situations: (A) The reunion of mother and child after a short separation at age 1 (“strange situation”, Ainsworth et al., 1978, Main & Solomon 1990, Köhler-Dauner et al. 2019). Here, the major task is to re-establish contact, at this age typically through play. (B) The “cry-baby paradigm” using the RealCare Baby © infant simulator at age 5, where a life-like doll has to be taken care of (changing diapers, soothing after crying). Here, the child has to recruit the assistance of the mother to secure the physical and emotional well-being of the baby doll. This paradigm has been used in several developmental studies (Eisenberg et al. 1996, Nichols et al. 2015, Bakermans-Kranenburg et al. 2015).

Recruitment activities include requests, orders, and suggestions (Floyd, Rossi, & Enfield, 2020), and require social coordination and here-and-now co-operation of temporally adjacent moves (Tomasello, 2019; 2020) within a participation framework (Goodwin, 2007; 2017). The two mother-child dyads analyzed in this pilot study show systematic differences along bodily synchronization, interactional style, and verbal elaborateness throughout development. In the participation framework of Dyad 1, timing and content of the interaction are mother-dominated, leaving little room for the child's initiative who mainly delegates tasks to the mother. In Dyad 2, the child has more room for exploration and initiative, and this leads to a richer co-constructed and more complex and abstract verbal exchange (cf. Hart & Risley, 1995, for related finding regarding interactional styles and language acquisition outcomes).

Despite these differences, both dyads show a close alignment and synchronization in their relative timing of the discourse moves, which suggests close attunement and the ability to anticipate the other's reactions. The stability of the interactional frames over time, and their correlation later with multimodal alignment and linguistic richness suggests that a close interdisciplinary collaboration between attachment research and interactional and developmental linguistics could lead to an analytical diagnostic inventory that also allows us to identify interactional resources for early intervention.

# Individual differences in teenagers' mastery of connectives from the written mode

Panel contribution

***Ms. Ekaterina Tskhovrebova<sup>1</sup>, Prof. Sandrine Zufferey<sup>1</sup>, Dr. Pascal Gygax<sup>2</sup>***

***1. University of Bern, 2. University of Fribourg***

Children start producing connectives many years before they fully master them in comprehension tasks (McClure & Geva, 1983). For instance, children below the age of 10 to 12 do not master connectives frequently used in speech such as *because*, *and*, *but*, or *after* (e.g. Cain & Nash, 2011; Pyykkönen and Järvikivi, 2012). Yet, most European languages also possess a vast repertoire of connectives that are bound to the written mode, such as *therefore* and *nevertheless* in English. Even though they are seldom used in speech, in writing many of these connectives are very frequent. Mastering them represents therefore an important step to achieve effective written communication.

However, little is known so far about the acquisition of these connectives during teenage years. Previous research has demonstrated a link between the mastery of these connectives and the degree of exposure to print for adults (Zufferey & Gygax, 2020a). In addition, academic background seems to be an efficient predictor of the mastery of these connectives for 16-year-olds (Zufferey & Gygax, 2020b) and early middle school children (Oğuz & Özge, 2020). However, no study has systematically assessed the role these factors across a larger group of teenagers.

In this presentation, we investigate the ability of teenagers aged 12 to 18 and adults to correctly use four French connectives typical of the written mode (*aussi*, *en outre*, *en effet*, and *toutefois*) which have different frequencies and encode relations with a varying degree of cognitive complexity. In order to track individual differences, we assessed the role of exposure to print and academic background as predictors of competence with connectives. Results from sentence and text completion tasks indicate that if teenagers are not yet able to use all four connectives correctly (though with a clear split in scores between frequent and non-frequent connectives), not all adults fully master infrequent connectives. In addition, academic background and degree of exposure to print seem to be relevant predictors for the mastery of written connectives among younger populations as well as among adults independently of age.

# Individual differences in the brain response to metaphorical language: an Even-Related Brain Potential approach

Panel contribution

***Dr. Paolo Canal<sup>1</sup>, Dr. Luca Bischetti<sup>1</sup>, Prof. Valentina Bambini<sup>1</sup>***

***1. University School for Advanced Studies IUSS Pavia, Pavia, Italy***

Individuals differ in cognitive performance, and language use and interpretation are no exception. Many factors affect the more automatic aspects of language processing [Pakulak & Neville, 2010], from working memory to general intelligence, and pragmatic interpretation arguably hinges on an even broader range of skills, encompassing also sociocognitive abilities.

We present three studies on the comprehension of metaphors using the Event-Related Potentials (ERPs) in different experimental paradigms. In the first study, we compared two groups of participants with or without academic education, while reading literal and figurative sentences (*In hard times hopes are starsthat light the soul up* vs. *Those lights in the night sky are starsof distant galaxies*) and controlling for individual variability in working memory, social skills, reading habits, and semantic fluency [Di Paola et al., 2016]. In the second study, we compared two kinds of metaphors, conveying either physical (*Dancers are butterflies*) or mental (*Teachers are books*) content, to assess the role of Theory of Mind skills in figurative language processing [Canal et al., 2019]. In the third study, we compared pairs of concepts with a metaphoric (*Language-Bridge*) or literal (*River-Bridge*) relation presented either verbally or verbo-pictorially, to assess the impact of modality as well as individual's imagery skills [Canal et al., 2020].

Throughout the studies, the most relevant processing differences across individuals involved the N400 component, which is linked to the retrieval and pragmatic adjustment of the meaning of the metaphor constituents [Bambini et al. 2016]. The different facets of individual variation point to three main findings: a) lower educational attainment is associated with prolonged retrieval effort; b) better Theory of Mind skills ease the processing of metaphors, especially when they convey mental contents; c) imagery skills are associated with larger N400 effects especially in frontal electrodes, but independently of modality or figurativity, possibly due to a more intense use of mental images in processing.

Strengths and weaknesses of this approach will be discussed, as well as the implications for the status of pragmatic skills.

# Individual variations in learners' ability to use connectives in a foreign language

Panel contribution

***Mr. Mathis Wetzel<sup>1</sup>, Prof. Sandrine Zufferey<sup>1</sup>, Dr. Pascal Gygax<sup>2</sup>***

***1. University of Bern, 2. University of Fribourg***

Connectives are linguistic items that indicate discourse relations like cause and condition between discourse segments and thus represent crucial elements for coherence (Halliday and Hasan, 1976; Sanders, Spooren, & Noordman, 1992). Despite their high frequency in most discourse genres, the ability to handle connectives typical of the written mode has been found to be quite variable even among adult native speakers (Zufferey & Gygax, 2020), and this variability has been linked to the degree of exposure to print that people have.

In this presentation, we investigate the ability of German-speaking learners of French to use 12 French connectives typical of the written mode. We also investigate the role of three variables that could account for the variability between learners: language proficiency; exposure to print in the second language (French) and exposure to print in the first language (German). In a sentence completion task performed online, we tested 151 German-speaking learners of French as well as a control group of 63 French native speakers. In order to assess learners' proficiency level in written French, we gave them a written language competence task (Zufferey and Gygax, 2020) and a vocabulary knowledge-test (*Lextale*, Brysbaert, 2013). In addition, we tested the exposition to print in both their L1 (*Art-Ger*, Grolig, Tiffin-Richards & Schroeder, 2020) and L2 (*Art-F*, Zufferey and Gygax, 2020). Finally, in a self-assessment task, we measured learners' perceived importance of 10 given factors (e.g. *school, friends, reading, Internet*) for their acquisition of French.

Results indicate that for the non-native speakers, a higher vocabulary knowledge and a better grammar mastery predicted a better score in the main task. More intriguingly, a higher exposition to print in L1, but not in L2, also predicted a better mastery of connectives in L2. These results thus tend to indicate that L2 acquisition research should focus more on the first language competence of the participants as predictors of their ability to use connectives, as results show that there are several factors that facilitate or hinder learners' mastery that are linked to their native language. These factors raise important questions about a possible interaction between the native and foreign languages (see also Sparks, Patton, Ganschow, Humbach, & Javorsky, 2006; Sparks, Patton, Ganschow, & Humbach, 2012). Finally, participants that assigned a higher importance to the factor *reading* for their acquisition of French were more likely to score higher at the main task. Beside supporting our finding of the link between connective mastery and the exposition to print, this finding shows that subjective impressions of participants are reliable predictors of their level of competence.

# Inferring meaning from composite utterances: The flexibility of multimodal communicative acts

Panel contribution

***Dr. Jack Wilson<sup>1</sup>***

**1.** University of Salford

Pragmatic theory has been predominantly concerned with the inference involved in the causal sequence of INTENTION-BEHAVIOUR-GOAL. During such sequences, it is argued that comprehenders infer intentions from behaviours and producers infer behaviours from goals. These inferences have been referred to as comprehension and subprehension, respectively (see Enfield 2013).

However, another type of inference which is as prevalent as any other in communication is how complex, multimodal/multisensory behaviours are taken to be components of single communicative acts. This process should be considered as properly inferential because the outcome (communicated meaning) is regularly more than the sum of its parts, e.g., language, gesture, eye-gaze, intonation etc. The inferences involved in communication relate to the selection of the components of communicative acts and the interpretation of the different components of communicative acts as part of a rich meaningful whole. The particular focus of this paper is how meaningful utterances are decomposed into (and inferred from) speech-gesture composites. This research, then, builds on previous research into ‘co-expressive’ (McNeil, 2015) utterances which have focused on language and hand-gesture.

Within the literature on gesture production it is often assumed that gesture is dominated by language (see Ruiter (2017)). The picture, I will argue, is far more nuanced. I argue that a fuller picture of how speech-gesture ensembles are composed must pay attention to the direction of composition, i.e. that gesture can be fitted to language, but language can also be fitted to gesture. I argue that this view of multimodal utterances better accounts for the fact that communicators are opportunistic and use whatever is at their disposal to make meaning.

In this paper, I introduce and analyse interactional lab data collected using a bespoke data collection method. I take a composite utterance (Enfield, 2013) approach to demonstrate that communicators rely on a range of devices to ensure that both components are taken as part of a single utterance. Further, I show that for the same communicative content, an utterance can be language-framed or gesture-framed. I conclude by arguing that the inference required to treat two behaviours as realising a single communicative meaning is flexible and context dependent.

# Initiating conversations in the toddler peer group

Panel contribution

***Ms. Bryndis Gunnarsdottir<sup>1</sup>***

**1.** University of Iceland

Two-year-old children (toddlers) often express their understanding and intentions in peer to peer interactions through embodied language as they co-produce social relationships (Løkken, 2004; Greve, 2005). Research using conversation analysis (CA) has also shown that toddlers are capable of complex interactions with each other long before they start to communicate verbally (Kidwell, 2005; Filipi, 2009) and that they are knowledgeable and capable as they co-produce their everyday lives (Bateman & Church, 2017). There is still a need to understand better *how* toddlers initiate these embodied interactions though, and what may be the difference between a successful interaction and an interaction that is rejected by a peer.

This is an ethnomethodological study using CA to transcribe and analyse the interactions that were video recorded over a period of nine months in Iceland. The study examines embodied peer to peer interactions in an early years setting between toddlers to explore how they initiate interactions and the strategies they use in order to be accepted by their peers. This presentation will be focusing on the sequence of the interaction, looking at "...how the body is used to display a stance toward someone else and propose a course of action" (Goodwin, Cekaite & Goodwin, 2012, p.21).

The findings suggest that toddlers are competent in managing the organisation of their own social worlds through the specific strategies of pointing, gaze and touch to co-produce shared attention in competent ways. These findings demonstrate that toddlers are adept at reading social cues from their peers and capable of interacting through turn-taking and repair in embodied interactions resulting in acceptance and successful interaction. The findings also highlight that although toddlers are highly competent at peer interactions, they are still in need of knowledgeable teachers who can help them when their interactions are unsuccessful.

# Institutional arguments to counteract conspiracy-based dissent on COVID-19 vaccines

Panel contribution

***Ms. Roberta Martina Zagarella<sup>1</sup>, Mr. Marco Annoni<sup>1</sup>***

***1. Consiglio Nazionale delle Ricerche***

The Covid-19 pandemics has led to a global effort to search for an effective vaccine. This unprecedented endeavor, however, has been accompanied by a growing series of vocal conspiracies theories (CTs) (Ball & Maxmen 2020; Bertin et al. 2020; EU DisinfoLab 2020). For instance, as showed by a YouGov poll, during the first phase of the Covid-19 pandemics one of the most diffused CTs consisted in casting doubts about the involvement of the billionaire philanthropist Bill Gates in the development of the Covid-19 vaccine. Importantly, even though such kind of CTs may appear to be innocuous and believed only by a vocal minority, in the last decades empirical studies have repeatedly shown that they are nonetheless able to exercise a significant performative function by influencing and swaying individual behaviours and public perceptions (Danblon and Nicolas 2010; Lewandowsky, Oberauer and Gignac 2013; Taïeb 2010; Sunstein and Vermeule 2009; Taguieff 2013).

Against this background, in this talk we present an analysis of the main discursive strategies that have been used by institutions to counteract a conspiracy-based dissent to Covid-19 vaccines. This analysis drawn on series of exemplar texts, from institutional website and to official documents (in English, without limitation to specific countries or regions), such as the European Commission and UNESCO initiative “Identifying conspiracy theories”. Specifically, we adopt a rhetorical-argumentative approach based on the three “entechnic” proof of rhetoric – *logos*, *ethos*, and *pathos* (Cf. Aristotle *Rh.* 1355b-1356a) – which allows us to illuminate: (1) what kind of arguments are deployed to help citizens identifying, debunking and countering conspiracy theories (*logos*); (2) how the orators’ credibility is constructed to counter CTs (*ethos*); (3) how the emotional sphere is recruited (*pathos*).

As we argue, this rhetorical-argumentative approach can shed significant light on how CTs succeed in achieving their persuasive effect and aid institutions in addressing their practical and sociopolitical implications (Zagarella and Annoni 2019).

# Institutional norms as resources: the relevance of rule formulations for peer in/exclusion practices in the classroom

Panel contribution

***Mr. Nicola Nasi<sup>1</sup>***

**1. University of Bologna**

The paper explores non-native children's negotiations of classroom institutional norms in the peer group, focusing on rule formulations as a resource to a) socialize peers to expected ways of behaving and b) assume an authoritative position in the group hierarchy. Based on a larger ethnography documented with video-recordings in a primary school in Northern Italy, this study adopts a CA-informed approach to analyze peer interactional practices within an Italian L2 class attended by children aged 8 to 10.

Drawing from the theoretical frameworks of language socialization and interpretive reproduction, the paper builds upon previous research on rules as resources for action (Wootton 1986) that children might employ for a number of local purposes within the peer group (Cobb-Moore, Danby and Farrell 2009; Martin and Evaldsson 2012; Corsaro & Schwarz 1991). The focus is on children's explicit formulations (and consequent multimodal negotiations) of rules following peers' actions which are deemed problematic. As the analysis illustrates, non-native children make use of the deontic modality (*must*, i.e. the Italian *dovere*) to reproduce institutional norms of appropriate behavior, norms they have been socialized to in the few months of peripheral participation in everyday activities. It is argued that, by "presentifying" the institution with the limited resources in their interactional repertoire, children manage to assume a position of (deontic) authority within the group hierarchy (Goodwin 1990; Maynard 1985) and socialize peers to specific norms of expected behavior in the classroom. Children's situated use of institutional norms seems to entail opportunities for novices' inclusion in the new community as well as risks concerning possible exclusion practices based on (alleged) misalignments to the moral and social order of the peer group (Kyratzis 2004).

# Instruction by installment: A recurrent format used in teaching Jiu-jitsu techniques

Panel contribution

***Dr. Yasuharu Den<sup>1</sup>***

***1. Chiba University***

In this presentation, I investigate how the teacher at a Jiu-jitsu class in Japan instructs a complex technique in a way that enables him to progressively confirm the students' understanding of successive installments of a series of bodily actions. The teacher effectively segments the whole series of actions into smaller parts, providing the verbal explanation and bodily demonstration of each part, making the students emulate the teacher's movements, confirming the students' achievement, and going forward to the next part. I illustrate details of this process based on a multimodal analysis of video-taped Jiu-jitsu classes.

Instruction of physical skills with demonstration has been increasingly paid attention to, and a number of studies have recently been conducted on analysis of instruction with bodily demonstration based on video-recording of lessons and classes (e.g., Keevallik, 2013, 2014, 2018, 2020). In particular, Japanese martial arts, such as Judo, Aikido, and Jiu-jitsu, have become one of the new hottest topics in this line of research (e.g., Lefebvre, 2016; Råman and Haddington, 2018; Råman, 2019). However, it has not been fully studied what makes these martial arts regarded as *Budo*, or more generally *Geido*, a traditional Japanese way of practicing techniques.

In the current study, I focus on scenes in which a Japanese Jiu-jitsu teacher instructs submission holding techniques such as chokes and joint locks at his class. These techniques generally consist of a complex series of bodily actions, and it is very difficult for students to understand the whole series at once. The teacher first shows only the initial part of the series as an installment, repeatedly demonstrating that part several times. He then instructs all students in pairs to perform the same action by themselves a specified number of times. After confirming their achievement, he goes forward to the next installment. This is a recurrent *format* of instruction in his Jiu-jitsu class (cf. Råman and Haddington, 2018).

The format is formed not by the idea of the teacher alone, but it is rather interactively organized with the students. For instance, the teacher sometimes asks a question in the course of demonstration such as "Is anyone unfamiliar with this body position?" Depending on the response(s) from the students, he decides what the size and the content of the current installment should be. Or, when he finds the performance of some students following his demonstration unsatisfactory, he redoing (a part of) the previous demonstration in a bit different way, prefacing the second demonstration by saying "I did crudely before, but ..." In this way, instruction by installment is interactively organized by both the teacher and the students.

In the presentation, I will provide some excerpts illustrating details of the teacher's instruction process and discuss how this format of instruction serves as a key to understand a traditional Japanese way of practicing techniques.

# Interactional Frames in a Literary Work: Multiple Levels of Interaction

Panel contribution

***Prof. Kyoko Ohara<sup>1</sup>, Dr. Miriam R. L. Petrucci<sup>2</sup>***

*1. Keio University, 2. International Computer Science Institute*

This paper addresses the interactional frame insofar as it mediates between author and reader in the opening of a “children’s” book, Antoine de Saint-Exupéry’s (1943) *The Little Prince*.

While every text invokes an interaction between author and reader implicitly, even when the author does not say so explicitly, *The Little Prince* might be unusual for a number of reasons. The text is explicit about engaging in an interaction; and the author addresses those he wants or perhaps only pretends his reader(s) to be, while acknowledging that he has dedicated the book to an adult (not the preferred reader, based on the author’s own words). Even before analyzing the language of the opening, the reader likely would realize that the author is playing with more than one level of interaction.

Beginning with the dedication, interactionally, in terms of conceptualizing what is going on between author and reader, a number of questions demand attention:

1. What is going on between Saint-Exupéry and Werth?
2. What is going on between Saint-Exupéry and the adult reader?
3. What is going on between Saint-Exupéry and the child reader?

To illustrate, consider a difference among the different editions that changes the reader’s understanding of what is going on between Saint-Exupéry and Leon Werth, the person to whom the author has dedicated the book. While both the English and the Japanese provide the simplest dedication possible (“To Leon Werth”), the Hebrew frames the dedicatee as a “dear friend” of the author: *lō-yədidi ha-yakar* (to-friend-my def-dear) – ‘to my dear friend’. Identifying an individual as a “dear friend” necessarily impresses the reader in a different way than only identifying an individual by name. The (translator’s) choice of salutation highlights interactional information necessarily characterized as such, rather than via a semantic frame.

The first sentence requires further analysis. Ohara (2020) advocated the frames-and-construction approach for linguistic analysis to help identify functionally equivalent constructions in different languages (despite differences in form), thus clearing the way to address those aspects of translation equivalents that must be accounted for otherwise, i.e., with interactional frames. Each language uses different forms in the predicate of the main clause: Hebrew uses a predicate nominal construction; English and Japanese use transitive constructions. Furthermore, each language evokes a different frame: \*Apology, Request, and Attempt\_suasion, respectively. Structural differences and frame mismatches notwithstanding, each language shows a high degree of politeness, and that characteristic informs (the analyst’s) understanding of the interaction between author and reader, regardless of reader (Werth, adult, or child).

The present work extends Ohara’s (2020) approach to another language, namely Modern Hebrew, and for the explicit purpose of exploring whether and how each translation informs any understanding of the interaction between author and reader. It has begun to uncover some of the details for what constitutes information appropriately captured in an interactional frame. That type of information currently does not exist in any FrameNet-like resource but ought to be included, for those resources to serve the goal of natural language understanding.

# Interactional Frames in the German Frame-Semantic Online Lexicon (G-FOL)

Panel contribution

***Prof. Hans Boas<sup>1</sup>, Dr. Maggie Gemmell<sup>2</sup>***

*<sup>1</sup> The University of Texas at Austin, <sup>2</sup> University of Texas at Austin*

This paper describes how interactional frames (Fillmore 1982: 117) can be implemented in a learner's dictionary for German, so that learners can study outside of the classroom and discover how to maintain communications in German using a variety of linguistic forms. First, we discuss interactional frames within the broader context of Frame Semantics and analyze interactional frames in terms of how useful they are (or could be) to foreign language learners. The next step is to introduce the German Frame-Semantic Online Lexicon (G-FOL, [www.coerll.utexas.edu/frames](http://www.coerll.utexas.edu/frames)) to contextualize the practical approach that follows. We then identify a methodology for creating interactional frames that is consistent with the G-FOL project's objectives (namely, helping learners acquire vocabulary) and utilizes the same Frame-Semantic concepts that are employed in other, non-interactional linguistic frames (e.g. lexical units, frame elements, authentic examples). We also explore how other linguistic tools, such as cultural scripts, are useful in defining interactional frames.

The unique nature of interactional frames is sure to present challenges. For instance, examples of how lexical units are used to maintain communication are hardly meaningful without their communicative context. Rather than extracting single sentences from a corpus to use as examples (as has been preferred practice for existing non-interactional frames), learners will benefit from seeing some sort of dialectic between speakers. Additional information about the interlocutors and their relationship may also be necessary to demonstrate accurate use of lexical units in interactional frames (e.g. number of interlocutors, factors that influence the appropriate degree of formality in the exchange).

The goal of this paper is to explore theories associated with interactional frames and apply that information to lexical units that evoke such frames in German. In the course of this application, we will identify strengths and weaknesses of the theoretical approach and use our findings to contribute to our collective understanding of interactional frames.

# Interactional humour in colloquial conversations in Spanish

---

Panel contribution

---

**Prof. Leonor Ruiz Gurillo<sup>1</sup>**

**1. UNIVERSITY OF ALICANTE**

This paper presents the results of a quantitative and qualitative analysis into the use of humor in colloquial conversations in Peninsular Spanish. A total of 148 humorous sequences were extracted from 67 conversations from Val.Es.Co. corpus ([www.valesco.es](http://www.valesco.es)). The data shows a trend (39%) towards the *Least Disruption Principle* (Esterhold et al. 2006; Attardo et al. 2011, 2013), since irony and humor occur in a single intervention (M1) and responses are limited to a single intervention in 14% of instances (D2). In contrast to the findings from this data, our corpus supports a wide-ranging trend towards *sustained humor* (Attardo, 2019) over more than three interventions (47%) (D3-Dn). Additionally, the type of response (Kotthoff, 2003) will also be presented: to the said (11.36%), to the implicated (19.32%), laughter (13.64%) and mixed responses (55.68%). Thus, our analysis of humorous sequences indicates a balance between the short disruption of the progress of conversation and the sustained humor along a sequence.

# Interactional practices of inclusion in social employment

Panel contribution

**Dr. Sanni Tiitinen<sup>1</sup>, Dr. Aija Logren<sup>1</sup>**

***1. Tampere University***

Interactional practices that promote social and knowledge-based inclusion are important in every workplace as the panel abstract describes. One work environment where the practices of inclusion have an emphasized significance are workplaces of social employment. In social employment, the goal is that the work environment supports client-employees in such a way that their opportunities to get a job from non-supported labor markets are enhanced. Thus, promoting inclusion is not only connected to the client-employee's work well-being and satisfaction in the current workplace, but a fundamental means to enabling long-term inclusion in labor market in the first place.

In this presentation, we focus on interaction between coaches and client-employees in social employment workplaces. The coaches are professionals who manage and support the work tasks. The client-employees are clients in the eyes of the employment services due to their challenges in labor markets (e.g., prolonged unemployment) and employees who work (although in a supported fashion) in the organization. We aim at understanding *what kinds of interactional practices by the coaches promote clients' opportunities for inclusion*.

We utilize empirical data from three social employment workplaces situated in non-profit organizations. The data includes field observations (both participant and non-participant observations) and audio-recordings of approximately 57 hours of interaction in total. With an ethnomethodological approach and methods, we have analyzed systematically the sequences of interaction where the coaches and clients produce their epistemic relations – that is, their relations related to knowledge – relevant to work tasks.

In the data, we have identified and named four interactional orientations that are linked with the epistemic relations.

1. In the *comforting orientation* neither the coach nor the client-employee are treated as having expertise on the work tasks. The coach presents work tasks as easy, non-serious and not needing any expertise – or as so difficult that no-one can have expertise on them. With these types of descriptions, the coach normalizes client-employees' challenges in relation to work tasks either beforehand (when introducing the tasks) or after challenges have occurred.
2. In the *education orientation* the coach is treated as having more expertise than the client-employee. The client-employee seeks advice from the coach and the coach gives (unsolicited or solicited) advice, information and instructions.
3. In the *orientation of enhancing individual expertise*, the participants treat the client-employee having more expertise than the coach. The client-employee offers advice or information either unsolicited or after the coach's request.
4. In the *co-operation orientation*, the coach treats the client-employee as having equally good expertise on the work tasks as themselves. If the client-employee asks for advice, the coach initiates a joint discussion about the matter and treats it as not having a single correct answer.

We suggest that all these orientations might be beneficial for enhancing client-employees' inclusion in interaction in the social employment workplace. However, we discuss the co-operation orientation as potentially being the most significant for enhancing client-employees' opportunities for labor market inclusion.

# Interactional Practices that Foster Inclusivity during Conversations with Severely Compromised Persons with Dementia and A Few Practices to Avoid

Panel contribution

***Dr. Trini Stickle<sup>1</sup>, Dr. anja wanner<sup>2</sup>***

*<sup>1</sup> Western Kentucky University, <sup>2</sup> University of Wisconsin-Madison*

Many people suffer no significant loss of linguistic abilities as they age, yet others experience great language loss as the result of age-related degeneration due to any number of neurocognitive diseases, primarily brought on by dementia, a syndrome caused by any number of progressive disorders that affect memory, thinking, communication, and the ability to perform everyday activities (American Psychiatric Association, 2013). Such deficits in memory and language quality can affect persons' facility to easily participate in everyday conversations. The cumulative effect, then, can rob persons of their perceived role as productive conversation participants, a vital part of identity. This inability to communicate with family and friends due to disruptions among memories, retrieval of words, and disruptive or disjointed syntax can cause persons diagnosed with dementia to "withdraw from social activities for fear of being seen as a burden to others or as failures when their disabilities come to show themselves" (Ryan, Bannister, & Anas, 2009).

In this presentation, we highlight the application of co-participant strategies noted in actual conversations that seem to allow continued, productive interaction with participants diagnosed with dementia who are demonstrating severely compromised linguistic and interactional abilities. Such co-participant strategies seem to allow a small window for persons with dementia to use language effectively and to participate in their respective conversations. Our analysis will show that when co-participants respond to impaired syntax as making sense or completing a syntactic–semantic action, participants with dementia may use these cues to continue communicating (if only briefly) (as reported in Stickle & Wanner, 2020). Additionally, we present a second trajectory of observations in which we discuss co-participant strategies that result in persons with dementia demonstrating resistance to continue or, occasionally, withdrawing completely from the conversation. Such practices include downplaying dementia symptoms or recasting them in terms of "bright-side" tellings (Holt, 1993), providing factual corrections, or assuming an interviewer role. A close analysis of both types of co-participant practices better ensures the development of models for (best) communication practices that foster inclusivity during interactions with persons with dementia.

# Interactional surveillance of racial categories and knowledges in casual Chinese conversation

Panel contribution

***Mr. Hayden Blain<sup>1</sup>***

*1. University of Melbourne*

There is a long-standing debate within conversation analytic and critical discourse analytic work about the demonstrable effect of discourses in interaction. This paper uses interactional data from a casual conversation among Chinese women and one white man (the researcher) in Mandarin Chinese to analyse how members navigate productions of racial categories (e.g., Chinese people; white people) and associated knowledges. The article draws on conversation analysis and the Foucauldian concepts of discourse and surveillance to analyse the operations of Chinese and white discourses in interaction. I present several data excerpts to explore this. For example:

24 FANG: jiu wo haoqi, zheyang

就 我 好奇 这样

MOD I curious this way

'I am curious, +it's+ like this'

25 (.)

26 [xiang ni]men, bairen de [hua] hui j[ie]yi (zh[e s]hi) [ma]= [hui]

像 你们 白人 的 话 会 介意 这 事 吗= 会

like you-PL white people DMP talk will mind this thing Q will

'Like you-PL, with white people, will +you/they+'

27 GU: [HH HEH] [.HH] [HH] [.HH] [HH] [.HH]

28 FANG: (>hen jieyi<) yi ge gongchang fang pi ma

很 介意 一个 公场 放屁 吗

very mind one C public fart Q

'mind (this)? Will +you/they+ (mind) a fart in a public place?'

29 KE: °hui ba° hh

会 吧

will MOD

‘°+They+ will +I think+° hh’

30 HAY: >shenme<

什么

What

'What'

31 GU: £wo juede shei dou hui jieyi ba£ hh=

我 觉得 谁 都 会 介意 吧

I think who all will mind MOD

‘£I think anyone would mind +right+£ hh’

I show how, in this excerpt, the selection of the visibly-white participant to speak on behalf of a particular type of knowledge of white people, and the temporary ambiguation of who has interactional rights to produce the appropriate second pair part, shows a Foucauldian surveillance at work. Although discourse is operational through surveillance, CA analyses can uncover interactional techniques which may alter the regular operation of discourse.

Contrary to many contemporary studies of racial discourse which understand discourse as a hegemonic ideology, I suggest that discourses can be locally produced and managed in talk. The paper argues that members can draw on interactional ambiguity to divert the discursive project of racial surveillance. I conclude that operations of racial discourses may not be as deterministic as previously thought, but are in fact manageable using the resources of the interaction order.

# Interactionally situating the power scream: Analyzing bodily motivated vocalizations

Panel contribution

***Dr. Emily Hofstetter***<sup>1</sup>

*1. Linköping university*

Everyday interaction is filled with sounds that are connected to bodily events: breathing, sniffing (Hoey, 2020), crying (Hepburn, 2004), grunting, and so on. Most linguistic theories, however, exclude the body from consideration, arguing its contributions are insufficiently symbolic or conventionalized, and most of all, merely unintentional by-products. In contrast, ethnomethodological and interactional linguistics studies show how speakers orient to such sounds as meaningful and accountable (e.g. Keevallik 2020).

This paper begins to address the lack of research concerning ‘bodily motivated’ sounds, specifically the diverse vocalizations involved in physical strain, using a corpus of 25 hours of recorded naturally occurring rock climbing as data (368 strain vocalizations). It uses the term ‘bodily motivated’ to capture the dual nature of these sounds as both physiological and social events. The analysis proceeds using multimodal conversation analysis, that is, it elucidates the pragmatics of the vocalizations as demonstrated through the participants’ own orientations to the phenomena *in situ*. The participants in the data treat the vocalizations as simultaneously physiological and socially meaningful for their ongoing interaction, which makes available their understandings of the vocalizations for both co-participants at the time of recording, and the analyst for research. Climbers have a particular need to distinguish strain vocalizations, as safety partners (belayers) must anticipate the climber’s motions in order to safely manage the equipment.

