Patient advocacy is often crucial to patients successfully navigating complex and obscure institutional health systems. Advocates work as part of the health service to support patients through certain institutional processes, such as complaining. Our research documents the journey of a complainant through a complex institutional system with the assistance of an advocate. Work by Raymond (2014) explores the dilemma of the advocate – and how they broker information; similarly, Wroe (2018) demonstrates the critical work that refugee advocates do to manage hostility toward refugees and migrants. In healthcare, studies have sought to sensitise staff members and patient advocates to their behaviour which facilitate or impedes a disabled person's autonomy (see Jingree et al., 2006). Indeed, advocates are experts at negotiating the demands of different systems whilst providing comfort to clients whose concerns have not been addressed by their healthcare provider.

Our project draws on data from the complaints process and cross-references analysis of the interactions between patients, their advocate, and the healthcare institution with patients' self-report of their experience of the interactions. We use Conversation Analysis (Heritage, 1984) to examine the sequential environment, turn design, and prosodic features to reveal how the clients' reported affect is organised as displays of stance, states, and attitudes in the interaction (Couper-Kuhlen, 2012).

Our analysis asks whether and how nuanced 'backstage' emotions can be tracked in the interaction between the patient and different institutions, and how an advocate (1) handles their client's affect, (2) navigating an exogenous institutional system, and (3) working with their own institutional processes all whilst championing their client's cause. These intricate and complex demands on the advocate are reflected in levels of sick absence and staff turnover and in how advocates describe the cumulative impact in the working day of managing multiple client encounters.

Therefore, by illuminating the full picture of patient advocacy in complaining– from how an advocate orients to their role, how that orientation to role is influenced by affect during the encounter, how this relates to the overall trajectory of making a complaint to a healthcare institution, to the emotional toll that this all takes on the advocate, we aim to inform support and training for patient advocates.

# Negotiating Power-Asymmetry In Teacher-Child Conflict Resolution In An Indian Preschool

Panel contribution

***Dr. Carolin Demuth***<sup>1</sup>

**1.** Aalborg University

This presentation addresses adult-child conflict socialization in an English speaking preschool in Northern India with a particular focus on interactions between teacher and individual children. Studies on socialization practices have typically focused on caregiver's interactional moves. Little attention has so far been given to children's interactional moves to manage power asymmetry in conflict situations. There has also been an increasing interest in recent years in studying bodily contact in caregiver's socialization strategies and how touch and talk are synchronized to achieve the child's compliance to directives (Burdelski, 2014, Cekaite, 2015, Goodwin & Cekaite, 2018; Kern, 2018; Takada, 2019). The present study investigates conflict resolution between teacher and child in pre-school interactions with a focus on embodied resources used in the interaction as well as children's interactional moves in the conflict resolution. The study is based on video-recorded interactions in a class with one teacher and 30 5-year old children collected during a larger ethnographic study over a period of 3 months. Analysis is based on discursive psychology (Wiggins, 2017) and multimodal interaction analysis (Goodwin, 2000). The analytical focus lies on how power-asymmetry is culturally organized in these conflict-resolutions and how social stances and identities (e.g. teacher as authority) are conveyed and constructed through communicative resources and practices. Conflicts between teachers and children typically arose during transitions between two activities or in group activities in which the children were expected to sit still while individual children did not follow the teacher's instructions. They grew out of a child's opposition to a repeated request for action by the teacher. Both teacher and children deployed a variety of discursive, embodied, and material resources to resolve these conflict situations. The teacher used verbal directives together with eye gaze, gesture, body movement, body position as well as more invasive strategies like touching and pulling the child's body as gradual upgrade of her directives. Children used subtle embodied interactional moves to display defiance which can be seen as a way to undermine the exertion of power over them and to maintain a certain degree of agency. Conflict resolution strategies included the teacher's re-framing the child's non-compliant behavior which allowed the teacher to maintain control over the situation despite the child's non-compliance. By their joint interactional moves, both teacher and child manage to not threaten the teacher's authority while allowing for the child to resist certain power exertion. Conflict resolution hence not only served to re-establish classroom order but also to do face-saving interactional work for both the teacher and the child. We argue that these interactional patterns can be considered following culturally acceptable ways of conflict resolution. Moreover, the findings show that children are Overall, the findings attempt at contributing insights into the interactive processes through which children are socialized towards a cultural 'choreography' of conflict resolution in teacher-child settings.

# Negotiating team cohesion through processes of inclusion and exclusion. An ethnographic study of a professional football team.

Panel contribution

***Ms. Solveig Wolfers-Pommerenke<sup>1</sup>***

*1. University of Warwick*

This paper explores how team cohesion is negotiated among members of a professional football team - with a particular focus on discursive processes of inclusion and exclusion through humour.

Drawing on over 56 hours of audio-recordings of authentic interactions, 87 hours of observations and interviews with 13 players, I identify and discuss some of the context-specific discursive features and processes through which team cohesion is negotiated among members of the team. Focusing on humour use and function, it will be shown that cohesion does not necessarily mean for a group to "stick together and remain united" (Carron, Brawley & Widmeyer, 1998, p. 213) at all times. Rather, findings illustrate that the temporary inclusion and exclusion of members of the team through the construction of sub-, in- or out-groups form part of the negotiation of team cohesion in this specific context.

By offering concrete empirical evidence of the negotiation of team cohesion in action, this paper bridges the gap between mostly quantitative studies and discourse analytical work on team cohesion in sports teams. The value of discourse analysis as a method for unpacking some of the deeply complex processes involved in the negotiation of coherence is illustrated. Also, I argue that humour constitutes a useful discursive strategy through which to study and unpack team cohesion as a discursive process – illustrating the link between team cohesion and communication.

# Negotiation of In-group and Out-group Memberships in Chinese Board Game Interactions

Panel contribution

***Ms. Yi Ren***<sup>1</sup>

**1.** University of California, Los Angeles

Games not only bring people fun, but also provide an extremely radical situational context of competition that amplifies people's language use and complicates the dynamics of common and conflicting interest. Zooming in on this particular type of social interaction, board game conversations, the present study examines how adult Mandarin speakers deploy various interactional resources to communicate affective stance, mark in-group and out-group memberships, and convey affiliation and distance. Prior studies have investigated the morphological marking of clusivity as a typological feature (e.g. Filimonova, 2005) as well as the display of group membership through lexical items, such as personal pronouns (e.g. Mao, 1996; Scheibman, 2004). This study advances the previous research and further explores how the construction of inclusion/ exclusion is also accomplished at the sequential level in moment-by-moment interactions. Specifically, I built a mini-corpus based on a total of 5 hours of audio-recorded conversational data that were collected during multiple sessions of a multiplayer role-playing board game called The Resistance: Avalon. In this game, players are divided into two groups that compete against each other to complete tasks. Since the role of each player is hidden, the game process involves constant deception, discussion, and judgment of the group membership of each other, and thus allows us to observe a more transparent distinction of "us" versus "them" than ordinary conversations. With the frameworks of Conversation Analysis and Membership Categorization Analysis (Sacks, 1972), findings of a qualitative analysis suggest that Mandarin speakers negotiate inclusivity/ exclusivity in the game setting by establishing epistemic authority, contrasting person references, and explicitly mapping the in-group and out-group membership categories of self and other. By looking into board game interactions, the study intends to provide insights into how people perform their role of social actors to impose inclusion/ exclusion in interactions through linguistic choices.

# Negotiation of meaning in persons with acquired speech impairment. Power and agency in Communication

---

Panel contribution

---

***Prof. Gema Rubio Carbonero<sup>1</sup>***

***1. Universitat Autònoma de Barcelona***

More than 150 million people in the world suffer some kind of speech impairment. The negotiation of meaning with abled speakers is a complex enterprise where speech impaired persons are in an unequal alignment with their interlocutor and may need the help of ad-hoc interpreters with whom they also negotiate meaning. Data comes from 13 qualitative interviews and participant observations of 7 persons with acquired brain injury and their families during 18 months. The paper shows the communicative and multimodal strategies ad-hoc interpreters use to understand the person with impaired speech and the strategies such persons use to make themselves understandable. It also shows how meaning is negotiated and jointly constructed, the power dynamics that emerge from interpreting practices and the impact this has on the speech impaired persons' agency.

# Negotiation of norms and relational work in Greek food blogs

Panel contribution

**Prof. Angeliki Tzanne<sup>1</sup>**

***1. National and Kapodistrian University of Athens***

Food blogging, “the practice of publishing food-related posts on a blog” (Lee et al., 2014: 228), is a way for people to exchange information about food in a non-professional capacity (Lofgren, 2013). Food blogs can be seen as an online affinity space (Gee, 2005), that is a set of places where people with a shared interest are drawn together to exchange information on, and to learn from, each other’s cooking practices.

The paper is concerned with Greek food blogs and aims to examine the negotiation of norms in the specific affinity space in terms of the relational work (Locher and Watts, 2005) carried out by the participants in the comment section of the blogs. More specifically, by focusing on the discourse of food blog comments, the paper purports to examine the role im/politeness seems to play in establishing and maintaining the ‘cite your sources’ norm, a norm which is highly relevant in the affinity space of food blogs hosting amateur cooks who usually copy rather than create the recipes they post. Furthermore, the paper aims to examine whether, as a norm, ‘citing one’s sources’ relates to moral judgements and whether (not)abiding by this norm has implications for the construction of ingroup and outgroup identities of the bloggers involved. The data for this study come from a corpus of 2,570 comments collected between September 2014 and June 2020.

The results indicate that (i) in order to establish and safeguard the norm concerning the citing of one’s sources, participants mainly use positively marked behaviour, either as an exclusive means of norm negotiation, or as a preface to negatively marked behaviour, (ii) bloggers employ implicated impoliteness (Garcés-Conejos Blitvich, 2010) to draw non-abiders’ attention to the norm, while no on record impoliteness strategies were identified in the corpus regarding the negotiation of the specific norm, and (iii) referring to, or assessing, others’ normative behaviour may involve moral judgments, which confirms the relationship of the norm discussed to morality issues. Finally, it is suggested that abiding or failing to abide by the specific norm does not seem to have any straightforward implications for the categorisation of bloggers as core or peripheral members of the community of Greek food bloggers.

# New social categories in dangerous times. An NSM analysis of some social terms used in Spain's “new normal”

Panel contribution

***Dr. Monica Aznarez-Mauleon<sup>1</sup>***

*1. Universidad Pública de Navarra*

After the three-month Covid-19 lockdown, the Spanish national and regional governments have enforced several rules and restrictions in the so-called “new normal”, in an attempt to contain the spread of the pandemic. Aimed at reducing face-to-face interactions while maintaining economic and educational activities, these decisions are changing the way people behave socially and the way people think about other people. This means that, as it is happening also in other parts of the world, some aspects of the local social cognition are being reshaped in the context of the “new normal”. More specifically, a clear change can be observed in the Spanish landscape of social groups and relationships. This particular landscape has traditionally included keywords such as *familia* and *amigos*, used in Spanish everyday discourse to refer to people we like to spend time with and, more importantly, who are dear to us. These words are now coexisting with technical terms –coming from political and legal jargon– that refer to newly generated social categories. Expressions such as *grupo burbuja*, *grupo de convivencia estable*, *conviviente*, *unidad familiar*, *contacto estrecho* etc. have entered the public sphere and are now commonly used not only in the media but also in everyday conversation.

The present contribution aims at analysing some of these expressions using the Natural Semantic Metalanguage (NSM) framework (Wierzbicka, 1992; Goddard & Wierzbicka, 2002, among others). The study draws on research carried out within this approach on social cognition in different languages (Levisen, 2012; Goddard, 2013; Gladkova, 2013, among others). The NSM approach to language description has proved to be successful in semantic and pragmatic analysis, because it offers a suitable tool for explaining complex and culture-specific meanings in a clear, translatable, non-circular and culture-independent way. The semantic explications resulting from the analysis reveal that, unlike the words *familia* and *amigos*, these new expressions are mainly grounded on the concept of “space”, and don't imply an emotional component. This finding raises some reflections on the impact that the prevalence of these concepts in social discourse might have on people's mindsets in this “new normal” era.

# No seas buey, cabrón: From bestiality to closeness in address forms

Panel contribution

***Prof. Ricardo Maldonado***<sup>1</sup>

1. Universidad Nacional Autónoma de México

Nouns for animals are naturally extended to address people in interpersonal communications. Possessive constructions *mi pichón* ‘my pigeon’, *mi palomita* ‘my dove’ are but a few expressions to refer to the significant other. More interesting is the development of vocative forms coming from specific negative connotations assigned to animals such as *buey* ‘ox’ [‘wei] > [we:] and *cabrón* ‘male goat’ [ka.b’ron] > [ka’on]. While *buey* was originally used to impose stupidity on people, *cabrón* identified people as abusive, rude and lacking consideration or loyalty. These forms replaced old warm forms such as *cuate* ‘mate’ and *mano* ‘bro’ [lit. ‘hand’] to address the hearer.

1. No sé qué decirte, *buey* ‘Don’t know what to tell you, man’
2. ¿Cómo estás, *cabrón*? ‘How are you doing, mate?’

In contrast with previous forms, which only had positive connotations, *buey* and *cabrón* only developed friendly connotations after they were used as offensive addressing forms. The purpose of this paper is to explore the rapid bleaching, subjectification and intersubjectification processes (Athanasidou 2006; Langacker 1985, 2002; Nuyts 2015; Traugott 1995, 2010; Traugott and Dasher 2002) by which these forms changed from names for animals to different attributes, to unfriendly and, finally, friendly addressing forms.

1. ¡Qué *buey* eres! ‘how dumb/funny you are’
2. Su esposo es un *cabrón* ‘Her husband is a recurrent bastard (unloyal)’
3. El examen está bien *cabrón* ‘This exam is very difficult’
4. Es un *cabrón* para las matemáticas ‘He is a champ at mathematics’
5. Esto está muy *cabrón* ‘This is great, good, difficult, bad’

While the polysemy of *cabrón* (4-7) is notable, that of *buey* is restricted to dumbness and some invited inferences, as in (3). Besides the semantic change, this paper explores the social expansion of the figurative meanings as well as the development of the addressing use since the XIXth Century in Mexican Spanish. Gender observations are at stake since these forms extended from the use on young and middle age men to all masculine generations by the end of the XXth Century, to the expansion of young women in contemporary informal Mexican Spanish. Crucially, it will be shown that the use of these forms among women, particularly among young people, is determined by the spread of social media, a way of communication that has leveled up otherwise asymmetric relationships. They were not attested until radio and tv shows followed the internet use allowing all sorts of informal jargon as a linkage mark among participants. Informal data were collected from oral corpus from RAE (CORDE, CREA), oral Mexican corpus *Corpus Sociolingüístico de la Ciudad de México* as well as informal communication in electronic social media.

# Non-lexical vocalizations as local words during multimodal instructive sequences in opera rehearsals

Panel contribution

***Ms. Agnes Löfgren<sup>1</sup>***

***1. Linköping university***

This paper explores sequences where non-lexical vocalizations are recycled in instructive tellings during scenic opera rehearsals that target the combination of music and dramatic action. During the rehearsals depictive (Clark, 2016) non-lexical vocalizations are frequently used to illustrate physical features of the world (such as a perceptible object), or emotional displays of a character. Even though they occasionally go unnoticed, orientations to these non-lexical vocalizations vary from active displays of understandings through confirmatory tokens such as 'yeah' and implicit displays of understanding through non-lexical vocalizations, to embodied responsive receipts or verbal reformulations. This paper focuses on the latter instances in sequences that follow a pattern where 1) the director illustrates a feature of the performance through a non-lexical vocalization 2) a performer displays a tentative understanding of the non-lexical item 3) the director dismisses the understanding through verbal reformulation and iteration of the non-lexical item. Through these multimodal sequences, aesthetic properties of the developing opera performance are established. Although the non-lexical vocalizations that are re-used in a sequence may vary in form, the paper shows that they are conceptually linked, as evidenced by their sequential proximity, relational similarity and the similar embodied behavior that accompany them. The paper argues that the participants establish the non-lexical vocalizations as *local words* with variable phonetic forms that can be recycled in the interactional context. It is thereby demonstrated how the sensing body gives rise to items with lexical potential in real time, thus providing possible insights to the phylogenesis of words.

# Non-signers' perceptions of non-manual im/politeness markers in British Sign Language (BSL)

Panel contribution

***Dr. Rachel Mapson<sup>1</sup>***

***1. Queen Margaret University, Edinburgh***

Non-manual im/politeness markers, including use of facial expression and movements of the head and upper body, have been identified as important for conveying im/politeness in Libras (Ferreira Brito 1995), American Sign Language (Hoza 2007, Roush 2007), Nihon Shuwa (George 2011), and British Sign Language (Mapson 2014). However, Mapson (2013) reports a concern from deaf participants that non-signers may mistake the polite body language used in BSL as uncertainty, lack of confidence or aggression. Deaf people report mitigating the use of some of these features in order to accommodate the non-signers they interact with.

This study explores the reality of this perception to ascertain how non-deaf people evaluate the use of the im/politeness markers identified within British Sign Language. The method adopted takes a two phased approach with the first phase involving qualitative interviews with non-deaf participants in which video material of requests and apologies in BSL will be viewed, and participants asked for their evaluations of the intent and emotion of the signers. These interviews are being conducted online in order to meet local restrictions imposed during the COVID pandemic.

Data from the first phase of the research will be used to inform the design of questions in an online survey, which will incorporate video of the requests and apologies in BSL, to ascertain the perceptions of non-signers more broadly to the im/politeness markers used. Results from the survey will be compared with the qualitative interview data from phase one, and with the evaluations of BSL/English interpreters generated in earlier research (Mapson 2015). Data will reveal whether the views of the deaf participants in earlier research are supported by the perceptions of the non-signers in the study.