Participants distinguished between four variations: 1) ‘power screams’, laryngeally constricted vocalizations made during intense physical strain, 2) ‘power hups’, short vocalized bursts with glottal onsets that accompany motion, often jump-like moves, 3) ‘pain cries’, which involve sudden intake of breath and high pitched vocalization, and 4) ‘strain releases’, outbreaks that accompany a relaxation of muscles. The screams and hups are treated as projecting motion, whereas the other two project cessation. Participants respond according to how the vocalizations are interwoven with climbing progressivity, such as anticipating changes in movement, inquiring about problems, or encouraging climbers. Vocalizations that display hindrances to climb progressivity are treated as trouble markers: e.g. a strain release or pain cry can inform on having given up an attempt.

This study proposes the concept of ‘bodily motivated’ sounds as an emically defined form of vocalization that blurs the boundaries between the ‘merely physiological’ and ‘socially meaningful display’. It questions the a priori separation of ‘bodily outpouring’ and ‘linguistic’, and investigates instead how participants themselves organize their vocalizations to be bodily or linguistic, that is, how they systematically orient to vocalizations as sensible by virtue of being embodied. Such vocalizations provide a perspicuous opportunity to examine how the body and language are interwoven.

# Interactive Roles and Narrative Functions on Vlogs: Some Evidence from Gay Taiwanese YouTubers' Verbal Interactions about Homophobic Bullying

Panel contribution

***Dr. Li-Chi Chen<sup>1</sup>***

*1. Kazimierz Wielki University*

According to Kaufman and Raphael (1996), gay men may have all the times heard people referring to them as sick, unnatural, and even evil. Different from seeking friendship, support, and providing empathy, as manifested in the self-disclosure of many bullied LGBT people in YouTube videos (see Green, Bobrowicz and Ang 2015), gay Taiwanese YouTubers' self-disclosure is not always focused on negative affect. Their narrative on YouTube of past experiences of homophobic bullying can be presented humorously. Three LGBT-friendly YouTube channels were selected for analysis, including *Tyla*, *FJ234*, and *Girls' Bedtime Talk*. The methodological approaches used in the present study are informed by the multimodal social semiotic approach (van Leeuwen 2005) and the framing approach (Goffman 1981; Tannen 1996).

Analyzing the data, this study has observed that the gay Taiwanese YouTubers shifted between *the sociable frame* and *the audience-targeted frame*, as signaled by their linguistic and nonlinguistic cues. The sociable frame frequently overlapped with a humorous episode and was signaled by their use of involvement tokens, such as using eye gaze, proposing questions, and providing comments. On the other hand, the audience-targeted frame was triggered when they gazed at the camera or used the second-person pronoun. The audience-targeted frame was also signaled by the textual, pictographic, or sound/music inserts added for the audience during post-production.

The gay Taiwanese YouTubers also took up different narrative roles in their verbal interactions about homophobic bullying. Three narrative frames were observed, including *the story-telling frame*, *the commentary frame*, and *the fictional episode frame*. The story-telling frame indicates that the interaction is now focused on a past event of the speaker, or that of the other person, which is signaled by the use of time indicator and is dramatized by the use of quoted speech. The commentary frame shows the speaker's revealing of his opinions on the narrated event, as signaled by the use of assertives, rhetorical questions, the frequent discourse chunk *wǒ juéde* 'I feel', and the inserted texts. The fictional episode frame indicates the speaker jumping out of the real world and going into an imagined or a hypothesized situation, which is signaled by the imitated tone of voice and the pictographic inserts.

*Gayspeak* was also observed in my data, which was presented either verbally or nonverbally. For example, the gay Taiwanese YouTubers were found to frequently touch their interlocutors during embarrassing or joking moments. They were also found to violate 'the canonical script' (Bruner, 1991; quoted in Coates, 2003) to attract more viewers. For example, they were found to imitate a feminine tone of voice, which was intended sarcastically in response to those who had despised male feminine traits.

# Intercultural Competence, (Im) Politeness and the Use of Social Media During the Intercultural Adjustment Period of Indonesian Postgraduate Students in the UK

Panel contribution

***Mr. Erizal Lugman<sup>1</sup>***

***1. Anglia Ruskin University***

To achieve their academic goals whilst studying abroad, international students must successfully adjust to cross-cultural differences (Palacios et al 2015; Zhang et al. 2016; Eldaba, 2016; Ragavan, 2014). As a result, they need to develop new abilities, including those of intercultural competence, in order to effectively communicate between different languages and cultures (Salisbury et al., 2013; Schartner, 2016; Paige and Goode, 2009). Evidently, one significant aspect of this intercultural competence is awareness, understanding and application of (im)politeness norms which are vital for effective intercultural communication. Given the fact that many of our interactions today seem to be in one way or another influenced by our social media presence, this study seeks to integrate different aspects of intercultural competence, (im)politeness and the use of social media platforms by Indonesian students studying at UK universities. Solidly grounded in an ethnographic framework involving student blogs, observation and detailed semi-structured interviews, this study sheds light on how and why intercultural competence is most required, how it is developed and how international students manage intercultural encounters involving (im)politeness during the intercultural adjustment period. Applying a data-driven thematic content analysis and by using the Nvivo software, the study reveals eight categories of themes, ranging from “acquiring new knowledge of other cultural backgrounds” to “appreciating the cultural differences of (im)politeness” (cf. Kadar & Haugh, 2013; Culpeper, Haugh & Kadar, 2017). Challenging some of the most widely held assumptions about intercultural competence, the study greatly advances our understanding of both intercultural competence and (im)politeness by re-examining some of the most commonly held assumptions about intercultural competence and impoliteness.

# Intercultural interactions between Persian and French speakers and the impolite evaluation of the other's behavior

Panel contribution

***Dr. Shima Moallemi<sup>1</sup>***

***1. Sorbonne Nouvelle University***

If many cross-cultural studies comparing the pragmatic system of Persian and other languages (mainly English) have been conducted, the intercultural interaction between Persian and non-Persian speakers has not yet been quite explored. In this study, following an ethnographic approach, based on comprehensive interviews (Kaufmann, [1996] 2011), I examine the difficulties that 15 Iranians and 3 French speakers encounter in intercultural interactions, respectively in France and in Iran. The analysis of the interview data shows that im/politeness issues appear as the most recurrent issue in the way Iranians and French speakers narrate their intercultural experience.

In this paper, I will focus on the ways both groups of speakers assess the impoliteness in the communicative behavior of the other. Interviews, as metapragmatic data, give access to the etic and emic perspectives of the speakers (Haugh & Kádár, 2017). This can help the researcher understand the communicative ethos (Kerbrat-Orecchioni, 2002, 1994; Béal, 2013) dominant in Persian and French and eventually the ideological and moral values beneath them. For the analysis of the interview data, I will use discourse analysis tools and I will explore how the Basic Moral Perspective (Parvaresh, 2019) shared in a community of practice can influence the speaker's polite or impolite evaluation of the other's behavior in intercultural communication. Furthermore, as both the French and the Persian participants of my research are in a context of learning/practicing an L2, I will also study the impact of their intercultural sensitivity (Bennett, 1986; Bennett & Bennett, 2001) on the impoliteness evaluation they make of the other's behavior.

# Intergenerational conflict and dark humour in COVID-19 'Boomer Remover' memes

Panel contribution

**Dr. Andrew Ross**<sup>1</sup>

**1.** University of Sydney

The COVID-19 pandemic has wreaked havoc on the global economy, on national health systems, and on the lives and livelihoods of millions of people. The event has necessitated the need for a 'pressure release' valve of sorts, and much of this pressure has been released online. As more became known about the more severe manner the virus affects older members of the population, a series of memes emerged referring to COVID-19 as the 'Boomer Remover' in reference to members of the Baby Boomer generation and the likelihood of the virus resulting in death or serious illness. The very nature of the memes in the 'Boomer Remover' cycle implicates a degree of intergenerational conflict, with the phenomenon of memes being a feature of the digital cultures younger people inhabit, and the content of these particular memes explicitly targeting Baby Boomers. While aligning with the crux of the humour in these memes, other issues are also addressed such as a focus on generational differences in emotional sensitivity, attitudes towards climate change, and political change. In other words, the memes are deployed to communicate ideological and attitudinal differences (Ross & Rivers, 2017). The humour in the memes aligns with what has been defined as dark humour (Dynel & Poppi, 2018), with their emphasis on the health-related vulnerability of older citizens to COVID-19. Combined with the opportunity to engage in a critique of the worldviews and attitudes of the older generation at the same time as downplaying the severity of the pandemic for younger generations, this provides an interesting insight into memetic activity during the pandemic. This presentation will discuss a selection of memes drawn from a corpus collated from various platforms including reddit and knowyourmeme.com with a focus on the integrated communication of dark humour and intergenerational ideological conflict. The data are approached from the perspective of Multimodal Discourse Analysis, with an emphasis on the discursive and social practices leading to the memes' creation, and how the multimodal meanings inherent in their composition contribute to the meanings communicated.

# Interjection as responses in assessment sequences: Evidence from Mandarin conversation

Panel contribution

***Dr. Di Fang<sup>1</sup>***

1. Chinese Academy of Social Sciences

Interjections are small, uninflected words that have been widely observed to be important verbal devices for interaction. In Conversation Analysis and Interactional Linguistics, injections are often seen as a subcategory of ‘particles’. Recent years have witnessed a growing amount of studies on particles (including interjections) in talk-in-interaction of different languages. However, studies on interjections in Mandarin conversation are relatively rare.

This study draws on 10 hours of video-recorded Mandarin conversation to examine the use of interjections as responses in assessment sequences using the conversation analytic approach. In particular, we examine the use of interjections in two sequential environments – second assessment and responsive assessment in story-telling. It is observed that responsive uses include 1) a free-standing interjection or a combination of interjections occupying a whole turn, and 2) an interjection, though intonationally independent, occurring with other elements in the turn. The extracts below provide a quick illustration:

(1) 1 Y: 你要能先-先有一件事办好 了

Ni yao neng xian- xian you yi jian shi ban hao le  
2sg if can firstly firstly have one CL thing do well PRT

‘If you have a single case done well at first,’

2 也能好点儿哈.

ye neng hao dianr ha.  
also can good a.little PRT  
‘you can also feel better’

3 Z : 对，我是 一事无成，这叫这个 挫败感 哪。

Dui, wo shi yishiwucheng, zhe jiao zhege cuobaigan na.  
right, 1sg COP good-for-nothing this call this frustration PRT  
‘Yeah, I’m such a good-for-nothing. This is really frustrated.’

4 Y : [哎呀],

Aiya,

INT

Aiya

5 Z : @@@

(2) 1 R : 那个 桌上 那个 乱 啊,

Nage zhuoshang nage luan a,  
that on.the.table such mess PRT  
‘It’s such a mess on the table’

2 我的天哪.

Wodetiana.

my.god

‘My god.’

3 L : 哟,我都受不了.

Aiyou, wo dou shou buliao le.

INT 1sg even stand can.not PRT

'Aiyou, I can't even stand it.'

It is found that some interjections, such as *ai* (with a falling intonation) and *aiyou*, can serve as filler in the production of assessment responses, implying a negative evaluative stance. While some interjections merely show speakers' affective reaction on the assessable, such as *wa*, *wo*, the majority of instances display speakers' epistemic stance, alongside the delivery of affects. And their intonation patterns play a great role in identifying their functions in terms of assessment organization and stance (dis)affiliation.

Through this study, we expect to reveal how interjections function in responses and thereby facilitate the assessment action/activity. Moreover, by using authentic conversational data, the study contributes to deepen our understanding of such 'meaning' levels of interjections as actions, affects, stances and epistemic issues in talk-in-interaction, which has been largely neglected in traditional Chinese language study.

# Internet Memes as Multimodal Vehicles for Political Sarcasm

Panel contribution

***Prof. Lars Bülow<sup>1</sup>, Dr. Michael Johann<sup>2</sup>***

***1. University of Vienna, 2. University of Augsburg***

Image macros, a multimodal type of Internet memes, have become an essential practice of participatory culture on the Internet (Ross & Rivers 2017). Due to their increasing importance in political discourses (Heiskanen 2017; Johann & Bülow 2019a) a growing body of communication and linguistic research has focused on political image macros (PIMs) as vehicles for meaning making and identity building, also explicating their multimodal characteristics, and diffusion in social media networks. Furthermore, cognitive linguistic research also investigated how these multimodal artefacts generate different types of humor (Lou 2017; Merten & Bülow 2019). Despite increasing research interest in this phenomenon, only little research is done on how PIMs affect peoples' attitudes (Huntington 2019; Johann & Bülow 2019b). Thus, this paper aims to examine how multimodally evoked humor and different language varieties affect peoples' perceptions.

PIMs are seen in this context as visual-verbal jokes (Dynel 2016) with sarcasm as a prevailing type of humor (Harvey et al. 2019; Taecharungroj & Nueangjamnong 2015) in order to express criticism (Haiman 1990). Moreover, research has shown that especially humorous content is likely to be forwarded online (Golan & Zaidner 2008). It is therefore expected that sarcastic messages in PIMs are perceived more effective (H1) and more likely to be forwarded (H2) than PIMs without sarcasm if people share the expressed criticism. Due to the persuasive power of multimodality in PIMs (Huntington 2019) it is further assumed that sarcastic messages presented as image macros are perceived more effective (H3) and more likely to be forwarded than sarcastic plain text messages (H4). The effectiveness of messages and the willingness to forward them might also be affected by the use of a certain language variety: The use of a (written) dialect in online contexts often signals identity and membership to a particular community of practice, sharing common values and attitudes (Meyerhoff & Strycharz 2013). Thus, it is expected that sarcastic messages in PIMs formulated in the participants' dialect (Central Bavarian) are perceived more effective (H5) and more likely to be forwarded than PIMs in standard German (H6).

To test the hypotheses, we conducted a 2 (sarcasm/no sarcasm) x 2 (image macro/plain text) x 2 (dialect/standard) quasi-experiment among dialect-speaking social media users (in progress). To assign the stimuli, we controlled for the participants' agreement with the presented memes and their political ideology. The depended variables were operationalized leaning on the work of Kang and Cappella (2008) (message effectiveness) and Chiu et al. (2007) (intent to forward). We further controlled the results for the participants' political interest (Ekström & Shehata 2018), perceived political efficacy (Halpern et al., 2017), and their intensity of social media prosumption (Yamamoto et al. 2019). The results of this study contribute to the growing body of research on Internet memes as multimodal vehicles for political criticism from the audience point of view.

# Interpellations and relational violence in a ‘non’-civic public space

Panel contribution

***Prof. Rosina Marquez Reiter<sup>1</sup>, Prof. Patricia Bou-Franch<sup>2</sup>***

*1. The Open University, 2. Universitat de València*

This study explores the interconnections between conflictual interactions and morality on Facebook. More specifically, it examines the multiplicity of citizens' moralizing discourses that emerged as a result of a proposed legislation to ban and fine smoking cigarettes in private vehicles with children and young people as well as smoking in bus stops next to children or pregnant women in Uruguay. The announcement of the bill to protect vulnerable people from the dangers of second-hand smoke triggered varied citizens' reactions in light of the fact that cannabis consumption is legal, routinely observed in public spaces, State-managed and did not form part of the proposed legislation.

The analysis is based on a corpus of reactions (cc 23,500 words) that the news generated on the public Facebook page of *El Observador* national newspaper. These reactions are understood as *interpellations* (Althusser 1971), that is, communicative practices by which rationalizations about civic behaviour and moral conduct in public spaces, stemming from private domains (family, media and politics) and public institutions (the government) are hailed into social interactions in a modern ‘non-civic’ public context (Bauman 2012). In new public interaction spaces (Castells, 2000; Heyd & Schneider 2019) such as Facebook, the government -and its ideology- as the main creator of a new social order becomes *interpellated* by stakeholders’ (citizens) contestations and challenges over the ideological and principally moral grounds of the proposed bill.

Through the *interpellation* of each other’s stances (viewpoints) and positionings (role-identities) adopted and ascribed to one another through the interactions, stakeholders reflexively question the contemporary social order in society. These reveal that civility remains relevant in understanding the new social order. There is agreement among stakeholders that behaviour in public spaces such as in parks, squares and bus stops is increasingly permeated by relational violence. Nevertheless, the moral grounds of such violence and the moral order that should inform citizens’ behaviour in public spaces is differently understood.

A bottom-up thematic examination (Paulus & Wise 2019) of the data shows how the affordances (Gibson 1977) and usability of Facebook (e.g. Miller, 2011, Madianou & Miller 2014, Page 2012; Tagg, Sargeant & Brown 2017) enables stakeholders to invoke the discourse of insecurity that circulates in the larger society to exercise their civic rights and responsibilities and express social discontent. Specifically, insecurity is seen through the lens of cannabis consumption and the latter mainly associated with the criminalization of the youth and of poverty. Stakeholders use Facebook as an apposite new public space platform to moralize cannabis users, poverty and justify or challenge social discrimination and government policies. In so doing, the participants leave moral imprints that allow the analyst to shine light on the moral grounds of civic behaviour in public spaces, including Facebook as a *chez soispace* (Bauman 2012), and their link between a new social order (Goffman 1967) and its (dis)connect with the moral order (e.g. Culpeper 2011 on the morality of social norms and impoliteness; Kádar & Haugh, 2013 on the nexus between evaluations and the moral order).

# Interpreter's use of gestures in interpreter-mediated psychotherapy

Panel contribution

***Dr. Jelena Vranjes<sup>1</sup>***

***1. UGent***

Talk is one of the building blocks of therapeutic counseling. Through the process of talking, the patients gradually open up about their experiences and establish a shared ground of mutual understanding with the therapist (Peräkylä, 2013). The question is how therapeutic work is organized when the therapist and the patient have no understanding of each other's language. Many industrialized countries offer mental health care programs that rely on interpreters to enable communicative contact between the therapist and the patient. However, the interpreter's presence inevitably changes the interactional dynamics of a typically dyadic therapeutic setting into a *triadic constellation* (Bot, 2005). Studies have shown that, besides translating language, interpreters perform multiple tasks during the therapeutic encounter and thus have a significant impact on the negotiation of meaning and the unfolding of the interaction (Bot, 2005; Miller et al., 2005; Tribe & Keefe, 2009; Bot & Verrept, 2013; Ticca, 2018, Vranjes et al. 2019). Furthermore, dialogue interpreting is a multimodal activity, in which speakers integrate speech with bodily action (e.g. facial expressions, gestures and gaze orientation). Yet, except for a few studies focusing on the interpreter's body orientation, gaze and head movements (Wadensjö 2001, Bot 2005, Vranjes et al. 2018, Vranjes et al. 2019), research on multimodal aspects of interpreting in therapeutic conversations remains scarce. Adopting a micro-analytic approach, I will investigate in detail the use and the role of the interpreter's co-speech gestures in the context of a therapeutic encounter. More specifically, I will focus on the interpreter's use of gestures as a face-work strategy in the context of face-threatening acts (Goffman 1967).

The analysis is based on one interpreter-mediated psychotherapeutic session between a Russian speaking asylum seeker and a Dutch therapist. The session was recorded using mobile eye-tracking glasses (Vranjes et al. 2019). The study contributes to a better understanding of the role of gestures in interpreter-mediated psychotherapy. More globally, this case study may extend our understanding of the interpreter's social role in the institutional context of mental health care.

# Interpreter-mediated formal clinical assessments – prospects and consequences

Panel contribution

***Prof. Charlotta Plejert<sup>1</sup>***

***1. Linköping university***

Research has demonstrated that interpreted formal clinical assessments are often challenging for everyone involved, i.e. clinicians, interpreters, and patients (e.g. Bot, 2005-mental health, Plejert et al., 2015; Majlesi & Plejert, 2018-dementia; Roger & Code, 2011-aphasia). The aim of this panel contribution is to shed light on some such challenges, and to highlight beneficial strategies that facilitate formal medical encounters from the perspective of patient safety and diagnostic accuracy. Data is video-recorded authentic interaction of interpreter-mediated clinical assessments from two settings: 1) Dementia assessments for ethnic minority patients in memory clinics, and 2) Logopaedic assessment for language impairment in multilingual children. The theoretical and methodological basis for the study is Multimodal interaction analysis (e.g Mondada, 2006). Results reveal patterns that are similar for the interpreted encounters, irrespective of settings and patients. A salient challenge is how the clinical screening instruments used, affect how the social interaction unfolds, and how lengthy instances of repair can be referred to the patients' as well as the interpreters' unfamiliarity with and displayed misunderstandings of test tasks. Clinicians may also put too much trust into the accuracy of the interpreters' renditions, which affects how they assess patients' results. Beneficial strategies comprise measures that clinicians take to make sure a task is carried out appropriately, e.g. asking the interpreter for repetitions, confirmations of understanding, request clarifications, and to explicitly discuss certain aspects of language and dialects in cases where there are signals that this may be causing the patient problems. Of particular interest is the frequent practise of clinicians to ask for *prima vista* interpretations of written parts of screening instruments – most often performed due to the fact that materials validated in and adapted to specific languages are lacking. In sum, this panel contribution will not discuss the conduit model of interpreting or deviations from interpreters' oath of conduct. Rather, the identified challenges and prospects are examined from the point of departure how interpreter-mediated formal clinical assessments may be carried out to ensure diagnostic accuracy and patient safety, despite the many challenges that face clinicians, interpreters, and patients alike.

# Interpreting on the phone: interpreter's participation in healthcare and medical emergency service calls

Panel contribution

***Mrs. Amalia Amato***<sup>1</sup>

**1.** Department of Interpreting and Translation, University of Bologna - Forlì Campus

The rise of remote interpreting (RI) - by telephone, videoconference or internet platforms – derives from both technological advances and various socio-economic trends in the last fifty years. The COVID19 pandemic has boosted the use of RI even further. Telephone interpreting (TI) over a “conventional” phone - without a video channel - is a particularly challenging form of RI for interpreters who experience some drawbacks: the lack of “social” presence in the interactions, with the ensuing difficulty in building rapport between the interlocutors (Ozolins 2011); the lack of visual, tactile and kinetic components of communication and difficulties due to poor quality of the channel or sound (Wang 2018b). Some studies have shown that telephone interpreters find it difficult to make use of contextual information (Braun 2015) and that because of lack of visual inputs they may have to coordinate turns at talk (Wadensjö 1999) to avoid overlaps, another perceived challenge by interpreters (Wang 2018b). In a survey conducted in Australia by Wang (2018a) the respondents stated that they felt obliged to coordinate interactions more explicitly when interpreting over the phone. This presentation deals with the coordination role of interpreters in TI. The research question focuses on if and how the interpreter’s “active interventions” to manage the interaction change the participation pattern of a service call identified by previous studies (Zimmerman 1992; Zorzi and Monzoni 2003). Drawing on a set of 9 recordings of interpreter-mediated healthcare calls, changes in the structure of participation in the different phases of the calls compared to monolingual ones are discussed on the basis of examples adopting a micro-analytical approach on a turn-by-turn basis. The analysis focuses on discourse initiatives carried out by interpreters either autonomously or in cooperation with other parties. Results show teamwork between interpreter and operator who jointly manage information gathering during the call.

# Interpreting ‘Thanks and Greet Expressions’ in ELF Settings

---

Panel contribution

---

**Ms. Yi Kang<sup>1</sup>**

**1.** Dalian University of Foreign Languages

In this talk, we examine various interpretational issues that expressions associated with the speech acts Thanks and Greet may trigger in ELF settings. The relationship between expressions and speech acts is indefinite: along with a most strongly conventionlised relationship (e.g. *thank you* à speech act of Thanks), an expression can conventionally indicate many other speech acts. The relationship between expressions and speech acts is subject to linguacultural variation: in some linguacultures such as Chinese there are many expressions which very strongly ‘mark’ one particular speech act, while in some other linguacultures such as English this relationship between an expression and one particular speech act is more casual. This linguacultural variation has important implication for ELF settings and the acquisition of language competence. We will examine this issue with the aid of questionnaires and interviews distributed to Chinese learners of English.

# Interspecies haptic sociality in equestrian grooming activities

Panel contribution

***Dr. Chloe Mondeme***<sup>1</sup>

1. CNRS, Ecole Normale Supérieure

This presentation aims to consider practices of grooming as typical instances of interspecies haptic sociality. Grooming a horse is an ordinary activity, usually taking place at the beginning of a riding session, aimed at cleaning and combing the horse before saddling. Strictly speaking, only the horse is touched, by a material artefact manipulated by a human participant (a brush or a currycomb). However, human participants orient to the reception of their haptic actions by considering the fact, for the horse, of being touched – and adjust or reorient their touching gestures accordingly. By doing so, they constitute the horse's body as an “esthesiologic body” (Merleau Ponty, 1995).

The data examined are taken from a corpus of equine assisted psychotherapy sessions, with disabled young adults, in Finland and in France. During grooming activities, therapists invite the clients to pay close attention to the horses' behavioral displays of comfort or discomfort. Drawing on multimodal sequential analysis, and on the recent notion of haptic sociality (Goodwin, 2017; Cekaite & Mondada, 2020) as explored in interspecies interactions (Mondeme, 2020), I will in particular focus on how these displays are treated by the human participants as resources to adjust, in a moment by moment and incremental fashion, to the horse's reactions.

The aim of the presentation is threefold:

- a) empirically examine how touch undergoes a process of socialization, by treating the animal as a sentient being, and considering what (s)he could feel in the act of being touched;
- b) conceptually extend the notion of intercorporeality – as borrowed from Merleau Ponty and recently re-appropriated by Meyer *et alii.* (2017) – to encompass interspecies interactions. The phenomenological notion is here envisioned praxiologically: intercorporeality is seen as an *achievement* rather than a state, produced by raising awareness of the other (the animal) as a sensitive body, and as a sentient creature;
- c) discuss on a methodological level the potential (ir)relevancies of an emic endeavor to describe haptic and perceptual phenomena, especially within interspecies interactions.

# Intersubjectivity through low transitivity: Building common ground with demonstrative adverbs in Indonesian

Panel contribution

***Dr. Michael Ewing<sup>1</sup>***

**1.** University of Melbourne

Indonesian conversational interaction is overwhelmingly intransitive, with approximately three-quarters of clauses made up of various low-transitive constructions. This study focuses on one commonly occurring low-transitive construction type: predicates consisting of the demonstrative adverb of manner *gitu* ‘thus, in that way, like that’. Predicate *gitu* participates in a number of common formats. It can occur with an overt subject: *Ya Benar. Mereka gitu* [yes correct 3PL like.that] ‘Yes. (That’s) right. They (are) like that’; or without a subject: *Kok gitu sih.* [PART like.that PART] ‘How could (he be) like that?’ Predicate *gitu* also occurs in common formulaic expressions of stance such as *Oh gitu* ‘Oh (it’s) like that, Oh I see’ and *Gitu kan?* ‘(It’s) like that right?’ I argue that use of *gitu* highlights intersubjective attention to common ground. In the previous examples this includes expressing agreement, expressing surprise, acceptance of interlocutor’s contribution, eliciting agreement from interlocutor. *Gitu* is also especially common at the end of a TCU, as in excerpt (1).

(1) Nantinya akhirnya kan, .. yang dibingungin ini,  
later-DEF end-DEF PART REL PV-confuse-CAUSE this  
raknya ini untuk siapa. **Gitu.**  
rack-DEF this for who like.that

‘Later in the end you know, what will be confusing is this, who is the rack for. (It’s) **like that.**’

TCU-final *gitu* highlights what the speaker has just said, tacitly urging their interlocutor to accept it while simultaneously marking the end of the TCU. TCU-final *gitu* is reminiscent of clause-final *like* in some dialects of English (D’Arcy 2017), e.g. “and also you don’t want to sort of overstep their privacy like” (Miller 2009: 335), which marks key points of argumentation or explanation, similar to (1). While English clause-final *like* is a clause-modifying adverb, Indonesian TCU final *gitu* generally retains its structural status as an independent predicate. At the same time, there is conversational evidence that *gitu* is also taking on a more particle-like function.

As Thompson and Hopper (2001: 53) point out in their analysis of low transitivity in conversation, “our talk is mostly about ‘how things are from our perspective’”. As a demonstrative adverb of manner, Indonesian intransitive predicate *gitu* has the indexical function of linking to some prior propositional content of discourse, affording speakers the opportunity to present things from “their perspective” in the intersubjective pursuit of building and maintaining common ground.

# Investigating customers' use of shopping baskets in shopping activities online and in physical shops

Panel contribution

***Ms. Elisabeth Kristiansen<sup>1</sup>***

**1.** University of Southern Denmark

Increasingly, shopping takes place online rather than in physical shops, and the lockdown periods and social distancing strategies necessitated by the corona pandemic are adding momentum to this development. A staple ingredient of online shopping is the virtual shopping basket, which is in fact a web page where selected items are available as a list and from where customers may proceed to checkout. The name of the page and the visual representation of it on websites suggest that the virtual shopping basket is straightforwardly a digitalized version of the shopping basket used by customers to transport selected goods to the checkout counter in physical shops. This paper aims to discuss whether that is in fact the case.

Through analyses inspired by multimodal ethnomethodological conversation analysis (Mondada 2014; Hazel, Mortensen, and Rasmussen 2014), the paper describes how customers buying e.g. books, medicine, posters and picture frames in online shops use the virtual shopping basket e.g. for examining the list of items selected before clicking to proceed to payment and for evaluating the progress of the shopping activity. Further, the paper analyses comparable activities in physical shops, i.e. in face-to-face interaction, describing how customers buying the same types of goods organize e.g. the transition from selecting items to paying and evaluating the progress of the shopping activity. The analysis includes customers who use a shopping basket as well as customers who do not use a basket.

The analyses demonstrate how comparable activities online and in physical shops are organized in significantly different ways and how the shopping basket, virtual or physical, is one resource among others used by customers to achieve this organization. The paper argues that the virtual shopping basket is not a straightforward digitalized version of its physical counterpart but a separate, digital phenomenon which must be investigated and understood on its own terms.

The study is based on a data set consisting of video and eye-tracking recordings of shopping conducted in physical shops and online in Denmark in 2018 and 2019. The data has been collected by the Velux-funded research project *The Digital Resemiotization of Buying and Selling Interaction (RESEMINA)*. The data is collected, managed and stored in accordance with the Data Protection Office at The University of Southern Denmark.

# Investigating practices of fostering inclusion and participation in economic life. Empowering society-at-large with the language of numbers

Panel contribution

**Mrs. Marlies Whitehouse**<sup>1</sup>

1. Zurich University of Applied Sciences

The mere question as to what *cash flow*, *bonds*, or *shares* are, often causes embarrassment in people. Not understanding the “language of numbers” is one of the reasons why individuals cannot or do not set up investment plans for their current and future wealth. Unfortunately, an insufficiently financed pension, for example, can lead to dependency on social welfare and the financial resources of society-at-large.

As a review of the state-of-the-art research reveals, there are no contextual studies, informed by both theoretical and practical knowledge, that provide in-depth analyses of language mediation between the financial community and society-at-large as the addressee of financial text products. This is the gap that my research on communication in the financial sector aims to close.

In my presentation, I first define two key concepts of the language of numbers: financial literacy, and context awareness (part 1). Based on a large text corpus, contextualized with ethnographic data collected since 1990, surveys, and interviews (part 2), I then use pragmatic text analysis (part 3) to explain how this lack of language mediation affects individuals and what the social costs can be (part 4).

I conclude by showing measures that can improve the communicative potential of financial text products. The measures help empower society-at-large when it comes to participating in financial communication in the interest of social welfare. Such participation both requires and promotes the ability of society as a whole to speak, besides everyday language, the language of numbers (part 5).