# Noticing and assessing nature

Panel contribution

**Dr. Kerstin Botsch<sup>1</sup>, Prof. Peter Auer<sup>2</sup>, Dr. Martin Pfeiffer<sup>3</sup>, Ms. Barbara Laner<sup>2</sup>**

**1.** Social Science Department, National Park Black Forest, **2.** Universität Freiburg, Section of German Linguistics, **3.** University of Freiburg, Department of German Linguistics / Freiburg Institute for Advanced Studies (FRIAS)

This contribution results from a cooperation project *Looking, noticing and talking: How walkers experience the Black Forest National Park* between sociologists and linguists in which we use recordings of German dyadic interactions between persons wearing mobile eye-tracking glasses with integrated microphones.

Previous research has investigated various aspects of mobile interactions during guided city tours (De Stefani/Mondada 2014), museum visits (Heath/Lehn 2004), and market visits (Stukenbrock/Dao 2019). In our project, we add to this line of research by examining embodied verbal interaction while walking through nature. Our focus is on how walkers establish joint attention to noteworthy observables in nature. The data allow us to investigate human experience with nature and understand how subjective perception is made interactionally relevant in order to create the social event of ‘jointly experiencing nature’ *in situ*.

We will show how interactants systematically deploy verbal resources such as attention-getting perception imperatives ('look') (Laner 2020), demonstratives ('there') and wh-exclamatives ('how beautiful!'), as well as bodily resources – different gaze patterns, depicting and non-depicting pointing gestures (cf. Goodwin 2003), body posture, and reducing walking speed – to accomplish different social actions, such as noticing and assessments.

# Nous sommes beaucoup plus forts que les Européens – Social/ethnic Positioning and Moral Reasoning in Cameroonian Discourse on Covid-19

Panel contribution

***Prof. Martina Drescher<sup>1</sup>, Dr. Carline Liliane Ngawa Mbaho<sup>2</sup>***

*1. University of Bayreuth, 2. University of Bangangte*

When the coronavirus first spread throughout Europe, there was great concern that once it reaches more vulnerable countries with poor health infrastructures, the impact will be even more destructive. The African continent with its deficient health systems came especially into focus. Yet up to now, with except for South Africa, sub-Saharan Africa seems to cope with the disease. Although the testing rates are still low and infection numbers remain speculative, the draconic measures taken by most of the African governments at the beginning of the pandemic seem to be quite effective in containing the spread of the virus.

Taking the example of Cameroon, we will adopt a discourse analytic approach in order to investigate how this unexpected result is reflected in the perceptions of Covid-19. Our data consists mainly of interviews and focus group discussions with people from different social and professional backgrounds (doctors, nurses and other health workers but also students, sellers, hairdressers etc.). In addition, we will include extracts from the social media.

Guided by a theoretical interest in moral framings and linguistic expressions of ‘doing ethics’ in interaction (Bergmann/Luckmann 1999, Spencer-Bennett 2018, Drescher 2020), the analysis will put a spotlight on categorization and positioning practices by focusing on the evaluation of different ethnic and social groups in relation to Covid-19. In this regard, the opposition between African and European countries and more generally between black and white people in the face of the pandemic is often stressed in our data. Controversies about the testing of vaccines on Africans, the risks of traditional burial practices in times of Covid-19 or the role of healers and the efficiency of local medical knowledge in the struggle against the disease as well as conspiracy theories are among the topics that bring up this dichotomy. Hence, in our analysis we will first have a close look on how this *topos* emerges and second pin down some of its discursive functions. In the light of the pandemic’s disastrous effects in some Western countries compared to the less affected African continent, categorization and positioning practices seem frequently used to question and to revise some of the stereotypes associated with both groups. By providing databased insights into Cameroonian and, more generally, African perspectives on the pandemic, our analysis will also pave the way for comparative studies on Covid-19 discourses.

# Now everybody's heart is surely racing: Bringing emotions into institutional practice in organizational training

Panel contribution

**Dr. Heidi Hirsto**<sup>1</sup>, **Dr. Riikka Nissi**<sup>2</sup>

**1.** University of Vaasa, **2.** University of Jyväskylä

This paper investigates the interconnections between emotions and institutional practice in the context of organizational training and consulting. Our video recorded data come from a training and development program of a Finnish educational organization, delivered to its management teams by a consulting company. The training aimed at creating a new kind of organizational culture that is based on the managers' raised awareness of their routine work practices and their consequences for the creation of the organization as a social system.

By drawing on discursive psychology and conversation analysis, we examine how the transformation the training is expected to generate is construed and managed through a sequence comprising 1.) the consultant's request to reflect on the work practices, 2.) the participant's response and 3.) the consultant's follow-up. More specifically, we analyze how emotions become embedded and are organized in different phases of the sequence. In particular, we study how the consultant's initial request turn is designed to evoke the participants' recognition of their routine practices and desire for their transformation, for example, by topicalizing emotions and projecting an account of the participants' personal and embodied experiences.

The results show how the request turns at the same time construe a normal emotional order (Stevanovic & Peräkylä, 2014) and violate it, thus discursively creating and pursuing a training space where the participants can – and are expected to – undergo extraordinary experiences for the purposes of personal and organizational transformation and renewal. However, for the participants, the display of emotions – such as confusion and amusement shown through non-lexical vocalizations – within their responses also function as a device for creating a performative trainee identity and regulating a suitable level of participation in the training activities that does not jeopardize the integrity of their 'usual' self. In conclusion, we discuss the findings in the context of contemporary management thinking that emphasizes the relational nature of leadership (Cunliffe & Eriksen 2011) and assigns value to various identity-related practices.

# Object manipulation as a narrative resource in the dynamics of ‘Ba’

Panel contribution

***Dr. Yasuhiro Katagiri<sup>1</sup>***

***1. Future University Hakodate***

Human face-to-face interaction takes place in an interactional ‘Ba’: a space, both psychological and physical. ‘Ba’ sets the stage for, mediates, supports, and orients the development of interaction. Interaction, in turn, affects, maintains, and shapes ‘Ba.’ Face-to-face dialogue interaction usually takes the form of multimodal exchange of information in terms of speech, gestures and other bodily movements. But often it also involves manipulation of physical objects. These objects primarily serve as functional items necessary to conduct some joint task through interaction, but their manipulation can also constitute an indicative semiotic act of placing (Clark, 2003). Object manipulation also reflects the relative power status of participants, in such factors as who has control of each of the objects involved, or whether the control relationship is implicit or should be explicitly negotiated.

We have been looking at task dialogues in Mr. O corpora, which have been collected in several languages, including Japanese, English, Thai, Chinese and Arabic, to carve out elements of ‘Ba’ and concomitant ‘Ba’-affecting acts, focusing on speech - object manipulation interrelationships. The task they engage in, joint story construction, requires reaching agreement on the sequential arrangement of cards, each of which depicts a scene from a silent manga-like story. We argue that relative power status, an important element of ‘Ba,’ is dynamically maintained by participants through interactions between initiate dialogue utterances and card-placing acts, and that weakening of dialogue initiative (co-telling) and card-placing (co-manipulation) corresponds to the manifestation of collective self.

# Occasionalisms: between linguistic economy and establishing tellability

Panel contribution

**Dr. Henrike Helmer<sup>1</sup>**

1. Leibniz-Institut für Deutsche Sprache

My talk deals with the formation and meaning of occasionalisms (i.e. nonce words or ad-hoc-expressions). I will show that speakers routinely use occasionalisms to economically categorize and refer to past events or objects/matters that are associated with those events. The ad-hoc-expressions are semantically transparent enough for those recipients, who shared the experience, to understand their local meaning and re-activate the associated event. Furthermore, the expressions establish the event as a “tellable” (Ochs/Capps 2001) for interlocutors who do not share the respective knowledge.

Pursuing a conversation analytic approach, I analyse sequences of interactions in which German speakers use occasionalisms, typically ad-hoc-compounds whose head or modifier is a placeholder (*special\**, *\*action*, *\*story*). I argue that those occasionalisms work as “reminiscence recognition solicits” (Lerner 1992) for speakers, who share the respective knowledge, and as a “puzzle” (Schenkein 1978) for other speakers and thus as a “ticket” (Sacks 1971) that makes an elaboration relevant.

This can be seen in the following extract, taken from a girl’s night at one of the friend’s home:

FOLK\_E\_00287\_T03\_1830

01-> MB ° nee? äh (.) netti hatSPEcialwein.

*no Netti has special-wine*

02 (0.31)

03 MB muss die heut die GANze flasche von trinken.

*(she) must drink the whole bottle of it today*

04 (0.41)

05-> FB WAS für\_n spE[cialwein? ]

*what kind of special-wine*

06 AF [(laughs)]

07 (0.29)

08 MB °h wovon se [b beim letzten mal geKOTZ]T hat- [(laughs)]

*the one she threw up from the last time*

09-> AF [<KOTZwein.> ]

*throw-up-wine*

10 (0.31)

11 MB ((laughs)) °h [da hat sie] heute ne flasche MITgebracht; ((laughs))

*she brought a bottle of it today*

12 FB [oh GOT- ]

13 (0.74)

14 MB °h ja SIE is ja der meinung des wär nUr von dem WEIN;=

*well she believes it was only from the wine*

15 und ich hab gesagt das liegt dran dass du zwischendurch noch bier und

SCHNAPS getrunken has.

*and I said it is because you had drunk beer and schnapps in between*

MF mentions a “special-wine” AF (called “netti” by her friends, line 01) has brought along. FB was not part of the group that respective evening and requests a clarification (line 05). AF, being the person affected, understands the alluding categorization (she laughs and substitutes the occasionalism with the more specific “throw-up-wine” as a response to FB, line 09). MB characterizes the wine (line 08), orienting to FB’s problem of understanding, and then elaborates by telling about the past evening (lines 14-15). The occasionalism “special wine” thus works as both, a “reminiscence recognition solicit” and as a “puzzle” about the local meaning of the expression that elicits clarification and elaboration in form of a small story (Georgakopoulou 2007, 2015).

My analysis is based on occasionalisms (mostly *hapax legomena*) found in the corpus FOLK of the Leibniz Institute for the German Language (IDS), which comprises ~300 hours of audio and video recordings from different interaction types.

# Of creepiness and masculinity: queer male characters' mediatization in popular shōnen anime

Panel contribution

***Dr. Mie Hiramoto<sup>1</sup>***

**1.** National University of Singapore

This presentation demonstrates the representations of unconventional speech styles and semiotics through an examination of queer male characters in popular *shōnen* action anime, a genre of animated work that is aimed at adolescent boys and young adults (see Dahlberg-Dodd 2018). Gender ideologies, especially for different types of masculinities, have certain overlapping elements across different cultures. However, representations of queer Japanese men in popular *shōnen* anime are characterized by a distinctive element, namely, creepiness. By examining mediatization strategies of queer action anime characters and their portrayals in mainstream media, I pay particular attention to constructions of masculinity and sexuality from the viewpoints of sociolinguistics, masculinity studies, and semiotics.

Many anime are adopted from manga including the selected data for this study; however, for my data, I only use anime and exclude the original manga productions in order to incorporate features for fuller analysis such as voice quality and color. Based on the notions of linguistic and visual enregisterment, this study employs concepts of mediatization and semiotics to illustrate two points (1) widely accepted male queer characters' typecasting in action anime is implicit way to encourage discrimination, and (2) characteristics of the queer male characters are conventionalized via caricatures based on dominant discourses of hegemonic masculinity.

Most of the characters that appear in my data conform to heterosexual norms; however, several of them feature queer male characters as sidekicks. Yet, protagonists are always dominated by heteronormative male characters. In a way, queer male characters have been successfully mediated and mediatized with undesirable values such as creepiness, unwanted attachments, maniac nature, and hypermasculine ruthlessness. These values are associated with traditional masculine ideologies through naturalized semiotic processes.

I examine the following prototypical queer male characters from the fighting action-based genre: Yuda (*Hokuto no Ken 'Fist of the NorthStar'*), Nathan Seymore (*Tiger & Bunny*), and Puri Pri Prisoner (*One Punch Man*). These anime share a common story of characters surviving in a chaotic world by mainly utilizing their battle skills. Generally, these characters are depicted as sexually non-heteronormative and non-normative in their ways of practicing and developing their combatting skills. Their roles are to emphasize the protagonists' superior capabilities in their survival regardless of their villainous or heroic attributes; moreover, they share both feminine and masculine demeanors through their language use and appearances.

By focusing on the discursive patterns and visual representations of the characters, I discuss how these mediations index queer masculinity in ways that mesh with the audiences' expectations of creepiness. This is a result of their deviance from normative masculine ideologies due to typecasting, as such figures have developed through mediations. As Lippi-Green (1997) points out, popular media productions, such as Disney, can implicitly influence viewers to motivate discrimination against minority characters. Similarly, the trivializations of the queer male characters in popular *shōnen* anime does not help the existing stigmatization of sexual minorities.

# Official Media Discourse as Ritual Response to Public Crises: A Contrastive Pragmatic Analysis of COVID-19 Announcements of the Chinese, Japanese and American Governments

Panel contribution

**Mr. Sen Zhang<sup>1</sup>, Prof. Daniel Kadar<sup>2</sup>, Prof. Juliane House<sup>3</sup>**

*1. Dalian University of Foreign Languages, 2. Dalian University of Foreign Languages & Hungarian Academy of Sciences, 3. University of Hamburg*

This study aims to conduct a contrastive pragmatic analysis of governmental announcements issued by Chinese, Japanese and American official media in the wake of COVID-19. Recent research has shown that the genre of governmental announcements is a highly ritual one, and as such is heavily loaded with realisations of ritual behaviour spanning honorifics, to political metaphors, and complex culturally-embedded political symbols (see an overview in Kadar and Zhang 2019). It goes without saying that such realisations of ritual behaviour are subject to significant linguacultural variation, and the aim of this study is to systematise these linguacultural differences across the data contrastively examined. As part of this contrastive pragmatic analysis, we will focus on various pragmatic units, including expressions (defining them as ‘ritual frame indicating expressions’, cf. Kadar and House 2020), pragmatic strategies (including strategies through which ritual politeness is realised) and broader discursive behaviour. In the course of systematically interpreting the use of these units of analysis and systematising their linguacultural variation, we will rely on the Goffmanian concept of ‘alignment’, by arguing that the primary goal of governmental announcements issued in Chinese, Japanese and American official media is to trigger alignment between the producing entity and (mainly national) recipients of the announcement. The prevalence of triggering alignment explains why the producers of these announcements very often do not make any attempt to adopt a standard ‘international’ discourse style to communicate the crises to an international audience but rather follow linguaculturally diverse pragmatic patterns, which often even contradict with the expected norms of announcing crises in other linguacultures.

Keywords: governmental announcements; official media discourse; contrastive pragmatics; public crises; COVID-19 pandemic

# Old people's use of email consultations as self-governing technology

Panel contribution

***Mrs. Anette Grønning<sup>1</sup>, Mr. Martin Bavngaard<sup>1</sup>***

*<sup>1</sup>. University of Southern Denmark*

The focus of this empirical-analytical presentation is email consultations (e-cons) in the context of general practitioners (GPs) in Denmark. Over the past twenty years, the doctor-patient relationship has undergone a perceptible change. In Western countries, the biomedical paradigm in which the patient is seen as passive and in need of doctors' guidance has been the generally accepted view since the Age of Enlightenment; however, this belief is now in decline (Fage-Butler & Anesa, 2016, p. 197). Instead, the perception of patients as empowered and involved in the decision-making processes regarding their health is gaining currency to a higher degree (Eckman, 2018; Elwyn et al., 2016). This development is being driven further by the prevalence of the Internet, which expands possibilities within the healthcare system for both patients and doctors (Dickerson & Brennan, 2002). Some initiatives have tried to make patients self-conducive by giving them different degrees of autonomy, for example, by providing information search tools (Fage-Butler & Jensen, 2016), guiding them through visual campaigns (Köksal, 2018), or conducting digital surveillance of a patient (Verwey et al., 2012). This development is also seen through e-cons, which in Denmark were implemented in general practice in 2009 (Grønning et al., 2020).

Corresponding with a growth rate of 59%, there are expected to be 160,000 more people over the age of 80 in Denmark by 2030, and old people are the most frequent users of e-cons. Therefore, the research question is: How do e-cons affect old people's relationships with and perceptions of their GPs with regard to trust, self-governance and indirect/direct power? Informed by the existing literature and based on an inductive-thematic analysis of 20 interviews with patients between 66 and 83 years old, this presentation investigates the characteristics of these patients' relationships with their clinics and how the use of digital tools, such as e-mail and information searches, affect the patients' relationships with and perceptions of their GPs with regard to self-governance and direct/indirect power.

Our study demonstrates that the patients perceived the general practitioner as powerful, knowledgeable and busy; this corresponds with the power relationship between disciplinary institutions and individuals. At the same time, many patients used email consultations as a technology of self-governance, thereby taking responsibility for their own health while still being able to contact the clinic. In this way, patients achieve the potential for self-management while clinics maintain their institutional power.

In the Danish context, little research on this topic has been conducted (Grønning et al., 2020; Klausen & Grønning, 2021). However, since old patients' self-governance depends on socio-cultural factors (Sak et al., 2017, p. 11), it is particularly relevant to examine the situation in Denmark, which is the world's most digitalised country (Erhvervsstyrelsen [Danish Business Authority], 2019). Indeed, in 2019, the number of e-cons in Denmark constituted 7.2 million, comprising just under 21% of all GP consultations (Statistics Denmark, 2020).

# On an even playing field of haiku making – Inclusive narrative activity among young and older participants with varied cognitive conditions

Panel contribution

**Prof. Yoshiko Matsumoto<sup>1</sup>, Ms. Harumi Maeda<sup>1</sup>, Ms. Emily Wan<sup>1</sup>, Prof. Hsiao-Wen Liao<sup>2</sup>**

*1. Stanford University, 2. Georgia Institute of Technology*

Many of us may have unconsciously *othered* the old and people with cognitive impairments, perhaps from fears of facing our own future decline. Based on the review of qualitative and quantitative studies on social inclusion and exclusion of persons with dementia (PwDs), Pinkert et al. (2019:21) state that “the exclusions experienced by PwD [people with dementia] are social barriers that are related more to the social relationships between people with and without dementia than to the cognitive effects of dementia.” Indeed, narrative and conversational studies of persons with dementia (e.g. Davis et al. 2005, Hamilton 1994, Ramanathan 1997, Ryan et al. 2005) have illustrated the importance of interactions to promote communicative ability and “personhood” of PwDs (Kitwood 1997).

This study explores how social integration of persons with varied ages and cognitive conditions can be promoted through the activity of creating and appreciating the verbal art of *haiku*. Our main aims are (i) to ascertain whether sharing the art of *haiku* has positive effects to foster interactions among participants and promote social inclusion, (ii) to understand communicative patterns that enhance interactions and personhood of PwDs, and (iii) to consider the study’s implications to the direction of pragmatic studies.

*Haiku* is a short form of poetry (17 syllables usually grouped in three ideas) originating in Japan, which has gained recognition in the U.S. although its familiarity remains limited. Traditionally, a *haiku* conveys a simple yet emotive image of a season without the heightened language of conventional poetry or prose, through words or phrases evoking a scene, rather than through the continuity of a sentence. Therefore, linguistic difficulties experienced by PwDs may be not much of an impediment, if not a possible advantage, while anyone with or without dementia experience the challenge of following simple yet unfamiliar rules.

In our on-going case study, three older adults with mild cognitive impairment and three young adults participate in the *haiku* activity via Zoom, which is recorded and transcribed. Each participant brings a picture of a seasonal scene to share with others and composes a *haiku* about the scene with guidance. The picture is an object present in the “here and now,” which encourages PwDs’ participation (Isaac and Hamilton 2020) and is an item that can elicit personal feelings and reminiscence. After (mostly) completing a *haiku*, one younger and one older adult go to a breakout room and talk freely about each one’s own and the other’s *haiku* and the stories behind their *haiku*. This session illustrates how participants position themselves in the interaction, who takes a lead and how interaction is negotiated. It also informs what effective strategies might be for promoting inclusive and meaningful interaction between persons with dementia and those without. Post-activity interviews add to the evaluation of the effectiveness of *haiku* activity. The *pragmatics of understanding*, an approach suggested in an in-depth analysis of interaction of Alzheimer’s patients at a memory care center (Matsumoto 2020), is applied to discuss how a *haiku* activity may promote inclusivity.

# On being a sister theory: Construction Discourse as a mediator between Construction Grammar and Frame Semantics/FrameNet

Panel contribution

***Prof. Jan-Ola Östman<sup>1</sup>***

*1. Dalarna University*

Charles Fillmore repeatedly stressed the “sister theory” status of Frame Semantics (FS; and its systematization into FrameNet, FN) in relation to Construction Grammar (CxG). These approaches have mostly been developed separately, albeit that attempts have been made to explicate the relation between them, also by Fillmore himself (cf. Fillmore 2008).

This presentation takes a discourse-pragmatic perspective on the topic of the panel. Following IPrA’s mission, pragmatics should be “the science of language use, in its widest interdisciplinary sense as a functional (i.e. cognitive, social, and cultural) perspective on language and communication”. In this perspective, contextual-pragmatic categories have to be set up independently of the linguistic manifestations we use in order to describe the grammars of the world’s languages: We have to start from outside of language. But it is in the interest of construction-grammatical theory formation that such categories be couched in terms of CxG’s attributes and values, or FS’s and FN’s frame specifications and roles.

That is, we cannot start with an undifferentiated “universe” as such, as the ‘outside of language’. For analytical purposes, we start with something we can conceptualize. I argue that we have a good starting point if we “operationalize the world” by means of a three-way distinction in terms of the individual, people’s interactions with others, and socio-historical and cultural perspectives – of, among other things, language use. By using these as tools and breaking them down into sub-categories, we will be able to suggest systematically ordered factors as attribute-value matrices. With the help of these contextual, “sentence-external” features we get a better understanding of under what circumstances a construction licenses constructs – and thus what contextual factors of generalizations over usage need to be accounted for in a particular, abstract construction. Constructions as form–meaning–function constellations are the resources we have available for language use.

In this approach, called Construction Pragmatics, or Construction Discourse (CxD), one crucial task has been the very extraction of contextual factors (as attributes) that are needed in order to explicate the constructions, and whose values do not overlap. In this endeavor to operationalize context as a system, I presently work with an arrangement with twelve major/“outermost” CxD attributes. Combinations of their primary and n-ordered values will then be adhered to when defining under what circumstances a construction as resource is (felicitously) used. All of this entails that these contextual attributes and their values are not outside of grammar, but they belong properly inside grammar, as part of what is needed to give an appropriate grammatical description. Thus, the “D” of CxD is to be understood in the same (rigid) manner as the “G” of CxG.

In my presentation I will go through and exemplify the tool-status of the contextual CxD attributes (which range from ‘implicit anchoring’ and ‘discourse pattern’ through ‘sociolinguistic variables’ to ‘construction packaging’, ‘non-verbal’ and ‘prosody’) and some of their values, offering these as a necessary resource that should be linked to the FrameNet-application.

Fillmore, C.J. 2008. “Border Conflicts: FrameNet Meets Construction Grammar,” *EURALEX XIII*:49–68.

# On coming to grips with the EMOTION-OPINION interplay in persuasive discourse through the lens of a redefined Appraisal scheme: Three case studies

Panel contribution

**Dr. Miguel-Angel Benítez-Castro<sup>1</sup>, Prof. Encarnación Hidalgo-Tenorio<sup>2</sup>**

*1. University of Zaragoza, 2. University of Granada*

Appraisal Theory is aimed to understand how social relations are negotiated through alignment, as linguistically realised by the axes of Engagement, Graduation and Attitude (Martin & White 2005). Of the three subsystems, the latter has attracted more attention so far. Attitude helps classify instances of emotion/al talk through the meaning domains of AFFECT, JUDGEMENT and APPRECIATION. As argued, among others, by White (2004) and Bednarek (2009), emotional talk may entail the more indirect expression of emotion by attending to ethical and aesthetic values. As such, and given the omnipresence of affect in language (e.g. Ochs & Schieffelin 1989; Barrett 2017), there is growing consensus about the desirability of treating AFFECT as a superordinate category, now taken to encompass the expression of EMOTION (emotional evaluation) and OPINION (ethical and aesthetic evaluation). As emotion permeates all levels of linguistic description (e.g. Alba-Juez & Thompson 2014; Alba-Juez & Mackenzie 2019), and all utterances are produced and interpreted through emotions (Klann-Delius 2015), we believe that AFFECT may be enriched through a more explicit focus on affective psychology, thereby proposing more sharply defined categories that may better describe any instance of emotive language (Thompson 2014).

In this talk, we will show how our proposal of a more psychologically-driven Appraisal EMOTION sub-system (Benítez-Castro & Hidalgo-Tenorio 2019) has led to a user-generated Appraisal scheme which allows a more fine-grained analysis of the multi-layered interplay between (explicit and implicit) EMOTION and OPINION in discourse. To do so, we draw on examples and findings from three research strands we have been working on over the past six years: abuse and trauma narratives (Hidalgo-Tenorio & Benítez Castro 2020), and jihadist propaganda and American right-wing populist discourse. Persuasion is key to populism and jihadism; whilst differing in the radicalising and violent path intended by the latter (McCauley & Moskalenko 2014), both share a similar moral polarisation of the world into a struggle between *us*, standing for goodness and purity, and *them*, epitomising evil and corruption (Barbalet 2006). The persuasive appeal of these discursive practices crucially depends on their loaded *pathos*, and their success hinges upon these social actors' ability to convey their messages in such a way that they either elicit certain emotions from their recipients or tap into their existing affective states (Nabi 2002; Petty & Briñol 2015). The Appraisal analysis of the EMOTION-OPINION interplay in populist and jihadist discourse no doubt helps to uncover their evaluative and affective roots, thereby contributing to a better understanding of the typical emotions and motivations that each manages to engender among their recipients.

# On constructional changes in conversations: the diachronical network of Spanish ‘rollo’ through the 20th century

Panel contribution

**Dr. Marlies Jansegers<sup>1</sup>, Dr. Ana Belén Llopis Cardona<sup>2</sup>**

**1.** Ghent University, **2.** University of Valencia

Studies of constructional change largely focused on (morpho)syntactic phenomena (e.g., Traugott and Trousdale 2013; Hilpert 2013; Traugott 2014; Boogaart et al. 2014). More recently, several studies tend to go beyond syntax and move into the realm of discourse (Hilpert 2013; Jansegers and Gries 2020). However, relevant parameters such as social and cultural factors are disregarded so far (Llopis&Pons 2020; Pons & Llopis 2020).

This is precisely the aim of the present paper, which focuses on the rise of ‘rollo’ as a catchall noun and as an approximator that developed in oral conversation through the 20<sup>th</sup> century. Indeed, this item displays a rich constructional profile, both semantically – extending from referential meanings (examples 1) to more abstract uses (examples 2 and 3) towards a more pragmatic use as approximator (example 4) and hedge – and syntactically – taking different kinds of complements. In addition, these changes go hand in hand with specific registers and sociolects, and some of them are linked to historical and sociocultural events.

1. Puedes estirar la masa con el **rollo** o rodillo (cilindro de madera o metal)  
Un **rollo** empezó a rodar ('película enrollada en forma de bobina')
2. No sueltes ningún **rollo** ('discurso largo y aburrido')
3. ¿Estás en el **rollo** ('mundo de la droga') o no? No me gusta el rollo de tus amigos ('actitud'), me da mal rollo (' impresión), eso es propio del rollo del rock ('ámbito'), el rollo de las compras no me va ('asunto')  
...
4. Iban disfrazados **rollo** zombis (approximator)  
'They were disguised as zombies'

Lexical constructionalizations that do not create a new word are supposed to undergo a specification of meaning. Nevertheless, the evolution of ‘rollo’ noun (3) shows an increase of generality in meaning, which could be the basis of the use as an approximator. We consider that this increase in schematicity could be a pattern typical of changes developed in oral conversations.

The data will be analysed by means of multifactorial statistical modelling. Special attention will also be paid to extralinguistic and text-related features like genre, register, sociolect and author.

# On effective and non-effective management of dyadic sequences in triadic clinician-patient-interpreter interaction

Panel contribution

***Prof. Laura Gavioli<sup>1</sup>, Prof. Claudio Baraldi<sup>1</sup>***

***1. Università di Modena e Reggio Emilia***

Studies on healthcare interaction with migrant patients have highlighted that language barriers increase the hierarchical distribution of authority in conversation, making migrant patients' participation difficult. Healthcare interpreting has been devised as a solution to remove linguistic obstacles, revealing, however, that involving the patients and enabling them to contribute in relevant ways to their interaction with clinicians requires complex communicative practices. A practice that has attracted particular attention in the literature on healthcare interpreting is so called "dyadic talk", that is sequences of monolingual interaction involving the interpreter and one of the participants alone. Especially when patients are involved, dyadic sequences seem to be functional to eliciting doubts and worries, clarifying medical items in simpler terms, and putting patients at their ease (e.g. Angelelli 2004, Penn and Watermeyer 2012). Interpreters' engagement in dyadic sequences has however been debated because it excludes one participant from talk, even though temporarily (e.g. Valero Garcés 2007), and less experienced or non-trained interpreters may run the risk of not (properly) conveying information to the participant who was left aside (Baraldi and Gavioli 2017).

In this contribution, we would like to delve into the problem of dyadic sequences within triadic interpreted interactions a bit further. While our former studies were based on a large collection of mediated encounters in women's health, where the language mediators providing interpreting are experienced and with some training, we have recently collected a sample of data in men's health settings, where the mediators are unfamiliar with the setting and much less experienced. The data show that while dyadic sequences occur in this setting too, their handling on the part of the mediators is highly non-effective. In particular: (1) while clinician's talk (explanations and prescriptions) is rendered to the patients mainly through dyadic sequences, there is no getting back to the clinicians with patients' reactions; (2) clinician-mediator talk does not clarify what is actually to be rendered to the patients and what is instead information for the mediator, thus making it difficult for the mediator to re-design the clinicians' talk for the patients. Either of these occurrences were hardly present in the women data set.

While the two sets of data are not comparable in size (the women's collecting over 400 encounters, the men's less than 10), the occurrence of problems in handling dyadic sequences permits to highlight "what went wrong" and allows for suggestions about how to help both mediators and clinicians to improve their management of such an important talk practice.

# On indicating and dealing with uncertainty in healthcare dialogues: questions and findings for medical practice and teaching

Panel contribution

***Prof. Kristin Bührig<sup>1</sup>, Ms. Julia Gärnter<sup>2</sup>, Prof. Sigrid Harendza<sup>3</sup>***

***1. Universität Hamburg, 2. Universitätsklinikum Eppendorf, 3. Universitätsklinikum Eppendorf***

Previous studies of communication between physicians and patients which were based on concrete data from conversations, repeatedly drew attention to the asymmetry of those conversations (cf. e.g. Siegrist 1978) and its manifold consequences for the communication and participation in institutions of medical care. An essential starting point of the studies is that physicians have a characteristic knowledge advantage over patients in terms of their specialist knowledge. However, with regard to the process of diagnosis, this knowledge advantage does not mean that physicians are immediately aware of what a patient is suffering from, or that it becomes immediately clear in the conversation. And yet, the question of what is wrong with them and what will happen to them brings patients to physicians.

In addition to the context of diagnostic uncertainty, which is always present in one form or another in medical interactions (Gärtner et al. 2020), moments of irritation can arise in the linguistic interaction, which show themselves as uncertainties of the physicians or also result in an ›uncertainty‹ on the side of the patient (cf. e.g. Ghosh et al. 2004).

In our interdisciplinary contribution we want to investigate the occurrence and handling of uncertainties in the conversation between physician and patient and thereby investigate the extent to which asymmetries in communication and manifestations of insecurity are related or may even increase.

We will use selected data from a simulation with final-year medical students in the physician's role interacting with simulated patients in physician-patient-encounters (Prediger et al. 2020) to examine the occurrence and expression of uncertainty, to reconstruct the noticing and dealing with uncertainty and to identify the effects of action with regard to asymmetry resp. its reduction.

In the course of the ongoing discussions on eHealth and telemedicine (Dockweiler & Hornberg 2016), we are interested in investigating digitally mediated communication, irrespective of the current pandemic situation. We therefore look at data from the so-called telemedicine and try to formulate approaches and ways based on interdisciplinary research from medicine and pragmatic linguistics in order to integrate our findings into the teaching of medical students.

# On language ideologies and exclusionary styles: Congolese youth and marking “the excluded” in interactions

---

Panel contribution

---

***Prof. Nico Nassenstein<sup>1</sup>***

***1. JGU Mainz***

In this contribution, I focus on metalinguistic practices that refer to included community members and excluded non-members in gangs and youth groups from Kinshasa, DR Congo. Based on several months of linguistic field-work in 2009/2010 on the youth language Lingala ya Bayankee/Yanké (see also Nassenstein 2014) and digital ethnographic data collected in 2016-2018, I analyze labels that mark and categorize non-youth, or those adolescents who are not considered “street youth/street-based”, as well as metalinguistic reference in interaction. By looking at conversational patterns, stylistic choices such as “crossing” (Rampton 1995) and mocking non-initiated youth and based on focus group discussions, my talk approaches language ideologies of exclusion. While most sociolinguistic studies have approached African youth language practices by investigating inclusion (communities of practice, membership, strong ties of social networks), the focus of the present talk lies on exclusionary ideologies and practices.

# On Males, Wusses, Knights, and Grasshoppers: categories for men (and women) across platforms and cultures

Panel contribution

***Prof. Gonen Dori-hacohen<sup>1</sup>, Ms. Lizhen Zhao<sup>2</sup>***

***1. University of Massachusetts Amherst, 2. University of Massachusetts, Amherst***

Gender is a membership device (Rendle-Short, 2005) which entails many categories. We follow Kiesling's "Dude" (2004) and Shrikant's (2015), breaking down the categories for Lesbian women, to discuss the categories of "Man". From Membership Categorization Analysis (Fitzgerald 2015), men may usually be part of the relational pair of Men/Women, it can also be part of Masculinity as a device, and then it has duplicative organization. We present this duplicative organization from two distinct data sets: US Dave Ramsey financial advice show and Weibo comments threads on gender-centered comedy. Some categories ascertain the hegemonic masculinity (Connell and Messerschmidt, 2005), and others are opposed to it, in a possibly new relational pair of Normative/non-normative man. In the US data, the White, Conservative hosts use various categories, for this relational pair: gentlemen, husbands, dads, knights, and guys, versus boys, children, males, boy child, and wuss. In the Weibo data, the Chinese participants isolated negative categories such as straight man (直男), grasshoppers (蜩螗, homophone with 国男Chinese men), male (男的) from neutral categories like men (男人), male (男性), male students (男生, commonly refers to young men), and boys (男孩). These categories also carry predicates and activities: a good man is a man of valor, good husband, and good dad, unlike the wuss who looks for himself and his fun. In Weibo, the heterosexual (直男) Chinese (蜩螗) men are disrespectful and patronizing to women, overconfident, and supporting traditional gender roles, which distinguish them from men in general (男人, 男性, 男生, 男孩). Both platforms promote a complex view of masculinity, opposing it not only to women but to include a variety of masculine categories. Both arenas discuss the heteronormative hegemonic masculine order either to question it (in the Chinese case) or to enforce it (in the US case). As a preliminary suggestion, we assume that in the US case, the heteronormative order created by the various categories also promotes selling ideology and advice to men and women. In the Weibo discussion, we suggest the many categories promote popular culture polysomic and at times subversive views of masculinity which enhance the diverse view of gender in general. Thus, we connect the categories for masculinities with the platform and cultural background to present how different masculinities are constructed.

# On Metapragmatic Gasligthing: Truth and Trump's Epistemic Tactics in a Plague Year

Panel contribution

***Dr. Aurora Donzelli<sup>1</sup>***

*1. SLC and University of Bologna Alma Mater Studiorum*

The covid-19 pandemic has exacerbated contemporary concerns about the arbitration of truth. Often delegated to the media industry, the efforts to ascertain real facts from fake news constitute a prominent feature of the public sphere in the US and beyond (Overell and Nicholls 2019). The ongoing viral contagion has, however, enhanced the tensions between reality and its representation, saturating our mediascapes with a profusion of epidemiological and statistical data and triggering moral panics about our capacity to discriminate the fake from the real.