# Investigating the diagnosis of autism in women: a sociolinguistic approach to the identity constructions of autistic women

Panel contribution

***Ms. Annelies Foccaert<sup>1</sup>***

*1. King's College London*

Although Autism Spectrum Condition is a highly investigated topic in various research areas, especially in biomedical areas, not much knowledge is available on the characteristics of autism in girls and women or on their lived realities. As a result, girls and women often struggle to receive an accurate and timely clinical diagnosis which can have negative consequences for their well-being. In my PhD project I seek to offer an alternative approach to researching autism that focusses on girls and women's personal experiences with the diagnosis. To do so, I have conducted in-depth interviews with women on the spectrum about their autism (self-) diagnosis process, how they make sense of their experiences and how they use digital platforms as sources of support and information. To analyse the interviewees' stories, I have adopted a social interactional approach to narrative research and I am combining elements from narrative analysis (Riessman, 2001; De Fina and Georgakopoulou, 2015), small stories research (Georgakopoulou, 2007) and positioning theories (Bamberg and Georgakopoulou, 2008; Harré and Van Langenhove, 1991). In this panel contribution, I will discuss my initial findings on how the diagnosis journey is narrated and how identities are constructed in the interview interactions. In particular, I will focus on how the interviewees position themselves in relation to health professionals, what epistemic authority is granted to whom, and how ideologies on autism and clinical diagnoses are constructed or questioned. More insight into autistic girls and women's lived realities and their perceptions of the diagnosis could help to develop a better understanding of the various ways in which autism can be expressed and experienced, and can provide ideas on how the diagnosis process might be improved.

# Investigating young-olds' memory in everyday life

---

Panel contribution

---

***Prof. Yueguo Gu<sup>1</sup>***

***1. Beijing Foreign Studies University***

By 2018 China's late adulthood reached a population of 250 million. The commonest complaint they make about themselves, as they are aging, is that their memory often let them down and make them lose face. This paper investigates memory performance in everyday life with a focus on a 60-75 year old cohort, conveniently addressed as "young olds". For this purpose a corpus for special purpose (CSP) has been compiled consisting of (1) self-recorded audio-video diary of everyday events; (2) tips of the tongue (TOT) diary; (3) audio-video taped everyday activities such as cooking, birthday celebration, parties. Memory subsystems analyzed include (1) working memory; (2) episodic memory (further anatomized into sensory memory, sensorimotor memory, declarative memory); (3) procedural memory and (4) prospective memory.

# Is it language or social cognition? The cognitive status of expressive pragmatics and prosody in young preschool children.

Panel contribution

***Ms. Mariia Pronina<sup>1</sup>, Dr. Pilar Prieto<sup>2</sup>, Dr. Luca Bischetti<sup>3</sup>, Prof. Valentina Bambini<sup>3</sup>***

**1.** Universitat Pompeu Fabra, Barcelona, Catalonia, **2.** Institutió Catalana de Recerca i Estudis Avançats, ICREA, Barcelona, Catalonia; Universitat Pompeu Fabra, Barcelona, Catalonia, **3.** University School for Advanced Studies IUSS Pavia, Pavia, Italy

The use of language in context is pivotal for children's social life and development. However, little is known about the relationship between expressive pragmatic skills and other developing abilities (e.g., structural language skills and social cognition abilities). Moreover, little attention has been paid to prosodic skills, which are highly intertwined with expressive pragmatics in development. This study sets out to investigate how both expressive pragmatics and expressive prosody are related to structural language and social cognition skills in preschool children.

A total of 105 Catalan 3- to 4-year-old typically developing children ( $M = 3;9$ ,  $SD = 3.25$  months, 47 boys and 58 girls) were assessed for pragmatics and prosody with the Audiovisual Pragmatic Test (APT), a recently developed assessment tool which involves the elicitation of pragmatically and prosodically appropriate responses to presented social scenarios. Children were also administered two language measures, that is, an expressive syntax test and an expressive vocabulary test, as well a series of social cognition measures that included Theory of Mind (ToM, measured with two false belief tasks), an emotion understanding test, and a test for metacognitive vocabulary.

The association between pragmatic and prosodic abilities, on the one hand, and both core language and social cognition, on the other hand, was investigated through multiple statistical approaches. We used a correlational, regression, and structural equation modeling (SEM) approach. SEM allows for the simultaneous consideration of the relationships between multiple independent and dependent variables in a single model, which makes it ideal to map the network of associations between predictors and their contribution to pragmatic and prosodic competence. For pragmatics, correlations revealed associations with both structural language ( $p < .001$ ) and social cognition skills ( $p < .05$ ). However, regression analysis and the comprehensive SEM approach indicated that only structural language was a significant predictor of pragmatic ability ( $b = .90$ ,  $p < .001$ ). The same pattern of results holds for prosodic ability. Bivariate correlations showed a relationship between prosody and structural language ( $p < .001$ ), as well as between prosody and some measures of social cognition ( $p < .05$ ). Further analysis by multiple regressions pointed to the role of structural language and false belief but in the SEM model only language remained a significant predictor ( $b = .91$ ,  $p < .001$ ).

Overall, these findings indicate that at 3-4 years of age both expressive pragmatic and prosodic abilities are strictly related to language skills, while the role of social cognition is negligible. A possible explanation of these results can be that conversation in early preschool age is still very simple and expressive pragmatic skills may not fully involve ToM aspects, which comes into the picture only later, with more sophisticated pragmatic abilities. Thus, we suggest that in early preschool years, expressive pragmatic and prosodic skills seem to pertain to the language domain rather than to the socio-cognitive one.

# Is the copula for the equation?: Copula *da* and the related patterns in Japanese everyday talk

Panel contribution

***Dr. Ryoko Suzuki***<sup>1</sup>

*1. Keio University*

*A wa B da* ‘A is B’ as we see in (1) is treated as one of the most popular/famous sentence patterns in Japanese grammatical descriptions. *Wa* is a topic marker, and *da* is usually translated as the copula, and the sentence with the copula is called an equational sentence as in (1):

- *hanako was isha da*
- NAME TOP doctor COP
- Hanako is a doctor. (Iwasaki 2002:6)

In this study, I will focus on the use of the morpheme *da* in Japanese everyday talk. Do we find *da* occurring in equational sentences as in (1)? Or do we find other uses of *da*?

I limit the target forms to be the copula *da* in the non-past tense: *da* occurring by itself at the end of an utterance as in (1), as well as *da* co-occurring with final particles or connective particles (e.g., *da yo* ‘COP+PRT'; *da kedo* ‘COP+but'), are included and referred to as *da*-tokens. The polite version, *desu*, will not be considered.

The initial investigation shows the following:

1. Contrary to what other grammatical descriptions claim, treating *A wa B da* ‘A is B’ as the basic structure misrepresents actual language use. Such a structure, like (1) above, is sporadic in everyday talk.
2. Most examples have only the predicative part, *B da* (i.e., *B* plus *da*-tokens, to be precise). *A wa* part (i.e., the topic phrase) is generally understood by interactants based on what goes on in the talk, so is often left unexpressed.
3. No. 2 above shows that the use of *da* is fitted to the discourse context/interaction. This is supported by the fact that most copulada instances are followed by a wide range of markers with pragmatic meanings, i.e., utterance-final particles (e.g., *ne*, *yo*) or conjunctive particles (e.g. *kara* ‘so, then’, *kedo* ‘but’, *shi* ‘and’). Those instances of *da*-tokens include *da ne*, *da yo*, *da yo ne*, *da kara*, *da kedo*, among others.
4. Nearly half of observed *da*-tokens occur as a part of fixed expressions. The most common among them include fixed reactive expressions, e.g., *soo da ne* ‘right/true’ as well as the nouns of emotivity: e.g., *daijobu da tte* ‘(It) is gonna be okay.’
5. Many of the non-fixed instances include the predicate nominals, and those serve characterizing functions as shown in (a) below:

- *iyaiya daijina koto da shi.*
- no no important thing COP CONJ
- ‘No no. (It) is an important thing.’

When we look at the copula *da* in everyday talk, the equational *A wa B da* ‘A is B,’ which is called the “most basic sentence structure” (Makino and Tsutsui 1986:522), is hardly present (or shows a very restricted distribution). Instead, only the predicative part, *B da*, in fixed format is found. *Da* is combined with various particles to express a range of pragmatic functions in interactions.

# Ist uſ gnaden unnd barmhertzigkeyt enthauptet worden (Has been beheaded out of grace and mercifulness) A historical sociolinguistic analysis on the basis of Bernese criminal case protocols of the Early Modern Time

Panel contribution

**Ms. Christa Schneider**<sup>1</sup>

1. University of Bern

In Early Modern Times, some criminals were brought to the Tower of Bern (*Käfigturm*). Protocols of the criminal processes were collected in what are called tower books (*Turmbücher*) and are today accessible in the State Archive of Bern. Even if these protocols are in principle open to the public, systematic research from a historical, linguistic or jurisprudential perspective is still missing. Reasons for the absence of research could lay in the size of the corpus (approx. 250'000 pages) and certainly also in the type of handwriting used in the documents (*Kurrentschrift*), which is not legible for modern readers. In addition to the absence of research concerning the Bernese tower books, there is also no systematic research on early written languages or on language history in early modern Switzerland. This project aims to fill some of these gaps.

The main goals of the project are to detect and describe language variation (specifically in Early Bernese Swiss German) in the early modern period as well as an attempt to depict early Bernese language history. In addition, the project intends to take a first look at the written language: Was it an office language and if yes, did it resemble other kinds/variants/forms of officialese used in the German-speaking area by that time? How frequent are dialect traces in the written languages and what are their function? In the past few weeks, approx. 15'000 pages of the tower books have been digitized, partially transcribed and are, after having been enriched with annotations, ready for some initial analyses.

In this talk, I want to focus on the written language of the tower books and its limitations, mainly represented by the usage of dialect elements. First, examinations of the Bernese tower books have already shown that utterances of both, suspects and witnesses, are mostly represented by indirect speech. Nevertheless, we also find traces of direct speech in the protocols, often characterized by Bernese dialect words. Possibly, these dialect traces are only present due to the state of the written language as a kind of an *Ausbau sprache* at that time, or they have to be understood as idiomatic features in the speech of a certain suspect or witness. The use and function of dialect traces in the Bernese tower books will be analysed on the basis of three selected criminal protocols; the results will be presented in this talk.

# Japanese Gay Men in Comic Books and Television Series: A Multimodal Analysis of Kinoo Nani Tabeta? ‘What Did You Eat Yesterday?’

Panel contribution

***Prof. Chie Yoshinaga***<sup>1</sup>

**1.** Sanyo Gakuen University

In Japan, there had been an atmosphere in which LGBT people could not come out. However, the last two years, mass communication sometimes support LGBT. In 2020, the number of local governments that accept the partnership system has increased and a full-page advertisement of major newspapers featured “National Coming Out Day” on October 11. On the contrary, in Japanese comics (*manga*) which is famous in the world, boys love, lesbian and gay have been described since the 1970s and some of the comics have been made into dramas.

This study intends to analyze the *manga* and television series versions of *Kinoo Nani Tabeta?* “What Did You Eat Yesterday?”, which express gay couple. I intend to analyze its perspective about (1) language usage, (2) nonverbal communication including visual metaphors (comic book exclusive symbols). The results are as follows: First, in Japanese there are words and end of sentence expressions that are used by men or by women. In this manga, both two men (Shiro and Kenji) use *ore* ‘I’ as a first-person pronoun. It is used only for men. However, in other words and end of sentence expressions, Shiro uses men’s usage like *omae* ‘you’, *kuu* ‘eat’, *suman* ‘sorry’, *umee* ‘delicious’ , and *-daro* ‘don’t you’. On the contrary, Kenji uses *Shiro-san* ‘first name plus *san*’, *taberu* ‘eat’, and *Oishisoo desho* ‘It seems to be delicious, doesn’t it?’, which are like ordinary or women’s usage. Second, visual metaphors(comic book exclusive symbols) are called *Manpu* or *Keiyu* in Japanese. There are a variety of visual metaphors in Japanese comic books. In this book heart mark (□) is often used at Kenji’s end of sentences, especially when Kenji feels happy. In addition, when Kenji feels shy or joyful, /// is used. Third, as Shiro is a lawyer, he always wears dark-colored suits and does not have a beard to give a clean image. On the contrary, as Kenji is a barber, he has a beard and wears rough style clothes. In addition, the clothes of Kenji’s colors are usually yellow, red, and orange which women love.

To conclude, both manga and drama show the gay character’s image in verbal and nonverbal elements.

# Jeffree Star Approved? Impoliteness and affect in YouTube make-up reviews by a male beauty guru.

Panel contribution

***Dr. Marta Andersson<sup>1</sup>, Mr. Alberto Greco<sup>1</sup>***

***1. Stockholm University***

This paper analyses linguistic and prosodic features of impoliteness and affect in YouTube-based product reviews by a male beauty influencer and one of the most controversial personae in the cyberspace, Jeffree Star. As the increasing potential of beauty gurus has rendered them independent of ad revenues/product marketing incentives, many of them choose to set out their own rules of social media marketing by building their self-branding on controversy, sensationalization, and provocative rhetoric. This is in line with Language Expectancy Theory (Burgoon and Miller, 1985) that individuals who enjoy social power are free to select linguistic strategies to achieve their goals. As we argue, this resembles Goffman's (1959) sociological construct of dramaturgy, where the goal of 'performance' is to form bonds and to influence others according to one's own plan. In online culture, this goal is often achieved via hyper-emotional and aggressive verbal behaviour (Qi, et al., 2018; e.g., Star's declaration: *sarcasm is my life*); however, according to Goffman, the impression of ourselves is best conveyed via non-verbal means.

We therefore investigate both linguistic and prosodic features of Jeffree Star's performance and argue that the two tactics he deploys to influence his audience are theatrical sarcasm and hyper-emotional impoliteness (e.g., *How the fuck is everybody doing today?*); however, it seems that certain prosodic features (e.g., intonation) can be teased out to distinguish between the strategies used towards those to form bonds with and those to merely 'other'. As we suggest, Star's criticism of other brands and products via impoliteness (e.g., *Today we're taking out the trash!*) coincides with a falling tone and slower speech rate, which indexes confidence, truthfulness and certainty (Chattopadhyay et al., 2003). Consequently, Star positions himself as an expert whose opinion can be trusted. The non-falling tones, in contrast, mark sarcasm and impoliteness which is either self-directed or generic (e.g., *Internet has an opinion on fucking everything!*), a strategy that helps enhance, sensationalize, and create drama to meet the expectations of the existing fanbase and attract new audiences. The falling tone, however, indexes confidentiality and ambience of the in-group (lower pitch may emulate whispering meant to exclude some groups), and often is a sign of sarcasm, which clearly signals who belongs within the community and is thus likely to get the message. Our further analysis will focus on the relationship of nuclear tones, sentence type, and pragmatic/discourse meaning of Jeffree Star's persuasive stance and impoliteness targeting different groups/products.

# Jejueo Education and Policy

---

Panel contribution

---

***Mr. Sebastian Ohara-Saft<sup>1</sup>***

1. hawaii

Jejueo is the endangered language native to Jeju Island, an island south of mainland South Korea, which is known for having its own unique culture and history. This presentation focuses on how Jejueo's status as an endangered language and how it is incorporated into the larger educational ecosystem of Jeju Island. The presentation first notes that unlike some endangered languages that are considered dialects of majority national languages, Jejueo has official recognition as its own distinct language. As of 2007, the local government in Jeju has recognized Jejueo's independent language status by referring to it as Jejueo instead of the previously used *Jejumal*'Jeju speech', or *Jeju satuli* and *Jeju bangeon* 'Jeju dialect.' In addition to this, the local government, in collaboration with the Institute of Korean Language and Culture, implemented two General Plan(s) for Jejueo Development (Yang 2018). Besides these government-level changes, linguistic research has suggested levels of intelligibility as low as 10 percent of Jejueo by monolingual Standard Korean speakers (Yang et al. 2017). All of these developments point to positive trends for the situation of Jejueo and its preservation. However, the implementation of concrete educational programs aimed at transmitting Jejueo knowledge and usage to future generations have been slow and unsystematic.

Until now, two schools have incorporated Jejueo into their school programs. They are Udo Middle School from March 2012 to February 2014 (Case 1) and Gwangryeong Elementary School from March 2014 to February 2016 (Case 2) (Yang 2018). The results from both of these programs indicated that attitudes of students, teachers, and parents surrounding Jejueo, as well as students' Jejueo ability all improved after the two-year period. In the first case, measurements of improved Jejueo ability were based on a Jejueo vocabulary task and a bi-directional translation task (Korean and Jejueo). In addition to these two tasks, the first school employed a self-assessment survey to measure improvement in speaking ability. In the second case, the school devised a vocabulary test and a speaking test. In the pre-test, 91.1 percent of students scored lower than 60 out of 100 (Yang 2018: 28). According to Yang (2018), the results from the post-test for this case study have not been made publicly available. Following discussion of the efforts by Jeju Island's local government not only to recognize Jejueo as a language but also to increase usage and knowledge amongst the younger generations, this presentation considers other endeavors that are necessary to ensure the maintenance and preservation of Jejueo in the future.

# Journalistic Roles and Journalistic Performance: Findings from a Swiss research project

Panel contribution

***Prof. Guido Keel<sup>1</sup>***

**1. ZHA**

Professional roles are one of the key topics in journalism research and are also fundamental elements when it comes to defining journalism as a profession (Hanitzsch, 2011; Keel, 2011). For many decades, journalism scholars devoted their efforts to analyzing normative standards and journalistic ideals.

However, due to the lack of theorization of professional roles within the journalistic field, it remained often unclear how the role conceptions relate to and influence the journalistic role performance (Mellado and Dalen, 2014; Patterson and Donsbach, 1996; Schudson, 2003). Specifically, it remained unclear how professional roles relate to news decisions and the news outcome that reaches the public (Mellado et al., 2016; Weischenberg and Scholl, 1998, pp. 157–180).

The concept of role performance focuses on the connection between journalists' beliefs about the role of journalism and the actual practice of producing the news. It connects studies on the professionalism of roles with those on news production and the sociology of news, and it draws its specific value from focusing attention on issues relating to structure, agency, culture, and political economy. In accordance with gatekeeping and hierarchy-of-influences studies, results from a previous study in Switzerland have shown a wide gap between professional ideals and professional practices at different levels (Raemy et al., 2019). With reference to the concept of hypocrisy brought forward by Nils Brunsson (1995), this can be explained by the assumption that hypocrisy is benefitting news organizations – like any other organization – more than is generally assumed, as these organizations have to serve contradicting expectations (Wyss 2008).

Our research project focuses on this question by addressing the (dis)connection between ideals and practice in journalism, analyzing how different dimensions of professional roles materialize in the news product in different organizational, institutional, political and social settings. In order to do that, this research project analyzes 4200 articles and reports from 10 different media outlets of all media types in Switzerland, to see which of six pre-defined journalistic orientation is prevalent, and compares these results with the findings from interviews with 160 journalists who are responsible for the articles and reports.

# Keeping up political authority and credibility during the Covid19 crisis

Panel contribution

**Dr. Martina Berrocal**<sup>1</sup>

1. Friedrich-Schiller-Universität Jena

Effective political leadership in times of crisis plays a crucial role in tackling the dangers and losses during crisis situations and in overcoming its consequences afterwards, be it a natural catastrophe, health threat, such as epidemic, or some other troublesome circumstance or event. Of paramount importance in such situations are legitimizing and delegitimizing strategies (Chilton 2004, Hart 2010:89-110) which relate to maintenance and enhancement of authority and credibility of the political leaders. In the times of crisis, such as the Covid19-pandemic, unforeseen and unexpected events and developments come up, which make the leaders time and time again to reformulate or reframe the measures in effect in order to enhance, maintain or repair their authority and credibility.

This study examines the case of Czech government informational inconsistencies during the Covid-19 crisis. The primary focus lies on the rhetoric strategies of blame avoidance in government press conferences during the first year of Covid19-pandemics. Some of the discussed topics are insufficient reserves of protective gear - not using the local producers and pushing through procurements from China under unclear conditions; testing capacity – overloading the state laboratories, not using the private ones; insufficient knowledge and lack of readiness to exploit available scientific data and analyses. In this study, deception is understood as a “manipulation of information focus” which should ensure the weakening of the critical scrutiny from the addressee or addressee groups. (Oswald 2014). This study parts from a quantitative analysis of downtowners and amplifiers and it will be further contextualized and refined qualitatively. The study of the linguistic micro level shows how lexical choices contribute to the positive self and negative other representations, how discursive markers (downtowners, hedges, boosters, amplifiers) are used in order to maintain a strong leadership role and what role play quotes in it. These issues will be examined in a corpus of the government press conferences (28<sup>th</sup> February 2020 – 23<sup>rd</sup> Dez 2020) which covers the three pandemic waves that struck the Czech Republic. Methodically, this study combines qualitative pragmatic analysis with corpus linguistic techniques, such as keyword, concordance and collocation analysis.

# Keepin' it real: Styling authenticity on Twitter disinformation accounts

Panel contribution

***Ms. Aurora Goodwin<sup>1</sup>***

**1.** Cardiff University

Disinformation is the intentional spread of information known to be false. Social media has been weaponised to spread such information leading to societal and political unrest. One of the most prominent disinformation campaigns was led by the Internet Research Agency (IRA) on Twitter during the 2016 US Presidential Election. Accounts aimed to appear as authentic as possible, remaining undiscovered to push agendas that would disrupt American democracy. Authentication processes consequently contributed to legitimising the identity performances as American citizens online and the views that they purported to hold.

This presentation aims to investigate how metadata is used within Twitter disinformation accounts to perform identity and contribute to authentication processes. Metadata refers to parts of twitter profiles that are not tweets. I focus on handles, usernames, and profile pictures because they are controlled by users. Previous research has found that these features can influence perceptions of authenticity and credibility (Jäkälä and Berki 2013; Morris et al 2012). It therefore appears that naming strategies and profile pictures can reveal identity claims associated with profiles, and that these factors can influence how users interpret accounts and their tweets.

Using a pre-existing dataset of IRA accounts, I combine qualitative and quantitative methods to investigate authentication processes carried out by 'popular' and 'less popular' accounts. Separating the samples enables an investigation into if and how identity performances differed between the two. The analysis of naming strategies draws on Jäkälä and Berki's (2013) work and distinguishes between eponyms (first names as handles/usernames) and pseudonyms. The naming strategies were further coded in terms of the identity aspect potentially revealed, such as gender, location etc. The profile pictures have been analysed using previous visual analysis approaches. Kress and Van Leeuwen's (2006) visual modality model, and Ledin and Machin's (2018) adaptation were the key frameworks for analysing profile picture content and design. I have then labelled the profile pictures based on what identity aspects are present within them. Preliminary findings suggest that location-based pseudonyms and profile pictures play a key role in the authentication of a broad sample of popular disinformation accounts. However, the top 10 **most** followed accounts do not reflect this pattern; profile pictures depicting people are more prevalent.

I approach authenticity as a dynamic process that can be performed and negotiated, rather than a static quality of unquestionable realness. I find that different metadata units are used simultaneously to contribute to authentication processes by creating constant, unified identity performances. Within these performances, I find that amongst other things, different identity aspects are prominent in more and less popular accounts, but in both samples where gender is performed it is more often female.

## Knowing how to present yourself by knowing how to recognize the false true facts

---

Panel contribution

---

***Prof. Ilkka Arminen<sup>1</sup>, Ms. Anna Heino<sup>1</sup>***

***1. University of Helsinki***

The presentation of self is a particular kind of a knowledge of how to appear and speak publicly in the face of inferences of what can be drawn of how you have appeared and what you have said. As a specific case of the latter, there are things you cannot say publicly even if, or in particular, when they are true. This can be called the recognition of the false true facts. Of course, it could be claimed that knowing false true facts is just a knowledge of a type of facts, which does not require know-how, but plain knowledge. In this presentation, we try to show that knowing false true facts is a part of the presentation of self, which is based on the know-how how to tell false true facts from other facts, i.e., what you should never say publicly however true it were. As our data, we analyze a videotaped interaction of a group of young females discussing on what were differently in your life if you were a man. In their group discussion, they make a distinction on how a woman could answer to that question and what could not be answered. Through defining, what women could publicly say, the group of women performatively defines how women can do the presentation of self. In that way, the presentation of self is based on the know-how of the distinction between false true facts and other facts. At least, on occasion there exists gender-specific expertise that delimits the public performance of the sex.

# Knowing What People Want: The Pragmatics of (Not) Being Accountable

---

Panel contribution

---

***Dr. Naomi Truan*** <sup>1</sup>

**1.** Universität Leipzig

As an interactive form of political interaction, parliamentary debates epitomize the instantiation of polyphonic voices. Members of Parliament indeed function as representatives who are both “standing for” and “acting for” others (Pitkin 1967). This representative function, which is at the heart of modern democracies (Hermet 2001: 46), is however being called into question, in particular by populist movements, thus leading to a more and more fragmented public space.

Against this background, the question of accountability and authority, or, in other words, of who is (deemed to be) entitled to share their views, gains new importance—and this even in traditional political contexts. A pragmatic view on accountability revolves around the notion of facework “as a form of communicative skill” (Bull & Fetzer 2010) and relational work (Locher & Watts 2005), i.e. how do social actors communicate what they (think they) know and construct themselves as reliable without damaging their own face (sounding overconfident) and their addressee’s (positioning themselves as superior or having a higher epistemic status)?

The use of the phrase ‘I’m not an expert’ and other metadiscursive devices to strategically index common ground offers some insights into this complex interplay. Based on a corpus of 44 plenary sessions of the British, German, and French parliamentary, respectively, I ask how Members of Parliament account for the necessity to mention the people without highlighting their position of representatives. Offering a typology of the metadiscursive devices at play to (apparently?) resolve this tension, I rely on the notion of stance, understood as “a public act by a social actor, achieved dialogically... through which social actors simultaneously evaluate objects, position subjects (themselves and others), and align with other subjects, with respect to any salient dimension of value in the sociocultural field” (Du Bois 2007: 163).

Interestingly, the metadiscursive strategies are not predominantly used to actually perform facework by putting forward an ethos of modesty. Quite the contrary, the use of metadiscursive devices enables Members of Parliament to perform a complex task: sharing apparently obvious facts—those for which you do not need to qualify as an expert, since they are constructed as common sense—while still positioning themselves above the ‘mass’. In doing so, I argue, Members of Parliament try to resolve the contradiction between speaking on behalf of the people, which means instead of them, and empowering the people by giving them the resources to understand.

# Knowledge as the locus of discrimination: confrontational talk in a broadcast interview

Panel contribution

***Dr. Eleni Karafoti<sup>1</sup>, Dr. Charikleia Kapellidi<sup>2</sup>***

***1. National and Kapodistrian University of Athens, 2. Freelancer***

Although broadcast talk adopts elements of ordinary conversation, it is an institutional form of discourse, produced for the benefit of an ‘overhearing’ audience (Hutchby 2005). More specifically, broadcast interviews depart substantially from the way in which conversational talk is organized, first and foremost in their form (i.e. a chain of question-answer sequences). Nevertheless, the specific structure is an active accomplishment of the participants’ conduct rather than a pre-existing constraint of their behavior (Clayman & Heritage 2002; Greatbatch 1988; Schegloff 1988/89).

In the present paper, we examine a live broadcast interview between a (female) journalist and a famous litterateur (man of letters). The interview was carried out a few years ago on a Greek private television channel, and has been discussed both as an example of aggressive and impolite talk on the part of the litterateur, and as a source of resistance to the television status quo (<https://www.youtube.com/watch?v=7QFI01nIrGE>). Our research aim is twofold: to explore a) whether the two participants cooperate in the constitution of the occasion as an ‘interview’, and b) how they construct themselves and other, by virtue of knowledge claims. Thus, on the one hand, we will look into departures from the question-answer turn-taking system that characterizes the interview, focusing also on their consequences for its recognizable character. On the other hand, we will investigate the membership categories that the participants display, and the practices (e.g. epistemic claims) or the linguistic means (e.g. mock-(im)polite turns (Haugh 2012), taboo/foul language, dysphemisms (for example, *shit*) (Allan & Burridge, 1991) and words that explicitly comment on (im)politeness; see Hutchby, 2008) that they employ, in order to be confrontative/aggressive/discriminative or professional and consensual.

The examination of a ‘breakdown’ in interview conduct is expected to shed light on the normative organization of interviews (i.e. deviant cases often provide the strongest evidence for the analysis), while the study of self- and other-construction is likely to reveal how power, as a result of knowledge, and discrimination can be actually exercised in interview talk. The study adopts a conversation analytic method, not *a priori* accepting pre-existing power relations, but providing compelling accounts of how power comes to operate as a feature of institutional interaction.

# Kuyagira: Expressing condolence among Banyabwisha

---

Panel contribution

---

***Mr. Paulin Baraka Bose<sup>1</sup>***

*1. University of Cologne*

Among Banyabwisha people of East Africa, situations of bereavement call for communicative and material support from other community members. For Banyabwisha, as for many others, the death of loved ones is understood to be one of the most painful experiences a family can go through. In such times of trauma, how do people communicate their emotional support? This talk explores how Banyabwisha express their condolences to the family of the deceased by analysing a range of relevant scenarios observed during several periods of fieldwork (including periods between 2012–2016 when I worked as an assistant to a Western researcher and in 2020 where I collected ethnographic and linguistic data as an insider researcher). The language, Kinyabwisha, is a variety of Kinyarwanda-Kirundi, closely related to Rufumbira (Nassenstein 2016), and has so far received very little attention from linguists.

The paper has two analytic goals: first, to investigate local meta-pragmatic concepts relating to communication in situations of bereavement, and second, to identify communicative resources employed in condolence-giving. In Kinyabwisha, the term *abamotsi* refers to the people who are chosen to spread the news of the death across the area. The *abamotsi* need to ensure that the news reaches relatives and acquaintances, from whom an immediate response is expected (i.e., abandoning all activities and going to the place of the bereavement). In 2015, I experienced the way the death of a close relative was dealt with in a small village in Bwisha collectivity, where the only physician on duty could no longer attend to any patients for this reason. The expression *kujya kumuyaagira* (written as *kuyagira*) is restricted to situations of human death and combines *kujyayo* ‘going there’ and *kumuyaagira* ‘speak with him/her’. This social activity involves giving an emotionally supportive speech and providing material items that will be of use to the bereaved family. In my analysis of this speech event, I consider certain conventionalized linguistic expressions, including bereavement-specific greeting practices, and I also discuss the significance of bodily contact in communicating sympathy. The paper suggests that *kujya kumuyaagira* situations may be generally conceptualized as overarching problem-remedy sequences (Beach & LeBaron, 2002, Hepburn & Potter, 2012; Kidwell, 2006).

# Language aggression in third party talk: The relational work of Greek negatively affective words

Panel contribution

***Dr. Angeliki Alvanoudi<sup>1</sup>***

**1.** Aristotle University of Thessaloniki

The present study examines the use of negatively affective words, known as conventionalized impoliteness formulae (Culpeper 2011) or dysphemisms (Allan & Burridge 1991), when interlocutors talk about third non-present parties in Greek conversation. Building on conversation analytic informed studies on third person reference (Enfield and Stivers 2007; Whitehead and Lerner 2009; Klein 2011) and affective stance in interaction (Selting 2010; Du Bois and Kärkkäinen 2012; Peräkylä and Sorjonen 2012), this study shows that negatively affective words position the referent in shared emotional space among interlocutors and are mobilized as practices for carrying out affective actions (such as assessing or complaining). Moreover, such words link affect to aspects of ideological systems (gender, ethnicity, the moral order) and contribute to the intersubjective construction of identity, by foregrounding relations of adequation and distinction (Bucholtz and Hall 2005). As the analysis demonstrates, in moments of cooperative talk against non-present others subtle forms of discrimination may arise and routine everyday forms of oppression can occur.

# Language ideologies about the communication of chronic pain in later life

Panel contribution

***Dr. Gilles Merminod<sup>1</sup>, Ms. Imane Semlali<sup>2</sup>, Ms. Ana Terrier<sup>2</sup>, Dr. Orest Weber<sup>2</sup>, Prof. Pascal Singy<sup>1</sup>***

*1. University of Lausanne, 2. Lausanne University Hospital*

Among the many health issues affecting the elderly, the difficult management of chronic pain in later life (Larsson et al. 2017) is a case in point, where part of the solution relies upon everyday communication (Clarke et al. 2012). Yet a significant lack of scientific data prevents the healthcare system from being able to offer solutions in line with the realities experienced and perceived by the elderly suffering from chronic pain. As a consequence, our study aims to better understand the elders' communicative practices relating to chronic pain: Is chronic pain a topic within elders' social networks? If so, when, how and why?

We carried out a qualitative analysis on interviews with persons between 75 and 100 years old (N: 49), suffering from chronic pain and without major cognitive or auditory troubles, all from the French-speaking part of Switzerland. Drawing on an applied linguistic perspective on health communication (Jones 2013) and on social network theories (Dominguez & Hollstein 2014), we first described the place the elderly give to the communication of chronic pain in their networks. We then identified the language ideologies surrounding the communication of chronic pain in later life. Our findings evidence that far from being only a barrier to communication, these ideologies allow the elderly to adjust their discursive practices to the audience with whom they are interacting. Our contribution will explore this issue from the study of a social categorisation used by the participants during the interviews: "les tamalous" (literally, "the wheredoesithurts"), that is the relentlessly complaining old people.

# Language ideology and cultural capital in Okinawan language textbooks

Panel contribution

***Dr. Patrick Heinrich<sup>1</sup>***

**1.** “Ca’ Foscari” University of Venice

Language education in the Ryukyu islands in the southwest of the Japanese Archipelago awaits to be institutionalized into the (Japanese) education system. Lack of formal inclusion of the endangered language notwithstanding, we can today find a number of textbooks for the Okinawan language, the largest of altogether six Ryukyuan languages. These materials play a key-role in supporting Okinawan second language learning in the Ryukyus, as they provide for fundamental information with regard to pronunciation, grammar, lexicon, and pragmatic routines. Just as any other language teaching materials, these textbooks comprise also what can be termed a ‘hidden curriculum’. This hidden curriculum consists of ideological imaginations of speakers, their lives, their relations with others, their position in society and, in so doing, these textbooks also inform language learners what can be done with Okinawan language in contemporary society, and who you can be when speaking Okinawan. This presentation presents language ideological notions in four Okinawan textbooks: Funatsu’s *Speaking Okinawan (Uchinaaguchi sabira)*, Nishioka & Nakahara’s *Introduction to Okinawan (Okinawago no nyūmon)*, Sakihara’s *Let’s Go to Okinawa (Rikka, Uchinaa nkai)* and the Prefectural textbook *Community Language Reader (Shimakutuba dokuhon)*. By studying the characters who appear in these textbooks (gender, age, occupation ,educational background), their activities, their relations to Okinawa (and Japan), and their communicative behavior and repertoire, it is argued that an Okinawa society is projected in these materials that downplays economic capital and that places much attention on Okinawan cultural capital that has been devalued during the process of language replacement. Cultural and economic capital linked to an endangered language is crucial, because saving a language implies saving its market. The crux in Okinawa, as it emerges from the textbook analysis, is how Okinawan cultural capital can be transferred to economic capital? At present, this crucial connection between cultural and economic capital is non-existent.

# Language in the abortion clinic: where ideologies clash

Panel contribution

**Ms. Ella van Hest**<sup>1</sup>

1. Ghent University

This contribution discusses how language ideologies lead to unequal treatment in an abortion clinic in Flanders, the Dutch-speaking part of Belgium. In general, women opting for abortion in Belgium can choose between a medical abortion or a surgical abortion, depending on the duration of the pregnancy. The medical abortion involves taking pills to induce a miscarriage, whereas the surgical abortion is an intervention performed by a doctor. In the abortion clinic under study, however, women who lack proficiency in the clinic's institutional languages (Dutch, French, and English) are excluded from the medical abortion. From the clinic's staff emic perspective, the medical abortion, as opposed to its surgical counterpart, requires *direct* verbal communication due to a higher risk of complications. Therefore, the staff members argue that a language gap jeopardizes safety. The insights in this research are based on linguistic-ethnographic data, comprising audio-recordings and observations of abortion intake interviews, along with fieldnotes of the clinic's daily activities and a discourse analytical approach of internal policy documents. The analysis shows how the clinic's assumptions about language and medical safety are nurtured by dominant ideologies regarding Flanders' language reality. For instance, the fact that English and French are considered appropriate linguistic resources for establishing safe medical communication, despite the co-workers' self-reported and observed insufficient language skills in those languages, is in our view inextricably linked to notions of prestigious and plebeian multilingualism (Jaspers, 2009). The same assumptions are further reflected in the staff members' discourses about those clients lacking knowledge of Dutch, French, or English as "clients with a language problem" or "clients without language". Moreover, the clinic's policy to cope with those "language problems" is one driven by a process of *erasure* (Irvine & Gal, 2000): rather than bridging the language gap, for instance by appealing to interpreters, the clients who do not fit the language ideological framework are *a priori* excluded from the communicative event of a medical abortion. This contribution aims to demonstrate this crystallization of macro ideologies into professional language ideologies (Kroskrity, 2000), by showing excerpts from intake interviews and looking at how the clinic's exclusionary policy is delivered to and received by the clients. It is argued that this professional language ideology clashes with the ideology underlying the clinic's *raison d'être*, i.e. a framework of freedom of choice and self-determination for women confronted with an unwanted pregnancy.

# Language Socialization in Shared Picture-book Reading: A Cross-Cultural Perspective on Stancetaking within Parent–Child Interactions

Panel contribution

**Ms. Mana Kitazawa<sup>1</sup>**

1. Keio University

This paper discusses how parents and children negotiate their stances in shared picture-book reading and demonstrates how children, through the act of stancetaking, acquire the sociocultural values generally accepted in their native cultures. Kulick and Schieffelin (2004) argue that language socialization is based on the idea of affective stances, such as the emotions and feelings associated with persons or situations. Understanding culturally intelligible affective stances is essential for becoming a member of society, and exchanging stances influences how parents react to children and how children learn to behave.

Although the importance of the relationship between language socialization and stance is often taken for granted (Cook, 2011; Duranti et al., 2011; Ochs, 1993), most studies of shared picture-book reading lack the number of samples needed to understand precisely the process of language socialization and the interactional aspects of reading, despite the activities being mutually performed. With this in mind, this paper, adopting sample-abundant data consisting of more than 150 video recordings covering 1–72-month-old American and Japanese children, examines how parents and children negotiate their stances during interactions via shared picture-book reading.

This study analyzes parent–child interactions in light of Du Bois's (2007) views on stancetaking, which highlight the dialogical aspect of stance acts and the importance of understanding stances within a sequence as subjects evaluate objects, thereby positioning themselves and aligning their stances with one another. In the case of shared picture-book reading, this approach reveals that the objects parents and children evaluate, and how they negotiate stances with each other, change as children develop, and that there are differences between the American and Japanese contexts. It is hoped that this paper will contribute to a better understanding of language socialization in each culture, from the perspective of stancetaking.

# Las fórmulas rutinarias en un corpus humorístico multimodal: El caso de Cómo conocí a vuestra madre

Panel contribution

**Dr. María Belén Alvarado Ortega<sup>1</sup>, Dr. Laura Aliaga Aguza<sup>2</sup>**

*<sup>1</sup> Universidad de Alicante, <sup>2</sup> Universidad Internacional de La Rioja*

El estudio de la fraseología, en general, y de las fórmulas rutinarias, en particular, ha crecido en los últimos años debido al interés que suscita la investigación lingüística relacionada con el análisis del discurso y el análisis interaccional. En este sentido, también han proliferado las investigaciones sobre humor en la interacción y en corpus multimodales (Aliaga 2020, Alvarado 2020), donde existen formas de más de un código semiótico, ya sea, texto, imagen, gesto, o sonido, en las que el lector debe asumir la presunción óptima de relevancia y resolver las incongruencias existentes, para captar el mensaje humorístico o discernir la función de las unidades fraseológicas que aparezcan.

Las fórmulas rutinarias, como UFs que son, deben poseer las características comunes a todas ellas, la fijación y, en ocasiones, la idiosincrasia, pero además, pueden presentar algún tipo de independencia como enunciados fraseológicos (Alvarado 2010). Consideramos que toda fórmula rutinaria posee fijación formal, entendida como perdurabilidad de los componentes que la constituyen, y fijación psico-lingüística, referida a la convencionalización en la comunidad lingüística, es decir, a la estabilidad en su reproducción y a su frecuencia de uso. Sin embargo, para las fórmulas rutinarias estos rasgos definitorios se pueden dar de manera gradual. Además, las fórmulas rutinarias pueden tener diferentes funciones en el enunciado en el que se integran y que variará con el carácter del corpus analizado.

Asimismo, la comedia de situación es un formato de ficción humorística que posee unos rasgos propios orientados a divertir a la audiencia. Se caracteriza por simular situaciones basadas en la realidad, pero de forma humorística. Del mismo modo, se trata de un medio multimodal que se nutre de tres tipos de humor diferentes, donde las secuencias humorísticas se generan por medio del humor verbal, del humor visual, del humor de situación o la mezcla de alguno de ellos. Este hecho complica el análisis humorístico, debido a que el humor puede aparecer desde cualquier vía (Aliaga, 2020). No obstante, que la misma idiosincrasia de este formato permite utilizar elementos cotidianos de la comunicación, como las fórmulas rutinarias, para generar el giro humorístico.

En esta comunicación pretendemos llevar a cabo un acercamiento al análisis de las fórmulas rutinarias a través del humor audiovisual desde una perspectiva lingüístico – pragmática, concretamente, se analizará un formato multimodal como es la comedia de situación. Para ello, utilizaremos como base teórica la Teoría General del Humor Verbal (TGHV) establecida por Attardo y Raskin en 1991 y la revisión posterior que realiza Ruiz Gurillo (2012, 2019) para el humor en español. Para realizar nuestro estudio analizaremos una temporada de la versión doblada al castellano de la serie Cómo conocí a vuestra madre. El objetivo de esta comunicación es mostrar cómo funcionan las fórmulas rutinarias como indicadores humorísticos en un género como es la comedia de situación.

Aliaga Aguza, L. 2020. Análisis lingüístico del humor en el medio audiovisual: Las estrategias humorísticas de la comedia de situación.

Alvarado, M. Belén. 2010. Las fórmulas rutinarias del español: teoría y aplicaciones. Frankfurt: Peter Lang.

# Laughter and face maintenance in focus groups assessments

Panel contribution

***Mr. Jonathon Coltz***<sup>1</sup>

1. Saarland University

In this talk, I build on earlier studies of laughter associated with troubles talk (Jefferson 1984) and intimate talk (Jefferson, Sacks, and Schegloff 1987) by exploring the role of laughter in the assessment of foods in focus groups. I show that laughter by an assessor accompanies potentially face-threatening assessments (FTAs; see Goffman 1967, Brown and Levinson 1978), and as such, corresponds to criticism-associated laughter in the framework of Chafe (2007). Specifically, laughter follows multimodal FTAs that the assessor considers in need of redressive action. The assessor's laughter is therefore an act of negative politeness, or deference, that restores cooperativity among focus group participants. I discuss the implications of this finding for a model of assessment known as the Stance Triangle (Du Bois 2007).

My data are taken from 8 hours of focus groups on food with 24 participants (8 triads). In each group, participants tasted and evaluated snack bars and tortilla chips that were assigned three-digit codes to conceal their brand and flavor.

Prior to Excerpt 1, Holly has registered a negative evaluation of one of the snack bars and has eaten very little of it. Gloria then positively evaluates the bar. In lines 2–3, Gloria says, "Well, I have to look at hers" (Holly's), as she has fully eaten her own bar. Her FTA (threatened face: Holly's) is followed by an extended series of laughter pulses in line 6.

Excerpt 1: *I ate my whole bar*

2 Glo //Well||

3 I have to look at hers cause I ate my whole //bar.||

4 Mod //You did=

5 it's it's //gone you now (.) you now||

6 Glo //{Uh hah hah hah hef}||

Prior to Excerpt 2, taken from a different focus group, Natasha has voiced her dislike of the bar she has just eaten, in contrast to the positive prior evaluation of her fellow participant Oliver. Her FTA in lines 10–12 (threatened face: Oliver's) is not immediately followed by laughter, but rather, by an attempt at levity on the part of the moderator (line 14), which then elicits laughter from Natasha (line 15).

Excerpt 2: *Some date thing*

10 Nat It reminds me of some date thing=

11 my mom made way back in the (.) 60s.=

12 I didn't particularly care for it.

13 Mod °Mm-hm (.) okay.° Yeah.=

14 Sometimes the plate tells the whole story.

15 Nat {hehh Hah Hah Hah Hah .hhhh hah hah}

This study contributes to the growing body of research on laughter in food-related conversation by showing that in focus groups on food, FTAs trigger laughter on the part of the assessor; this laughter is an act of negative politeness that serves to restore cooperativity. When an assessor's laughter is not triggered by an FTA, cooperativity is restored by another means (e.g., via the moderator). The implications for stancetaking are twofold: (1) In any given stance act, there may be multiple Stance Triangles, and (2) Stance Triangles are not static entities, but rather, are dynamic.

# Laughter and interactive stancetaking in German Taster Lunches

Panel contribution

**Ms. Caroline Collet<sup>1</sup>, Prof. Stefan Diemer<sup>2</sup>**

***1. Saarland University, 2. Trier University of Applied Sciences***

This paper investigates how laughter, when combined with lexical, nonverbal and paralinguistic elements, achieves and contributes to establishing and negotiating participants' stances in an interactive meal setting. In this context, laughter can convey nuanced stances, it frames and reframes the situation and interaction, and it serves as a mitigation and exit device in delicate situations.

We use a dataset of German Taster Lunches (Brunner & Diemer, 2016), each with three German native speaker participants, recorded at Saarland University, Germany, in July 2016. Participants were given three different courses to taste, one Japanese, one Senegalese, and one German, without providing information about the respective backgrounds of the meals (see Szatrowski 2014: 27ff. for the concrete setup of the Taster Lunches). The conversation during the meal was recorded and selectively transcribed. For the purpose of the current paper, we focus on interactions involving laughter.

Results of this study suggest that laughter is interwoven in the complex process of stancetaking during food consumption, evaluation, and interaction over food, particularly, but not only, in connection with humor. Laughter frequently occurs in initial or relative stancetaking, where it is used to introduce a nuanced stance perspective and thus serves to create rapport and mitigate potential face loss by the speaker or other interlocutors. Joint laughter signals the successful creation of rapport (Spencer-Oatey 2002, Spencer-Oatey & Franklin 2009, Schmidt 2020) and a joint stance which can also be directed against the "other" (Jensen 2011). Participants can, for example, mark the assumption of an expert status and a shared cultural identity towards a non-present other through joint laughter. Laughter can also frame and structure personal descriptions and storytelling, which are not necessarily humorous (Jefferson 1984, Brunner et al. 2014), also in mutual laughter, where echoing of laughter can indicate a continued shared stance (Thonus 2008).

Laughter also serves to humorously downplay expert identity, for example during anecdotes related to food items unknown to other participants. The identification of culturally familiar food items, particularly from the participants' own culture, is often accompanied and surrounded by laughter and the assumption of an ironic stance.

In contrast to humor, laughter is not dependent on the presence of the food being topicalized (Mondada 2009, Goodwin 1981), but can be present in stancetaking apart from food, e.g. when assuming or rejecting a national or regional identity (cf. also Brunner & Diemer 2018). Non-humorous laughter frequently serves as a mitigation device (Warner-Garcia 2014) and exit strategy (Partington 2006) in delicate situations, for example when commenting on the Taster Lunch setting, challenging conversation partners' stance and evaluation, or disagreeing with food evaluations. Its use as a mitigation and exit device may entail humorous exchanges employing irony and punning, or mark a distinct topic termination (Holt 2010).

In conclusion, findings suggest that laughter in German Taster Lunches is a central tool to mark and negotiate conversational stance, reflecting observations on dinner table conversations (Tannen 1986) and virtual settings (Diemer & Frobenius 2013), contributing to a more nuanced understanding of the relationship of laughter and stance.

# Learnables in teacher formulations in the Second Language Classroom

Panel contribution

***Ms. Emma Greenhalgh<sup>1</sup>, Dr. Liz Holt<sup>2</sup>, Prof. Ray Wilkinson<sup>1</sup>***

*<sup>1</sup> University of Sheffield, <sup>2</sup> University of Huddersfield*

In recent Second Language (L2) classroom literature, the recognition that language learning is fundamentally dialogic in nature (Wong & Waring, 2020) has resulted in a stronger push for inclusion of 'real' talk in the classroom (Illés & Akcan, 2017). With the aim of developing learners' fluency in a more authentic way, the L2 teacher will often include activities that seek to engage the learners through the elicitation of their personal or cultural knowledge. In the resulting interaction, and in contrast to the teacher's K+ position (Heritage, 2012) during standard classroom interaction, the teacher will take on a K- position in relation to the topic being discussed while still performing the role of the L2 expert/teacher. These competing demands of the interactional and pedagogical can give rise to some distinctive teaching practices in conversational sequences in the L2 classroom. In a dataset of approximately 12 hours of English L2 classes recorded in adult education colleges in the North of England, it was observed that L2 teachers frequently produce utterances which formulate some display or checking of understanding of the student's prior turn (Solem & Skovholt, 2019). Moreover, it was noted that when the teacher opted to formulate a learner's utterance, this was often not simply a response to the learner who contributed but was also treated as an opportunity for an 'emergent learnable' for the rest of the class (Majlesi & Broth, 2012). With the emergent vocabulary item seemingly being flagged as a learnable to the students by one or more of a range of turn design features including pre-launch pause, stress on the 'learnable' word, and/or a gloss of the new lexical item.

By the incorporation of 'learnables' into formulations in conversational sequences in the L2 classroom, L2 teachers' skilful on-line attention to the progressivity of talk in its local interactional context, whilst maintaining the overall pedagogical goals that maximise learning (Atkinson & Shvidko, 2019), becomes apparent; therefore allowing detailed analysis of formulations in this particular institutional setting (Drew, 2003).

# Learning displays as negotiated achievements

---

Panel contribution

---

***Prof. Beatrice Szczepk Reed<sup>1</sup>, Dr. Darren Reed<sup>2</sup>***

***1. King's College London, 2. University of York***

During one-to-one instruction, teachers typically produce strings of directives while learners monitor teachers' instruction turns for opportunities to display their learning (Szczepk Reed, Reed & Haddon 2013). This paper presents findings from an analysis of music masterclasses that show the emergent and collaboratively achieved nature of students' learning displays. The paper focuses, first, on the sequential organization of how learners negotiate interactional spaces for showing their learning; and, second, on the multiple ways in which learning is displayed.

While learning can be assumed to be a priority purpose for music (and other) tuition, a close analysis of one to one music instruction shows that learner opportunities for complying with, or showing understanding of teachers' instructions are not always easy to come by. Instructors do not necessarily offer sequential slots for learners to show their learning; and when they do so, they may limit students' learning displays significantly, for example, by specifying exactly which type of skill or understanding should be displayed, and/or by defining the time available for doing so. Data from music masterclasses recorded between 2011 and 2013 show that learners and instructors have at their disposal several means of negotiating slots for compliance and other learning displays.

Once a slot for a learning display has been interactionally achieved, learners have a basic choice between responding to an instruction verbally or through embodied compliance. With regard to the latter, previous work has shown that music teachers differentiate between learnables (Zemel & Koschmann 2014) which they treat as primarily embodied (body-focused instruction) and those they treat as primarily conceptualised (concept-focused instruction) (Szczepk Reed in press). The body is centrally involved in both. However, while learners' compliance with body-focused instructions is clearly recognisable as either an imitation of the teacher's embodied demonstration (see Keevallik 2010) or an enactment of their verbal description of an action (such as 'drop your jaw'), compliance with concept-focused instructions (such as 'try and make her really off balance') is less clearly accessible to the non-expert. Here, compliance is very much within the judgment of the teacher, which has implications for the way it is interactionally managed.

The paper will present data evidencing the sequential organization and interactional forms of learning displays in music masterclasses. It makes a contribution to the panel 'Orientations to 'knowing how' in interaction' and to the wider field of instructional interaction, epistemics in interaction and embodied interaction.

# Learnings from the past, opportunities for the future: Framing the discussion of dementia and the pragmatics of inclusion

---

Panel contribution

---

***Prof. Heidi Hamilton<sup>1</sup>***

*1. Georgetown University*

The past four decades have been filled with a dizzying array of studies at the intersection of pragmatics and dementia. Some of these investigations have focused on changes in language and/or communication that accompany dementia as it progresses. Others have explored how language used by individuals with dementia may shape a range of social identities related to interactional goals, participation frameworks, and cognitive health. Still others have highlighted the critical importance of social relationships as displayed in talk among friends and family members, and of professional relationships as demonstrated in medical encounters and as part of life in skilled care facilities. And, finally, others have examined public discourses about dementia, considering the effects these discourses may have on individuals of all ages. Such studies have only infrequently centered on inclusion, but all have something to offer as we lift our gaze more intentionally toward this life-affirming focus.

In this presentation, I paint broad strokes of a backdrop that spans these forty years of scholarship on pragmatics and dementia, stopping along the way to point out key insights and approaches that provide necessary preconditions for situating the rich and important discussions of inclusion represented in today's panel. These include, but are certainly not limited to, the personhood movement (Kitwood 1988); communication accommodation theory (Giles, Coupland & Coupland 1991); interactional sociolinguistics (Hamilton 1994); conversation as care (Ryan 2005); the 'forget memory' approach (Basting 2009); narrative collaboration and scaffolding (Hydén 2011); malignant positioning (Sabat 2013); reframing of cognition as embodied, distributed, and culturally grounded (Schrauf and Müller 2014); and a focus on multilingual interaction (Plejert, Lindholm & Schrauf 2017). By tracing these intellectual contributions over the years we can discern a fundamental shift in language and dementia inquiry from a focus on individuals' cognitive and communicative abilities being evaluated in the clinic to a focus on individuals with dementia living meaningful lives in interaction with others in the wider world. And this more expansive view smooths the path toward critical engagement with issues of inclusion. I conclude this framing discussion with a call that may move us closer to the more inclusive world we envision—future explorations should include a *wider range* of verbal and nonverbal communicative features and strategies used by a *wider range* of individuals with dementia (e.g., more first and second languages, races, ethnicities, ages, gender identities) engaging with a *wider range* of interactional partners in a *wider range* of everyday and institutional activities (beyond typical casual conversations and research interviews). The future of this highly complex, multi-faceted research into the pragmatics of inclusion in dementia studies looks bright if linguists meet the challenge by reaching out creatively and collaboratively to colleagues in other disciplines and by opening their minds and hearts to learn from and with those whose lives are shaped by dementia.

# Less than confirming, and doing more than that – An explorative study about German *joa* in responses to RfCs and related interjection + repetition type responses in Yurakaré

Panel contribution

***Dr. Alexandra Groß<sup>1</sup>, Dr. Sonja Gipper<sup>2</sup>***

***1. University of Bayreuth, 2. Universität zu Köln***

Based on the general observation that German tends to prefer *interjection type* answers (see Enfield et al. 2019) for confirming RfCs while speakers of Yurakaré predominantly use repetitional formats (see the quantitative overview by König & Pfeiffer 2020) we present an exploratory study about language-specific practices of managing complex relevancies while responding to RfCs in German and Yurakaré.

The starting point is the multifunctionality of the German response particle *joa* (a variant of *ja* (yes)): Ranging from roughly confirming to signaling problems with some terms of the question (e.g. Raymond 2020), we will show how answers with German *joa* are “shaped with an orientation to” (Sacks 1987: 62) aligning with the proposed course of action while constraining the confirmation at the same time. As a *downgrading interjection* (Stivers 2019) *joa* might further display hesitation or a reduced epistemic stance or orient to the desirability of the state of affairs in question (Heritage & Raymond 2021). German answers with *joa* constitute an example of how different interactional tasks are bundled in one lexical item while being adapted to specific needs by the use of prosodic variation, bodily resources and elaborated responses.

We will then turn to Yurakaré and show how the language-specific repetition-type strategy for fully confirming a RfC is adapted to the need for constraining the confirmation or *doing more* in terms of reducing one's own epistemic stance, (dis)affiliating with the questioner's evaluative stance etc.. Correspondingly, we see repetitional responses with different degrees of modification for giving less than a full confirmation. Here, the use of interjections like *te* (a reduced variant of *otte* (yes)) is typically additional, managing specific extra tasks like questioning the askability of the RfC. The data are drawn from a range of mundane and institutional conversations that have been videotaped for the purpose of analysis.

# Libyan Arabic interaction and communication analysis and interpretation: social and cultural perspectives vs CA and DA theories

Panel contribution

***Prof. Mayouf Ali Amarif<sup>1</sup>***

*1. Sebha University*

This paper investigates the applicability of CA and DA conventions and practices, postulated by Western analysts, to interactional data from a different social and cultural background (e.g. Eastern). Naturally-occurring interactions in both social and institutional contexts in Libya are analyzed in this paper. The analysis shows that the long occupation of turns and the other-initiate/ other-repair strategies practiced by fathers when interacting with sons, which is seen as impoliteness from Western perspectives, are interpreted as high social status and respect of the father. Moreover, the analysis of Mr. O Corpus data (teacher/students conversations) reports exceeding silence by the students. According to Libya culture, such silence can be interpreted as a sign of agreement and respect. In contrast, other cultures may describe silence as a sign disagreement and uncollaborativeness. Furthermore, expressing agreement/disagreement seems to be governed by the interactants' social and cultural norms rather than the CA/DA standards of interaction. Other institutional data from Libya (elderly patient/younger physician) shows what can be interpreted by Western analysts as off-target verbosity and talkativeness associated with ageing. The elderly patients call their doctors as "sons" and ask them about their social and familial background. In fact, taking the Libyan social and cultural values into account, the more reasonable interpretation of such practice can be described as an interactional strategy by the elderly patient to change the context from institutional (physician has the power) into social where the elderly patient regains the power from his younger physician. This paper concludes that the analysis and interpretation processes of CA and DA claimed by Western analysts are not importantly appropriate for other interactions and communications from different social and cultural background.

# Like-Prefacing in the Organization of Repair

Panel contribution

***Dr. Jeffrey Robinson<sup>1</sup>, Ms. Leah Nodar<sup>2</sup>, Dr. Felicia Roberts<sup>2</sup>***

*<sup>1</sup> Portland State University, <sup>2</sup> Purdue University*

## ***Like-Prefacing in the Organization of Repair***

Jeffrey D. Robinson, Leah Nodar, Felicia Roberts

This paper focuses on the role of '*like*' in self-initiated, transition-space repair (Ex.1, line 5), which has escaped attention in almost all of the dense literature on '*like*' (D'Arcy, 2017).

Ex.1:

Context: Giselle's friends, Max and his wife, are moving to another city

- 01 GIS: I'm excited for them but .hhhh Max
- 02 was thuh first person I met here in
- 03 Portlan':?
- 04 (.)

**05> GIS: Like [my fir]st frie:nd,**

- 06 NED: [Oh: ]
- 07 (.)
- 08 NED: <Oh.> really.

The method is conversation analysis. Data are videotaped, unstructured interactions between native-English-speaking, adult, close friends. This paper analyzes 246 cases of '*like*'-prefaced, self-initiated, transition-space, self repair.

Repair prefices – such as ['Well' + repair] vs. ['Or' + repair] – are different from repair alerts (e.g., cutoffs) and are not present in all repairs (Lerner & Kitzinger, 2019). Distinct repair prefices cast distinct relationships between projected repair solutions and their trouble sources. For example, whereas 'Well' projects a 'noteworthy revision,' 'Or' projects a 'better alternative' (*ibid.*). We find that '*Like*' projects a 'complementary version' of the trouble source, 'filling it out' in order to enhance its sensibility (as a description, social action, etc.). As such, '*Like*' retrospectively casts the trouble-source's sensibility as sufficient-in-a-manner-of-speaking but as possibly needing enhancement.

Findings force analysts to scrutinize, and perhaps expand their conception of, what participants orient to as repair, including what counts as a trouble source. For instance, '*Like*'-prefaced repair solutions frequently involve new turn-constructional units that are accounts of/for trouble sources, and these trouble sources frequently involve entire trouble-source units as social actions. For example, in Ex.2. (line 8), Julie opts to '*Like*'-preface "it is so stressful." (line 8), as opposed to a range of other options, such as omitting any preface (e.g., "*It is so stressful*") or beginning with a conjunctival (e.g., "[Cause/And] it is so stressful"). Julie's "*It is so stressful*" (line 8) is a justification for 'hating' her job, which complements and repairs her prior justification (lines 5-6) by enhancing its sensibility.

Ex.2

Context: Talking about Julie's job

- 01 KAR: I thought you liked [it. ]
- 02 JUL: [Oh m]y Go:sh. it's like (0.3)
- 03 (nuh)- (.) du:ngeon. I ha:te it.
- 04 (0.4)
- 05 JUL: I like can not do this whole sa:les meeting goals
- 06 an' stuff.

07 (0.2) ((Karen gazes at Julie))

**08> JUL: .hhh Like it is so stress[ful.**

09 KAR: [Yeah I wouldn't like that.

Finally, findings expand our understanding of next-turn, other-initiation of repair, which can similarly be 'Like'-prefaced (data not shown). Ultimately, examining repair-prefacing practices highlights the relationship between the mechanics of repair and the sensemaking practices involved in knitting together prior- and next social actions.

# Linguistic change in the 20th century: colloquialization processes through football broadcastings and interviews.

Panel contribution

***Dr. Shima Salameh Jiménez<sup>1</sup>***

***1. Universitat Jaume I***

To draw a complete map of general linguistic change, some researchers argue for the integration of variational variables in diachronic studies (dialects, registers, genres, discourse traditions, etc.) (Biber & Gray, 2013). Changes related to such variables might reflect systematic modifications in general linguistic patterns (e.g., colloquialization of writing practices > representation of speech in novels > writing generally; Traugott 2010: 104). This contribution addresses how changes in registers in the 20<sup>th</sup> century let colloquial and interactive structures become more frequent and the external and internal mechanisms involved in this change.

To do so, football match broadcastings and pre/post-match interviews in radio and TV programs have been analyzed (RNE, RTVE, CORDE). The lexical structure of football in Spanish is well-known (Nomdedeu 2019), thanks to research on written corpus (especially newspapers). However, football and football-related practices have not been studied from a pragmatic-discursive perspective, let alone from a conversational perspective (because of the lack of oral samples in written corpus). A study addressing how oral spontaneous uses in football-related practices changed through various decades would reflect some general colloquialization processes developed during the 20<sup>th</sup> century.

In this sense, approaching TV and radio football broadcastings from discourse analysis constitutes an interesting point of departure to address the 20<sup>th</sup> century as a novel diachronic space (Llopis and Pons 2020):

- (a) Mass media comprise monological and dialogical samples (basically, broadcastings and interviews), which allow us to describe such different items as formulation procedures, turn-taking devices, changes and new meanings in discourse markers, etc.;
- (b) Radio and TV broadcastings constitute an optimal source of data to retrieve interaction structures. However, to do so, diachronic sports corpora must be created. Compiling and transcribing sports oral samples (e.g. radio recordings from 1930 on, and TV programs from 1960 on), reveals an interesting picture of linguistic changes during the second half of the 20th century. Such a compilation involves crucial methodological decisions to adequately delimit the object of study, like the amount of data selected, the parameters of the corpus, the qualitative/quantitative treatment of data, etc.;
- (c) Sports publications and broadcastings boosted since the late 19<sup>th</sup> century on in USA and Europe (Pons Bordería 2014: 1002); this would mean that, in at least major Western languages, changes could be approached from parallel corpora. As a result, oral mechanisms found in these genres could be posited as general features of spoken language and compared to other languages as well. Works like (Ferguson 1994: 16-17) would validate this approach.