This paper engages the nexus between political discourse and contemporary concerns about truth. Based on the analysis of press conferences held at the White House during the first five months of the pandemic, I focus on Trump's explicit commentaries on how language is used—what Silverstein (1976) called metapragmatics—and explore Trump's metapragmatic discourse both as an epistemic tactic for the manipulation of information and as an effective style of political self-presentation.

I argue that Trump's reflexive use of language to referentially describe how language is (or should be) used is driven by an approach to truth and evidence that resembles the manipulation tactic commonly called gaslighting. Originating from the title of a 1940s film by George Kukor, gaslighting has been described as a form of psychological abuse whereby false information is deliberately presented to the victim with the aim of making the victim question their own memory and perception of reality. By focusing on specific instances of Trump's metapragmatic commentaries that blatantly contradict shared pragmatic principles for the interpretation of utterances' illocutionary force, the analysis shows how Trump is paradoxically able to present himself as a champion of semantic, pragmatic, and moral candor: By representing as a mis-quote what was in fact a verbatim citation or by claiming that an act of denigration was in fact an endorsement, Trump is not only able to practice "plausible deniability" (Hodges 2020) and assert his preferred version of truth, but he can also perform an effective political persona based on a highly individualist, referentialist, and proprietary semiotic ideology. By presenting himself as a matter-of-fact/trenchant speaking subject and as someone who "calls a spade a spade," Trump claims to fight the growing tendency—typical, in his view, of liberals—of speaking with periphrastic circumlocutions, as dictated by the imperative of political correctness. These epistemic tactics allow Trump to promote a personalist view of meaning-making processes—one that denies the interlocutors' collaboration, representing meaning as established solely by the speaker's will (Hill 2001, Duranti 1993). One of the consequences of Trump's flabbergasting metapragmatic conduct is that, much like gaslit people, those who are critical of his politics often scramble to establish some sort of universal immovable truth beneath what are perceived as fake articulations of discourse. The risk is that, as we try to ascertain the real from the fake, we plummet into a fact-checking frenzy and lose track of the importance of taking a stance—a political one—about what we deem right and what we consider discriminatory and unjust.

# On Multimodality as a Resource for Understanding in Tertiary Education

Panel contribution

***Dr. Arne Krause***<sup>1</sup>

1. University of Hamburg

Tertiary education is predominantly centered around language, spoken and written. In detail, knowledge dissemination is realized through different combinations of bodily resources such as gestures, gaze or posture, and medial resources such as PowerPoint, chalkboards or handouts (Krause 2019). Hence, multimodality is the inevitable reality of every discourse in tertiary education. To analyze this complex reality and the respective affordances within institutions of tertiary education, different approaches can be chosen.

The differentiation of spoken language and written language as modes with more differences than similarities (Kress 2014) is a useful analytical approach to these complex phenomena from a semiotic perspective, but it limits the possibility to analyze the consequences of the use of different modes in the mental process of understanding (cf. Rehbein 1977, Ehlich 1979). An action-centered approach towards multimodality (cf. Krause 2017) within the theoretical framework of Functional Pragmatics (cf. Redder 2008) can help to shed light on this process, incorporating the multimodal complexity of knowledge dissemination.

This paper seeks to identify multimodality not (only) as a resource for meaning-making (as cf. in Kress & van Leeuwen 2001) but as a resource for understanding, hence highlighting ties and differences of Social Semiotics and Functional Pragmatics through a critical appraisal of the current state of research paired with exemplarily insights into tertiary education.

This approach enables to further address questions of inclusive communication in tertiary education, as a ‘targeted applications’ of multimodal resources could be a key factor. But: The needs of deaf and hard of hearing students on the one hand and blind and visually impaired students on the other hand differ in terms of the need of modal resources to ensure understanding of disseminated knowledge. This has to be taken into careful consideration for the development of possible ‘applications’ and will be further addressed in this paper.

# On Responses to “weisha/zenme” (why/how come)-formatted Interrogatives as Complaining in Chinese Conversation

Panel contribution

*Dr. Mei Li<sup>1</sup>*

1. Shanghai International Studies University

Conversation-analytic research has found that why-interrogatives are often used to display a challenging stance and are thus complicated in actions such as complaining, criticizing, and blaming (Bolden & Robinson 2011). A number of studies have examined in detail complainings formatted in interrogatives in German, English, Italian, and Korean conversation (Egbert & Vöge 2008; Koshik 2005; Sterponi, 2005; Yoon 2007). Schegloff (2007: 61) pointed out that complaining sequences are complicated and a range of responses can be relevant next in general. Thus, on what occasion and for what particular recipient a particular response is seen as relevant is an empirical question that needs systematic investigation.

As an initial attempt, this study examines responses to “weisha/zenme” (why/how come)-formatted interrogatives designed as complaining in naturally occurring Chinese conversation. The following example illustrates such an instance:

- 01 Daughter: Ni (wei)- ni **weisha** "yao qiang ta dongxi?  
                   you for you for.what want grab his stuff  
                   ‘**why did you take his stuff?**’
- 02 Mom: -> Wo meiyou qiang a, wo jiu shuo bu qiang a.  
                   I NEG grab PRT I just said NEG grab PRT  
                   ‘**I didn't take it. I just said I hadn't taken it.**’
- 03           Ta na wo de shouji,  
                  he take I GEN cell.phone  
                  ‘**He took my cell phone,**’
- 04           Wo kending yao gei ta nong- yao guolai ya,  
                  I certainly want from him take want back PRT  
                  ‘**I certainly want to get it- take it back,**’
- 05           Ta jiu bu yuanyi.  
                  he just NEG willing  
                  ‘**and then he was just unwilling.**’

The database for the study builds on a collection of 156 telephone calls, and the conversation-analytic approach is adopted for data transcription and analysis. Complaining sequences initiated with the “weisha/zenme” format are identified and the design of the responsive turns is analyzed.

It is found in our data that a complaint sequence is less complicated if the recipient accepts the complaint. However, in most of the cases the recipient rejects the complaint, and the rejection often leads to a rather lengthy and complex sequence expansion. Prolonged pause or silence from the recipient may also be taken as rejection and mobilize the complainant's reformulation of the complaining. It is also found that occasionally the recipient treats a complaining question as information seeking which may be rebutted by the complainant and lead to the complainant's pursuit by further complaining. The findings will be discussed in relation to (1) how moral work is managed in complaint sequences and how participants confront and evaluate the morality of conduct; (2) how epistemic asymmetry between the complainant and the recipient, e.g., their relative access and right to the complainable, can influence the turn design and sequential features of complaining.

# On Stage and Off Stage: the treatment of monologic speech in the work of the Romanian writer I.L. Caragiale

Panel contribution

*Dr. Daniela Caluianu<sup>1</sup>*

*1. otaru university of commerce*

This talk will explore the characteristics of monologic speech in the work of the Romanian writer I.L. Caragiale. The choice of topic was determined not only by the fact that Caragiale is a keen observer of human behavior and, consequently, likely to provide valuable insight into the characteristics of monologic speech but also because he has written apart from plays, a large number of short stories. This allows for a comparison between monologic linguistic behavior on stage and off stage. On-stage monologue is a pseudo monologue since it is meant for an audience present in the theater. Off-stage monologue, on the other hand, is directed to a hypothetical reader and closer to monologic language. Any systematic differences between the two could be seen as reflecting the artist's intuitions on monologic speech.

Monologic acts produced in the presence of other characters have the same properties both on stage and off stage: they represent uncontrolled, emotional outbursts produced in response to stressful situations. They are brief, exclamatory utterances often involving the use of expletives. This linguistic behavior could be described as 'outer thought.' By contrast, the monologic language produced in the absence of any other characters corresponds to Vygotskian 'inner speech.'

As predicted, there are significant differences between Caragiale's instances of inner speech on stage and off stage. In terms of function, there are no notable differences. Both on stage and off stage monologues cover functions generally associated in the literature with monologic speech: self-regulation (initiating, guiding, and controlling behavior) planning of future actions, going through the steps and examining alternative courses of action, or emotional release.

The formal properties of off-stage monologue, on the other hand, set it apart from monologue produced on stage. While dramatic monologue, produced in the presence of a theatrical audience, tends to follow the standard syntactic and semantic rules of the language, monologic discourse off stage often exhibits the properties of self-directed speech noted by Vygotsky: it is predicative, compressed and abbreviated. An intriguing feature of off-stage monologue is the blurring between direct and indirect speech possibly associated with the self-awareness function of inner speech. Caragiale is also well aware of the high speed of inner speech remarking on it more than once.

As this brief account shows, the characteristics of monologic speech in the century-old work of the Romanian playwright reflect the properties attributed to inner speech in psycholinguistic research. This correspondence is encouraging for the student of monologic speech as it suggests that literature can be regarded as a reliable source of data on inner speech, an area notoriously difficult to investigate.

# On stance-taking and the construction of the professional identity of a manager of Chinese origin in a Japanese workplace

Panel contribution

***Prof. Etsuko Yoshida***<sup>1</sup>

*1. Mie University*

The aim of this study is to explore the professional identity of a manager of Chinese origin employed by a Japanese company where a Korean exchange student worked as an intern in 2016. Although it is not obviously advantageous for typical Japanese workplaces to accept foreign trainees/interns, the internationalization of the workplace has become a key issue in Japan that may generate certain positive outcomes for Japanese co-workers. In this study I conducted a semi-structured interview with two staff members: the Chinese employee mentioned above, and one Japanese employee, who were both managers and engaged in instructing the intern. The recent studies on the use of stance markers in discourse have enabled us to examine the attitude of the Chinese manager towards the intern on social context and sociolinguistic perspectives as well as linguistic phenomena (Jaffe 2009; Du Bois 2014). Focusing on the qualitative analysis of the interview data, I claim that the act of taking a stance is essentially emergent and underpin the manager's position as a bridge between his Japanese co-workers and the foreign interns in the company.

The main purpose of the interview was twofold: to collect the Korean intern's reports regarding his participation in the workplace and any direct reactions from the main staff, the manager who monitored the intern. The analysis focuses on (1) the recurrent use of the Japanese 'think' verb *omou* and the overt first person pronoun *boku*('I') in the manager's narrative discourse as a stance-taker (Du Bois 2007, Takahashi 2018) and (2) his recurring lexical back-channels, such as *sodesune* ('that's true'), with the interviewer. These two features of dialogicality reflect an interesting interaction between the subjectivity and intersubjectivity of the interview participants.

Based on the data, the process of stance-taking was found to uncover the dual sides of dialogicality. One is the side of subjectivity—where the Chinese manager shows his struggling consciousness in relation to his managerial position—which reflects the construction process of his new professional identity in a local Japanese factory with direct connections to the global cosmetics industry. The other side is that of intersubjectivity, where the Chinese manager wishes to share common ground with the interviewer through verbal resonances that indicate the amplified confirmation of his professional identity towards foreign personnel. Thus, this study sheds light on how Japanese workplaces can adequately prepare themselves for effectively incorporating foreign personnel into their workforce in transitional social contexts.

## On the Considerate Expressions in Japanese.

---

Panel contribution

---

**Prof. Masaki Ono<sup>1</sup>, Prof. Tsutomu Makihara<sup>2</sup>**

***1. University of Tsukuba, 2. GUNMA UNIVERSITY***

Brown & Levinson (1983) identified “NPS 9. Nominalize” as one of the negative politeness strategies. Japanese belongs to the SOV-type language group. In this language group verbs appear at the end of a sentence in a verb sentence, and considerate expressions for the listener can be found at the end of a sentence. For this reason, nominalization is realized in the form of nominalization of the verb at the end of the sentence. Observing the prohibited expressions of noun predicates, there are two types. The first is the legally prohibited 『command』 such as “Parking is prohibited here” and the other is the customary 『request』 and 『advice』 such as “This dish is forbidden to be sauced twice.” In these linguistic expressions, we report that the backgrounding of the subject is associated with politeness and is frequently used in modern Japanese.

# On the interactive negotiation of procedural rules and language norms in class councils

Panel contribution

***Dr. Stefan Hauser<sup>1</sup>, Dr. Judith Kreuz<sup>1</sup>***

***1. University of Teacher Education Zug***

The so called “class council” is an interactional format that has become well known and widely practiced in many schools, both at primary and secondary level. It is an institutional setting aiming at planning and organizing learning as well as discussing various other school-related topics. In our presentation, we report on a project in which data from 52 videographed class councils are analysed by means of conversation analysis (Birkner et al. 2020, Sidnell/Stivers 2013).

A core idea of the class council is to leave the responsibility for the organization and implementation of the interaction to the children (see also Freinet pedagogy). In order for the teacher to be able to stay in the background the class council usually relies on a strongly pre-structured course of action. In many cases, the class council is also oriented towards various linguistic norms and pedagogical (sub-)goals, such as citizenship education, joint decision-making as well as conversational skills (de Boer 2006).

In our presentation we will deal with the question of how institutionalized rules, here procedural rules and linguistic norms, are addressed and negotiated in the class council, and how these are reflected in the interactional behaviour of the participants. We are interested in which phases and for which topics rules are implemented and how norms are negotiated. We focus on the strategies for the local relevance of these norms with respect to both explicit and implicit negotiation processes. For example, the data allow us to reconstruct how justifications for opinions are demanded (see Hauser/Kreuz 2018 for completeness in oral argumentation) or that positive formulations represent a target norm for the class council.

In the data, it can be reconstructed that the participants are continuously oriented towards these normative ideals. The class council interaction thus shows the permanent creation of a specific institutional context through highly standardized interaction procedures (cf. Clayman/Heritage 2010). Norm negotiations can be shown by means of conversation analysis, for example, when contributions that are marked as ‘inappropriate’ in terms of content and/or language are sanctioned by calls for norms. Thus, not only the implementation but also the breaches and their subsequent negotiation of the rules can be seen as a window into the joint construction of the class council as an institutional setting, that is shaped by various interactively negotiated procedural rules and language norms.

# On the Mechanisms of Presuppositions in Chinese Media Narratives about the Sino-US Trade Conflict

Panel contribution

***Ms. Ying Xu<sup>1</sup>, Prof. Lutgard Lams<sup>2</sup>***

***1. KU LEUVEN, CAMPUS BRUSSEL, 2. KU Leuven Campus Brussels***

The notion of presupposition, as studied in the field of Pragmatics, refers to knowledge that is taken for granted by participants in the exchange of information (Grundy, 2000). Presupposition manifests itself through linguistic carriers responsible for triggering presupposed messages (Potts, 2015). Our study investigates whether the taxonomies of presupposition triggers, as proposed by Levinson (1983) for the English language, are also applicable in Chinese-language contexts and whether any linguistic devices, particular to the Chinese language, can be found to operate as presupposition carriers that do not easily fit Levinson's categories.

Furthermore, to explore how presuppositions function as implicit tools of meaning generation in the context of Chinese media discourse, we analyze their use in the Chinese official press narratives (Renmin Ribao and Xinhua Daily Telegraph) about the initial phases of the Sino-US trade conflict from March to December 2018. Such a dispute, with its contrasting interpretative readings and positions, lends itself perfectly for a study of presuppositions and taken-for-granted meanings. After a brief survey of the most important triggers in Levinson's taxonomy, we offer examples of presupposition carriers in the Chinese language, analyze their linguistic mechanisms, and explore the roles of presuppositions in their concrete co-text. Findings demonstrate that most of the English language triggers are also salient in the Chinese language. Moreover, other presupposition-carrying devices, specific to the Chinese language, are identified and discussed as well. Above all, the analysis illustrates how presuppositions, as used in the corpora investigated, fulfill various roles, not in the least to generate meaning on an implicit level by presenting information as taken-for-granted assumptions, shared by the participants to the communication exchange. In a sensitive context of geopolitical tension, such as the present trade conflict between China and the US, backgrounded information in the guise of presuppositions constitutes a potentially powerful tool to influence audience uptake.

# On the remediation of embarrassables

---

Panel contribution

---

**Prof. Alexa Hepburn<sup>1</sup>, Dr. Elliott Hoey<sup>2</sup>, Prof. Jonathan Potter<sup>1</sup>**

1. Rutgers University, 2. University of Basel

Goffman enshrined embarrassment at the center of the interaction order given its ability to fluster precisely that which interaction requires. Under the English vernacular use of embarrassment, people are strongly motivated to avoid embarrassing situations and to remediate them when they occur. Like other sources of interactional trouble, however, some embarrassing moments may pass by without remark. This raises the question of how and under what circumstances participants make something of a potentially embarrassing event.

In this paper, we build on prior interactional work on embarrassment and related phenomena (Heath, 1988; Billig, 2001; Sandlund, 2004; Butler & Fitzgerald, 2011; Burford-Rice & Augustinos, 2018) by focusing on examples found in naturally occurring interactions in US/UK English. Our goal is to move away from conceptualizing embarrassment as an emotional state by focusing on the sequentially located management of problematic events that might be described in vernacular terms as ‘embarrassing’. Our collection consists of 25 cases encompassing a range of candidate ‘embarrassables’ found in recordings of mostly (but not exclusively) ordinary interactions among friends, peers, and intimates.

Using conversation analysis, initial findings suggest that the exposure of putatively embarrassing situations may play out in different ways according to what the problem reveals (e.g. loss of physical composure, failure of epistemic responsibility) and whether it's the speaker (e.g. via self-reproach, non-verbal cries, facial expressions and gestures, laughter) or the recipient (e.g. via teasing, laughter, accounts, complaints, accusations) who initiates the exposure of the embarrassable. We also show how exposure can be calibrated according to the severity of the event/infraction in ways that show that it has not created a relational problem.

This study aims to contribute to a conversation analytic approach to embarrassment. In doing so, it provides further illustration of the complex social organization of laughter in relation to action modulation, and more broadly, contributes to the further interactional reconfiguration of notions of emotion, intentionality, and accountability.

When we say that *Some elephants are mammals*, we implicate that *Not all elephants are mammals*. This scalar implicature arises when we produce a weaker expression instead of a stronger one. Studies on bilingual adults suggest that L2 learners, regardless of their proficiency level, are equally sensitive to pragmatic interpretations and they exhibit superior performance on a par with monolingual control groups. This controversial phenomenon was mainly explained in the light of the default theory which suggests that pragmatic interpretations arrive by default without cognitive costs. However, the evidence obtained from these L2 studies is largely one-dimensional stemming from offline-tasks that provide limited information about implicature processing. Studies on second language sentence processing also suggest that L2 performance is variable across online and offline tasks. In this study, we investigate scalar implicature comprehension among L2 adults using an online sentence verification paradigm similar to that of Bott and Noveck. We also examine how individual differences in language skills and personality traits would modulate the proportion of pragmatic interpretations and processing times. Malay undergraduate students at two levels of English proficiency, modest and competent, were recruited. They were required to judge the veracity of under-informative sentences as quickly as possible and to complete three personality-related questionnaires (i.e., the AQ, SQ-R, B5). Our results indicated that the modest English group tended to be less sensitive to scalar implicatures compared to their competent peers. The two proficiency groups also took significantly longer processing times to make the pragmatic interpretation than the logical interpretation, and the pragmatic slowdown was significantly larger among the modest English group than the competent group. The results further revealed that the rate of pragmatic responses for the modest English group is, partly, positively correlated with *systemizing* and negatively correlated with the autistic trait *attention to detail*, but it is negatively correlated with the two autistic traits *social skill* and *imagination* for the competent group. All the participants who recorded a high score on trait *neuroticism* exhibited larger delays in processing the pragmatic reading, but only the competent participants who had a high score on the autistic trait *communication* and low score on *openness* tended to show processing delays orthogonal to pragmatic responses. Our results provide novel empirical insights into how L2 speakers process scalar implicatures, and thus useful implications for the processing theories in experimental pragmatics and second language acquisition.

# One two(.) THREE! Moving a person as collaborative activity in (trainings of) mass casualty incidents

Panel contribution

***Prof. Karola Pitsch<sup>1</sup>, Mr. Maximilian Krug<sup>1</sup>***

***1. University of Duisburg-Essen***

In this paper, we investigate how victims/patients are rescued from underneath a vehicle and/or transferred from a stretcher to a hospital bed by a group of rescue/hospital staff. In both situations, the participants use a counting practice (one – two – three) to coordinate their moving of the victim’s/patient’s body as a collaborative activity. The two situations differ in particular in the ways in which the participants treat counting as an orientational frame that projects (but not dictates) specific actions within a series of actions that need to be followed and timed precisely. Analysis will show that the coordinative practices within the teams highly depend on how the counting is embedded in the sequences of actions and how it is organized prosodically. Our analytic focus is on the spontaneously emerging teams’ coordinative practices and their detailed embodied ways in which they constantly adjust and negotiate the ‘pulling’ (i.e. moving a person’s body) as a collaborative and coordinative practice.

These activities are part of a video corpus of (trainings of) mass casualty incidents (MCI) (Pitsch et al. 2020), in which participants find themselves in situations in which different emergency services (fire brigade, medical doctors, paramedics, police) are called to the location of an alleged emergency with several victims and provide aid. In doing so, they interact with co-participants from diverse professional/institutional backgrounds (Goodwin 1994) and have to deal with complex participation frameworks (Schmitt 2012) and involvement in multiple courses of action (Haddington et al. 2014). In some cases, patients have to be rescued before being transported to local hospitals and entering regular medical treatment. To capture some of the complexities of the setting, we have documented these situations with time-synchronized recordings of multiple video cameras, mobile eye-tracking glasses, a drone camera, and radio communication circuits.

# Online complaints from a cross-cultural perspective: The case of Aegean and Turkish airlines

Panel contribution

***Dr. Dimitra Vladimirou<sup>1</sup>, Dr. Ciler Hatipoglu<sup>2</sup>***

***1. Coventry University, 2. Middle East Technical University***

Customer complaints have been studied extensively in the field of linguistics from both a CA and a speech act perspective (e.g. Marquez Reiter 2013; Orthaber & Marquez-Reiter 2011). Yet, the study of online complaints has so far received scant attention (with a few exceptions, e.g. Depraetere et al. 2021; Vladimirou et al. 2021; Decock & Spiessens 2017; Vásquez 2011), despite emerging as an increasingly ubiquitous practice in digital contexts of communication.

Situated in a discursive pragmatic approach and drawing on conceptual tools from social media and digital discourse research, this study examines the distribution and linguistic realisation of complaint strategies in the Turkish and Greek lingua cultures. We examine an authentic corpus of 500 Turkish and 500 Greek online public complaints appearing in corporate Facebook airline pages with a view to compare and contrast two geographically close lingua-cultures, but typologically different languages (see also Bayraktaroglu and Sifianou 2001).

Building upon previous work on complaints (House and Kasper 1981; Trosborg 1995; Decock & Spiessens 2017) we propose a data-driven taxonomy that seeks to capture nuanced similarities and differences between the two lingua-cultures. We identify and analyse the distribution of various sub-categories of past/present and future-oriented complaint strategies, focusing on the level and potential of 1) face threat and 2) the construction of affiliation and solidarity among the online communities and networks formed by the airlines' customers.

Our results reveal that 'dissatisfaction' was the most salient strategy in both datasets. The two lingua-cultures also display an equal preference for disarmsers/ downgraders (see House and Kasper 1981), such as compliments, congratulations and well-wishes, that seek to soften the face-threatening potential of the complaints. Complaints in both datasets often feature detailed explanations and extended narratives; these were found to contribute to the construction of complaints as authentic experiences and facilitated the building of solidarity between the complainer and their perceived audience.

Our results also show key differences between the two lingua-cultures. Complainants in Turkish show a higher preference for requests for repair, placing more emphasis on attempting to remedy the complainable. This in turn suggests that in the Turkish dataset complaints are conceptualized more as action-oriented practices. On the contrary, Greek customers preferred the use of face aggravating strategies, such as condemnations and insults and showed a tendency towards informalisation – a finding which confirms previous observations on Greek im/politeness in globalized contexts (Sifianou 2013).

By adopting a contrastive perspective this study aims to offer valuable insights to the study of lingua-cultural variation of complaints in computer mediated communication and contributes to the exploration of public expressions of customer dissatisfaction in social media contexts.

# Online Hostility at the Nexus of Migration and Gender: Exploring the Gendered Hate Discourse Towards Syrian Refugee Women in Turkey

Panel contribution

***Ms. Yasemin Erdogan-Ozturk<sup>1</sup>, Dr. Hale Isik-Guler<sup>2</sup>***

*1. Karabuk University; Middle East Technical University, 2. Middle East Technical University*

As the boundaries of the nation-states have become more blurred than ever, public discourses and perceptions around refugee populations are now positioned at the core of today's political landscape and simultaneously of a growing academic interest. Such discourses predominantly index an anti-refugee and anti-immigration stance (Krzyżanowski, 2020). This stance is mostly manifested through aggressive, offensive and discriminatory language use directed at refugees in overt or covert ways. The affordances of online space significantly contribute to the visibility, proliferation and intensification of hate towards refugees in the form of offensive language practices at discursive and societal levels (KhosraviNik and Esposito, 2018).

We witness the rise of a severe anti-refugee discourse towards Syrian refugees in Turkey, particularly in digitally-mediated spaces (Erdogan-Ozturk and Isik-Guler, 2020). More interestingly, we observe a gendered dimension of such discourses emerging at the intersection of race and gender. Refugee women are represented by means of multiple linguistics, discursive and argumentation strategies that uniquely construct gendered images of refugee womanhood. Adopting a critical lens into the intricate relationship of gender, anti-refugee discourses and offensive language practices, our research aims to explore (i) how refugee women are targeted and delineated in online anti-immigration discourses and (ii) what stances and identity categories are claimed by online social media users.

Building on the analytical framework of the Social Media Critical Discourse Studies (SM-CDS) proposed by KhosraviNik (2018), our study analyses the comment section of a short YouTube video consisting of Syrian refugee women's reflections on the hardships that they encounter in their everyday lives in Turkey. The specific focus of the video allows us to trace hegemonic understandings and meta-discourses concerning refugee women residing in Turkey. Our initial observations reveal that refugee women, unlike men, are constructed not only as racialized but also as sexualized objects. The hostile discourse towards refugee women is shaped by a masculinist-nationalist ideology and include direct references to their bodies, sexualities and physical appearances. Those references and stigmas are realized through gendered slurs, insults and taboo words at a referential level and through argumentation strategies of delegitimization at a discursive level. By taking a collective anti-refugee stance, Turkish social media users also form a hegemonic *community of practice* based on shared nationalist norms while they assign refugee women and refugees in general to the category of *the other* who does not belong to the society and country.

# Online political discourse on populism: from self-expression to aggression

Panel contribution

***Ms. Nadezda Shchinova<sup>1</sup>, Prof. Barbara De Cock<sup>1</sup>, Prof. Philippe Hambye<sup>1</sup>, Mr. Raül Nuevo Gascó<sup>1</sup>,***

***Prof. Sandrine Roginsky<sup>1</sup>***

***1. Université catholique de Louvain***

This study discusses the social acts performed through the use of the notion of *populism* on the social media platform Twitter and focuses on the use of the term *populismo* and its derivatives (e.g., *populista*)—henceforth *populis\**—in the tweets of Spanish politicians and the received interactions. Since the meaning of populism is still open to debate and it can be considered an “empty signifier” (De Cleen et al., 2018), the aim of this study is to explore different pragmatic and interactional purposes underlying the use of *populis\** in digital political discourse. The term can be used with a positive and negative value and can be itself the subject of controversy. The study of its use can hence shed light on the forms and functions of the qualification of individuals or events as “populist” and on the way politicians and lay citizens engage in online political communication (Breeze, 2020). We examine a corpus of tweets from Spanish political parties and politicians generated during 2019 in order to determine which political actors refer to the notion of *populism* in Twitter discourse. Then we generate a dataset of Twitter interactions involving at least one message from a Spanish politician and its reply or replies. In this dataset, we first analyze the linguistic, communicational and socio-political context of each message containing at least one token of *populis\** in order to (i) determine whether the use of *populis\** performs such social acts as self-expression and self-positioning (Roginsky & De Cock, 2015), or rather qualification of another person or event, associated with aggression, and (ii) assess the positive or negative value conveyed by the term. Second, we examine each interaction in order to determine (iii) whether reactions to a tweet with *populis\** comment upon the use of the term in that particular message, and (iv) whether these reactions support or reject the initial message (De Cock & Pizarro Pedraza, 2018). Finally, we investigate the link between the tweets containing *populis\** and offline events, focusing on whether the use and frequency of tweets with *populis\** can be linked to significant political events. We expect that *populis\** will be employed mainly for negative qualification. Furthermore, we expect controversies about the use of the term to appear in interactions involving, on the one hand, mainstream politicians who use the term to (dis)qualify other parties or social movements and, on the other hand, other political parties or citizens who contest this (dis)qualification.

# Onomatopoeias and body in the demonstrations of Japanese classical *Buyo* dance performances

Panel contribution

**Dr. Eiko Yasui**<sup>1</sup>

1. Nagoya University

Drawing upon micro analysis of interaction, this study investigates the employment and coordination of language and body in a Japanese dance instruction. The data examined for this study is a videotaped interaction of a Japanese classical dance (*Nihon Buyo* or *Kabuki Buyo*) workshop held for international students at a Japanese university. There, a professional dance instructor introduces *Buyo* dance by teaching the students some dance performances using props, such as a Japanese traditional umbrella and fan. It is observed in the data that the instructor often employs onomatopoeias and other vocalizations. As onomatopoeias often accompany gestures or body movements (Kita 1997, Hosoma 2012), in the data, they are employed during the instructor's embodied demonstration of a performance.

The purpose of the study, therefore, is to investigate how the instruction of a *Buyo* dance is constructed through the coordination of onomatopoeias, other linguistic resources, and bodily conduct. The analyses show that the use of onomatopoeias contributes to the students' understanding of the instructed performances as well as enables the instructor to bodily demonstrate the details of performance within a coherent sentence. First, onomatopoeias, since they can evoke impressions or images of movements (Kita, 1997), enable the students to understand the body movements in an imagery and sensuous way. They also highlight certain aspects of movements and mark bodily accents as they are coordinated with body movements. Second, onomatopoeias enable embodied demonstration to be fitted into talk. Unlike non-lexical vocalizations frequently used in dance or music instruction (Haviland, 2007; Keevallik, 2015), Japanese onomatopoeias constitute a part of syntax, such as [onomatopoeia ('su::,' 'shu::,' 'kyyu,' etc.) + quotative marker ('tte' or 'to') + verb]. Deixis, which can tie the talk to what is demonstrated by the ongoing bodily conduct (Keevallik, 2010), are also often employed together; [deixis ('koo') + onomatopoeia + quotative marker + verb]. As such, onomatopoeias create space for demonstration of both the performance and its detailed features within a syntactic structure while instructing the students to perform with her.

This study, therefore, attempts to reveal how the use of onomatopoeias contribute to demonstrating the dance performances in combination with their impressions as well as how Japanese grammar is fitted to and organized by an ongoing physical activity and its instruction.

# Optimising Covid-19 contact tracing in Belgium: an applied conversation analytic study

Panel contribution

*Ms. Anne-Sophie Bafort<sup>1</sup>, Mr. Romeo De Timmerman<sup>2</sup>, Prof. Stef Slembrouck<sup>2</sup>,*

*Prof. Mieke Vandenbroucke<sup>3</sup>, Ms. Sofie Van de Geuchte<sup>2</sup>*

*1. University of Antwerp, 2. Ghent University, 3. University Antwerp*

Effective, qualitative, systematically applied and centralised contact tracing is repeatedly noted as an absolutely vital measure and essential public health tool in containing (and eventually exiting) the Covid-19 pandemic (WHO 2020). The WHO also stresses that “a workforce of trained contact tracers and supervisors” is crucial and that “communication about contact tracing should emphasise solidarity, reciprocity and the common good”. In Flanders/Belgium, a number of interactional problems which hinder the effective functioning of “national” contact tracing have been noted in the media to allegedly persist: e.g. calls remain too short; the talk is script-dominated; reluctance exists to divulge necessary information; there is a lack of rapport between interlocutors. In this presentation, we report on an applied conversation analytic project that aims to optimise the interactional functioning of contact tracing phone calls by (1) empirically diagnosing the state of contact tracing interactions over the telephone through fieldwork, audio-recordings and detailed interactional analysis; (2) developing and implementing evidence-based recommendations and training materials and (3) testing their efficacy. The over-arching aim of the project is to optimise and foster professional-reflexive forms of pragmatic awareness among call-centre practitioners in the conduct of task-focused ‘sensitive’ encounters (cf. Slembrouck & Hall: 2019; Vandenbroucke 2020). In doing so, the project avails itself of the taxonomies developed within conversation analysis (Schegloff 2007; Hutchby & Wooffitt, 2008) and interactional sociolinguistics (Rampton 2019) and analytically topicalises those micro-interactional aspects which are constitutive in conversational interaction (i.e. turn-taking dynamics, topic management, formulation and face work). As such, this project inserts itself in the tradition of interactional sociolinguistic research on professional institutional discourse (e.g. Sarangi & Roberts 1999) which prioritizes the need to engage dialogically with practitioners and to foster their professional reflexive pragmatic-linguistic awareness (Candlin & Candlin 2003; Slembrouck & Hall 2011), with the aim to accomplish a transition from analysing/explaining professional interactional behaviour to sustainable, jointly-supported effects on how practitioners interact with clients.

# Oral communication and interaction in social services: what strategies towards a mutual understanding?

Panel contribution

***Dr. Anne Parpan-Blaser<sup>1</sup>, Dr. Paloma López Grüninger<sup>2</sup>, Dr. Christoph Imhof<sup>1</sup>***

*<sup>1</sup> FHNW School for Social Work Olten, <sup>2</sup> FHNW Academy of Art and Design*

## Background

In order to prevent and combat poverty, every Swiss municipality is obliged to ensure economic and social support in the form of social assistance, if the criteria of subsidiarity and material needs are met. For this support to be effective, a successful outcome of counselling interviews and, as a basis, the participation of the person concerned are central prerequisites. However, communication between social workers (which represent the legal authority) and clients (as the recipients of help) in social welfare is structurally embedded in a situation of asymmetry (Becker-Mrotzek, 2001). Furthermore, documents, information and processes provided by social services are often neither clear nor comprehensible to clients (Hartmann 2014, Eser Davolio et al. 2013, Neuenschwander et al. 2012).

## Main issue

Since the potential of visual communication - visualizations making things perceptible, imaginable and graspable - is not nearly exploited in social assistance, in our R+D project we address the question, what means of visual communication could support counseling interviews in this context. To identify needs more precisely and opting for a qualitative approach (using content analysis), in a first phase, we observed eight counselling interviews in two social services, led topic-oriented guideline interviews with twelve stakeholders, and analysed documents used in the consultations. The majority of the clients in the observed conversations and interviews were people who have little knowledge of the local conditions and language because they have immigrated to Switzerland, some of them only recently. Against this background, the present paper tackles the following questions: What strategies do those involved use to achieve mutual understanding and how could these be supported by means of visual communication?

## Results

With regard to understanding and making oneself understood in the interaction situation of the consultation, the analysis highlights several indicators that show whether or not comprehension has been achieved. It also points out influencing factors promoting or hindering understanding. In particular, the conditions for counseling - be it on the part of the client (e.g. stressful life situation, understanding of administrative processes ), the social worker (e.g. the capacity to address different levels of understanding) or the structures, where interaction takes place (e.g. the language level of the documents) – proves to be significant.