# Linguistic skills and SES: Two oft forgotten factors in child metaphor comprehension

Panel contribution

***Dr. Nausicaa Pouscoulous<sup>1</sup>, Dr. Alexandra Perovic<sup>1</sup>***

*<sup>1</sup>. University College London*

The development of metaphor understanding in children has experienced a surge of interest. Metaphor understanding can be tricky for children until mid-childhood, yet some research suggests that preschoolers are already competent. Many factors have been proposed to play a role in the development of metaphor comprehension (e.g., mentalizing ability; the ability to attribute two labels to the same object; analogical reasoning skills). In this study we focus on two obvious contenders that have been overlooked in recent years: general language skills and socio-economic status (SES).

To investigate the role of general linguistic abilities and SES in metaphor comprehension, we recruited 264 children (2;11-11;04) from a range of SES backgrounds from the South East of England (including inner and outer London). They were assessed on standardised measures of vocabulary (BPVS) and grammar comprehension (TROG), as well as non-verbal reasoning (KBIT). Metaphor comprehension was tested with a simple reference assignment paradigm designed by Pouscoulous and Tomasello (2020), where children have to choose one of two similar looking toys based on a metaphoric description. It uses novel perceptual metaphors that do not require any previous exposure, or learning, and correspond to young children's world knowledge and linguistic abilities. Additionally, the participants' SES was established using a composite measure linked to school location (Index of Multiple Deprivation).

The findings suggest that novel metaphor understanding is associated with age, as has been found elsewhere in the literature. Importantly, it is linked to vocabulary skills; grammar comprehension and SES also contribute but to a lesser extent.

# Linguistic strategies to present complexity in a time of crisis

Panel contribution

***Dr. Elena Callegari***<sup>1</sup>

**1.** University of Iceland

Since the beginning of the Covid-19 pandemic, many world leaders have regularly addressed their constituents to update them on the spread of the virus, and to motivate the implementation of any measure meant to slow Covid-19 down. Strategies to fight Covid have been complex in nature: they have consisted of different measures, tackling different areas of society, affecting diverse populations groups, coming into effect at different times and having different durations (e.g. closing of schools, but only high schools, but only in Manchester and only in April). In this talk, I analyze different strategies used to present complex information, focusing on factors such as syntactic structure, number and types of connectors, number of topicalizations but also lexical diversity and lexical choices. I study four European leaders: Erna Solberg (Norway), Giuseppe Conte (Italy), Emmanuel Macron (France) and Boris Johnson (UK). I analyze all Covid-related public speeches given by these leaders between March the 3rd and October the 28th. **Solberg** tackles complexity by oversimplification. She uses strikingly simple language (e.g. *det er veldig bra* “this is very good”), and often resorts to non-specific expressions in place of more specific DPs: “many companies”, “many municipalities”, “many countries”. The modifier *mange* (many) is used 77 times (compare the use of *molte/i* in Conte’s speeches: 9 times). When motivating anti-Covid measures, Solberg chooses to highlight causality relations: the connector *derfor* (“therefore”) is used 55 times (comp. with Johnson’s use of *therefore/thus/that’s why*: 12 times). **Johnson** chooses to structure his speeches by subdividing them into smaller discourse units using ordinal adverbs. Different Covid measures as well as their implementation are also framed within the context of his *Contain, Delay, Research, and Mitigate* plan – which equally consists of temporally ranked autonomous units– from his very first pandemic speech. **Conte** has no real strategy to handle complexity: anti-Covid measures are simply presented in the form of lists, as evidenced by the abundant use of *ancora* (≈ “and also”), which he often uses when introducing a new batch of anti-Covid measures. He only really resorts to framing-topic expressions of the type of “as far as X is concerned” when answering questions posed by journalists; his speeches also exhibit the highest lexical diversity index out of all four leaders. **Macron** is the only leader to systematically use open questions to segment discourse into smaller, thematically coherent units. During the second epidemic wave (October speeches), he also abundantly resorts to frame topics/fronted adverbials to highlight differences and similarities between March measures and October measures; this aids the listener in internalizing what measure is currently valid. Noteworthy is the extremely low frequency of left dislocations to realize shifting topics in both Conte and Macron’s speeches. Left dislocation of shifting topics is a common strategy to segment discourse in Romance languages, yet it is virtually absent in the speeches analyzed for this study.

# Linguistic-based and ableist cyberhate within deaf network on social media

Panel contribution

***Prof. Aryane Santos Nogueira<sup>1</sup>***

**1.** UNICAMP (State University of Campinas)

This presentation is intended to approach cyberhate within a deaf network through the analysis of hatred language strategies employed on comments to a Facebook post. These linguistic and discursive strategies, afforded by the participatory ethos of social media, besides visibilizing the *diversities within the difference* (Cavalcanti, 2011), also indicate a blind spot in cyberhate studies, frequently focusing on the dynamics of online discrimination and hostility *against* minorities, but not *within* the same minority group. From a corpus consisted of a post and its comments scraped from the public Facebook page of the current National Secretary for the Rights of People with Disabilities, the first deaf woman to occupy a position in the second level of the Brazilian Federal Government, I break into minor compounds the occurrence of cyberhate, identifying and tracing the characteristics of strategic deployment of linguistic and semiotic resources made in order to invest and engage in processes of othering, producing and contributing to online-offline animosity within the Brazilian deaf network. To do this, I follow some indicators suggested by Bauman et al. (2021) and others authors to map aspects such as target, form, and content of hate speech to understand how the phenomenon of cyberhate in this specific setting occurs. In this process, an important *transcontextual* (Blommaert, 2016) aspect of the cyberhate to be considered emerges, as different layers of contextualization framed target, form and content of the analyzed hateful comments. Among the strategies used to maintain an asymmetry of power, there is the ableist and linguistic discrediting of the Other by triggering representations that resemble the same biased strategies that have been historically used – both offline and online – against deaf people to discriminate their sociolinguistics differences. Considering that this linguistic-based and ableist hate reveals the interconnectedness of “the new discursive online practices and the socio-political [and historical] context of the offline world and its established power relations”, we comprehend the importance of understanding these language practices in a deaf setting as online-offline “socially relevant rather than isolated online dynamics” (Khosravinik & Esposito, 2018).

# Lip-smacks and the multimodal co-ordination of eating with an infant

Panel contribution

***Dr. Sally Wiggins<sup>1</sup>, Prof. Leelo Keevallik<sup>1</sup>***

***1. Linköping university***

While typically glossed as a single word – eating – the process of consuming food is a complex series of activities that are often coordinated with other embodied and interactional events. Recent work in sensory practices has begun to unpack some of these activities, such as the sniffing and smelling of beer or coffee (Lieberman, 2012; Mondada, 2020), the tasting of cheese (Mondada, 2019), and the enacting of another's taste (Wiggins, 2019; Wiggins & Keevallik, 2020). Both the interactional and sensorial aspects of eating come to the fore when feeding infants since it is while they are taking their first mouthfuls that they learn how to attend to the food in their mouths and consume it together with others. In this paper we focus on how parents use lip-smacks (a series of bilabial click sounds) to co-ordinate a meal as a shared social practice and orient to the mechanical aspects of consumption. The activity environment allows us to target the boundary between (early) language practices and the body through the systematic use of non-lexical sounds that ostensibly originate in an individual bodily activity but actually feature robust interactional patterns. The data are taken from a corpus of 66 video-recorded infant (5-8 months old) mealtimes in Scotland from five families with a total of around 19 hours of interaction. Within this corpus, 391 instances of lip-smack particles – produced together in rhythmical chains – were identified and analysed using multimodal conversation analysis that enables a detailed scrutiny of vocal and bodily actions in video data in order to establish patterns of mutual responsiveness in real time. Being produced in a variety of phonetic formats (dental, alveolar, or labial clicks with or without vocal elements), the lip-smacks form prosodically coherent phrases of 3-5 particles that are furthermore performed with the gaze on the infant and regularly involve leaning in towards the infant, head tilts, and nuanced facial expressions. The infants respond through gaze change to the sounding adult, smiles, reflexively mirrored jaw moves as well as vocalizations placed at phrase completion, rendering the activity as being both about joint food consumption and a sequentially structured occasion for social engagement. We illustrate how the lip-smacks are co-ordinated with the infant's oral manipulation of the food and thus illustrate how one of the processes of 'eating' becomes manifest in social interaction involving a novice eater.

# Literary Complexity in Conversational Storytelling Revisited

---

Panel contribution

---

***Dr. Jarmila Mildorf<sup>1</sup>***

**1.** University of Paderborn

Linguists like Deborah Tannen (1989), Wallace Chafe (1994), Livia Polanyi (1984) and Ronald Carter (2004) have foregrounded the literary qualities of everyday speech, focusing on features such as constructed dialogue, the representation of other people's thoughts, repetition, symmetrical and parallel patterns, metaphorical speech and imagery. Neal Norrick (2000/2001) even suggested that it might be worthwhile investigating everyday talk as a literary artifact. Despite growing interest among literary narratologists in narratives beyond the realm of prose fiction, few have taken on the task of applying literary-analytical tools to the study of non-fictional and, more specifically, conversational stories (cf. Herman 1999, 2009; Mildorf 2006, 2012 and forthcoming; Hatavara & Mildorf 2017; Björninen, Hatavara & Mäkelä 2020).

In this talk, I revisit the notion of literary complexity in conversational storytelling by paying attention to specifically *narrative* features which can make a conversational story resemble a fictional one in terms of its rhetorical density and narrative complexity: double deixis, which captures how shifting and potentially multi-referential address pronouns create ambiguity (Herman 1994); focalization, i.e., the perspectival lens through which recipients are made to perceive a storyworld (Chatman 1986; Jahn 1996, 1999); the distinction between *experiencing* and *narrating I*, i.e., the presentation of oneself as an experiencing 'character' in the depicted storyworld in contrast to the person telling his or her story with hindsight; and the evocation of cultural story templates. The story I analyze was told as part of an oral history interview with fiber artist Dominic Di Mare for the Smithsonian Archives of American Art. I show how the above-mentioned narrative features are used alongside rhetorical figures of repetition to create involvement and suspense, and to offer listeners an opportunity to participate imaginatively in the events related in the story.

Rather than reducing storytelling functions to questions of relevance and information management in conversation, I argue that it is important to acknowledge and explore the *creative impulse* behind and *aesthetic dimensions* of conversational narratives, which in and of themselves may become reasons for telling stories and support phatic and expressive functions of talk.

# Locality and materiality in humorous memes

Panel contribution

**Dr. Galia Hirsch**<sup>1</sup>

1. Bar

Even though nowadays people's interactions are less bound to a "physical place" (Baker 2008), among other reasons due to the development of mobile phones (Yus submitted), this notion, both in a narrower or broader sense, has not lost its importance. Users still incorporate the "physical place" into their interactions and exploit it for communicative purposes, among which humor plays a major role.

As many studies rightfully claim, humor's meaning and appropriateness are derived from shared knowledge, codes and emotional significances (Baym 1995; Yus 2003). The creation and appreciation of Internet memes – which are often characterized by humor (Knobel & Lankshear 2007) – demonstrate not only knowledge of online environments, culture and history; but also of a shared "physical place", since these frequently address very local themes (Hirsch 2019).

It is argued here that memes often feature a "physical place", at least thematically, because many of them rely on a clash between the physical and moral (Bergson 1911), which is considered in this framework and previous studies (Hirsch 2017) a specific mechanism of humor. Bergson (1911) believes that the comic resides first and foremost in a particular conflict between "the stupidly monotonous body, perpetually obstructing everything with its machine-like obstinacy" (p. 93), and intellectual and moral life. Indeed, the juxtaposition of sublime and elevated human thoughts with the physical aspect of life can be a dominant cause for a humorous effect, as was detected in digital jokes (Hirsch 2017) and in *Hitler Rants* parodic memes (Hirsch 2019).

The humorous incongruity behind many digital memes builds on this clash between the moral intellectual personality and the body's material essence. This materiality is often intertwined with a local, physical space. In Hitler's *Downfall*videos, for example, the incongruity is between the original subject and the trivial topics treated by the subtitles, such as the search for a parking spot in Tel Aviv or the quality of the café in *Aroma Espresso Bar*. These mundane issues are relevant to users' daily lives and embedded in their physical landscape.

This contribution thus aims to address the importance of "physical place" in today's humorous digital memes, explaining it in Bergsonian terms.

## Lost voices? (Il)literacy in witness depositions and suspect interrogations (Bruges, 1700-1900)

Panel contribution

***Dr. Tom Bervoets<sup>1</sup>, Prof. Wouter Ryckbosch<sup>1</sup>***

***1. Vrije Universiteit Brussel***

Almost as a rule, ordinary people left fewer writer testimonies to posterity than elites or institutions, so that archival records often reflect the views of wealthy, educated, powerful men. Witness depositions and suspect interrogations preserved in the archives of civil and criminal courts are an exception to the rule, as they offer rare insight into quotidian historical practices from broad layers of the population and (even if indirectly) into the speech ordinary witnesses and suspects used to describe those practices to the clerk who recorded the testimonies. The legal principles upheld at the time placed a great deal of emphasis on the accurate recording of depositions, since the ultimate motivation for a verdict was not the 'internal conviction' of the lawyers, but the formal evidence obtained within a highly regulated evidence system. This means that creditable witness depositions and confessions by the suspect were of crucial importance for the determination of the procedures to be followed and for the final verdict. They do provide us with such an – albeit indirect – reflection of the everyday spoken word and thus allow us to write a 'language history' from below. A significant part of the people who testified in the context of a criminal investigation were illiterate. But was everyone as likely to appear as a witness – or did courts exhibit a preference for better-educated and better-off witnesses? And did courts record and confront less highly educated witnesses in a different way? Based on a corpus of more than 3000 witness depositions and suspect interrogations preserved for eighteenth- and nineteenth-century Bruges and its rural surroundings, this contribution wants to analyse if there existed a link between the (il)literacy of witnesses and suspects and specific features of their testimonies, such as the kind of cases in which they were called upon, the length of their testimony, the use of direct speech, and implicit (de-)constructions of reliability and credibility,...).

# Low Transitivity across passive-like structures in Spanish and French A corpus-based analysis of types of verb processes in Low transitivity clauses.

Panel contribution

***Ms. Emeline Pierre<sup>1</sup>***

*1. Université catholique de Louvain*

Various researchers (Halliday 1996, Hopper & Thompson 1980, Quesada 1998, Helasvuo 2001, Naess 2007) have studied the notion of transitivity and demonstrated its primordial role in syntactic and usage-based studies. Nevertheless, few studies have examined the relation between transitivity and agent defocusing. This paper aims to fill this gap by exploring how the degree of transitivity impacts the characteristics of a series of impersonal constructions in French and Spanish. More precisely, I concentrate on low transitivity clauses in periphrastic passives, se-constructions, man-impersonals and non-anaphoric third person plurals. Analysing corpus-based data from oral and written modes and from formal and informal registers, I aim to evaluate the potential impact of transitivity on the behaviour of passive-like structures across two languages, with a special focus on the type of verb process.

When applying Hopper and Thompson's model of ten components to distinguish low from high transitivity clauses, preliminary results show that few occurrences of impersonal constructions possess all the characteristics of a true low transitive clause. The selection of data thus comprises low transitivity occurrences including from 0 to 3 of the ten transitive features listed by Hopper and Thompson (1980).

A closer examination reveals the following elements. Preliminary results show that French is the one to resort the most to impersonal constructions low in transitivity, especially the man-impersonal. Findings also indicate that low transitivity impersonal mechanisms are more specific of the oral mode as they account for 69% of the data, with a preponderant use in informal oral productions. Zooming in on these data, with a focus on the type of verb process, impersonal constructions exhibit a general tendency for mental and relational verbs which are commonly used to support speakers' intersubjective perspective. While the extensive use of mental verbs could be observed in both languages, relational verbs seem to be more specific to French. Since low transitivity impersonal constructions were mainly found in conversational situations, this extensive use of relational and mental verbs is in line with the fact that language production is about 'how things are from our perspective', a specificity of day-to-day pragmatics of interactional situations highlighted by Hopper & Thompson (2001:53). As for the distribution of the type of process per language French preferentially resorts to both mental and relational verbs while Spanish displays a marked preference for mental verbs. In conclusion, when analysing impersonal constructions with a special focus on low transitivity clauses, it can be suggested that the degree of transitivity, the language and the mode/register variation are key factors and may impact on their characteristics and, more precisely, on the type of verb process used in the clause.

# Lying as a general phenomenon and lying as a manipulative act

Panel contribution

**Prof. Xin Li<sup>1</sup>**

**1.** Shanghai International Studies University

Lying is a common but controversial phenomenon in human society. This paper sets out to examine lying in verbal communication adopting the Relevance-Adaptation Model (Yang, 2001) to accommodate both the speaker's and the addressee's stance. Four specific research questions are addressed to highlight the motivation and mechanisms of lying:

- (1) What is a working definition of lying?
- (2) Why does a speaker choose to lie?
- (3) How does a speaker produce lies?
- (4) How does an addressee interpret lies?

By conducting a qualitative analysis of the lying cases retrieved from *Lie to Me*, an American TV drama which is teemed with all sorts of lies told by different people with different backgrounds, positions and ages, in different settings and for different purposes, this paper works out an operational definition under the research framework. For the speaker, to lie is to choose a verbal stimulus through developing a misrepresentation of truth, with the non-prior-notified intention to make this representation manifest or more manifest to the addressee. For the addressee, the speaker is lying when what s/he states disagrees with the addressee's assumption of the speaker's cognitive environment.

In addition, this paper proposes a hypothesis regarding the production and interpretation of lying. The presumption of relevance motivates both the speaker to lie, and the addressee to process lying in the first place. Then, both communicators will enter a relevance-adaptation phase by making structural choices inter-adapt with relevant contextual correlates. Only a successful interpretation by the addressee of the speaker's hidden intentions in lying can result in its relevance. This finding motivates the addressee to conduct multi-turn conversations in order to seek relevant outputs.

Finally, this paper makes the case that lying is a manipulative speech act which is closely related to the cultural, historical, and political context it takes place in. By relentlessly dismissing and distorting facts, or by deliberately stretching and exaggerating the truth, lying helps to create new realities in the interest of the manipulator. Thus, as a specific form of intentional manipulation, it is of great significance to understand lying including its meaningful impacts, severe consequences, or violent repercussions on the person(s) and community being lied to since the stakes can be pretty high particularly under critical circumstances and during times of crisis. With a close scrutiny of lying from the pragmatics perspective, we can have the potential to identify its workings and more importantly, develop the means for counter-manipulation.

# Lying through the prism of contrastive pragmatics

---

Panel contribution

---

***Dr. Songthama Intachakra<sup>1</sup>***

**1.** Thammasat University

Lying is an interactional practice common to all cultures. However, issues regarding how lying varies in form and interpretation (e.g. understatements, half-truths, white lies, malicious lies and fake news), as well as in function (e.g. promoting H's peace of mind, exonerating S him/herself, putting H's life or safety under threat, etc.), remain relatively unexplored across cultural boundaries. My contribution is an attempt to critically discuss the current state of studies of "being less than truthful" between cultures (and specific to cultures) and the implications of major analytical frameworks employed, from a contrastive pragmatic perspective. Particular focus is given to culture-specific assessments of pro-social lying, types of those engaged in lying, and the role ideologies such as politeness, cost-benefit, credibility and responsibility play in lying and in the management of interpersonal rapport in different cultures.

# Making sense of danmu: Coherence in massive anonymous chats on Bilibili.com

Panel contribution

***Dr. Leticia-tian Zhang<sup>1</sup>, Dr. Daniel Cassany<sup>2</sup>***

*1. Beijing Foreign Studies University, 2. Universitat Pompeu Fabra*

Although coherence has been widely studied in computer-mediated communication (CMC), insufficient attention has been paid to emergent multimodal forms. This study analyzes a popular commentary system on Chinese and Japanese video-sharing sites – known as *danmu* or *danmaku* – where anonymous comments are superimposed on and scroll across the video frame. Through content and multimodal discourse analysis, we unpack *danmu*-mediated communication analyzing the newest interface (on Bilibili.com), the comments, the interpersonal interactions and the unusual use of the second-person pronoun. Results show that despite the technological constraints (hidden authorship, unmarked sending date and lack of options to structure comments), users construct order in interactions through repetition, *danmu*-specific expressions and multimodal references, while using playful language to make fun. This study provides an up-to-date analysis on an increasingly popular CMC medium beyond well-studied social networking sites, and broadens the understanding of coherence in contemporary CMC.

# Making sense of talk in context: the interrelation of private and public mental models

Panel contribution

***Dr. Henri de Jongste<sup>1</sup>***

**1.** FH Dortmund University of Applied Sciences

When people interact in a situational context, they must model the situation of the interaction in their minds. Building forth on Van Dijk's work (van Dijk, 2008, 2009, 2014), I call such situation models *private mental models* of the ongoing situation (de Jongste, 2016, 2018, 2020). Private mental models are not purely cognitive; they include evaluations, emotions, feelings and desires. In interaction, private mental models can be made public through discourse to coordinate the interactants' situated behaviour so that cooperation becomes possible. However, owing to social pressure, public mental models often deviate from private mental models.

I will argue that personal, cultural and universal knowledge about situational contexts together with theory of mind skills enable us to hypothesise what other people's private mental models of the ongoing interaction are, in spite of their private nature and independently from what people publicly profess. This implies that when people make sense of other people's discursive behaviour, they not only infer what these people's public mental models represent. They compare their inference of other people's public mental model with their reconstruction of their private mental model. In this way, people can make sense of forms of *overt untruthfulness* (Dynel, 2018); in other words, cases in which people are noticeably insincere.

To show that the reconstruction of private mental models is a routine practice, I will use a fragment from the British TV series Dragons Den. In one episode, the voice-over introduces a pitch by stating that the challenge for businesspeople is to get honest feedback. Feedback is often unreliable, as what people say [i.e., their (positive) public mental models] may deviate from what they really think [their (negative) private mental models]. In contrast, the Dragons provide "positive encouragement or brutal home truths"; in other words, their private mental models are made public without much social filtering. However, In the course of the programme, the investors freely share reconstructed private mental models of the pitching entrepreneur, and these serve as a basis for understanding the course of the interaction.

After having shown that private-mental-model reconstruction is a common phenomenon, I will discuss how the recognition of humour, irony and face work depend on comparing public and private mental models. I will also respond to sceptical reactions I have received.

# Managing engagement in multiplex digital interactions

Panel contribution

**Dr. Sage Graham<sup>1</sup>, Mr. Scott Dutt<sup>1</sup>**

*<sup>1</sup>. University of Memphis*

Early investigations of the sequential organization of online chat were a challenging endeavor. Characteristics such as multi-threading and disrupted turn adjacency made the turn-by-turn unfolding of interactions difficult, if not impossible, for analysts to follow (Cherny, 1999; Herring, 1999). One curious discrepancy that recurs throughout these studies is that actual chat users displayed few-to-no signs of trouble following and participating in the flow of chat. Researchers of participant-point-of-view screen capture (e.g. Garcia & Jacobs, 1999; Meredith & Potter, 2014) have discovered that sequential organization of chat is significantly nuanced and should be investigated not only through how chat messages form conversational sequences themselves, but also how sequences are complicated when multiple platforms operate in conjunction with one another.

This study will investigate the role of synchronous text-based chat used in conjunction with audiovisual artefacts (e.g. bots/AI, screen design) and explore what impact this conjunction has in communicative practices. Although chat and video are each more-or-less synchronous themselves, in a streaming environment they co-occur but are not always synchronous with one another. This creates tremendous variation in conversational sequences – which in turn may create misunderstanding and/or interfere with community-building.

We will focus here on the interplay between video and chat messages from 2 platforms: the online interactive platform Discord and the game-streaming platform TwitchTV. By cross-referencing verbal and visual conversational moves, we will assess how these sequences are understood by participants and identify where pragmatic (mis)understandings do (or do not) arise. In addition to recordings on interaction on the two platforms, the data from Discord will also include eye-tracker data that records where participants' gaze falls on the screen prior to posting chat messages. This will illuminate how the participants' attention (as indicated by where their eyes go) affects/reflects their subsequent chat responses. We can thereby gain a better understanding of how participants interpret and respond to prior messages, which will in turn shed light on how consistent understandings of sequential structures can potentially reinforce community norms. Specifically, we will address:

- How the complex turn sequences in synchronous multiplex media are managed by participants in real time
- How visual elements of a digital environment impact communicative choices.

# Managing engagement in the social space of online gaming

Panel contribution

**Ms. Elisabeth Andersen<sup>1</sup>, Mr. Anders Hougaard<sup>1</sup>**

**1.** University of Southern Denmark

Online multiplayer games not only involve interaction between individual players and the in-game actions and universe, crucially it also involves social interaction between players. Games such as the survival game Fortnite allow for players to organize as teams and to communicate verbally with team members using Voice over IP-systems such as Discord during games. This paper analyzes how interactional resources are distributed between and utilized by the participants in a two-player-team mission in Fortnite.

Focusing on instances in which one of the participants' avatar 'dies', we analyze how the participants continue their common mission by distributing their resources such that one participant mainly participates by interacting 'with the game', whereas the other participant actively indicates his understanding of and teammate-involvement in the in-game actions through verbal actions.

We show how, after having accounted for dying (Rusk & Ståhl, 2020) topicalising previous actions, the 'dead' participant re-engages in the joint mission by recognizably making noticing of and response cries (Goffman, 1978) to actions happening in the game, thereby positioning himself as an active spectator and teammate. In several instances, he comments on the in-game actions done by his teammate in evaluative terms, thereby displaying no accountability for the actions while continuing displaying active spectatorship.

We also show how he uses singing and other 'performative resources' (Aarsand & Aronsson, 2009) such as using English expressions with a distinct accent to indicate his continued social presence in the setting of the game and an understanding of the current in-game activities as 'routine' and not requiring his focused attention or being 'in an alert mode'.

These actions require minimal uptake from the co-participant who is engaged in the game, and lack of response is not treated as accountable. Further, when the 'dead' participant uses response-mobilizing strategies such as recipient address and question formats, only minimal verbal uptake is required by the co-participant.

Thereby, the participants organize and distribute their common engagement in the social space of the online game in ways that locally consider recent and current in-game actions and the participants' current possibilities for contributing to accomplishing a common in-game mission. Whereas one participant's presence and engagement are mainly observable and thereby potentially 'shared' through the visual representation of his avatar 'in the game', the 'dead' participant uses verbal means to manage engagement.

In sum the 'dead' teammate manages varied 'levels' of engagement, presence, intersubjectivity and even intercorporeality (through the living avatar) that are finely tuned to the practical gaming situation and events at hand. The study of these accomplishments testify to an emergent, mediated social space that gamers from the comfort of their leather chairs are constantly involved in co-constructing.

# Managing Inclusion in Bilingual Interactions in Residential Eldercare

Panel contribution

***Prof. Nicole Müller<sup>1</sup>***

***1. University College Cork***

Residential care homes for older persons tend to be contexts where people with widely differing language and communication skills live together. In such environments, it can be challenging to maximize opportunities for interaction and participation for individuals with cognitive-communication disorders associated with dementia. Additional challenges can arise in bilingual environments, where individuals' language skills and language use preferences vary, and where miscommunication and social exclusion may arise out of language barriers (see e.g. Müller, 2017).

This contribution reports on a field study in a bilingual nursing home in Ireland, where the majority of the residents speak Irish as their first language, and which is home to residents with and without dementia. The researcher generated data from field observations and interviews with staff and residents. The general research question was "How do residents and staff in the bilingual context of the nursing home use their languages in day-to-day life, and what meanings do the languages hold for them?". In this presentation, I will present data and analysis addressing a sub-question, namely, "How do residents and staff use language(s) in order to facilitate inclusion and participation in group interactions, and what are their perceptions about these interactions?" The framework of analysis is grounded in Systemic Functional Linguistics, which holds that choices made in language use enact two basic functions, namely the ideational or experiential function (construing and expressing realities) and the interpersonal function (construing and expressing relationships and identities). In addition, the textual function (structuring information into texts) enables the former two (see e.g. Halliday & Matthiessen, 2013).

Results will be presented under the following categories:

Functional language switching to manage communication breakdowns

Language-switching and informational redundancy to facilitate group participation

Targeted language choice to encourage and maintain individual participation

Adoption of learner and facilitator roles by staff to validate and encourage expression of expertise on the part of residents.

# Manipulating citizens' beliefs and emotions: Consensus-building and dissensus-suppressing tactics in times of crisis

Panel contribution

***Prof. Cornelia Ilie<sup>1</sup>***

**1.** Stömstad Academy

While the notion, manifestations and goals of manipulation have attracted the interest of a diversity of scholars (Billig and Marinho 2014; Coons and Weber 2014; Le Cheminant and Parrish 2010; Maillat and Oswald 2009; Nettel and Roque 2012; Rigotti 2005), less attention has been devoted to the scrutiny of discursive, meta-discursive and inter-discursive strategies that underpin the opaque and fuzzy institutional manipulating practices as they are perceived (challenged or defended) by citizens in multifaceted responses to official narratives. In times of crisis, such as the covid-19 pandemic, social divisions caused by dissensus of opinions about emerging social, economic and health policies tend to increase exponentially due to widespread uncertainty, anxiety and worry at all societal levels, being often fueled by the proliferation of covert and overt manipulative strategies in public authorities' discourses (Boczkowski, Mitchelstein and Walter 2011; Nettel and Roque 2012).

Managing an extensive and long-lasting crisis that involves controversial policies becomes highly problematic in a country like Sweden, where consensus is largely institutionalised and dissensus is regarded as an anomalous inconsistency (Rosenberg 2002; Witoszek and Trägårdh 2002). Like other nations, Swedes were confronted during the covid-19 crisis with scarce or inconsistent information, and sometimes potentially or actually conflicting information, while trying to ensure a tradition-rooted national consensus. To shed light on the argumentative underpinnings of manipulative communication practices used during the covid-19 crisis management in Sweden, this study scrutinizes the interactive dynamics of online newspaper threaded comments made by reactive and counter-reactive citizens with regard to incriminating facts and data disclosed by high-profile journalists about contested policies and disputed guidelines promoted by the national health authority.

A pragma-rhetorical framework of analysis (Ilie 2015; 2018) and an argumentation analytical approach (Walton 2005; Walton and Krabbe 1995) are used to account for the ways in which the manipulation of citizens' beliefs and emotions in official narratives is responded to by citizens' challenging or supportive online messages. The focus of the analysis is the polarisation between arguments contesting and arguments justifying official crisis management policies that involved both consensus-building tactics (repeating group-cohesive keywords, citizen-friendly overgeneralisations, reinforcing shared beliefs, dismissing contrary opinions) and dissensus-suppressing tactics (providing selective information, withholding strategic information, stonewalling, de/re-contextualising critical position-takings, scapegoating).

The following research questions have been pursued throughout this investigation:

- How are manipulative strategies used by Swedish political and health authorities to promote self-legitimization and other-delegitimization in covid-19-related communication practices aimed at the public at large?
- What cognitive, evaluative and/or emotional aspects of the official narratives are challenged, criticized or supported by Swedish citizens in online newspaper threaded comments?
- Which are the most recurrent (pro and con) arguments used by Swedish citizens in response to disclosures presented in online newspaper articles, and what do they particularly target (e.g. the journalists' standpoints on the issue under debate, the arguments advanced by previous commentators)?

# Manipulation in Exceptional Times: Exploiting overwhelming contextual parameters for deceptive purposes

Panel contribution

***Prof. Didier Maillat<sup>1</sup>, Dr. Steve Oswald<sup>1</sup>***

***1. University of Fribourg***

In the last fifteen years a flurry of cognitive pragmatic investigations has tackled descriptive and theoretical models of manipulative uses of discourse (see for instance Saussure 2005, Maillat & Oswald 2009, 2011, 2013; Meibauer 2014). Most of these works have considered manipulation as a form of language use targeting comprehension processes to hinder the hearer's ability to process and evaluate information optimally. Manipulative strategies were thus seen as requiring a constraining action affecting the hearer's comprehension and acceptance processes.

However, right from the outset of this joint effort, scholars noted that some such constraints could be the result of external, pre-existing circumstances rather than of some premeditated action of the manipulator. Saussure (2005: 12-3), for instance, identified times of social unrest as conducive to manipulative attempts. More recently, Mazzarella (2013: 40), working on the set of cognitive mechanisms human beings evolved to protect themselves against manipulation and misinformation, namely *Epistemic Vigilance*(EV; Sperber et al. 2010, Mercier & Sperber 2017), identified special contextual circumstances that could weaken the defensive action of EV, such as situations involving a sense of danger for the hearer.

In this paper, we look into the manipulative affordances of contextually salient events, using the recent COVID pandemic as a case in point, to investigate the types of manipulative strategies which could exploit the contextual constraints imposed in such exceptional times. Recent work published in *Frontiers: Public Health* looks for instance at the kind of disruption caused by the pandemic on the public's assessment of information (see Lavazza & Farina 2020 for expert opinion, or Thomas et al. 2020 for media coverage). We will draw from recent English and French data sourced from various western (online) media and political discourse to illustrate our points. More specifically, we will apply the relevance-theoretic model for the analysis of deceptive communication we developed over the years – Context-Selection Constraint (CSC) – to identify and analyse how manipulators harness overwhelming contextual features to deceive the hearers' interpretative and evaluative processes. Following up on Maillat & Oswald (2011), using examples taken from the recent health crisis, we will show how overwhelmingly salient contextual features can be used to minimise the relevance of undesirable pieces of information in the public eye. We will also look at how these exceptional contexts can impact epistemic vigilance, as they affect the processes governing the evaluation of source reliability and credibility (see Boulat & Maillat 2018) for instance, thereby creating a favourable ground for fallacious arguments of authority. Finally, we will see how an informational void can trigger a sense of urgency that can lead hearers to lower their epistemic filter for instance in terms of their assessment of information coherence.

# Manipulation through inferences: How mismatches in communicative goals affect meaning in a legal context

Panel contribution

***Prof. Luna Filipovic<sup>1</sup>***

**1.** University of East Asia (Uea)

In this talk I use pragmatic theory and apply it to novel, real-life data in order to shed light on communication in the legally sensitive context of police interviews with suspects. The rules of communicative interaction in this context are quite specific and restrictive and include unbalanced power relations and opposing communicative goals. I raise the question of what constitutes meaning when interlocutors purposefully try to derive inferences from each other's utterances that support their own goals rather than retrieving the speaker's intentions as envisaged by Gricean pragmatics. The focus is on inferences that are drawn by the hearer and clearly not intended by the speaker and I explain when and why the speaker may accept them. This context is of particular interest for the study of negotiated meaning because of the implications of what has been said and understood for practical outcomes that may significantly impact people's lives.

I follow the theoretical and methodological approach to speaker meaning and conversational inference by Elder and Haugh (2018) whereby a third turn in conversation is needed as a clue to whether and how the utterance meaning has been negotiated between interlocutors. Using an extensive database of both monolingual and bilingual (interpreter-assisted) interview transcripts from two different jurisdictions, the UK and the US, this study shows that in these two countries both police officers and suspects engage in manipulation through inferences while trying to reconcile two opposing aims of a) achieving the individual communicative goal and b) maintaining the fragile communicative cooperation. I illustrate how this balancing act has to be very fine-tuned if communication breakdown is to be avoided, though it is clear that this kind of exchange leads to a waste of precious police time. The question that arises then is why the police engage in this kind of meaning negotiation? One reason is the need to keep the communication channel open and build rapport, which is essential for any suspect questioning in police contexts. The second reason is different for the two countries because of the differences in the *process of meaning negotiation*, reflected in the two different police interview approaches adopted, the Reid technique in the US and the Cognitive Interview in the UK. In the US, manipulation through inferences is designed to get a confession while in the UK confession is not a goal in itself – rather the aim is to get enough information that is useful for subsequent legal processes. This is why there is more pressure in US police interviews to impose an inferential interpretation as a negotiated and agreed meaning than in the UK where inferences may remain unchallenged in order to allow for longer, information-rich speaker turns. I discuss the benefits and drawbacks of both approaches to meaning negotiation as well as the consequences of the use and abuse of inferences for information elicitation.

# Mappings and metaphorical scenarios in contemporary discussions on Facebook about the Brazilian vaccine “crisis”

Panel contribution

**Prof. Inês Signorini<sup>1</sup>, Prof. Luiz Andre Neves de Brito<sup>2</sup>**

**1.** UNICAMP (Universidade Estadual de Campinas), **2.** Universidade Federal de São Carlos

Tropes and imageries, particularly metaphors and metaphorical mappings and scenarios, are fundamental resources for making, enacting and managing meanings, as they play a relevant role in the rhetorical action of appealing, performing and persuading. In fact, as metaphor studies has been arguing since the 1980s (e.g., Lakoff & Johnson, 1980 ; Lakoff , 1993; Kövecses, 2002 ), metaphors provide a way of structuring attention and reasoning from an angle or perspective from which the object, concept, argument, event, or any semiotic representation will be viewed by audience, suppressing other aspects which are inconsistent or contradictory with the value referred. Thus, metaphorical framing may enhance efficacy and persuasive power, particularly in strategic discourse. Therefore, it is a powerful influencing tool in the sociopolitical arena. In this paper, we describe and analyze some frequent metaphorical mappings and scenarios in social media discourses about individual freedom and liberal values, produced by the Brazilian President's interlocutors in a facebook discussion about vaccination policy against Covid 19 pandemic (from October to December 2020), and involving expressions of hate towards people, images and statements not aligned to the position of authority or value to which the President's provocatives statements refer. Through illustrative examples underscoring both the official statements attributed to the President and the rhetoric linked to it on one hand, and the mobilization of socio-semiotic tools as well as historical and sociocultural knowledge by the audience on the other, we show that metaphorical framing in the conceptualization of the “vaccine crisis” mobilizes a structured cluster of conceptual metaphors articulated through mini-narratives or scenarios (Musolff , 2006 , 2016 ) which predominantly depict it as a common sensical indisputable issue - mandatory vaccine hurts individual freedom; vaccine from China hurts national sovereignty - , resulting in inaccurate and highly simplified descriptions of the problem, based on religious conservative tradition, immediate concrete individual experiences, information provided by network participants, both people and bots, and multimodal sociomedia advertising materials.

# Mask wearing rules! Formal and interpersonal rules in public disputes about face coverings

Panel contribution

**Dr. Jack Joyce<sup>1</sup>, Dr. Adrian Kerrison<sup>1</sup>, Ms. Hanna-Leena Ristimaki<sup>2</sup>**

*<sup>1</sup>. Ulster University, <sup>2</sup>. Tampere University*

Our research is interested in the invocation/rejection of formal rules versus the more local management of interpersonal rules. We ask how rules around (non)mask wearing are negotiated, and how people are held accountable for their social behaviour during Covid-19? Owing to the global Covid-19 pandemic, many countries have mandated rules around using face coverings in public spaces (eg. shops, public transport). As the Covid-19 pandemic began there was conflicting information as to whether masks were helpful in slowing the spread of the virus; however, research later confirmed the usefulness of face coverings (see Greenhalgh et al., 2020) and thus they were required in public spaces in most countries from the middle of 2020. The conflicting information regarding the usefulness of masks fostered anti-mask movements such as the “anti-maskers” who label face coverings as “muzzles”.

Using Conversation Analysis, we examine sequences of naturally occurring talk where a dispute over (non)mask wearing occurs. This method uniquely captures the linguistic practices which are used to (1) account for (not) wearing a mask, (2) produce and police rules of social conduct, (3) contend with moral issues. Our collection is being expanded and comprises recordings of public disputes regarding mask wearing. These recordings are produced by participants (usually on a mobile phone), and are subsequently uploaded onto social media (e.g. TikTok, YouTube, Twitter) often in an effort to ridicule one or both of the disputants.

The current context of Covid-19 has presented EMCA researchers with a novel opportunity to document ‘change-in-the-making’, whether that is new forms of greetings (eg. elbow bumps, foot taps etc.) (Mondada et al., 2020); communication through a mask (Cantarutti, 2020); or, the new normal of healthcare consultations (Seuren, 2020). Indeed, scrutinising new rules of social behaviour is important – but as is investigating the contentious nature of these rules, and how people adhere and breach them in their everyday lives (see Garfinkel, 1967). It is important to understand whether and how these rules of social behaviour are enforced, and individuals’ language solutions for producing and contesting rules. Pulling this together, our presentation will shine a light on how “change-in-the-making” (Mondada et al., 2020) is contended with, how “new” rules of social behaviour are not straightforwardly accepted, and the ways that arguments surrounding the face coverings are constructed on a moment-by-moment basis.

# Material, interactional and normative environment for tasting: first vs. second assessments of wine in gastronomic restaurants

Panel contribution

***Dr. Laurent Camus<sup>1</sup>, Prof. Lorenza Mondada<sup>1</sup>***

*1. University of Basel*

In high-end restaurants, tasting the wine proposed by the sommelier prior to its final approval is a recurrent practice that relates at the same time to the materiality and sensoriality of the wine tasted, to the normative cultural expectations relative to wine and the ways of tasting it, and to the interactional setting, concerning who interacts with the taster. This paper addresses the way these multiple issues are superposed in the practice of assessing (Goodwin & Goodwin 1987, 1992; M.H. Goodwin 2007; Pomerantz 1984), by analyzing two recurrent sequential environments in which tasting and assessing occur: a) in the first environment, the client's sensory engagement with tasting is followed by a first assessment addressed to the sommelier; b) in the second, wine is tasted again, assessed again, but in a way that is recipient-designed for the co-participant(s) at the table, after the sommelier has left. This phenomenon of double assessments, which often follow each other in a time span of a few minutes, constitutes a perspicuous setting to investigate the interplay of sensoriality, materiality, normativity and intersubjectivity. Within an ethnomethodological and conversation analytic framework interested in the multimodality and the multisensoriality of tasting, the collection on which the study is based enables to discuss several questions. First, it starts from an analysis of the embodied production of assessments in relation to the sensorial access to the object – contributing to the ongoing literature on tasting sessions (Liberman 2013, 2018; Fele 2016, 2019; Mondada, 2018, 2020), but also to other contexts in which tasting + assessing occurs. Second, it also enables to highlight the reflexive production of assessments in relation not only to their material source, but also to the specific participation framework in which tasting occurs, including another party who might be witnessing tasting (Mondada 2018, in press a), instructing it (Mondada 2020, Mondada & Fele in press) or co-engaging in it (Mondada, in press b). Finally, it enables to explore the way in which the other party – in our case the sommelier – incarnates authority, expertise and normativity and is oriented as such, reflexively shaping the production of assessments and, ultimately, the sensorial experience itself. The production of first and then second assessments in a changed ecology shows the recipient-oriented and normative dimensions of assessments: for instance, the taster might accept the wine proposed by the sommelier but criticize it afterwards when talking with their partner. The phenomenon of double assessments casts light on what is at stake in assessing an object, revealing that participants can use assessments to do diverse actions. Finally, the phenomenon also casts light on how the valuation (Hennion 2017) of products is locally achieved in situ, and sensible to changing contingencies, which crucially relate on social interaction.

# Maternal hope as a position of struggle: New representations of intellectual disability

Panel contribution

**Mrs. Mayssara Reany de Jesus Oliveira<sup>1</sup>, Dr. Izabel Magalhães<sup>2</sup>**

*1. Federal District Education Office, 2. University of Brasilia*

Chimamanda (2009) talks about how to tell a single story of a particular group can mean “danger” for identity construction. For students with intellectual disability, the medical report is still an important document to guarantee access to public policies in Brazil. The diagnosis moment, however, can be critical in relation to their mothers’ disappointment as to their dreamed possibilities in life. Associated with the constructed social stigma about disability, the biomedical clinical model of intellectual disability interpretation can represent true hopelessness, and it can reinforce the ableist.

This presentation analyzes accounts of women in a situation of social vulnerability, mothers of students with intellectual disability, focusing on the moment in which the doctor tells them about their children’s medical diagnosis. In the mothers’ comments, there is a common perspective of hope as a form of resistance to the medical interpretation of their children’s disabilities. The mothers’ hope concerning their children’s learning capacity can be seen as radical hope (Lear, 2006). Thus, different from mere optimism, the mothers’ position suggests a state of struggle against the hegemony of a “normal identity” (Silva, 2000: 83).

The mothers’ accounts belong to an ethnographic research in a community of students with intellectual disability, their mothers and teachers in an inclusive state school of the Federal District of Brazil. The data analysis followed the proposal of Critical Discourse Analysis (CDA) and the Social Model of Disability, examining the mothers’ strategies in coping with despair, which derive mainly from the religious discourse. It indicates the need to combat the notion of the ableist body and reductionism in relation to the representations of people with intellectual disability, in the emphasis given to maternal hope, which addresses the respect to the subjectivities of people with intellectual disability, and ensuring their learning process in school. In line with Miyazaki (2004) and Bloch (1986), we propose here a study of maternal hope in the mothers’ accounts, not in terms of contemplation, but as a method for knowledge building and engaging with the world.

**Keywords:** Intellectual Disability; Hope; Ableist Body; Social Model of Disability.

# Meaning Generation and Translation in Chinese Official Media Discourse in a Crisis Context

Panel contribution

***Dr. Bettina Mottura<sup>1</sup>***

*1. University of Milan*

Starting from the assumptions that all texts published by Xinhua News Agency vehiculate official media discourse, and that institutional translation (Koskinen 2014, Kang 2014) is a well-established practice in the Chinese official press, this paper analyses, from a discourse analysis perspective, how the articles published in different languages represent the role of China in the COVID-19 pandemic to audiences worldwide.

With translators acting as key mediators in the diffusion of an authoritative flow of information at the global level (Kang 2007), articles published by Xinhua News Agency in Chinese, French and English languages are products of institutional media discourse where a strategy of adaptation to the respective intended audience is performed. In this perspective, the paper will analyse and compare three language specific corpora of articles published by Xinhua News Agency on the COVID-19 pandemic in 2020.

First, quantitative analysis will be performed to highlight core topics in the three corpora. Second, qualitative analysis will be applied to a selection of data in order to trace patterns of intertextuality and recontextualization linking the translated texts (Bielsa and Bassnett 2009, Schäffner and Bassnett 2010) and to identify the discursive frames (Entman 1993) through which the topics are represented.

By tracing convergences and discrepancies emerging from articles in different languages and their framing strategies, the aim is to discuss how Xinhua News Agency acts as a gatekeeper and builds a well-defined image of the country (Cheng *et al.* 2016) through the products of institutional translation, thus contributing to strengthen the legitimacy of Chinese national political institutions worldwide (Hong 2011, Xin 2012) in a crisis context.

# Media as cookie cutters? Exploring the digital medialities of social media news

---

Panel contribution

---

***Dr. Daniel Pfurtscheller<sup>1</sup>***

*1. University of Innsbruck*

My paper deals with ways in which the medial environments of television and social media affect the design of news. I focus on digital ‘newsbites’: bite-sized snippets of news discourse to be shared and commented on social media services. Digital newsbites are appetizers, designed to simplify and reduce news items and encourage readers to visit the full article or news broadcast. The data consists of selected news items from ‘Zeit im Bild’ (ZIB), the most important news magazine and the largest public service news offering on social media platforms in Austria. Considering the TV news shows broadcast on the evening program, I analyze the newsbites that are posted on the ‘Zeit im Bild’ profile on Facebook and Instagram.

The qualitative analysis addresses the research question of how the established media procedures of television journalism are transferred and transformed to the new media environments of social media platforms. On the micro-level, my analysis deals with the multimodality of the news design. On this level I examine the language, presentation and composition of text elements, static images and video clips used as part of the digital news bites. On the meso-level, the contextual integration of the contributions into the media environment is examined. Here I focus on the practices of recontextualization and try to retrace these processes in the data. On the macro-level, the broad question of how the mediality of social media platforms can be described is at stake.

In my paper I will present the results of the analysis along these three dimensions. On this empirical basis I argue that social media platforms can be considered ‘designed spaces’ that shape the form and function of digital news and news-centered user interactions initiated therein. The affordances of the platforms as a framework do indeed establish a medial environment that defines the shape of the newsbites when it comes to their (external) form and functionality. The internal design of the newsbites (their ‘flavor’ so to say), however, is determined offsite and is related to specific journalistic practices and media cultures. To describe this kind of processing, the metaphor of the digital ‘cookie-cutter’ is proposed and put up for discussion regarding its usefulness and limitations.

---

## Media as social procedures – setting the scene

---

Panel contribution

---

**Prof. Martin Luginbühl<sup>1</sup>, Prof. Jan Schneider<sup>2</sup>**

***1. University of Basel, 2. University of Koblenz-Landau (Campus Landau)***

In our talk we will discuss our understanding of media especially in media linguistics. We argue that all communication is medial in the sense that every human sign-based interaction is shaped by medial aspects from the outset, and we propose a dynamic, semiotic concept of media that focuses on the process-related aspect of mediality. Media can be understood as social procedures of sign processing (Schneider 2017). We criticise the reification of media as matters of meaning transporters – that is still common in many works of media linguistics – by arguing that all media are technical media, but the technical aspect cannot be reduced to materiality or apparatuses. Rather, we include in our understanding of technology a broader understanding of the term as technique in the sense of practical skills (Winkler 2008). Our dynamic concept takes into account the narrow link and interdependence between “sign” and “medium” in social interaction and is therefore relevant as a theoretical and methodological basis of multimodal interaction analyses.

We test the applicability of the proposed media concept using as examples the second presidential debate between Hillary Clinton and Donald Trump in 2016, the first debate between John Biden and Donald Trump, and the debate between Kamala Harris and Mike Pence, both 2020, which show how the spatial arrangement and camerawork create meaning and how the protagonists both use the affordances of this special mediality and have their behavior shaped by it. The analysis also demonstrates that, even in this staged situation, face-to-face communication must already be regarded as an inescapable medium of human communication and has a mediality from the outset (Luginbühl 2019).

# Mediality vs. materiality. A multimodal perspective on the notion of medium

Panel contribution

***Dr. Janina Wildfeuer<sup>1</sup>***

*1. University of Groningen*

This talk aims at adding a multimodal perspective to the definition and understanding of the notions of medium/media and mediality and at critically reflecting upon their conceptualizations as ‘technical infrastructures’ and/or ‘socially constituted semiotic procedures’ and the understanding of as processing and constituting signs (see the panel description).

In our recent work, we provide a definition of medium that is strongly connected to the notion of semiotic modes operating in the medium and “realis[ing] meaning through their material or ‘virtual canvas’ as well as their semiotic side” (Bateman et al. 2017: 124). While this definition shares some similarities with both the above mentioned conceptualizations, it also differs from them in a significant aspect: In our opinion, a medium is indeed a “site for the deployment and distribution of some selection of semiotic modes” (Bateman et al. 2017: 123), but it is itself not the locus of semiotic procedures or activities. These rather happen directly on the level of the semiotic modes or, more precisely, on the level of the canvas as the specific material dimension of a semiotic mode.

The talk will first discuss the various notions involved in this definition and compare them to other definitions of media and mediality at issue in the panel (e.g. Schneider 2017, Luginbühl & Schneider 2020) - with the aim of pointing out the advantages and disadvantages of each concept. In a second step, the definitions will be applied to and tested with some practical examples of current media artefacts, i.e. recordings of online seminars conducted at the University of Groningen in the academic year 2020/2021. These online seminars can be seen as very complex multimodal artefacts in which various forms of texts and media come together. It is therefore particularly important to analyze the material and semiotic dimensions of all aspects involved in the meaning-making process. The analytical application will thus demonstrate the need for a clear distinction between various levels of description for both semiotic modes as well as media and the notion of the canvas as the “interface that a medium provides for the interpreters of the ‘messages’ that the medium carries” (Bateman et al. 2017: 101).

# Méi: An innovative human classifier and its social indexicality in Chinese digital culture

---

Panel contribution

---

***Ms. Heidi Hui Shi<sup>1</sup>***

*1. University of Oregon*

This study investigates emerging usages in Chinese cyberspace of the numeral classifier méi that violate syntactic and semantic conventions of the canonical grammar of modern Chinese. We treat these usages as constructional variants of the canonical classifier construction and show how they afford users of Weibo a device of social indexicality in the sense of Silverstein (1976, 1985, 2003) and Eckert (2000, 2008). We argue that the constructional variants facilitate the creation of a cute, chic, playful, humorous, and youthful online style and that its popularity draws on multiple indexical resources including the contrast to canonical grammar, contemporary language contact with Japanese, the influence of the cuteness culture and its commodification, and consumerism in the digital economy. This study contributes to research on the linguistic construction of identity and style, linguistic creativity in the new media and digital culture, and usage-based constructionist approaches to language use.

# Memeing a Pandemic: COVID-19 and the Curation of Memes for Fun and Literacy

---

Panel contribution

---

***Dr. Bradley Wiggins<sup>1</sup>***

**1.** Webster Vienna Private University

This study will present the results of a critical discourse analysis of a sample of intentionally humorous mediated content, also referred to as memes. Specifically, a randomized sample of posts to the Facebook group *Zoom Memes for Quaranteens*, which has a membership of over 857 thousand, serves as the primary corpus for analysis, with an equal number of posts from March 2020 and 2021, respectively. Additionally, posts to Instagram tagged with a reference to COVID-19 serve as a secondary corpus for additional analysis and comparison. The type and/or purpose of humor present in the memes collected for the samples will be categorized, and the study will also seek to identify whether and to what degree evidence and/or fact-based information was included in the meme's construction. The primary hypothesis is that, despite the humorous aspect of memes in general, humor is not diminished if the meme also includes fact-based information.

# Men going their own way: Exclusion and masculinity in online discourse

Panel contribution

***Ms. Jessica Aiston<sup>1</sup>, Dr. Veronika Koller<sup>1</sup>***

***1. Lancaster University***

The “manosphere” is a loose network of blogs, websites, forums, and online communities that is devoted to discussions of men and masculinity and unified by an anti-feminist worldview (Van Valkenburgh, 2019). The manosphere comprises several sub-communities, including “incels” (involuntary celibates), who perceive themselves as unable to find a romantic or sexual partner, “pick up artists”, who teach each other strategies to seduce women, and “MGTOW” (men going their own way), who voluntarily abstain from relationships with women. Research has indicated high levels of exclusionary and discriminatory language used within these communities, particularly towards women, but also towards men perceived to not measure up to traditional standards of masculinity (e.g. Farrell et al. 2019; Jaki et al. 2019; Krendel, 2020).

Based on a small corpus of 50 threads (50,209 tokens) from the content aggregation website Reddit, this presentation will examine the argumentation strategies used by male separatists to justify their anti-feminist beliefs and persuade members to withdraw from contact with women. We analyse argumentation schemas to examine the use of various *topoi*, i.e. warrants that link a premise to a conclusion. Preliminary results indicate that users apply the *topos of justice* to highlight the purported unequal treatment of men by women and feminists, the *topoi of threat* and *finance* to emphasise the universalised dangers that marriage and long-term relationships allegedly pose for men, and the *topos of advantage* to discuss the perceived benefits of “going your own way”, such as the ability to take up new hobbies. Users often present their arguments multimodally, for example in the form of a humorous Internet meme or by including photographs of their solitary activities as supporting evidence for the benefits of a MGTOW lifestyle. In terms of language, married men are often mocked (e.g. “this is the stuff that makes me laugh at guys who try to sell me on marriage”) and called names (“e.g. beta provider”). Overall, users negotiate and challenge dominant discourses of masculinity, notably through a rejection of the traditional masculine role as a breadwinner and provider for one’s family. Instead, users champion a masculine identity based on ideals of self-sovereignty and independence, enabled by their separation from women and the exclusion of men who disagree with the MGTOW philosophy from their online discourse communities.

# Metalinguistic Ritual and Qualia of Voice: A Case Study from a Japanese EFL Classroom

Panel contribution

***Dr. Takeshi Enomoto<sup>1</sup>***

***1. Osaka University***

One of the characteristic practices in Japanese EFL (English as a foreign language) classrooms is choral repetition in which students pronounce together words or (fragments of) sentences following the demonstrations given by the teacher. Although its main goal is to get students familiarized with newly introduced linguistic forms, its functions far exceed such a purposive end. This study aims to illuminate various aspects of semiosis involved in this activity, thereby reframing it as metalinguistic ritual.

To achieve this, the study analyzes audio and video data of a choral repetition activity in a junior high school EFL classroom in Kanazawa City, Japan. In analyzing the data, the concepts of poetic function (Jakobson, 1960), pragmatic calibration (Silverstein, 1993), qualia (Harkness, 2014), and chronotope (Bakhtin, 1981) are employed in an attempt to reveal different semiotic processes that make the activity a social, sensorial, and historical experience.

The study first depicts three pragmatic calibrations at the heart of the activity. As suggested by the initial, conventional, and denotationally explicit metapragmatic direction from the teacher, “repeat after me”, poetic function is the most salient and fundamental feature. In addition, recurring choral repetition of linguistic forms not only gives cohesiveness to the entire activity, but also sets sustained focus on English as the object language to be reified with no indexical anchoring. These elements, I will argue, constitute a stratal operation of reportive, reflexive, and nomic calibrations that entextualizes the activity into a metalinguistic ritual.

Then the study points to how the metalinguistic ritual brings about the emergence of particular socio-spatiotemporal organizations in the classroom. In order to illustrate this, I will focus on the manipulation of voice by one male student (M). Choral repetition requires students to coordinate phonically, and creates a public space for solidarity, while pushing free utterances aside into their private spaces. This is clearly shown by M’s obvious tuning of voice when he joins and withdraws from choral repetition. Such social adjustment seems to imply the existence of “culturally conceptualized sensuous quality” that students orient to when constituting a group to repeat after the teacher. Furthermore, based on the analysis, the study articulates that the ritual evokes a larger chunk of history, the chronotope of educational institution. The modern schooling system was introduced into Japan in the late nineteenth century, and the basic arrangement of classroom has been mostly maintained up until today. The metalinguistic ritual in which students are seated in an orderly manner and learn to discipline themselves by controlling their voice seems to be an indexical icon of the modern classroom. That is, the entextualization of the metalinguistic ritual is at the same time the process of historical regimentation.

Semiotic analyses of the choral repetition activity in an EFL classroom disclose its nature as metalinguistic ritual saturated with social, sensorial, and historical processes. A further empirical question is how and to what degree the above mentioned (con)textualizations are subject to defeasibility, and have a substantial influence upon students’ language acquisition and socialization.

# Metaphor use on the People's Daily Newspaper during Public Health Emergencies: A Diachronic and Quantitative Study

Panel contribution

***Prof. Nian Liu<sup>1</sup>, Ms. Shuyu Lu<sup>1</sup>***

*<sup>1</sup> University of Oklahoma*

The greatest value of language resides in its meaning, yet the way meaning is framed and communicated in news media varies widely across distinct historical periods. Since the emergence of HIV/AIDS in the 1980s, linguists have been exploring the metaphorical framing of infectious disease in its social context. Conceptual Metaphor Theory (CMT) advances the position that metaphor is not merely a literal device, but rather a way of understanding abstract concepts through more concrete ones. Lakoff and Johnson (1980:157), for instance, contend that metaphors have the persuasive power “to define reality ... through a coherent network of entailments that highlight some features of reality and hide others”. For example, disease can be described through an ENEMY in WAR metaphor. This metaphor shapes our language in the way we should FIGHT this ENEMY to WIN the BATTLE. It can also be described as a MONSTER who is MYSTERIOUS and DESTRUCTIVE, and needs to be TRACED, TRACKED, and HUNTED DOWN. Due to different framing, the same disease evokes divergent conceptualization and reaction.

The proposed study aims to explore how metaphor use differs diachronically in Chinese media during the major public health emergencies and their societal impacts in its history, namely the COVID-19 (2020), SARS (2003) and the Patriotic Health Campaign (1952). We have retrieved disease-related articles from *Renmin Ribao* (People's Daily) during three periods in question. *Renmin Ribao*, the main newspaper in China, is a major channel by which the Chinese Communist Party communicates its policies to the public and is conventionally regarded as the Party's “mouthpiece”. The retrieved articles consist of about 10 million Chinese words, covering reports about the three events. We hypothesize that the political orientations in certain time periods are transmitted through their use of metaphor and further affect their readers.

Regarding methodology, most previous studies on metaphor were qualitative. We will start with qualitative analysis by incorporating CMT into text analysis, identifying metaphors and their frames using Metaphor Identification Procedure (MIP) and Critical Metaphor Analysis (CMA). In other words, we will identify metaphorically used words in discourse and integrate cognitive linguistics to explore implicit writer intentions and covert power relations through the analysis of metaphoric expressions.

Furthermore, computational linguistics methods and quantitative analysis will be employed. Using R and Python, the mainstream software utilities for statistical computing, we will create three independent linguistic corpora based on the three events. Each dataset will be further processed and compared to a controlled text corpus (a bigger collection of media texts representing general language use) to calculate the Keyness of keywords (such as frontline, fight, defeat, heroes, etc.) used in metaphors.

Preliminary results show that militaristic language (WAR metaphors) were the dominant metaphor used during COVID-19, which is different from the overall pattern of metaphor use in SARS two decades ago but more like the tone and conceptualization during Public Health Campaign in the 50s. We provide some tentative explanations for the shift in linguistic framing by relating it to Chinese history, contemporary political concerns and media cultures.

# Metaphorical GIFs and humour online: the case of “when” posts on Tumblr

Panel contribution

***Dr. Celia Schneebeli<sup>1</sup>***

***1. Université de Bourgogne***

“When” posts have now become a staple of microblogging platforms such as Twitter, Tumblr or Facebook. They consist of two things: a sentence opening with “When” followed by an assertive clause describing a situation of life on the one hand, and an image or GIF presenting a visual elaboration of the situation described in the initial sentence on the other hand. “When” posts rely on the striking relationship between the meaning of the sentence and the content of the image or GIF, which is meant to be metaphorical and humorous at the same time.

While some scholars have already explored the link between humour and metaphor (for instance Mio and Graesser 1991, Kyratzis 2003, Dynel 2009), to the best of our knowledge, metaphorical GIFs have never been studied as a humorous device. However, even though GIFs are often presented as stand-ins for gestures and facial expressions in text-based online interaction (Tolins and Samermit 2016, Miltner and Highfield 2017), they are also often used as metaphorical devices. They present a convenient way to describe a thing, person, situation or feeling using a visual representation showing something completely different. In this case, GIFs, just as the vehicle of any metaphor, do not even have to belong to the same referential domain as what they describe (the tenor). Therefore, they may virtually picture anything, from a person’s gestures to an object.

This contribution thus explores how metaphorical GIFs are used as a humorous device online, more particularly in “when” posts. It will do so within the frame of pragmatic theory (which is particularly rich when it comes to examining how metaphors work), focusing on meaning creation and reception. The data will mainly come from three Tumblr pages that are highly popular among PhD students and academics: PhD in Gifs!, When in Academia, and Ciel mon doctorat!, which all rely on the use of metaphorical GIFs to share one’s experience of PhD and/or academic life.

# Metaphorical perceptions of migrants' inclusion/exclusion in host societies

Panel contribution

***Prof. Andreas Musolff<sup>1</sup>***

***1. University of East Anglia***

This paper investigates the metaphor of the NATION as BODY, to find out what impact it has on the awareness of and attitudes towards Self- and Other-identities and on inclusion/exclusion perception in migration discourses. It builds on comparative metaphor research conducted over the past decade, which has revealed five main types ("scenarios") of interpretations of this metaphor: nation as whole body, nation as body-part, nation as part of ego's body), nation as geobody, nation as person.