# Orchestrating children's action: an in-depth multimodal analysis of child-educator interactions in one Italian early childhood education setting

Panel contribution

***Prof. Marilena Fatigante<sup>1</sup>, Ms. Lilia Antici<sup>1</sup>, Prof. Cristina Zucchermaglio<sup>2</sup>, Dr. Valentina Fantasia<sup>1</sup>, Prof. Francesca Alby<sup>3</sup>***

*1. Sapienza University of Rome, 2. LiNC - Interaction & Culture Laboratory, Department of Social and Developmental Psychology, Sapienza, University of Rome, 3. LiNC, Interaction and Culture Laboratory, Department of Social and Developmental Psychology*

Early childhood education centers (ECEC), known in Italy as “nidi” (literally, “nests”), are educational contexts devoted to children aged 0-3, organized under the primary goals of providing daily extra-family care and opportunities for socialization. Through their participation in daily activities with peers and educators, young children make their first contact with culturally-determined rules, practices and values. The present work particularly investigates educators’ intervention in directive sequences, i.e. sequences in which the educator attempts to orient the child toward a certain- either explicitly or implicitly expected -course of action. Only a few studies so far have documented in detail the practices through which the educators direct the children’s action and attention while they are performing routine educational activities in ECE centers. By adopting a video-ethnographic and conversation analytic methodological approach, the study analyses the multimodal and sequential ways by which educators in an Italian ECE Center respond to children’s initiatives that diverge from an expected conduct, and how they manage to get the children’s compliance and collaboration. Data include longitudinal ethnographic observations (over the course of 5 months) collected in a ECE center in Rome, and a collection of 8 hours of video-recordings of interactions occurring between participating children and their educators, collected at different moments of the ECEC morning routines. Analysis was conducted accordingly to the method of Conversation Analysis, which closely follows the turn-by-turn development of actions. Videorecordings were fully transcribed also accounting for multimodal aspects of the production of participants’ actions and turns (gaze, gestures, posture, spatial positions of the body among the participants, manipulations of objects and material context, co-occurring within and between each speech turn), considered as essential carriers of semiotic meaning, particularly in children-adult interactions.

Analyses reveal the variety and recurrence of sequential and multimodal strategies that ECEC teachers use to orchestrate the children’s attention and actions toward the desired course of activity, when they diverge from an expected course of action. The analysis of how these multiple resources are coordinated shows how the educators are able to merge the competing educational needs of 1) having the children comply with institutional norms and values of the Center, and 2) allow children to experience their agency and autonomy in pursuing an individual course of action.

Particularly, when children diverge from the expected course of action, the educators allow them enough time and opportunities to revise their conduct, in so doing favouring the negotiation of meanings and affect with the children, and leaving them the opportunity to maintain affiliation with the educator even in the course of a break of the rule. Practice and methodological implications are discussed in the conclusions.

# Organizing safety and reconfiguring actions in institutional settings in the Covid-19 era

Panel contribution

***Mr. Sofian A. Bouaouina<sup>1</sup>, Ms. Julia Schneerson<sup>1</sup>, Prof. Lorenza Mondada<sup>1</sup>***

*<sup>1</sup>. University of Basel*

The Covid-19 pandemic is consequential for the way in which ordinary actions are organized and accountably designed and interpreted in situ. Within the framework of ethnomethodology and conversation analysis, this paper addresses how practices related to safety and hygiene – like wearing a mask, using hand sanitizer, and minimizing haptic sociality – are integrated in courses of action characterizing institutional and service activities. We focus on how service is reshaped by constraints related to safety measures; on how professional practices are reorganized by reference to safety and hygiene; and on how hygiene practices, such as sanitizing hands, are integrated in ordinary courses of action.

This paper shows how, in particular sequential environments – like openings, closings, and transitions between activities –, specific actions are reconfigured by orienting to, referring to or hinting at safety and hygiene measures. These reconfigurations reveal how constraints related to the pandemic can have perturbing and disruptive consequences on ordinary courses of actions. They also reveal how these constraints can be creatively integrated within activities and exploited as resources for (re)organizing them. In particular, in commercial activities at the market and in specialized shops – such as opticians and cosmeticians – one issue is how to deal with constraints that affect and transform service: How to impose constraining measures on the client while offering a service? How to integrate new practices related to safety and hygiene in the smooth progression of ordinary actions? The paper is based on a diversity of video-recorded activities in professional settings involving clients and service providers.

# Orientation to child agency in directive sequences in a Japanese daycare center

Panel contribution

**Ms. Mitsuko Ono<sup>1</sup>, Dr. Toshiaki Furukawa<sup>2</sup>, Dr. Eric Hauser<sup>3</sup>**

**1.** Rikkyo University, **2.** Waseda University, **3.** University of Electro-Communications

Drawing on the concepts of *agency* and *distributed agency* from Enfield (2017) and Floyd (2017), we use conversation analysis to demonstrate how teachers in a Japanese daycare center orient to the agency of two- and three-year-old children in directive sequences and how agency in such sequences is distributed across teacher and child. Agency is viewed as a combination of a social actor's flexibility with regard to their control over their own actions and accountability for their actions (Enfield, 2017). In a directive sequence, in which one participant responds (whether compliantly or otherwise) to a directive from another, agency is inherently distributed (Enfield, 2017; Floyd, 2017). Exactly how it is distributed, though, is contingent and variable.

The data come from fifteen hours and forty minutes of video-recordings at a daycare center in Tokyo. One of the researchers visited this institution ten times over the period of two months from January to February, 2020, focusing on one class that had three main teachers (and a couple of part-time assistant teachers) who took care of eighteen children. The different activities in the data include homeroom, lunch and snack time, exercises, picture book reading, self-reading, play time inside and outside, walking to nearby parks, etc. Unsurprisingly, there are a large number of directive sequences in which a teacher tells a child to do something, such as to empty his or her cup, to adjust the position of his or her chair, or to move out of the way. The directives are constructed as composite utterances containing both talk and gesture. The talk may or may not involve an explicit directive and may be related to such things as providing a reason that the child should do the action he or she is being directed to do, while the gesture is more closely related to what this action is. Interestingly, the directives also usually involve touch and a lesser or greater degree of physical control over the child's actions.

In most cases, teachers display a strong orientation to child agency. They tell the child what to do through talk and gesture and use touch to, at most, attract the child's attention and perhaps prompt him or her to initiate the action. The child is expected to be able to carry out the action relatively independently. In a few unusual cases, a teacher displays minimal orientation to child agency and physically moves the child without allowing the child to carry out the action independently. Finally, there are cases in which a teacher corrects a child's response. These cases show a change in teacher orientation, with an initial strong orientation to child agency being progressively weakened as the teacher takes greater control over the child's physical movement.

# Oriented to, but not penalised, rule violations: video analysis of substitutions in beach rugby

Panel contribution

***Mr. Roman Matvienko<sup>1</sup>, Prof. Christian Greiffenhagen<sup>1</sup>***

***1. The Chinese University of Hong Kong***

Codified rules are the constitutive element of team sports as a social activity. Athletes and umpires employ practical interpretations of rules to manage game encounters (Garfinkel 1963). Proper game management involves a balance between a consistent application of rules and maintaining a pace of play (Askins, Carter, and Wood 1981). This balance manifests itself in the fact that it is more preferable to prevent violations than to stop the game and penalise the offender. In this paper, we examine situations when players violate a formal rule of the game, but the referee does not penalise them. However, such violations have not gone unnoticed. As we will demonstrate, players and match officials orient towards these violations to reorganise their actions and restore the order.

We focus on a case of substitution in beach rugby, where such situations become evident. Rules of beach rugby allow any number of substitutions during the match but only when the referee blows the whistle to stop play. Since players resume the game on their own by “tapping” the ball, there is no fixed time interval between stopping and resuming the game. Quite often the game resumes when the substitutes have already entered the field and the replaced players have not left it yet. Formally, a team has too many players on the field in this situation, and the referee must order to reduce the number appropriately and penalise the offenders. In practice, it does not happen. Nonetheless, players either display that they recognise the situation as a rule violation and quickly leave the field or demonstrate their non-involvement in the game encounter.

We analyse video recordings of matches made during a beach rugby competition in Russia (17 matches, approximately 2 hours of data). We show how players complement their orientations towards formal rules with information about positions, actions and bodily manifestations of their teammates and opponents to deal with rule violations in situations under scrutiny. Our analysis highlights, therefore, the variety of interactional resources employed by participants to restore the order of play and empirically illustrates under-determination of game events by formal rules (Kew 1992).

# Orthography and writing reforms as stylistic exclusion

---

Panel contribution

---

***Dr. Katharina Tyran<sup>1</sup>***

**1.** University of Vienna

Situated in my broader research context of visual and social aspects of script systems in the south-Slavic area my contribution will focus on orthography as a stylistic marker in Croatian and Montenegrin. Drawing on both research questions posed for the panel “Indexing Exclusion through Style” I am asking how recent orthography reforms in both languages following their emancipation of Serbo-Croatian may be approached as a semiotic resource of style and how they are used as exclusionary practices. More specifically, I will discuss how competing orthography reforms are connected to ideological disputes and how the use of either one orthography or another is discursively constructed as stylistic representations of ideological perspectives. Specifically, I will elaborate the introduction of new graphemes and blank spaces as visible stylistic markers of exclusion and clear dissociation of Croatian and Montenegrin from former Serbo-Croatian but also Serbian, which needs to be contextualized in the disintegration of Serbo-Croatian as a common language concept after the breakup of Yugoslavia. In recent time, graphematics, orthography and corresponding reforms in the Croatian and Montenegrin context clearly function as visible linguistic ‘signs of difference’, following Gal’s and Irvine’s recently introduced concept on language and linguistic practices as differentiation (2019). Drawing also on both Spitzmüller’s work on graphic variation (2013a) and metapragmatics, idexicality and enregisterment (2013b) I will demonstrate exclusionary styles of writing in their ideological context by firstly analyzing competing orthographic policies through their introduction in compendia and discussion in linguistic discourses, followed by an evaluation of actual usage of orthographic style in the media (with a focus on print) and its ideological implication.

# Other-increments in multiperson interaction: the syntactic by-product of mutual gaze

Panel contribution

***Ms. Virginia Calabria<sup>1</sup>, Prof. Elwys De Stefani<sup>1</sup>***

***1. KU Leuven***

Conversation analysts have described gaze as a fundamental resource for turn-management in vocal interaction: speakers identify recipients (Goodwin 1979) and select next speakers (Stivers & Rossano 2010; Weiß 2018) with gaze, whereas recipients display recipiency by establishing mutual gaze with speakers. Consequently, within this domain, gaze behaviour has been described as a fundamental dimension participants orient to in the identification of potential turn- and TCU-boundaries, in the course of activities such as tellings and question/answer sequences (Rossano 2012). Whereas previous literature has provided profound insights into how turn-extensions are sensitive to gaze behaviour, studies on how gaze relates to the grammatical features of turn-construction are still scarce. In this contribution, we examine other-increments (“other-initiated increments”; Schegloff 2016), i.e., unprojected continuations that a self-selected speaker produces by uttering talk that is syntactically dependent on the prior speaker’s potentially complete turn. We investigate two cases that differ in the participants’ gaze behaviour. In the first case (1), a speaker establishes mutual gaze with a recipient, who subsequently self-selects at a TRP with an other-increment. In the second case (2), a non-gaze-addressed participant self-selects and produces an other-increment. We show that in the first case, turn-extensions tend to be produced as multi-clausal formats, whereas in the latter case, the increments tend to be shorter and syntactically simpler (i.e., mono-clausal). While this finding seems to resonate with Rossano’s (2012: 156) observation that speakers engaged in a first pair part “exert additional pressure” on recipients to produce a response by gazing at them, our contribution examines cases in which a response is not sequentially projected. Our analyses suggest that next-speakers who produce grammatically more complex (and more extended) increments display more entitlement to speak, whereas speakers of shorter other-increments display less entitlement to speak (and therefore orient to the potential disruptiveness of their turn-extension).

The analysis is based on 10.5 hours of video data of multiperson interactions in present-day Italian, recorded in ordinary (a dinner party) and institutional (two business meetings) settings. By examining naturally occurring multiperson interactions, our analysis elaborates on prior research, which focused mainly on two- or three-party interactions (Rossano 2012; Weiß 2020). The analysis of the above-mentioned phenomenon in a multiperson participation framework enables us to problematise fundamental notions of conversation analysis (Sacks 1992; Sacks, Schegloff & Jefferson 1974) and interactional linguistics (Couper-Kuhlen & Selting 2018), which set up the methodological backbone of our research. Indeed, if gaze has response mobilising properties (Stivers & Rossano 2010), the distinction between “addressing” a recipient through gaze and “selecting” them as the next speaker becomes blurred. We show that addressing and speaker-selection are in fact an emic achievement of co-present participants, rather than practices that would be entirely in control of the speaker. We also show that the establishment of mutual gaze increases the recipients’ entitlement to speak, thereby favouring self-selection.

In bringing to the interactional surface the work it takes to design a turn, self-repairs provide evidence for the normative character of constructing social actions (Drew, 2013; Jefferson, 1974, 1987; Schegloff, Jefferson, & Sacks, 1977). In doing self-repair, the speaker breaks the progressivity of the turn at talk, thereby exposing a bit of talk as having been inadequate in some way. However, the degree to which an error is exposed (or not) varies. In this paper, we analyze a type of self-initiated self-repair in which speakers draw attention to their error in the course of correcting it. In producing such “over-exposed” corrections, speakers not only repair an inappropriate formulation, but also repeat and/or comment on the trouble source, and/or apologize for having made the error, thereby further halting the progressivity of the turn. We argue that in over-exposing the error and its correction, speakers highlight their accountability for the error in the service of managing context-specific deleterious inferences about themselves (e.g., as incompetent, unprofessional, insensitive, ageist, or racist) that the error makes available. The paper uses Conversation Analysis and draws on a large and diverse corpus of talk-in-interaction, primarily in American and British English.

# Pandemic, Fear, and Language of Exclusion: Resurgence of debates over loanwords in Japan

Panel contribution

***Dr. Naoko Hosokawa***<sup>1</sup>

*1. University of Tokyo*

This article examines the controversy over the use of English-derived loanwords related to the Covid-19 pandemic in the Japanese news media. In Japanese, Western loanwords are referred to as *gairaigo*, which literally means ‘words that come from outside’. The use of foreign loanwords has always been a controversial issue. While some Japanese see it as a positive sign of Japan becoming an open society, others see it as linguistic corruption and point to the damage done to the beauty and purity of the Japanese language. Since the start of the pandemic, the Japanese news media has preferred the use of English-derived loanwords such as ‘cluster’, ‘lockdown’, ‘overshoot’ and ‘social distance’ in reportage related to the Covid-19 crisis. The media’s over reliance on foreign loanwords provoked a vehement public backlash, dividing public opinion into two opposing camps. One camp argues that public announcements relating to public health and safety should be ‘fully in Japanese’, as it concerns all the population including those who are unfamiliar with foreign languages. The opposing camp claims that loanwords better convey the sense of crisis appropriate to the Covid-19 pandemic. The article argues that the current debate over the use of *gairaigo* can be seen in the framework of a broader discursive practice that surfaces during times of crisis, which differentiates a Japanese ‘Self’ from a foreign ‘Other’. In linking the contingencies of the pandemic with loanword usage, we see two distinct developments. On one hand, the trepidation caused by the pandemic is transferred to a fear of the non-native ‘Other’. On the other hand, the use of pandemic-related loanwords to provide mental solace to the ‘Self’, as the hardships of the pandemic sound distant and confined to a far away foreign land.

## Parental Scaffolding of Updates

---

Panel contribution

---

***Dr. Darcey deSouza<sup>1</sup>***

*1. Northeastern University*

In this paper I use the methods of Conversation Analysis (Sidnell & Stivers, 2013) to examine the ways in which parents provide scaffolding (Vygotsky, 1978) in updating solicitations. I analyze video-recordings from 20 different families, totaling nearly 31 hours of video-recorded interaction. The video-recordings consist of everyday co-present family interactions where there is at least one child between the ages of 3 and 6 years. In analyzing the data I began noticing how children told their parents about their day, and how parents solicited talk from their children about their day, and I collected cases of child-initiated and parent-prompted instances of “telling about your day” (87 in total). For this paper, I focus on a subset of 36 cases in which parents solicit updates from their children. Relevant segments were transcribed using standard transcription conventions (Hepburn & Bolden, 2017), and any identifying information (e.g., names, places) was removed and replaced with pseudonyms.

I find that scaffolding helps parents solve a specific type of interactional problem: how to get their child to update about their day when they are struggling with providing a parent-solicited update. Parents provide scaffolding in their solicitation in two main ways: 1. Through update solicitations that then progress to providing turns for confirmation (wh-questions that are followed by yes/no interrogatives (YNIs)) and 2. yes/no interrogatives that are followed by related wh-questions.

Overall, in this paper I unpack how parents help children who struggle in reporting details about their own lives. At times, children demonstrate some difficulties in responding to parental update solicitations, either by claiming not to know what they did or what had happened, or by delaying a response in some way, possibly indicating difficulty. This may point to the fact that updating requires interactional competence that younger children may not have in that it is something that may develop over time (e.g. Forrester & Cherington, 2009; Wootton, 2010). Prior research shows that children as young as age 3 are able to produce unsolicited updates unproblematically (Searles, 2019). It may be possible to infer that children do recall past events and can tell about them in moments that arise naturally (and are self-initiated) within an interaction, but when they are prompted by others, are less able to retrieve them.

# Participation and Perspectivity in Interactional Learning Processes

Panel contribution

**Prof. Sören Ohlhus<sup>1</sup>**

**1.** University of Hildesheim

It is a characteristic of institutionalized learning processes that they are accompanied by certain predefinitions about the topics, roles and methods that can be expected. These specifications are an important reference point for situational negotiation processes on action building and participation. And even if there is agreement on what the legitimate expectations of an institutionalized learning situation are, they give rise to very different perspectives: that of teachers, with a focus on predictability and the production of certain types of participation to achieve pre-set goals. And that of learners, who often have to get along without such overview and planability and have to make an effort to find their own meaning in the learning situation or to evade it.