Whilst the survey has established a general overview of culture-specific scenario distributions, this paper focuses on one specific topic area in which it is applied, i.e. migration-discourses, which are represented in 10-15% of the survey. These are understood as comprising both migrants' own figurative identity constructions and migration narratives and 'national insiders' perception of immigration as well as emigration. The above-mentioned scenarios give rise to conceptualisations of 'externalised' parts of the nation (e.g. emigrants, former territories, contested artefacts) as *amputated limbs*, or as *injured body parts* that need to be recovered, or as *outgrowths* that can help establish new relations with the environment. On the other hand, immigration and its consequences can be depicted as a body invasion by *parasitic alien bodies* or, alternatively, as *new growth*. The comparison of both the insider and migrants' perspectives has implications for Intercultural Communication Theory and Training.

# Metapragmatic commentary in Chinese reality TV mediation shows

---

Panel contribution

---

***Dr. Weihua Zhu<sup>1</sup>***

***1. University of Wisconsin-Madison***

This study investigates the various ways of and reactions to metapragmatic commentary delivery by people in disparate roles in Chinese reality TV mediation shows. A few studies (e.g. Cloke 1987; Howes & Kong 2013; Deng et al. 2013) have examined Chinese reality TV mediation shows. However, they mostly disclosed the politics, mainstream values and resolution methods in the shows through content analysis. None of them has employed a linguistic perspective to look into the deployment of metapragmatic commentary in context. To fill this gap, I examine 50 episodes of *Jīn Pái Tiáo Jiě*, a Chinese reality TV mediation show, and employ interactional sociolinguistic methods to analyze the data. I adopt the theoretical framework of metapragmatics (e.g. Bublitz & Hübner 2007; Caffi 1994; Verschueren 2000) and the model of context, practice and perception (Zhu 2019) to account for metapragmatic commentary in general and criticism in particular in the mediation sessions. Results demonstrate that litigants who were involved in disputes often gave each other metapragmatic attacks (Jacquemet 1994); observers who volunteered to join the event provided constructive criticism; and the mediator attempted to deliver metapragmatic commentary calmly. The three parties employed emotionally loaded or judgmental words to different degrees. The litigants did not take offence at the observers' and the mediator's commentaries but appeared offended by each other's criticism. How these parties delivered the metapragmatic commentary and potentially caused offence (Culpeper 2011) and how the litigants reacted to the metapragmatic commentary and chose to (not) take offence (Haugh and Sinkeviciute 2019) were constrained by contextual factors including but not limited to interactional goals, status difference, and social distance. This study can contribute to the interdisciplinary research in linguistics, especially metapragmatics, and media.

# Metapragmatic Expressions as Common Ground Builder in Intercultural Business Communication

Panel contribution

***Dr. Ping Liu<sup>1</sup>***

*1. Guangdong University of Foreign Studies*

This research examines the role of metapragmatic expressions (MPEs) in building common ground (CG) in intercultural business communication. MPEs are linguistic expressions, which explicitly display the speaker's reflexive awareness of language use, and his/her intentions to manipulate the ongoing interactions for fulfilling particular communicative goals and/or needs (Liu & Ran 2016:463). Positioned within intercultural pragmatics, particularly the common ground (CG) theory of the Socio-cognitive Approach (SCA) proposed and developed by Kecskes (2008, 2010, 2013, 2017, 2019) and Kecskes and Zhang (2009, 2013), drawing on data from 42 recordings (about 7.5 hours in total) of English phone interactions between customers and Chinese agents of a complaint center of one Chinese airline, MPEs used by the customers and agents in interactions are analyzed to address the research question: How are MPEs used as common ground builder in complaint responses in intercultural phone interactions? Data analysis reveals that under the constraints of institutional rules and regulations, language proficiency, and asymmetrical social-cultural and other knowledge, the agents mainly employ MPEs to manifest intentions of building common ground for information sharing and interpersonal care. The customers mainly employ MPEs to manifest intentions of building common ground for meaning negotiation and personal feeling and emotion sharing. Generally, the agents are institutionalized and objective to a great extent whereas the customers are personalized and subjective most of the time in common ground building. The findings shed light on intercultural pragmatics and customer service practices in the intercultural business context.

# Metapragmatic expressions used by Chinese police officers in mediation discourse

---

Panel contribution

---

***Ms. Wenjing Feng<sup>1</sup>***

*1. Nanjing University, University of Antwerp*

While research on identity construction in police discourse is scarce, even less attention has been directed to police officers' reflexive awareness of their identity construction. This study explores the role of metapragmatic expressions (MPEs) used by Chinese police officers in mediation context, with data drawn from an ethnographic investigation involving 19 police officer-mediated interactions, in which 59 citizens and 19 police officers participated. It is found that the Chinese police officers mainly used such types of MPEs as performatives, hedges, commentaries, stance displayers, evidentials, summary, and message glosses. It is argued that the MPEs used by the Chinese police officers indicated their effort to manage the ongoing mediation interactions, in order to achieve both the transactional goal of conflict resolution and the relational goal of rapport management, as motivated by their need of identity balancing that arose out of a social change reflected in law. This study can provide explicit evidence for identity work by Chinese police officers in mediation discourse.

# Metapragmatic Function of the New Japanese Expression “With Korona” in the Covid-19 Pandemic

Panel contribution

*Ms. Kaho Nakagawa<sup>1</sup>*

*1. Osaka University*

The 2020 pandemic of Covid-19 has been significantly influencing our ways of speaking. In Japan, the expression, “with korona”, was coined, and is now in general use to refer to the situation where people have to coexist with the novel coronavirus. This study aims to explain in what context “with korona” first appeared and how it served as a reflexive/metapragmatic model in its early stage of dissemination.

To achieve this, the study conducts a discourse analysis of a members-only online program distributed on March 11th, 2020, in which “with korona” was coined, and a text analysis of 1,097 tweets containing “with korona” from March 11th to March 31st of the same year. The analyses employ the concept of “voicing contrast” (Agha 2005) in order to determine different discursive figures of personhood that metrical contrasts among text segments imply.

First, the tracking of the tweets reveals three stages in the trajectory of the spread of the phrase “with korona”:

1) Coinage in an online program broadcast by business elites.

2) Reaction to the program and their blogs.

3) Application of the phrase by Twitter users to express their opinions.

A discourse analysis of the online program and a text analysis of the tweets disclose that “with korona” creates a social space saturated with a particular worldview. In the program where the phrase was first used by business elites, the pseudo-evolutionary ideology “survival of the fittest” was repeatedly evoked. In the tweets that responded or referred to the program, six contrasting types of personhood can be identified depending on the positioning against the elite coiners:

(1) Authority seeker.

(2) Proponent.

(3) Informant

(4) Proactive.

(5) Admirer.

(6) Not-sure.

In the subsequent tweets in which “with korona” was used to express one’s opinion, the following types of personhood emerged in accordance with the degree of closeness to the fittest:

(7) Those who adapt to “with korona” in society.

(8) Those who are trying to adapt.

(9) Those enlightened by the knowledge of “with korona”.

(10) Those who cannot afford to adapt.

(11) Those who reserve judgment.

Moreover, topics of the tweets differ by personhood, with (7) tweeting about relatively macro topics, such as business, values, country, and future lifestyle, while (8) and (10) tweet about relatively micro topics, such as their own life and industry. Based on the analysis above, this study concludes that the phrase “with korona”, at the point of its coinage and early stage of dissemination, allowed the users to align themselves with the degree of proximity to “the fittest”, creating a social space where meritocracy is implicitly reinforced with a pseudo-evolutionary ideology.

The phrase has been criticized by some people, and lost its evolutionary association in its dissemination mainly since June of 2020, and is used simply to refer to the world where the presence of the novel coronavirus is

presupposed. The process of such ideological bleaching is a topic for future research.

# Metapragmatic reflections in support of shared knowledge and meaning negotiation in doctor-patient interaction

Panel contribution

***Dr. Ágnes Kuna<sup>1</sup>, Dr. Agnes Hamori<sup>2</sup>***

***1. Eötvös Loránd University, 2. Nyelvtudományi Intézet (Research Institute for Linguistics, Hungary)***

In doctor-patient interactions, successful knowledge transfer and shared understanding are central goals; to achieve them, participants need to construct common ground, coordinate their activity and collaborate jointly on meanings in conversation (Clark 1996). As the interaction proceeds, interactants have to monitor and maintain a mutual understanding, by relying on cooperation, adaptation and negotiation. Particularly important tools for this coordination and monitoring are reflexive language and metapragmatic reflections (Bublitz & Hübner 2007, Caffi 2016).

Previous research shows the prominent role of metapragmatics in doctor-patient interactions. Kuna and Hámori (2019) identify four major functions of metapragmatic reflections in this discourse type: 1) support of knowledge sharing and information management; 2) organization of the interaction and actions; 3) construal of social relations; and 4) communicating emotions.

This paper investigates the role of reflexive language and, especially, metapragmatic reflections in knowledge sharing, knowledge organization and grounding in doctor-patient interaction. It applies a social cognitive perspective (Verschueren 1999, Croft 2009) combined with the approach of metapragmatics in use (Bublitz-Hübner 2007).

The empirical data of this research comes from the audio recording and transcription of 20 doctor-patient consultations (including 8 G.P. consultation hours and 12 dental appointments; cca. 15.000 words, 987 conversation turns). We annotated and analysed the relevant explicit and implicit metapragmatic reflections of doctors and patients with qualitative methods using MAXQDA software. The paper focuses on the following questions:

- 1) What metapragmatic and other reflections appear in doctor-patient interactions in connection with knowledge sharing, information processing, mutual understanding or common ground?
- 2) How, by what characteristic linguistic constructions are these instantiated in the interactions' micro-events?
- 3) How can metapragmatic reflections signalize critical points in mutual understanding and how are they used to prevent misunderstandings and support knowledge sharing?

The analysis demonstrates how metapragmatic reflections aid meaning generation with regard to knowledge sharing, the creation of common ground, the foregrounding of relevant information and the checking of understanding at consultations; their key functions include the resolution or prevention of misunderstandings, too. Furthermore, it has been revealed that metapragmatic reflections are bound up with reflections related to other actions in interactions, playing a key role in shared knowledge, active participation and shared decision making as well.

# Microanalysis of clinical interaction (MCI): An inductive method for examining patients' inclusion and active participation

Panel contribution

***Dr. Jennifer Gerwing<sup>1</sup>, Ms. Sara Healing<sup>2</sup>, Dr. Julia Menichetti<sup>3</sup>***

*1. Akershus University Hospital, Health Services Research Unit, 2. University of Victoria, 3. Institute of Clinical Medicine, University of Oslo*

## Introduction

Clinicians can struggle to implement communication recommendations, even those that are intuitively appealing. While it is reasonable to recommend that clinicians address epistemic asymmetry in the clinic room by *fostering the inclusion and active participation* of their patients, such advice is vulnerable to implementation challenges, particularly if it is based on top down ideals lacking a sound, bottom-up empirical base. Indeed, recommendations developed outside everyday practice parameters can be impractical or even impossible to accomplish.

A pragmatic agenda for clinical communication must derive sound practice recommendations; this requires investigations based on *actual* clinical practice rather than *idealized* practice. Communicating with patients involves dialogue: Thus, investigative methods must use a dialogic lens to provide concrete examples of best actual practice.

This presentation introduces *microanalysis of clinical interaction* (MCI), which uses video-recorded consultations between clinicians and patients to reveal communicative practice in interaction. We will briefly describe its history, unique features and affordances, and examples from studies that have applied it. We then focus on its potential utility for explicating how to accomplish patients' inclusion and active participation in interaction.

## Method

MCI is an application of microanalysis of face-to-face dialogue (Bavelas, Gerwing, Healing, and Tomori, 2016), with roots in experimental social psychology (Bavelas, Black, Lemery, and Mullet, 1986). Two theoretical models guide it, both supported by experimental research on language use in interaction: the *integrated message model* (i.e. interlocutors integrate speech and visible action to contribute to the dialogue; Bavelas and Chovil, 2000) and the *collaborative model* of communication (i.e. interlocutors continuously adjust and respond to each other in their efforts to accumulate shared understanding; Clark, 1996).

MCI begins inductively, with an articulated *entry point* (e.g., a specified clinical activity or practice ideal) guiding observations, such as *signs from the patient of inclusion and active participation*. From there, analysis follows a systematic progression: (1) recognizing all moments when the phenomenon (e.g. inclusion and active participation) is happening, finding contrasting moments, and recursively constructing a robust definition of the phenomenon, (2) examining what happens before and after those moments, and (3) systematizing, distilling, and differentiating among qualitative features.

## Results

MCI can generate results in all stages of analysis. Results would answer: (1) "What are the signs of inclusion and active participation in clinical interaction?" and "how often do they happen?"; (2) "How do they unfold dialogically?" (3) "What are the common qualitative features of signs of inclusion and active participation, and under what conditions do they differ?" Operational definitions, created in the process of discovering all manifestations of the phenomena in the sample, provide means for conceptualization of the phenomena in their dialogic environment. They also further support replication and extension of the research (e.g., comparing unilingual and multilingual clinician-patient dyads).

## Discussion

MCI is a method that connects initial inductive work to later systematization, quantification, and demonstration. Its results require little transformation for creating macro-level knowledge translation materials (i.e. sound and viable teaching materials for clinical students). Further, its possibilities for aggregated results and probabilities allow for meaningful links to other outcomes.

# Millennials discursive practices in sharing economy platforms: The case of BlaBlaCar

Panel contribution

***Dr. María de la O Hernández López<sup>1</sup>***

***1. Pablo de Olavide University***

In the age of Internet communication, ridesharing as a form of digitized hitchhiking has become mainstream. BlaBlaCar, the world's leading online platform offering intercity carpooling services, lies its success mainly on connecting sociable drivers with empty seats to individuals who are travelling on the same trip and willing to meet other people. Previous studies have demonstrated that millennials, or Generation Y (i.e., youngsters born between 1981 and 1999) are not only the most frequent users in BlaBlaCar, but also the most representative generational cohort regarding their interests in activities organized around the collaborative consumption (Činjarević, Kožo and Berberović, 2019). A direct consequence of this fact is that the way millennials behave and communicate in this particular affinity space (Gee, 2005; Jenkins, 2006) may have an impact on virtual communicative discursive practices.

Against this backdrop, this study aims to examine 600 online consumer reviews (OCRs) taken from BlaBlaCar in Spain ([www.BlaBlaCar.es](http://www.BlaBlaCar.es)) in order to, first, analyse millennials' most common discursive practices in this particular cyberspace. Second, examine the most common norms of usage (Locher and Watts, 2008), vis-à-vis other platforms studied in the literature (e.g. Airbnb, TripAdvisor). And third, discuss the impact of millennials' communicative style on their own identity construction and face management (Locher and Watts, 2005). The results show that OCRs in this affinity space include a limited range of patterns in terms of vocabulary, register and tone, which points towards self and other's face enhancement, seeks group membership, and fosters self-fulfillment through interaction with others. Also, the drivers' identity is built in very similar terms in the data set (e.g., reliable, competent driver), and the reasons why millennials are fond of this cyberspace are revealed through their discursive practices (e.g. search for fun, interaction and self-esteem enhancement). All in all, BlaBlaCar reveals how millennials abide to a number of communicative norms of usage in order to enhance their group membership and shape their virtual self (Chaoqun and Yus, 2017; Yus, 2014). Therefore, given the influential nature of this age group on society in general, this study reveals the communicative trends that are most frequent in online platforms that are not only economy based (i.e., paying for a peer-to-peer service) but also community based in which talking is central –hence the platform's name, *BlaBlaCar*.

# Misbehaving in public: resolving incidents with strangers

---

Panel contribution

---

***Prof. Paul Luff<sup>1</sup>, Prof. Christian Heath<sup>1</sup>, Prof. Marina Jirotka<sup>2</sup>***

*1. King's College London, 2. University of Oxford*

The wide-spread deployment of surveillance technologies has enabled various authorities, including the police, transport operators, even retail organisations to oversee behaviour in public places and address problems and difficulties that arise. The technologies rely upon the ability of operators to monitor, scrutinise and assess the conduct of the general public and to deploy procedures that seek to resolve incidents that undermine or threaten the current state of affairs. In this paper, we explore the practices in and through which operators notice the unusual, the dubious, the suspicious, the dangerous, and the downright dishonest and how the discovery and determination of problems and incidents relies upon normal appearances, the well-behaved stranger within the local scene and setting. We address how the discovery and identification of problems provides the resources to enable the deployment of an organisational solution through which operators seek to engender particular patterns of interaction with strangers and transform the ways in which staff and for that matter the public see and respond to each other's actions. In turn, we consider how these solutions, these interactional arrangements, provide ways in which operators can use surveillance technologies to progress of the incident's resolution and where necessary intervene in its management. The observations and analysis are based upon a substantial corpus of video-based field studies of urban transport operation and control centres in the London and mainland Europe.

# Mixed emotions in times of coronavirus: a sociopragmatic analysis of the narratives of sanitary workers in Madrid (Spain)

Panel contribution

***Prof. Laura Alba-Juez<sup>1</sup>***

**1.** UNED (National Distance Education University)

In this presentation I will analyze the emotion processes (cf. Alba-Juez & Mackenzie 2019) inscribed and invoked in the discourse of the narratives of personal experience told by the sanitary staff of several hospitals in Madrid (Spain) during the hardest moments of the Coronavirus crisis through March-June 2020. I argue in favor of a sociopragmatic approach to emotion in these narratives, which takes into account not only the mere linguistic facts but also other variables having to do with cultural and social expectations, the semiotics involved, or the fact that human emotions are not static but dynamic phenomena. In so doing, I mainly focused on the Degree of directness (*Deg*) and Parameter (*P*) variables of the Emotive Functional Relationship  $Em = F(PH, LL, Deg, ContPos, P, Mo)$  (e.g. Alba-Juez 2018), and for the adjustment of the latter, I drew on interdisciplinary work such as Ortony & Turner's (1990) component approach to emotions, or Benítez-Castro & Hidalgo-Tenorio's (2019) refinement of the AFFECT domain of the Appraisal Model (Martin & White 2005).

The corpus used for the analysis consisted of 15 narratives published on different Spanish-speaking digital media, in both written and audiovisual form. The main research questions were the following:

- What are the emotion processes found in the discourse of these narratives?
- What are the strategies used to express these emotion processes coherently?
- Which phenomenon is more frequent in these texts, the direct (inscription) or the indirect (invocation) expression of emotion? (*Deg* variable within the *Em*)
- How can the Parameter variable (*P*) of the Emotive Functional Relationship be refined to describe and analyze emotion in these narratives more accurately?

My main and initial hypothesis was that the identifying features that make for a coherent expression of emotion in the narratives are mainly given by sociopragmatic variables such as the alignments (footing) of the participants within their frame or their expectations (cf. Alba-Juez forthcoming). The qualitative results allowed for the acceptance of this hypothesis, and the frequency count of the *Deg* variable of *Em* threw light on the fact that, in the corpus analyzed, invoked emotion is significantly more frequent than inscribed emotion.

# Modal verb constructions in the context of rule enforcements: A comparison of Italian and German

Panel contribution

***Ms. Christina Mack<sup>1</sup>***

*1. Leibniz-Institute for the German Language, Mannheim*

Wherever people interact, sooner or later it comes to the point where they raise ‘deontic claims’: one speaker tells another what to do or not to do, what they would wish the others to do or what they absolutely must not do. In language, such ‘deontic claims’ can be captured under the concept of modality. This presentation presents a study of how co-participants accomplish ‘allowing’ and ‘forbidding’ in Italian and German interaction. My special interest is in different affordances of Italian and German in the deontic meanings of ‘permissibility’. While German has a dedicated modal verb, *dürfen*, Italian has a more generic verb, *potere*. But of course speakers of Italian do express ‘non-permissibility’, as in the following example from the board game ‘Catan’.

**CatanRigoni02\_3244555**

34 Serena perché mi dai questo=

**why are you giving me this**

35 Vanda =perché son tutte uguali Serena

**because they're all the same Serena**

36 (2.4)/((Serena examines her own cards))

37 Serena no voglio la pecora allora ((throws card back to Vanda))

**no I want the wool then**

38 (0.4)

-> 39 Mauro eh non puoi decidere [o:h ((increasing loudness))

**-> well you can't pick he:y**

40 Serena [eh scusa lui me le ha fatte vedere ((loud))

**well excuse me he showed them to me**

41 lui me la dava allora io pren[do la pecorella

**he was going to give it to me so I'm taking the wool**

42 Franco [eh no tu hai preso

**well no you took**

My research question is: How do the affordances of different languages impact how speakers pursue similar interactional goals? For example, how do speakers of German use the related verbs *können* and *dürfen*, and do they make a distinction that Italian speakers do not make? Using the method of conversation analysis, I examine a parallel corpus of informal interactions in Italian and German.

# Moral accountability in the construction of negative others (and self)

Panel contribution

**Prof. Chaoqun Xie<sup>1</sup>**

1. Zhejiang International Studies University

Accountability has been shown to be an essential concept in accounting for what members of a society do and why they do it in social (inter)action by various scholarships in the social sciences and humanities, including, but not limited to, politics (Marshall 1987; Bellamy and Palumbo 2016), philosophy (Van Schoelandt 2018; O'Neill 2020), sociology (Webber 2016; Shuster 2017), anthropology (Zhao 2006; Igreja 2019), conversation analysis (Kent and Kendrick 2016; Robinson 2016) and pragmatics (Haugh 2013; Dynel 2016; Jaszczołt 2017). This paper focuses on a specific category of accountability, namely, moral accountability, illuminating its vital role in the (de)construction of discursive identities in social interactions. A 5-minute video featuring a Chinese tour guide's accounting practice on a tour bus and online comments on the incident constitute the data for the current research. Frustrated by her tourists' lower-than-expected expenditure on local products, the tour guide in her accounts resorts to the use of personal reference, empathy, self-exposure, irony, threatening, cursing and of what can be called 'moral questioning', with a view to constructing negative identities for the tourists characterized as being unvirtuous, immoral and unconscientious. The tour guide's accounts turn out to be a total failure, as evidenced by subsequent numerous negative and counter-offensive online comments and by the revocation of her tour guide permit. In constructing negative identities for her tourists, the tour guide is also constructing a negative identity for herself. This study demonstrates the omnipresence and complexity of moral accountability in social life as one of the fundamental and hardcore foundations of human sociality.

# More than the sum of its parts: Combining EM/CA with ethnography in the study of ethnic categorization

Panel contribution

***Dr. Pomme van de Weerd<sup>1</sup>***

**1.** University of Amsterdam

In this paper, a case is made for studying ethnic categorization by combining the use of ethnography to gather data, and EM/CA to analyze that data. This argument is based on a study conducted in a secondary school in Venlo, the Netherlands, where pupils with migration backgrounds (who were born and raised in the Netherlands) constantly referred to themselves as ‘Turks’, ‘Moroccans’, or ‘foreigners’, while referring to others without migration backgrounds as ‘Dutch people’. During nine months of ethnographic fieldwork, 265 interactions were recorded and transcribed in which reference was made to one of these categories.

Elsewhere (van de Weerd, 2020), I have argued that, though self-reference as anything other than ‘Dutch’ in the Netherlands (like ‘French’ in France, or ‘Belgian’ in Belgium, etc.) is often interpreted as a signal of lacking attachment or ‘integration’ to that country, this overlooks the known fact in interactional studies that membership categories have a complex and widely variable meaning potential. I also argued that categories that are often interpreted as ‘ethnic’ may be used to achieve interactional moves and thus do not only or necessarily signal that a participant is ‘doing ethnic identity’.

In this paper, I highlight how the combination of ethnographic fieldwork for gathering data, and EM/CA in the analysis of that data, has been indispensable in leading me to those analyses. Conversation Analysis and Membership Categorization Analysis push for a focus on clearly defined and delimitable processes (i.e. social categorization in interaction) and close attention to participants’ own concerns and interpretations when using categories, while the merits of ethnography are found in its long-term commitment, the importance of reflexivity, and the acknowledgement of the social, cultural, and historical situatedness of all interactions. I will furthermore argue why this combination is particularly suitable for studies of ethnicity, race, and racism.

# Moving from one world to another, from one language to another: clinician-interpreter collaboration during migrant children psychological assessment

Panel contribution

***Prof. Betty Goguikian<sup>1</sup>, Mrs. Coralie Sanson<sup>2</sup>***

***1. University of Geneva, 2. Hôpital Cochin, Paris and Hôpital Avicenne, Bobigny - France***

In mental health care settings, verbal and non-verbal communication are essential to undertake the central tasks of assessment and intervention. In adult psychiatry, the assessment mostly consist of exploring the symptomatology in order to diagnose the severity of a disorder. Within an intercultural context, the interpreter's role is not only to facilitate mutual understanding, but also to contribute to desintricate environmental adverse social conditions, from culturally anchored views or expectations, and psychopathology (i.e. inner states, personality traits, individual dysfunctionning or deficits) (Tribe & Lane, 2009). Leanza introduces the concept of « agent du monde vécu » to describe this active positioning (Leanza et al. 2020).

When it comes to the assessment of migrant children, particularly newly arrived ones, they are often referred for cognitive assessment because of a delayed learning of the local language (Kaplan et al. 2016). The clinician has to achieve two goals to avoid overdiagnosis of learning disorders and inappropriate educational placements. First, to explore the exposure to traumatic events and the subsequent potential psychopathology. Second, to assess fundamental abilities underlying school performance and social interaction with peers. It is now well established that the ability to learn a second language is predicted by native language verbal skills (Andreou & Karapetsas, 2004). Therefore, in child and adolescent psychiatry, one of the interpreter's roles, which has received scarce attention so far, consists of helping the clinician to assess the development of verbal abilities and bilingualism, either in the native language or in the new one (Bennabi Bensekhar et al., 2014).

Based on clinical illustrations, and questions emerging from training workshops, the presentation will show that in children psychological assessments the accuracy is related to the formal aspects of language (i.e. the rendition of how it is said) and not only what is said. The clinician has to explicit his objectives to achieve a good collaboration and rely on the interpreter within respective role frontiers (Goguikian Ratcliff et al. 2018).

# Multi-modal concessive repair in Israeli Hebrew conversation

Panel contribution

**Dr. Leon Shor**<sup>1</sup>, **Dr. Michal Marmorstein**<sup>2</sup>

1. Ben-Gurion University of the Negev, 2. The Hebrew University of Jerusalem

Interactional approaches to meaning have shown that the meaning of expressions in conversation is not determined in advance, but situated, negotiated, and locally elaborated through verbal and embodied means (Linell 2009; Deppermann 2005, 2011; Deppermann & De Stefani 2019). One recurring pattern of local elaboration is described by Couper-Kuhlen and Thompson (2005) as concessive repair, that is, the retrospective revision of claims deemed as overstated or in need of qualification. Previous research has shown that affirmative claims are typically retracted by verbal negation or counter-assertion (Couper-Kuhlen and Thompson 2005; Deppermann 2014). In this talk, we explore the multimodal realization of this pattern based on data coming from Israeli Hebrew conversational media talk.

We observe that retraction from a formulation can be realized by verbal means and/or by embodied resources. One such embodied resource – the Quoting Gesture (QG) – is demonstrated in the following excerpt, featuring an Israeli actress describing how she was once forced to stay in New York due to bad weather conditions:

Excerpt

- 1        *I had a lovely apartment in Gramercy in New York,*
- 2        *and,*
- 3        *and I got stuck there.*
- 4        \* (0.4) *stuck, (0.3) \**
- 5        **QG** \*.....2F+2H,.....\*
- 6        *I got stuck for a month in New York,*
- 7        *and I invited Tom to come be with me.*

After describing favourably her living conditions in New York (line 1), the speaker continues to report about her inability to leave the city by saying ‘I got stuck there’ (line 3). Following a short silence, she repeats the verbal phrase ‘I got stuck’ in a lower pitch and decreased loudness, while co-extensively producing the QG. The gesture shows clear articulation into its constitutive phases, resulting thus in a relatively long duration of the gesture. By using the QG, the speaker retroactively attributes her initial production of the phrase ‘I got stuck’ to another voice, thereby distancing herself and backing down on this formulation. The conceding in this case underscores the incompatibility between the standard negative interpretation of the verbal phrase, proposed by its first non-modified production, and the report on the positive living experience in New York (line 1). The articulated and elongated performance of the gesture brings into focus the action of repair and provides therefore a noticeable display of accountability for what may have otherwise been perceived as an inapposite choice of words. The speaker does not propose a revised statement but leaves it open for inference. She then employs the same verbal phrase for the third time (line 5), however now conveying the qualified meaning imparted by the QG in the previous production.

By attributing an initial formulation to another voice, the QG signals a break between the current ‘animator’ and author (the ‘previous-I’, cf. Goffman 1981), so that the speaker’s responsibility for that formulation is reduced. Foregrounding the presence of another voice invites the recipient to reconsider the meaning of the formulation, serving as yet another overt practice through which participants can self-appropriate and negotiate semantics.

# Multiactivity in complex work settings- the media production of a German Prime Time ARD Sportschau

Panel contribution

**Prof. Axel Schmidt<sup>1</sup>, Dr. Inke Du Bois<sup>2</sup>**

**1.** Institut für Deutsche Sprache, **2.** [www.dubois-linguistics.com](http://www.dubois-linguistics.com)

This presentation investigates how the successful synchronization of multiple tasks operates in a highly mediated and spatially distributed workplace to produce maximally effective communication under extreme time constraints. Several excerpts from a 33- hours video corpus of the production of the German ARD Sports Show are examined. In these excerpts, the soccer commentator and his assistant plan the production and sequence of the live commentary for the ARD Sports Show, a program aired on Saturday nights on German public TV. The soccer stadium with its audience ranks and field represents the larger speech setting in this communicative situation. In this speech setting, the interactants communicate face-to-face, via radio switchboard and mobile phone. Cameras provide different perspectives on the soccer field and the fan blocks. The references in the multiparty interaction include different anchoring points, screens and conceptual grounds (Broth, 2009; Hanks 2001; Stukenbrock, 2015). Within this complex setting, the commentator, who is also the director at the soccer stadium, plans the live commentary for the ARD Sports Show with his team.

The interactants work under strong performance and time pressure when live on air transmissions are produced. In TV production team work, multiactivity and foreshadowing are necessary to function under time pressure. Multiple time scales (Haddington et al. 2014) and planning of the future media product (e.g. a live commentary with corresponding video clips of a soccer game) require that the director perform parallel activities to coordinate the tasks at hand with the team (e.g. director, technicians, camera people) while he is planning which episodes of the 90 minute game will be shown, and additionally, which information of the players or fans will be reported and shown in the 11 minute live clip.

In the presentation, we will show how verbal and embodied features of interaction contribute to multitasking and how this could be applied to larger corpora.

# Multifunctionality of epistemic stance markers: Variation across discipline and speaker role in classroom discourse

Panel contribution

***Ms. Marcella Caprario<sup>1</sup>***

**1.** Northern Arizona University

Epistemic stance (ES), through which speakers show their level of commitment to a proposition (e.g., doubt or certainty), has been described as “one of the core pragmatic skills in speaking” (Gablasova, Brezina, Mcenery, & Boyd, 2015, p. 614), and ES markers are particularly frequent in university classroom discourse (Biber, 2006). Moreover, although categorized as epistemic, ES markers actually serve multiple communicative functions (Kärkkäinen 2003). Despite their importance in speech, stance markers have mostly been studied in writing, especially in corpus research (Staples & Fernandez, 2019). The few studies on spoken language (e.g., Biber, 2006; Kärkkäinen, 2007) have either overlooked multifunctionality, examined non-university contexts, or ignored variation within classroom discourse. Specifically, variation across role (i.e., student or instructor) and discipline (e.g., science or humanities) has been demonstrated (e.g., Csomay, 2007) and scholars have recommended including these factors in research on stance (e.g., Kaltenböck, 2010).

In response to the gaps described above, this study describes variation in instructor and student use of two of the most common epistemic markers (Kärkkäinen, 2007), *I think* and *I guess*, in classroom discourse across disciplines with a focus on multifunctionality. Two research questions regarding frequency and functional variation guided the study:

1. How do instructors and students use *I think* and *I guess* differently in university classroom discourse?
2. How do speakers use these linguistic features differently in different disciplines (humanities, natural sciences, and business)?