In order to better describe these different perspectives, I will in my paper refer to the work of Michel de Certeau. In his “Practice of Everyday Life” [1], de Certeau distinguishes a strategic mode of action from a tactical one. The strategy is characterized by the fact that the actors have the opportunity to shape the space of possible action themselves. This enables them to set goals, determine methods in advance – and later establish them in the interaction to achieve these goals. The area of tactical action, on the other hand, describes a mode of action in which the actors cannot dispose of the preconditions for their own actions and must instead rely on the exploitation of “favorable opportunities” to achieve their goals.

In my paper I want to use de Certeau’s distinction to investigate longitudinal data of interactive learning processes and to examine the reconstructible negotiation processes for action building and participation in terms of their strategic and tactical elements. For this purpose I will draw on a corpus of interactions from mathematical remedial teaching in elementary school ([2]). With reference to de Certeau and within the framework of a multimodal interaction analysis (e.g. [3]), the learning processes documented in this corpus of interactions in permanent interaction groups can be described as processes of building common resources for action (strategic dimension), which, however, require the constant recourse of all participants to tactical courses of action, by which only learning opportunities and participation can be established interactively. Only through them do planned learning processes really become processes of concrete acquisition of knowledge by acting individuals.

# Participation of clients with disabilities in adult protection procedures

Panel contribution

***Dr. Simone Girard<sup>1</sup>, Prof. Gabriela Antener<sup>1</sup>, Dr. Markus Bossert<sup>1</sup>, Dr. Sara Galle<sup>1</sup>,***

***Mrs. Annette Lichtenauer<sup>1</sup>***

***1. FHNW School for Social Work Olten***

The inclusion of people with disabilities has become the focus of research and development, particularly in the school and education sector and in policy-making. Another important area is access to legal and administrative procedures. In this article, we propose an analysis of communication practices between professionals in the current Child and Adult Protection Authorities (CAPA, *Kindes- und Erwachsenenschutzbehörde*, KESB; former guardianship authority) and their clients with disabilities. It stems from a larger SNSF project in which these practices are also examined in a historical perspective from 1970 to the present in three Swiss cantons (Antener, n.d.).

In this paper we focus on the current procedures for establishing a deputyship and give insight into the first results regarding the CAPA procedure under the law that has been in force since 2013. In these procedures, professionals clarify the clients' support needs, identify tailor-made support in specific areas (e.g. housing, finance, health) and define one or more persons as deputy. The participation of clients in their proceedings is considered important nowadays, both from a social work and a legal perspective. However, it is not yet sufficiently described how this participation is actually understood and promoted by the persons involved. A basic prerequisite is that clients are informed about the process and the aims of the procedure and can bring their views to bear in the procedure (see e.g. Rieger & Strassburger, 2014, on the preliminary stage of participation). In order to achieve these various objectives, professionals are faced with complex and challenging communication. The investigation focuses on the way professionals meet or report to meet these challenges in their current practice. The study is based on two datasets: guideline-based interviews with professionals and clients, analysed according to the grounded theory methodology (Strauss & Corbin, 1996), and a conversation-analytical case study (Stivers & Sidnell, 2013) of two video-recorded interactions between two authority members and a client with a learning disability and two relatives.

The results show that on the one hand, the professionals aim for the client's acceptance of the planned measure and, on the other hand, for a quick and smooth process. To meet this challenge, professionals prefer oral communication, as it seems to be more malleable and adaptable to the situation. In addition, they regularly rely on both relatives and future deputies to communicate the content of the legal decision in an understandable way. How this in turn affects the clients' participation is discussed in this paper.

# Peer experts as actors for shared understanding in Spanish online health fora

Panel contribution

***Prof. Barbara De Cock<sup>1</sup>, Prof. Carolina Figueras Bates<sup>2</sup>***

***1. Université catholique de Louvain, 2. Universitat de Barcelona***

Online support groups to assist individuals suffering from diverse medical conditions afford their users a platform to achieve legitimacy and recognition, as well as a social network that promotes the exchange of knowledge and experiences (McCormack and Coulson 2009). Such services provide not only information, but also diagnoses and therapies, thus contributing to creating a shared understanding between patients and healthcare professionals. One of the most popular resources available online are discussion forums run by patients. These platforms share the common goals of empowering their users, exchanging mutual peer support and experiential knowledge (Kummervold et al. 2002), making them useful resources that may complement the assistance offered by medical experts in the offline world. In this regard, some studies have underscored the therapeutic benefits of peer support groups, among others for recovery from eating disorders (cf. Stommel 2009).

In this presentation we aim to uncover some of the strategies deployed by users of patient fora to build shared understanding and inclusion within the group. We focus on the role of the “peer expert”, understood as a lay user who has achieved expertise and credibility on a particular health condition through personal experience (Vydiswaran and Reddy 2019). We examine epistemic asymmetry between peer experts and recipients when coping with a physical vs a mental illness. In addition, we explore how the peer expert identity fulfills a bridging function towards shared understanding between patients and expert. To that effect, we look at the interactions performed in two different Spanish online support forums on diabetes management and on recovery from an eating disorder. The analysis revealed that the discursive construction of expertise in diabetes and in eating disorders differs in relation to: a) how agency is interactively negotiated (as a distinctive feature between patients vs. experts); and b) the weight and the nature of the personal experience claimed by the peer expert. In this presentation we attend, specifically, to the particular linguistic material deployed in each forum to index inclusion and shared understanding (such as the reference of discourse persons) and to construe agency when coping with the illness (such as the types of verbs used when exchanging a recommendation).

# Performance, performativity, and storytelling in a multilingual radio show: The case of Hawaiian

Panel contribution

***Dr. Toshiaki Furukawa<sup>1</sup>***

**1.** Waseda University

The term performance has both everyday and technical meanings. In everyday use, performance is (1) deliberate play-acting that is believed to be highly intentional. On the other hand, in technical use, performance is (2) artful ways of speaking (Bauman, 1986; Hymes, 1974) or (3) doing, practicing, and achieving actions. In the third sense of the term, whether ‘doing’ is a conscious act does not matter, as Butler (1990) conceptualizes the notion of performativity as tied to iterability (i.e., repeating and changing conventional actions). I examine performativity in a Hawaiian language radio show. What is relevant to my analysis of performance is when and how the multilingual participants perform actions and bring various categories into being along with social meanings within and across interactional contexts.

Taking a discursive approach to the indigenous language of the islands of Hawai‘i, I report an ongoing research project on talk on a Hawaiian language radio program, *Ka Leo Hawai‘i* (The Voice of Hawai‘i). The program, which was hosted by Larry Kauanoe Kimura, broadcast over four hundred shows in the 1970s and 1980s. *Ka Leo Hawai‘i* aimed at documenting, primarily, Native Hawaiian elders’ talk, and made a significant contribution to creating resources for future generations and to the revitalization of the language. *Ka Leo Hawai‘i* was later hosted by Puakea Nogelmeier in the 1990s, broadcasting nearly four hundred shows. This project has so far roughly transcribed forty-nine shows, or approximately fifty-three hours of audio recording. Based on these rough transcripts, I have produced detailed transcripts for further analysis according to the conventions of conversation analysis.

While past linguistic studies using discourse data have focused on narrative structure, this study discusses the mechanisms of interaction between host, guests, and other participants such as call-in guests using Hawaiian on the radio, a non-traditional domain for storytelling in Hawaiian. A close analysis of the tellings of several legends such as *Falls of ‘Akaka* shows the dynamism of storytelling in Hawaiian on the show, as the participants deliver a story collaboratively through narrating the story, animating the characters, and making evaluative comments that relate the story to the narrating event. The study demonstrates that conversation analysis, which has been used mainly in research on major languages such as English, can serve as a powerful analytical tool for less-studied languages such as Hawaiian.

# Performing authority: Exploring the nexus of language, culture, and facemasks in YouTube videos

Panel contribution

***Dr. Jenifer Ho<sup>1</sup>, Dr. Jackie Lou<sup>2</sup>***

*<sup>1</sup> City University of Hong Kong, <sup>2</sup> Birkbeck College, University of London*

While facemasks have now become a common sight and an emblem of Covid-19, six months ago, they were a familiar trope in discriminatory discourse and even the target of racist attacks, when the virus was referred to as a ‘Chinese virus’, which later was also expanded to include other pan-Asian ethnicities. This paper explores to what extent two bilingual YouTube celebrities have participated in this reversal of public perception of facemasks by promoting their use in everyday activities. ‘Teacher Mike’ (American) has 642K subscribers, with content focusing on ESL, with occasional glimpses into his personal life; British teenager ‘Max’ has 95.3K subscribers, with content mainly about British culture and everyday life. What they have in common are their bilingual content and transnational trajectories (both lived in China for many years), and both uploaded videos in April 2020 promoting the use of facemasks.

Based on multimodal transcription and analysis (Ho, 2021) of the videos, we identify three moments from each as key ‘sites of engagement’ (Scollon & Scollon 2004), where facemasks were employed by the social actors to perform everyday activities, such as grocery shopping and family brunch. We then examine the interactional stances (Dubois 2007) taken by the actors towards facemasks through language and other semiotic resources, while also attending to the embedding of the interactional frame (Goffman 1974) of everyday activity within the social media frame of a YouTube video.

This leads us to argue that the two YouTubers’ knowledge of Chinese language and culture provided them with the authority on the necessity of facemasks, and at the same time, not wearing a facemask and its associated ‘magical thinking’ have become materials for cultural consumption. We conclude the paper by reflecting on whether these transnational social media personalities reduced or increased the gap in cross-cultural understandings of Covid-19.

# Person- versus content-oriented approaches in English and German email responses to customer complaints: A cross-cultural analysis of moves and first-person pronoun use

Panel contribution

***Ms. Rebecca Van Herck<sup>1</sup>, Ms. Babette Dobbenie<sup>1</sup>, Prof. Sofie Decock<sup>1</sup>***

*<sup>1</sup>. Ghent University*

Research in pragmatics suggests that English and German speakers differ in their communicative styles (House, 2006; Kranich, 2016). The former tend to prefer an interpersonal style, which refers to the use of language to establish and maintain social relationships (i.e., people-oriented); the latter tend to use a more transactional style, which is defined as the expression of content and information (i.e., content-oriented). This study examines if these differences also apply to the genre of English and German organizational email responses to customer complaints, which play a key role in present-day service recovery.

We do so by taking into account two parameters, discourse structure and first-person pronoun use, as these parameters reveal how agents construct their professional identity and their professional relationships with the customer. We expect differences in discourse structure and first-pronoun use to reflect differences in communicative style between English and German speakers (i.e., a more personal vs. detached approach). In a first phase, a rhetorical move analysis (i.e., identification of communicative functions of text segments) of 150 English and 84 German authentic emails is conducted to examine whether the English (German) data contain more interpersonal (transactional) moves. In a second phase, the frequency of first-person references (singular and plural) and their association to the specific moves is analyzed.

The results of the move analysis reveal that the discourse structure of both datasets is mainly similar: The genre's core elements are *Greeting*, *Gratitude*, *Apology*, *Explanation*, *Conclusion*, *Sign-off*, and *Signature* in both datasets. However, a small set of differences does indicate that English speakers tend to prefer a more interpersonal approach, while German speakers tend to prefer a more transactional style. The results of the pronominal analysis reveal that agents generally use more *we*-than *I*-references in both datasets, thus exhibiting mainly a corporate identity. However, this varies by submove, which points to pronominal shifting across move level: English agents use more *I*- than *we*-references in the moves *Apology* and *Empathy*. This implies the agent's personal involvement in the customer's situation and thus suggests that the agent expresses their personal, individual identity. In addition, results also show that German agents use more *we*-references compared to their English colleagues. Findings on pronoun use thus seem to be in line with previously attested differences in communicative style between English and German speakers. Overall, our findings suggest that English agents proclaim more often a personal and involved identity and communicative style. Similarly, German agents focus more on corporate identity and thus express an impersonal, detached, and business-like communicative style.

# Personal or collective certainty? Epistemic commitment in online communities

Panel contribution

***Ms. Ylva Biri***<sup>1</sup>

**1.** University of Helsinki

The goal of this study is to analyse how social media users express their epistemic certainty and commitment. Epistemic stance a key component of a writer's epistemological position, signalling certainty, commitment and basis of knowledge (Mushin, 2001), thus influencing also the writer's pathos as an informed authority or as a more cautious interactant.

This study compares epistemic commitment on two opposing sides of the climate change debate, which in unregulated social media discourse mixes information sharing with ideological persuasion, often in segregated like-minded bubbles (Mo Jang & Sol Hart, 2015; Williams et al., 2015). For this study, a 912,000-word study corpus is compiled of English-language Twitter posts using hashtags #climatechange and #climatehoax and of posts on discussion forum Reddit's *ClimateChange* and *ClimateSkepticssubforums*. While the social media platform predicts stylistic patterns, the beliefs and ideologies in the climate debate influence the constructed epistemological positions identified.

I use quantitative corpus methodology to systematically identify patterns of epistemic stance across genres and user groups. Epistemic stance positions are constructed in relation to other participants, and this paper focuses on subjective stance, attributed to first-person singular pronouns, and intersubjective stance, attributed to the first-person plural (cf. Marín Arrese 2011). The writer-oriented focus is thus on the first-person pronouns with frequent cognitive verbs (e.g. *know, think, guess*), and epistemic adjective labels (e.g. *I'm certain*). The instances are qualitatively classified by certainty range, from high-commitment "we know" to more tentative "I guess" and to the uncertain "I am not sure".

Expressions of certainty suggest roles of authority taken by the self, whereas expressions of uncertainty construct a more cautious position. In comparing first-person plural and first-person singular pronouns, the study contrasts epistemic positions attributed to the self with positions attributed to a collective. My findings show that expressions of epistemic stance are more frequent on the dialogical platform Reddit than on Twitter, suggesting differences in platform register. In-context discursive functions of expressions are also discussed: for example, while "I know" marks certainty and commitment, the intersubjective variant "we know", used more frequently on Twitter and discourse by skeptics, suggests general consensus as basis of knowledge, thereby increasing certainty. On the other hand, "I don't know" and "I guess" may be used sarcastically for insincere commitment.

# Phraseological manipulation for humorous purposes: The analysis of 8-to-12-year-olds' written stories in Spanish

Panel contribution

***Dr. Larissa Timofeeva-Timofeev<sup>1</sup>***

**1. UNIVERSITY OF ALICANTE**

Phraseological manipulation (PhM, henceforward) is defined as an intentional and recognizable transformation of a phraseological item, concerning its formal, semantic or discursive level (Mena 2003; Timofeeva 2009). To put it in another way, the fixed set is broken aiming to trigger different communicative effects (cfr. Timofeeva 2009; Martí 2014, 2015; Guerrero 2017). It is clear, thus, the relationship between this linguistic procedure and the notion of *incongruity*, stated this as the basic ingredient of a humorous product (vid. v.g. Forabosco 2008), and which is outlined as a disruption of the "default" inferential process compelling the hearer to seek for an alternative interpretation (cfr. Martin 2007, 2016; Yus 2016, 2017). Besides, it is also evident that the appropriate use of PhM requires good metalinguistic (especially metapragmatic) skills, and this becomes relevant when dealing with children (Gombert 1992; Timofeeva 2016, 2017).

Within this theoretical framework, in our paper we aim to analyze the use of PhM as a linguistic device to trigger humorous effects in stories written by schoolchildren of three age bands: 8, 10 and 12-years-old. Their humorous narratives form part of the corpus CHILDHUM, currently under construction. Thus, the analysis of 448 stories corresponding to the province of Alicante that we carry out in this paper, provides the following results:

- even if the three age bands under examination are supposed to demonstrate high metapragmatic competence levels, the use of PhM is scarce at the age of 8 (around 3 %); whereas it increases exponentially in 12-year-olds' stories (around 30 %).
- the qualitative approach to the examples reveals that children at the age of 8 make a rather epipragmatic use of this resource, which deserves some interesting observations.

This paper forms part of the research project *La formación de la conciencia figurativa en la etapa de Educación Primaria: el humor y la fraseología* (FFI2016-76047-P, AEI/FEDER, UE).

# Physicians' orientation to child patients in Finnish general practice consultations

Panel contribution

***Prof. Johanna Ruusuvuori<sup>1</sup>***

***1. Tampere University***

Child patients regularly attend medical consultations together with their parents or parent. It is likely that with child patients both the child and the parent have relevant knowledge on the child's symptoms and their development. However, while the child patient has the primary right to know about their own experience, they may not yet be competent in describing their symptoms, thus needing the help of their parent. Furthermore, specifically smaller children may not easily surrender to physical examination, which sometimes makes persuasion, tactile shepherding or even use of force necessary, and thus complicates the idea of every human's right to physical integrity, that is, the right to decide about when and how their own body is available to other's touch. Due to their developmental stage, child patients thus represent a group with diminished epistemic (Heritage & Raymond 2005) and deontic (Stevanovic & Peräkylä 2012) rights as compared to the adult participants. This places physicians in a dilemmatic situation in terms of how to negotiate the division of these rights between child patients and their parents.

This study asks how physicians go about in this multi-party situation where the division of epistemic and deontic rights is unclear. It describes both vocal and non-vocal, embodied practices of engagement with the child and/or the parent when asking the opening question, and subsequently approaching the child to start the physical examination in Finnish pediatric consultations. In focus are practices of turn-allocation and bodily orientation of the physician, and the ensuing embodied negotiation with the child and the parent, to perform the institutional tasks in question.

Drawing upon the preliminary analysis it seems that physicians' ways to treat the child as a more or less eligible participant varies according to their individual bedside manner rather than the child's age or interactional competence. The study sheds light on complications in terms of the allocation of epistemic and deontic authority in service encounters where a companion is present with the client/patient.

The data consist of 39 video-recorded encounters with child patients having symptoms of upper respiratory tract and attending a general practice consultation with a companion in Finnish municipal health care. The method of analysis is multimodal conversation analysis (Mondada 2018).

# Place names in legal texts: vagueness and ambiguity in the Italian Medieval Lombard kingdoms

Panel contribution

***Dr. Elisa D'Argenio***<sup>1</sup>, ***Dr. Chiara Ghezzi***<sup>2</sup>

*1. Università di Napoli Federico II, 2. Università di Bergamo*

Toponyms give an identity to a portion of natural space based on the definition of its relevant properties (physical, cultural, and/or historical) and relations. On this delimitation graft administrative/political demarcations which are essential in communicating geographically specific information.