The study used a corpus of transcripts of interactive lectures and labs from four US universities (nearly 400,000 words). A newly created coding instrument, based on previously reported functions (e.g., Biber, 2006; Kaltenböck, 2010; Kärkkäinen, 2007), sought to reveal the multifunctionality of *I think* and *I guess* in the corpus, while quantitative analyses examined differences in usage frequency overall and by function between instructors and students across the three disciplines. Macro-level functions included epistemic stance, hedging, marking personal perspective, and filler. A factorial ANOVA was performed to determine the significance of role and discipline, and their interaction, in predicting variation in use with implications for EAP instruction.

# Multilingual pragmatic awareness in consciousness-raising tasks

Panel contribution

***Prof. Pilar Safont<sup>1</sup>, Mr. Ignacio Buffa<sup>1</sup>***

***1. Universitat Jaume I***

Research on pragmatic awareness of language learners has mainly focused on the target language (Takahashi, 2012). As argued by some scholars (Keskes, 2019; McConachy, 2019), a multilingual perspective should also be adopted in the analysis of pragmatic awareness. In fact, existing findings (Portolés, 2015) point to the peculiar characteristics of multilingual pragmatic comprehension and awareness. Bearing these aspects in mind, this paper focuses on the pragmatic awareness of multilingual learners while they are performing a collaborative writing task in three different languages, namely those of Catalan, Spanish and English. Data include recordings from 26 university students' simultaneous introspection while writing three email messages to three different addressees. All messages involved the speech act of requesting. In an attempt to provide a holistic and ecological account of learners' performance, pragmatic-related episodes were identified by considering Brown and Levinson's politeness features (1987), and Leech's (1983) approach to pragmatic competence. Results are in line with previous studies tackling multilingual learners of English and they provide us with interesting insights about the mechanisms that multilingual students activate when planning and performing pragmatic production tasks.

# Multilingual representation of migrations in parliamentary discourse: A mixed-method approach with socio-political background and corpus linguistic methods

Panel contribution

***Prof. María Calzada Pérez<sup>1</sup>***

*1. Universitat Jaume I*

As part of the *Original, translated and interpreted representations of the refugee crisis*(RE-CRI, PID2019-108866RB-I00) research project, the present paper aims to put forward (and illustrate) a qualitative-quantitative, manual-automatised framework for the comparative study of original and translated representations of migrations from European chambers such as the European Parliament (EP), the British House of Commons (HC) and the Spanish Congreso de los Diputados (CD).

To do this, we draw on the CDA-inspired, socio-political approach put forward by Zapata Barrero et al. (2008) and Zapata Barrero (2009). In it, “the discourse politics on migrations” is seen as some form of Foucauldian hardened truth resulting from the process of chronological dispersion/convergence of discourses together with the work of geographically connected/disconnected “discourse networks”, within what they label the “politicization of migration”. Their examination of migration representations (in the form of topoi, mostly) is performed in three stages: stage 1, where the presence or absence of discussion of migrations is quantified and its spatio-temporal proliferation mapped; stage 2, where associated themes are identified and closely examined; and stage 3, where the pro-active or re-active nature of discourse politics is assessed.

While Zapata-Barrero et al. (2008) and Zapata Barrero (2009) perform a manual study of monolingual texts, this paper enrolls corpus linguistics methods with a similar (though multilingual) purpose. For our exploration, we use the European Comparable and Parallel Corpus Archive (ECPC), a set of monitor corpora of over 100 million tokens of parliamentary interventions from the HC, EP, CD compiled at the Universitat Jaume I (Castellón, Spain). The analysis is performed in three stages. In stage 1, detailed consistency is used to map the presence/absence of representations of migrations in the chambers under investigation. Specific (hot) periods are singled out here. In stage 2, characteristic themes (for all chambers at specific hot points) are identified and compared and their contextual uses are investigated with the aid of concordances (clusters, s-collocations and c-collocations). Stage 3 means a contextual assessment of the pro-active or re-active nature of discourses.

# Multimodal copular constructions

Panel contribution

***Dr. Maria Frick<sup>1</sup>, Dr. Niina Lilja<sup>2</sup>, Mrs. Ivana Leinonen<sup>1</sup>***

*<sup>1</sup> University of Oulu, <sup>2</sup> Tampere University*

Recent research drawing on multimodal conversation analysis and interactional linguistics has highlighted the role of bodily-visual resources in turn construction (see, e.g., Ford, Thompson & Drake 2012, Mondada 2015). This has inspired discussion about the role of bodily conduct in the grammatical description of language (see, e.g., Couper-Kuhlen 2018, Keevallik 2018). Building on this, we examine copular constructions that are started verbally but left syntactically unfinished after the lexical subject and copula, in the position in which a predicate nominal would be expected (Ex. 1–2). The constructions are then brought to recognizable completion with multimodal resources, such as depictive hand gestures or bodily enactments, usually accompanied with non-lexical vocalizations.

(1)

SIR +sä olet niin (.) °shh shh sh° +

you are so

+makes circular movements with arms in front of chest;

moves upper body from side to side+

(2)

CLI ja +se oli (.) +aaaaaa: +.hh +

and it was

+.....+hand to ears+,,,+

We will call these utterances *multimodal copular constructions*(MMC). Our collection of ca. 40 cases of MMCs is drawn from video-recorded everyday interactions between first and second language users of Finnish and English.

Our analytic focus is on the timing of the syntactic and bodily-visual resources in relation to each other and on the role of the different elements in the construction. We seek to understand how the bodily elements and non-lexical vocalizations that take the place of X in MMCs affect the semantic and pragmatic characteristics of the utterance. In addition, we analyze the social actions that MMCs (are part of or) are used to accomplish in their interactional contexts. We argue that such syntactic-bodily constructions should not be regarded as ‘incomplete’ or ‘elliptical’ but as one possible construction type in interaction. The study adds to the previous research on syntactic-bodily units in interactional environments (Li 2019; Olsher 2004; Mori and Hayashi 2006; Chevalier 2008; Keevallik 2013).

Online sexual harassment and other forms of online aggression targeting women have fallen under increased scrutiny. One recent study found that 50% of adult women surveyed had received some sort of unsolicited sexualized message online within the prior 12 months (Winkelmann et al., 2015). Other scholars have examined the various forms this harassment can take, for example, hypersexualized requests or the objectification/direct sexualization of the recipient (Hess & Flores, 2016) as well as the “missing discourse of consent,” or the “not hot enough discourse” (Thompson, 2018). As some of these studies have noted (e.g., Hess & Flores, 2016), such acts of online aggression have been met with variable responses from their recipients, such as ignoring, challenging, and sharing. As far as the latter is concerned, several “communities of resistance” have emerged in the form of social media accounts dedicated to documenting not only instances of sexual harassment (such as Tindernightmares and ByeFelipe), but also sharing some recipients’ creative responses to those acts of aggression (e.g., Vitis & Gilmour, 2017).

Our study builds on previous research which has focused on the linguistic aspects of humorous responses to online misogyny (e.g., Dynel & Poppi, 2019), and extends this line of inquiry to consider how a wider range of semiotic resources may be deployed for similar purposes. Specifically, the present study explores how female targets of hypersexualized digital communication respond to such acts of online aggression with humorous messages that exploit the multimodal potentials of digital media, including a wide range of intertextual references as well as resemiotizations. We focus on data collected from ByeFelipe, an Instagram account with nearly half a million followers, which documents various forms of online harassment that women have experienced across a wide range of digital platforms (e.g., dating sites, online games, Facebook). From the 500+ screenshots that were posted on this account from 2014-2019, we focus on 36 in which the responses included some type of visual content (e.g., image, GIF, emoji). Our analysis shows how targets of online aggression can deploy multimodal humor to empower themselves in response to harassment, demonstrating how multimodal humor is used in these situations to communicate serious meanings – and to engage in what may be considered a form of “discursive activism” (e.g., Lazar, 2014; Shaw, 2016). While these responses and their dissemination across social media disrupt previously established hegemonic power relations, they nevertheless raise new ethical questions for users and researchers alike.

# Multimodal interaction analysis of translanguaging in student discourse

Panel contribution

**Ms. Silke Tork<sup>1</sup>, Prof. Sabine Hoffmann<sup>2</sup>, Prof. Götz Schwab<sup>3</sup>, Prof. Stefan Jeuk<sup>3</sup>**

**1.** European University Institute, **2.** Università degli Studi di Palermo, **3.** PH Ludwigsburg

This paper analyses how multilingual practices can be described when the perspective on language is shifted away from a monolingual habit towards an internal view of language as proposed in the concept of *translanguaging* (García / Wei 2018, Blackledge / Creese 2017). This bottom-up approach focuses on actual language use and the speakers' entire communicative repertoire, being used reciprocally in alignment to the interlocutors. On the one hand this obliges us to re-examine established categories and criteria such as code-switching or code-mixing. On the other hand it allows to recognize competences – such as co-construction of meaning, ambiguity tolerance, mediation competence or cultural sensitivity – and practices of cross-cultural interaction that have hardly been considered or appreciated within the norm oriented view of language(s) and multilingualism. The PhD project from which this paper originates is a corpus-based study of multilingualism in higher education, specifically seminar situated student group work. The first data cohort consisting of six, up to twelve minute long videos was recorded during a Master course on multilingualism, migration and intercultural education. In these task-oriented work sessions there were mixed groups of two to four participants, including international students, students with a migration background or German students with ERASMUS experience. Each group was given German and English text materials on aspects of multilingualism to discuss.

The aim of the analysis is to provide a detailed description of multilingual practices used by the participants determined by the following research questions: What repertoire is actually used? Which languages are brought in when and why? Which aren't? Other than language choice and negotiation, what ways of expressing a multilingual identity in referring to each other are realised? To what extend does the institutional setting and the underlying assumptions of language(s) in education play a role within the interactions? The detailed description not only aims at a better understanding of multilingual practices in university settings, it also reflects the transformative potential of *translanguaging* in education.

The data have been transcribed on the basis of GAT 2 (Selting et al. 2009) extended through the *Conventions for transcribing multimodality* by Mondada (Mondada 2019). The multimodal approach takes into account the variety of modalities to construct meaning, create intersubjectivity, build knowledge, relations and identity in *translingual* interactions (Norris 2011, Blackledge / Creese 2017). This paper presents a collection of first findings and discusses preliminary descriptions of *translingual* practices from the internal view on language(s) and multilingualism.

# Multimodal markers of critical and non-critical irony

Panel contribution

**Dr. Claudia Lehmann**<sup>1</sup>

1. Universität Bremen

The ways in which verbal irony is marked in natural discourse are still underexplored. With the exception of raised eyebrows (Tabacaru, 2019, 2020) and head nods (Caucci & Kreuz, 2012; Tabacaru, 2019), which are attested as markers of verbal irony in both scripted and nonscripted discourse, research so far has been inconclusive. Some studies report smiles (Caucci & Kreuz, 2012; Tabacaru, 2019) and looks to partner (Caucci & Kreuz, 2012), while others report expressionless faces (Attardo, Esterhold, Hay, & Poggi, 2003) and gaze aversion (Colston, 2020) as resources for identifying ironic utterances.

The present paper analyses facial expressions, gaze and head movements of two potentially ironic constructions in nonscripted discourses in order to deepen our understanding of how irony is signalled nonverbally. The two constructions chosen are *Tell me about it* and *as if this/that VP*, because both allow an ironic and a nonironic interpretation, but are quite different in function since ironic *Tell me about it* mostly serves bonding purposes, while ironic *as if* clauses are mainly used to criticize others, as examples (1) and (2) illustrate:

(1) James Cordon: Talk me through the goatee, Mish, bold choice, why?

Mish: Because I gained a little bit of weight since I came back to America.

James Cordon: Sounds like me. Tell me about it.

(2) Willie Geist: Don't be afraid. He said don't let it dominate you. As if that were a choice for a coronavirus patient.

Both constructions have been searched for in the multimodal *NewsScape Library of International Television News* (Steen & Turner, 2013) and annotated for gaze, movements in the eyebrow, eye, and mouth region, and head movements. The results of the quantitative analysis show that gaze aversion, raised eyebrows, a raised cheek and smiles are features of ironic *Tell me about it*, while frowns, tightened eyelids and blinks are more frequent with *as if* clauses, irrespective of their interpretation. These results suggest that verbal irony is marked differently depending on whether it is used to bond with other people or to criticize them.

# Multimodal representation in antiracist discourse: The case of political cartoons on the refugee crisis

Panel contribution

***Dr. Stavros Assimakopoulos<sup>1</sup>, Dr. Anna Piata<sup>2</sup>***

*1. University of Malta, 2. Indep*

A prominent way in which the current refugee crisis seems to be consistently described, not just in elite texts but also in common parlance, is in terms of a ‘flood,’ a ‘wave’ and/or a ‘tide.’ The long-standing tradition in the critical analysis of racist discourse (e.g. Reisigl & Wodak 2001; Musolff 2015) has shown that, by evoking an essentially dehumanising representation of migrants and refugees, descriptions of this sort tend “to normalise certain ways of thinking about” them and by extension “justify their discrimination” (Ng 2018: 220). Such metaphorical representations, however, are not only present in discourse that could be generally characterised as racist or even as leaning towards an exclusionary ideology.

Drawing on a corpus comprising the 115 political cartoons that formed part of the *Suspended Step* exhibition, which was organised by the Greek Cartoonists Association with the aim of ‘mak[ing] the refugees’ voice be heard throughout the world,’ we discuss how this (and related) representations can also crop up in texts of an explicitly antiracist orientation. More specifically, we focus on the ways in which particular metaphorical source domains (e.g. waves), metonymies (e.g. barbed-wire fences) and symbols (e.g. the EU flag) visually recur creating what appears to be a coherent discourse surrounding the crisis. To this end, the annotation of the data is based on the VISMET’s scheme (Bolognesi et al. 2018), which was further adapted to allow for a deeper, qualitative analysis of the cartoons under study in terms of their ideological stance.

Our findings confirm the presence of representations that have been traditionally thought to underlie discriminatory attitudes, but also reveal cases where these very same representations can also be used to promote an inclusionary agenda. Against this backdrop, and in line with the background laid out by Conceptual Metaphor Theory (Lakoff & Johnson 1980), we pursue the argument that, through their ubiquitous presence, and regardless of the modality in which they present themselves, metaphorical associations can become so entrenched that they end up underlying our way of thinking about particular social issues and manage to creep up even when we have the best of intentions in fighting social injustice.

# Multimodal trajectories for indexing cognitive search: A longitudinal L2 study

Panel contribution

***Ms. Klara Skogmyr Marian<sup>1</sup>, Prof. Simona Pekarek Doepler<sup>1</sup>***

*<sup>1</sup>. University of Neuchâtel*

In social interaction “there is order at all points” (Sacks, 1984:22). Repair, for instance, has been shown to involve systematic sequential organization of verbal conduct. Yet, little is known about the temporal sequencing of related embodied conduct. Existing research has evidenced that speakers use gaze and facial expression to index cognitive search or mobilize response in word-searches (Goodwin & Goodwin, 1986; Hayashi, 2003; Koshik & Seo, 2012; Dressel, 2020), that iconic gestures may be used in a compensatory manner (Gullberg, 2011), that bodily movement may be kept on hold until the closing of repair sequences (Floyd et al., 2016), and that L2 speakers deploy referential and pragmatic gestures more than L1 speakers (Graziano & Gullberg, 2018). But how are these elements temporally concatenated? How do they interface with verbal conduct? And do such assemblies change over time during L2 learning?

In this paper, we investigate the temporal dynamics of bodily and vocal conduct in the course of L2 word-searches. Based on a longitudinal dataset of L2 French conversations, we first identify a recurrent multimodal search-trajectory involving specific simultaneous and successive assemblies of hand movements/holds with gaze, and (para)verbal displays of ongoing search. We interpret these Gestalt-like trajectories as methodic practices through which speakers both account for breaks in progressivity and display their search as ‘self-directed’, preempting recipient’s entry into the turn-in-progress. We then put our findings into a longitudinal perspective. We show a gradual redistribution in the use of highly recurrent assemblies of multimodal conduct in the middle (search process) and end (search resolution) stage of word-searches, which are tied to the accomplishment of different practical purposes in the search.

By scrutinizing the multimodal compositionality of word-search trajectories as part of participants’ routine practices, the study sheds light on some generic characteristics of word-searches beyond issues related specifically to L2 interaction while at the same time documenting a redistribution of repair practices and the related gestural conduct over time and proficiency levels. Ultimately, we provide further evidence for how “[t]he construction of action through talk within situated interaction is accomplished through the temporally unfolding juxtaposition of quite different kinds of semiotic resources” (Goodwin, 2000: 1490). Our study stresses the importance of analyzing language in relation to other meaning-making resources to advance our understanding of L2 use and learning.

# Multiple sayings of ‘no’(‘bu’ and ‘meiyou’) as responsive actions in Mandarin conversation

Panel contribution

***Dr. Wenxian Zhang<sup>1</sup>, Dr. Xianyin Li<sup>2</sup>***

***1. Peking University, 2. Beijing Language and Culture University***

Traditional studies on words of negation in Chinese (‘bu’ and ‘meiyou’) usually focused on their syntactic and semantic properties (cf. Lv, 1999 : 383; Shen, 2010; Hou, 2016), but rarely examine them as used in real-time talk-in-interaction. Based on the methodology of interactional linguistics and conversation analysis, this study focuses on the practice of multiple sayings of ‘bu’ and ‘meiyou’ as responsive actions in Mandarin conversation. Multiple sayings involve a speaker repeating some language form in the same turn, multiple times and under a single intonation contour in interaction (Stivers,2004; Li,2016). Excerpt (1) and (2) provide a quick illustration of this phenomenon.

(1)[Big client]

01H : 瞧不起                  人:

Qiaobuqi                  ren:

Look down upon people

You look down upon me.

02B : → 没有    没有    没有    没有,    绝对    没有,    大 客户□

Meiyou meiyou meiyou meiyou, juedui meiyou, da kehu.

No       no       no       no       absolutely no       big client

No no no no, absolutely no, you are my big client.

(2)[ Vinegar and sugar]

01B : 这 个 醋       和    糖,

Zhe ge cu       he    tang,

This CL vinegar and sugar

糖 糖 和 那 个 醋       真 的 放 太 少 了□

tang tang he na ge cu       zhende fang tai shao le.

sugar sugar and that CL vinegar really put too little PRT

You really put too little vinegar and sugar in this dish.

02L : →不 不 不, □ 刚    好□

Bu bu bu, gang gang hao.

No no no, just just good

No no no, it is just right.

Stivers(2004) shows that speakers of multiple sayings such as ‘No no no’ communicate their stance that the prior speaker has persisted unnecessarily in the prior course of action and should properly halt course of action. Then, what are the interactional functions of ‘No no no’ in Mandarin conversation? On the basis of previous studies, we address the following three issues:

- 1) the types of action units of multiple sayings of negative words;
- 2) the differences between ‘bu bu bu’ and ‘meiyou meiyou meiyou’ in sequential environments;
- 3) the motivations of using multiple sayings of ‘bu’ and ‘meiyou’.

The data are 30 hours of audio and video recorded Chinese natural conversations. It is found that the multiple sayings of ‘meiyou’ are more conventionalized, and often respond to the actions of appreciation and praise. Multiple sayings of ‘bu’ are found that they often respond to the actions of proposal and offer. It concludes

that the nature of this phenomenon is to cooperate. In a later part of the paper we will explain the discourse motivations of multiple sayings of negation based on the pragmatic principles.

# Mutual knowledge and the ‘hidden common ground’: An interdisciplinary perspective on mutual understanding in intercultural communication

Panel contribution

***Dr. Karsten Senkbeil***<sup>1</sup>

**1.** University of Hildesheim

This paper proposes and develops an argument that there exists a ‘hidden’ form of common ground which heavily influences intercultural understanding, and which should thus augment our theories on the common ground in Intercultural Pragmatics. It begins with a short recapitulation of the meaning of ‘knowledge’ in theoretical discussions in linguistics and other humanities, which is intended to add a transdisciplinary perspective of this term – and particularly on ‘mutual knowledge’ – in our discussions of the common ground as a central pragmatic concept (Kecske & Zhang 2009). With the aim of a synthesis of current developments in pragmatics, cognitive linguistics and anthropology, I will argue that similar trends surrounding terms such as *embodied knowledge* and *empracticism* can be observed across these neighboring disciplines (Cohen 2010, van Dijk 2014, Evans 2009, Konerding 2015). These scholars agree that knowledge develops through action, and it becomes communicatively relevant only in (inter)action with others. Therefore, our bodies and physical experiences are centrally involved (see e.g. *theembodied mind* theory, Lakoff & Johnson 2010), just as the concrete *domain of practice* (e.g. the professional setting), in which communication takes place. Empirical research on intercultural discourse in English as a lingua franca (e.g. in Senkbeil 2017, 2020) has shown that in authentic situations, intercultural speakers-hearers often share more concrete empractic knowledge, and thus can rely on a larger common ground, than a traditional perspective on interculturality would imply.

Combining a transdisciplinary look at theory with these empirical results into a unified perspective proves helpful to reassess and further develop what exactly we mean when we discuss ‘(assumed) mutually shared knowledge’ among speakers-hearers, particularly in intercultural encounters. Ultimately, this paper argues that we need to pay attention to embodied and empractic networks of knowledge that may be cognitively and communicatively complex at first glance, but still widely shared across cultures - a *hidden common ground* in intercultural communication.

# Negotiating contested illness – Finnish doctors' causal explanations to perceived sick building related symptoms

Panel contribution

***Mrs. Suvi Kaikkonen<sup>1</sup>***

***1. University of H***

Doctors regularly encounter patients whose symptoms cannot be attributed to any medically approved condition. One group of patients, falling into this category in Finland, is Sick Building Syndrome sufferers. They link their symptoms to indoor air pollutions such as molds and chemicals, whereas doctors – as a result of their professional rationale – may arrive attributing the symptoms to other factors.

When providing divergent explanation, doctors need to manage two conflicting relevancies. Their institutional task is to establish and communicate what causes patient's symptoms. From this point of view, providing explanation is socially preferred. In interaction, however, the preference of agreement makes it possibly problematic to present an explanation that disconfirms patient's understanding.

In this presentation, I analyze

- 1) how doctors orient to these conflicting relevancies when producing causal explanations;
- 2) how the relevancies are managed – in terms of social action and linguistic design – in the sequential unfolding of the conversation;
- 3) how patients respond.

As a method, Conversation Analysis is applied. Data comprises 75 video-recorded consultations with Sick Building Syndrome patients. 51 explanation sequences are investigated.

I show that doctors present causal explanations at different stages of consultation within various medical activities. Their explanations associate the symptoms with the patient's physical or psychosocial wellbeing and normalize the symptoms. The psychosocial explanations are conveyed indirectly and treated as sensitive whereas the explanations associating the problem to the patient's bodily health are treated as unproblematic. I demonstrate that doctors orient to the presence of the patient's different view in two ways. First, they argue for their explanations by medical evidence and by anamnestic information provided by the patient. In so doing, they display their orientation to collaboration, at the same time as they advance their causal explanations. Second, doctors systematically indicate how their explanations relate to the patient's understanding. They may formulate their explanations so as to *add* something to the patient's understanding or *transform* it.

Patients predominantly respond with indirectly expressed resistance. The study, however, reveals that patients tend to respond with greater alignment to explanations that build on and align with their own understanding of the problem. Despite the possible discrepancy of the views, both participants demonstrably work to maintain agreement, alignment and collaboration.

The analysis reveals that doctors are much aware of what several survey-based studies have documented, namely, that the patients with contested illnesses often experience invalidation in the health care (Gibson et al., 2016). By balancing between their own understanding and the patient's one, doctors facilitate patients' participation and inclusion in their care. This inclusive practice results in the patients' active involvement in the diagnostic discussion, but not in the achievement of shared understanding. The study sheds light on how contested illnesses are negotiated as a real time process, and the barriers the participants' different views pose to the patients' access to public services.

# Negotiating epistemic distribution in sports commentary.

---

Panel contribution

---

**Mr. Federico Corradini<sup>1</sup>**

**1.** Dipartimento di Studi Linguistici e Culturali - Università di Modena e Reggio Emilia

In institutional conversation, role asymmetries are often held to account for pre-determined attribution/distribution of role-related background. This perspective, however, does not consider the ways in which talk reflects orientations to expertise and epistemics as a locally constructed activity in interaction. In sports commentaries for instance, where journalists usually interact with expert players or coaches, the former are expected to contribute to the description and analysis of the event with encyclopedic knowledge of stats and stories about the players, whereas the latter rely on their expertise and first-hand knowledge to provide the audience with an insight into how players act or feel throughout the game. In this presentation I describe how sportscasters sequentially negotiate access to territories of knowledge by orienting to different sets of competencies in performing institutional activities. The analysis is carried out on a corpus of three-hundred minutes of live, nationally-televised US sports events, featuring two or three speakers, and focuses on how (i) experts refer to their competence to make explicit claims about players' feelings and behaviors, by associating them to categorical knowledge; (ii) play-by-play commentators attribute epistemic primacy to the experts when launching analytic sequences of commentary, by employing both implicit and explicit discursive practices; (iii) relatedly, when experts position as K+ speakers, they confirm journalists' analyses to balance the 'epistemic see-saw' and legitimize their contributions, before expanding on them. In general, my data suggest that participants' contributions acknowledge experts 'know-how' in order to organize actions in commentary, and that both parties take up different epistemic stances to provide mutual support and reliability to their commentary.

# Negotiating evacuation practices and responsibility: A discourse of vagueness, uncertainty and variation?

Panel contribution

***Prof. Annelie Ädel<sup>1</sup>, Prof. Catharina Nyström Höög<sup>1</sup>, Prof. Jan-Ola Östman<sup>1</sup>***

***1. Dalarna University***

Issues of risk and security affect all of us on a personal, an interpersonal and a societal level, but the distribution of responsibility for such issues in emergency situations tends to be a matter of debate. Especially in cases where security is questioned, even distrusted, and citizens are put to potential risk, aspects of responsibility come to the fore: who should have informed us, what is my own responsibility in relation to others, etc.? The communication of risk forms a backdrop for the EXIT project, where we specifically focus on issues of risk and responsibility in relation to communication about *evacuation* in e.g. fire hazards, risks of explosion, terror attacks. We deal with both what evacuation information to the general public looks like and with policies and attitudes behind specific evacuation information guiding the general public. In this sense, evacuation information is a possible resource for the distribution of responsibility.

In the present study we investigate how different groups and individuals construe their and others' sense of responsibility in relation to evacuation. More precisely, we ask: (a) How do people discursively construe their sense of responsibility in the face of risk and evacuation situations?; (b) To what extent does their interpretation of what to do correlate with the intentions of the policy makers who have produced and sanctioned the evacuation information?; (c) What is the ultimate purpose of the meaning production found in this field of discourse? Regarding (c), to what extent is the primary function to make evacuation as smooth as possible in a risk situation, to educate, preventatively, the general public in how to behave, or merely a matter of performing a social ritual?

Data for the study come from recorded focus-group discussions with Swedish-language participants from different spheres of life in Sweden and in Finland: (i) employees at a higher education institution who have grown up in a Swedish-language community; (ii) employees at the same higher education institution with a non-Swedish background; (iii) preschool teachers; and (iv) youngsters who have recently started their working career, taking care of the elderly, or working in a garage.

The semi-controlled focus-group discussions revolve around the participants' understanding of evacuation practices and their sense of individual responsibilities in situations of risk, as these apply to their different workplaces. One task in the focus-group discussions was to discuss a number of typical evacuation signs: the function of the information on the signs; the signs' general comprehensibility; the extent to which the signs are noticeable; what experience participants have of the signs; and what works well and what could be improved in the signs.

Results show that a large number of factors come to the fore in these discussions: the signs carry a considerable degree of vagueness; the participants express uncertainty in relation to evacuation practices; the participants display variation in what they consider to be objects of risk; and, the effect of people's personality is foregrounded by the participants. Issues of responsibility are brought up in relation to all these aspects.

# Negotiating hypocrisy in online discussions: a metapragmatic perspective

Panel contribution

***Prof. Sanna-Kaisa Tanskanen<sup>1</sup>***

**1. University of Helsinki**

This study contributes to pragmatic research on verbal hypocrisy from a metapragmatic perspective, arguing that our understanding of hypocrisy as a pragmatic phenomenon benefits from an analysis of how language users metapragmatically negotiate claims of hypocrisy in actual interaction. The material for the study comes from internet discussion forums.

The study follows the more narrowly focused definition of metapragmatics as the display of reflexive awareness by users of language of their use of language (Caffi 1998; Haugh 2018). The paper focuses on metapragmatics in use, which means analysing the metapragmatic acts by which interactants “intervene in ongoing discourse” (Hübner & Bublitz 2007). These acts can have several functions, but often they are used for assessing an utterance or influencing and negotiating how an utterance should be understood. Previous research has identified how metapragmatic acts are used in the negotiation of appropriateness and style of contributions to discussion forum interaction (Tanskanen 2007), rudeness in online discussion forums (Kleinke & Bös 2015), identity and interventions in online discussions (Tanskanen 2018; forthcoming) as well as in the evaluation of RoastMe posts (Dynel & Poppi 2019).

The focus of the study is thus on language users’ evaluations of communication as hypocritical. In practice, I analyse instances where the participants of an online discussion interpret and metapragmatically label communication as (potentially) hypocritical. Participants can target claims of hypocrisy at themselves (e.g. “*Does what I’m saying sound hypocritical?*”) or other participants (e.g. “*Stop being a hypocrite*”). Both types of claims can and often do lead to further negotiation, as participants reflect on their own language use or are asked to substantiate their claims (e.g. “*Can you point out what was hypocritical in my message?*”). The analysis throws light on how language users negotiate their evaluations and perceptions of hypocrisy in the context of an online discussion.

# Negotiating masculinities in the representation of national identities. A case study on US men's magazines

In this paper, we discuss how masculinities are negotiated in men's lifestyle magazines through the representation of national identity. We aim to determine whether, in the representation of national identities, men's magazines draw from dominant discourses of masculinity, insisting on ideas such as dominance, aggressiveness, and confidence or also leave space to "non-aligned forms of masculinity" (Baker & Balirano 2018: 3). As Balirano (2014: 49) noted, men's magazines are the ideal place for the investigation of how masculinity is represented as "male readers learn how to construct gender" around similar outputs. For this reason our research sets out to provide key insights on the way certain male audiences are grouped, categorised and perceived as citizens. It might as well yield a glimpse of how readers are invited to experience (or not) a sense of belonging and community based on gender and nationality, among other factors.

We focus on the US context, where nationality is generally felt as an important - although sometimes problematic - part of people's identity (Schildkraut 2011). In order to do so, we apply a Corpus-based Discourse Analysis approach (Baker et al. 2013) to a corpus of magazine articles. We collected the data through the platform NexisUni by using specific search terms related to the nation - i.e. "our country"; "America"; "USA"; "American"; "United States"; "our nation". The corpus covers a five year time span (15/06/2015 to 15/06/2020). The magazines included in the data collection are *Men's Health*, *Men's Vogue*, *Popular Mechanics*, *Esquire* and *GQ*. These magazines present themselves or are generally regarded as targeting a male audience. The corpus includes around 1750 articles and approximately 3.5 million words.

As we set out to look for both dominant and "non-aligned" attributes related to masculinity in the construction of national identity, our initial findings show that reference to the nation is often realised through personification, associating it to aggressive, risk-taking, proud and stoic attitudes with varying evaluative undertones. We also find that concepts such as strength, heroism and toughness, reflecting traditional gender ideologies related to masculinity (Balirano 2014; Giaccardi et al. 2016) are mentioned when words like "male" and "men" are associated with national identity. Simultaneously, the person-nation is made to experience contradictory and troubling psychological states. National identity in general is represented in a range of ways that highlight potential conflict and crisis.