Attributing a name to space is a complex task where considerations of vagueness and ambiguity are crucial as they affect the certainty of the outcome of place name - place comparison. Spatial vagueness is inherent in toponymy. The use of toponyms often implies blurred boundaries as reference to places that do not coincide with 'official' names of the same place, or that do not precisely coincide with that specific place are common (e.g. *the English Midlands*) (Bennet 2010). Equally, referential ambiguity is unavoidable in geographic naming as for instance the namepoint can refer to elements of distinct nature (e.g. *Pointa* city in Rains County, USA vs *Bear Point* a bay in Canada).

Also in the past, similar considerations raised relevant problems to groups of people who needed to represent accurately geographical space and its subdivisions, providing appropriate geographical context (Aitken/Prosser 1990). Our study focuses on legal documents (purchase and gift contracts) written in Latin in the Bergamo and Salerno areas during the Lombard kingdoms (8th-11th centuries) (Sornicola *et alii* 2017, Ghezzi 2000).

As pertains to vagueness, when describing the extent of vague places, as is the case of lands, it is common to explain its location relative to other named places (Byrkit 1992), to an official name (Arampatzis *et alii* 2006), or to the positioning of other places within the vague place identified. In our corpus we focus on trigger phrases which are typical of notarial language as *locus ubi dicitur* lit. 'place where it is called' which explicitly highlights such identification problems.

1. *in locum qui dicitur Mitilianu ubi proprio Priatum vocatur*(897, Salerno)

'in a place called Mitiliano which is said precisely Pregiato'

Moreover, in the documents, the name *locus* itself is highly polysemous as it refers to different entities (lands, localities, dwellings, etc.).

The main aim of our study is to compare quantitatively and qualitatively the strategies that Northern and Southern notaries/scribes in the Lombard kingdoms used to cope with spatial vagueness and ambiguity, and to represent geographical space in their society. Secondly, legal texts can give insights into the relationship between spatial vagueness and ambiguity, and linguistic vagueness and ambiguity, together with the theoretical conceptualizations of both.

# Players' orientation to rules during a board game

Panel contribution

***Ms. Roosa Oinas<sup>1</sup>, Prof. Marja-Leena Sorjonen<sup>1</sup>***

***1. University of Helsinki***

Playing a game together is a prototypical example of a situation that requires shared knowledge of rules, e.g. what actions are required and permitted, what counts as an allowable action, and to which extent there is flexibility in deciding on the permissibility of action. There are also rules regarding when, in which order, and in which way game actions should be done. Rules are set as guidelines to construct, maintain and, if needed, restore intersubjectivity, when someone is seen as breaching the rules, either by accident or on purpose. That is when it becomes relevant to start a discussion about rules. However, sometimes it may be unclear when overt rule formulations can be made.

This paper uses the methods of conversation analysis to investigate moments when players orient explicitly to rules during board game sessions. The data consist of video-recordings of a word explanation board game Alias (similar to Taboo). Alias is played in teams, and in each game in the data there are two teams competing against each other. The teams play in turns, and on each team's turn, one of the team members has to explain words on word cards to the other team member(s). The rules concern both the actions of the players explaining the words, and the ones guessing them. The performance time is often regulated with an hourglass and is extremely seldom paused once started.

In the data, both the player in an initiating role (explaining the word to be guessed), and the one in the responding position (providing the guess) can be treated as having departed from the rules. We will show that while a breach of rules in designing the explanation of the word to be guessed is typically detected after the answer has been provided (e.g. the explanation has contained a part of the word in question), there are deviant cases where the explanation is treated as unacceptable already before that. Treating the guess as departing from the rules may be related not only to the verbal construction of the guess but also how it was heard. We also discuss breaches having to do with the organization of the game, concerning mainly turn-taking, such as breaches in the timing of voicing a breach, and ones in the entitlement to talk during the performance time.

In the conclusion, we will discuss more generally the invoking of breaches of written rules as a way of orienting to the game as a rule-governed activity, and simultaneously modifying the practical implementation of rules on a moment-by-moment basis. Furthermore, we will take up the potential of rule discussions as bringing up types of rules that are not governed by the written rules.

# Playful Learning through Silences in the Speech Between Adults and Children

Panel contribution

***Dr. Kirsten Read***<sup>1</sup>

**1.** Santa Clara University

The conversations between adult caregivers and young children are powerfully important for language learning, and highlighting vocabulary for young children in both explicit and subtle ways is foundational for that learning. This kind of vocabulary highlighting is especially common and rich within the context of shared reading (i.e., reading a book aloud with a child), and because children's books often present language in highly structured and predictable formats, one way that adults highlight new words for children in this context is through silences, or intentional dramatic pauses designed to allow children to guess at upcoming words.

In this talk I will discuss empirical findings from my research with parents and young children engaged in playful everyday conversations, particularly during shared book reading. Both observations and experimental work from my lab have shown that intentional silent pauses on the part of an adult conversation partner can positively impact children's attention, predictive skills, and new word learning. When an adult uses predictable or familiar language and then cues a child with a silent pause to "fill in the rest" it increases the child's engagement and learning as well as the simple back-and-forth playfulness of the whole interaction. In a recent experimental study from my lab, we compared the effects of both location and type of prompting/pausing on vocabulary retention. Hearing stories featuring novel imaginary monsters named at the end of rhymed stanzas, 4-yr-olds ( $n=60$ ) were randomly assigned to conditions in which a reader either silently paused for 3 seconds prior to or after saying the monster name or asked "What's he called?" during the pause replacing the silence with a prompt. After hearing the stories twice, children were tested on how many of the monsters they could identify by name. We found there was a significant interaction effect between location of the pause and whether it was silent or filled on children's correct monster name identification. When the reader inserted a silence just before revealing the monster names, children remembered those names better than in any other condition. Thus, strategically used silences in pedagogical and playful interactions with young children can boost learning.

# Playing by the Rules – Video Game Play as Procedure

Panel contribution

**Dr. Hiloko Kato**<sup>1</sup>

1. Institute of German Studies, University of Zurich

For a long time, video game play was considered an activity of subculture, performed only by teenagers and computer geeks. This assumption has changed fundamentally, as video games have become a medium of everyday life: Nowadays, inviting friends over for gaming nights, casual gaming while taking the public transportation and Esports taking over entire arenas is no longer a rarity. Video games even have officially been declared as “cultural artifact” (“Kulturgut”, Angela Merkel at Gamescom 2017) and they are also being added to the collection of the Literaturarchiv Marburg since 2019.

Video games have been compared to traditional media, promising new forms of appropriation with seemingly unlimited interactivity and absolute freedom of reception. This understanding though is deceiving: It neglects the true nature of video games, being cybernetic systems and therefore defining and regulating the reception of the player by implemented rules and game mechanics (cf. Kato/Bauer 2018). In other words: video games need special attention to their specificity as a strongly restrictive and demanding medium – both in hard- and software – which shapes the gaming activity and interaction around and through it as such.

Already several papers have given insight into video game play, taking its interactional nature into account: Reeves/Greiffenhagen/Laurier (2016) for example collate several analysis of video gaming as practical accomplishment (e.g. Mondada on the coordination of gaming action and talk-in-interaction or Bennerstedt /Ivarsson on sequentiality and the situatedness of in-game action), discussing additionally methodological issues regarding the ethnomethodological and conversation analytic informed methods.

This proposal aims to analyse video game play by focussing on the perspective of the medium, thus requiring the appropriation of unique affordances, e.g. of reading space, of mastering hardware skills and of coping with tasks the game mechanics offer. The main data consists of recorded gaming sessions of the VR-game Keep Talking and Nobody Explodes (Steel Crate Games, since 2016). The goal of the game is to defuse a bomb against all odds: The player who has mounted the VR-goggles is the one who sees the (virtual) bomb, which consist of multiple modules. The other player only has the bomb defusal manual, where all possible modules are described. By ‘keep talking’, that means describing, identifying, instructing and guessing activities, the two players have to work together for the defusal of the bomb, coping as well with the hardware (controllers and VR-goggles) and the differences of perception in both virtual and real space. Even though this game certainly is a very singular example, it can clearly be of significant value for game play analysis in general, as it moves the focus on what has been submerged under the already habitual procedures of playing video games.

# Playing one's part within a medial procedure: a talk show host's role-specific interaction

Panel contribution

***Dr. Georg Albert***<sup>1</sup>

1. Universität Koblenz-Landau

The political talk show stages a multi-party discussion of its own kind. Participants are being faced with special interactional challenges regarding face work, turn taking, or topic management. Many characteristics of the talk show discussions are connected to their double articulation, i.e. the fact that the entire discussion is addressed to a non-present audience (cf. Luginbühl 2019, 127). In my presentation I am going to focus on yet another property influencing the interaction within talk shows, namely the predefined participation roles and the respective scopes for performance. The activity of the host has been chosen to be in the centre of attention.

Her distinguished role within the medial procedure *TV discussion* allows the talk show host to flout some of the conversational rules applying for the other participants. At the same time, however, she needs to exercise her duties as a chair and see to an entertaining as well as coherent discussion. Thus, she has the licence to drop or change a subject; and she can override the other participants' efforts to gain or keep the floor. One important device for the host to arrange the show is the ability to present film clips related to the subject under discussion. Interrupting the discussion and contextualising the film clips – for the non-present audience – are therefore interactional tasks to be specifically dealt with by the host of a talk show. Findings so far suggest that the film clips are treated like additional participants of the discussion, used to contradict or support other talk guests or to explain a subject for the audience.

The study presented is part of a research project dedicated to the topic management in a political talk show. Data samples are taken from a corpus of 19 editions of the German “Anne Will” show. The samples’ function is to reveal some of the effects of the host’s special role on the interaction staged. To this end, the video samples and corresponding transcripts are being closely analysed with special regard to sequential organisation and the concurrence of verbal and non-verbal expressions. The observed interactions reflect their medial context, which, reciprocally, is also the result of the participants’ practices.

# Pluri-modal poetic performance of humor and laughter in the angama ritual on Ishigaki Island

Panel contribution

***Dr. Makiko Takekuro<sup>1</sup>***

**1.** Waseda University

The So-ron festival is held throughout Ishigaki Island, one of the southernmost territories of Japan, on 13-15 July in the lunar calendar. Equivalent to the mainland Bon Festival, So-ron is a memorial rite, celebrating the return of ancestors' spirits from another world to the present life. Despite its religious nature, a cheerful atmosphere prevails. It includes the famous angama ritual, performed by young members of a community association disguised as ancestors' spirits. This paper describes the ritual and the poetic performance of humor and laughter involved in visits to designated houses or institutions (e.g. restaurants, hotels, nurseries, and senior care houses) to chant, sing, dance, and exchange banter with their audience of living people. It pays close attention to question-answer sessions between the performers and audience, linking this poetic performance to the physical and cultural space in which it is embedded. It focuses on the performers' appearance (especially that of the two leading performers, the male ushumai and the female umii, an ancestor couple) and on linguistic humor. This paper describes the use of super-high pitch by the ancestor couple, related to their supposedly spiritual identity, and of the repeated voice (cf. Bakhtin 1981), even though spontaneous wit is deemed crucial for verbal exchanges in angama. Resources for linguistic humor in angama rarely extend outside traditionally discussed matters and the insular life of the participants.

Based on videotaped data of these exchanges, this study first examines repetition and parallelism in "pluri-modal" (Kataoka 2018) (referential, prosodic, and gestural elements of linguistic) elements of humor and laughter, drawing on Hymes' (1996) ethnopoetics and Jakobson's (1960) poetic-aesthetic conception of language structure. It then discusses the cultural meanings of such poetic structures anchored in the context of the here-and-now, which is itself embedded in the reproduction of a timeless ritual frame. It also touches on issues of regional identity, in particular, how this humor conveys continuity as well as making use of the local language to dominate standard Japanese during angama.

# Poetic construction of vertical space: Chronotopic analysis of “an immense fall” narrative in rock climbing

Panel contribution

***Dr. Kuniyoshi Kataoka<sup>1</sup>***

*1. Aichi University*

In this presentation, I will examine how a danger-of-death narrative of rock climbing experience is closely related to a “chronotopic” construction of epistemological status, and confirm that such an involved narration can be represented in terms of highly poetic patterning in coordination with bodily actions and visual imageries (Kataoka 2001, Hill 2005). Chronotope (Bakhtin 1981), usually translated as “time-space,” is a notion that refers to the inherent inseparability of temporal and spatial relationships that are realized and fused into a coherent whole. As such, any image that has been socio-historically constructed through discourse is always chronotopic, and defines emergent genres and textual distinctiveness (Blommaert 2015, also De Fina and Perrino 2020). A classic example would be Basso’s (1990) discussion of Western Apache place names, which reveal “the moral teachings of their history.” Such temporally and spatially created images (or indexes, when realized as epitomized constructs) serve as an ideologized asset shared in each community.

Narration of rock climbing experiences also exhibits community-held chronotopic values that are differentiated from those on the horizontal plane in terms of delicate balancing and the awareness of gravity. Especially a climbing style called “American aid (climbing),” owing to its practical commitment to ecological “cleanliness” (use of natural protective devices against a fall), necessarily evokes a particular chronotopic configuration because of the possibility of immense falls. Thus, the images embraced by aid climbers project not only ordinary narrative temporality (e.g., Labov & Waletzky 1967, Fleischman 1990) but also a spatio-temporal configuration, which renders poetic patterning a natural part for narrating repeated actions involved in that style of climbing (cf. Hymes 1981, Tedlock 1983, Kroskrity and Webster 2015).

Relying on such an interdependent coordination between chronotopic and poetic configurations, different narrative components are demarcated by the choice/switch of perspectival and aspectual verbs, which serves an indexical function comparable to the historical present (cf. Wolfson 1978; Schiffrin 1981). It is pointed out that vantage point shifts in the topological structure are not haphazard but are collaboratively mobilized along with and across chronotopes associated with climbing and falling. For instance, in contrast to the narrative mode which usually favors an intrinsic and active (i.e., character-oriented) perspective, the present narrative on an “immense fall” is shown to be characterized by features of an extrinsic and passive (i.e., observer-oriented) perspective.

Narratives of (aid) climbing typically exhibit a habituated and typified mode of encoding rock climbing experiences since aid climbers are often subject to an immense fall, which inevitably evokes an action devoid of agency. What underlies these phenomena is spatio-temporal imagery building, which triggers an oral-visual exchange of narrative strategies crucial for chronotopic alignment.

# Poetic patterns of connectedness (parallelism) in episodes of ‘anomalous’ communication.

Panel contribution

***Dr. Alicia Fuentes-Calle***<sup>1</sup>

*1. University of York*

This presentation is based on research in progress on interactional poetics in communication episodes which exhibit interpersonal resonance. The analysis will focus on a form of social interaction which occurs naturally in conversation, in which *one participant’s spoken turn exhibits a poetic relationship to a co-participant’s unspoken thoughts or unarticulated mental imagery – a poetically realised confluence of interiority and talk* (Wooffitt 2018; Wooffitt, Fuentes-Calle, Campbell 2020). These are cases in which interactants report a strong sense of interpersonal alignment and of fuzzy (porous and permeable) boundaries between self and other. In the context of the trans-subjective processes of affect, Blackman (2012) attempts the description of instances when notions of individuality seem inadequate to describe experience, such as attunement and rhythm. Data in this analysis will include some traditional accounts of patient-analyst interactions in the context of psychoanalytic practice (to provide an initial background), and will focus on other examples of dense connectedness in linguistic interaction collected by the author. All these cases exhibit the pattern described above: poetic confluence between spoken turn/ unspoken thoughts. The author will examine her hypothesis that the confluence occurring between interactants is articulated to a high degree via the poetic principle of parallelism (Jakobson 1960; Tannen 1989; Fox 2014), both at the level of cross-turn poetic structure and of the text-metrical. It will be explored how the interplay between the propositional and the interactional is articulated in those cases via poetic principles, patterns, and resources (Lempert, 2008). The analysis will consider in particular to what extent in these episodes of *anomalous* communication the poetic infrastructure might be mapping the interactional level (hypothesised as primary) onto the propositional level (hypothesised as derivative). (And to what extent analytic patterns routinised by referential language ideologies may obscure the theoretical possibility of this sequence). This presentation is therefore framed in some overlapping areas between poetic function (levels of relative transparency-opacity of poetic structure and the text-metrical in discourse), the articulation of different degrees in the “(inter)subjectivity spectrum” as it is experienced by interactants, and the role of communication and language ideologies in the framing of normal/*anomalous* communication forms.

# Poetic performance in walking tour discourse

---

Panel contribution

---

***Dr. Hiroko Takanashi***<sup>1</sup>

**1.** Japan Women's University

This study demonstrates that poetic performance plays an active role in shaping sociocultural meanings in tourism discourse from the perspectives of *parallelism* and *dialogic resonance*. Jakobson (1960, 1981) maintains that repetition, parallelism, and equivalence are the major constituents of poetic language, where the selection and combination of linguistic elements produces poetic effects. In parallelism, differences in repeated structures call for the interpretation of equivalence, thus conveying poetic meanings embedded in the juxtaposed utterances. Underlying this kind of relation across utterances is dialogicality (Bakhtin 1981), which serves as part of the theoretical grounds for dialogic resonance, a notion of dialogic syntax that “encompasses the linguistic, cognitive, and interactional processes involved when speakers selectively reproduce aspects of prior utterances, and when recipients recognize the resulting parallelisms and draw inferences from them” (Du Bois 2014: 366). The poetic analysis of the walking tour data I have collected in various international tourist cities demonstrates that tourism discourse is a symbolic practice, whereby social meanings are interactionally constituted (Thurlow and Jaworski 2010). More specifically, a higher degree of dialogic resonance in the repetition, substitution, and transformation in parallel structures was found to occur when the tour guides make significant points about a selected dimension of a tourism resource, show greater emotional involvement, and produce humor. The results suggest that the layers of parallel dialogic structures set up a pattern in which the differentiated elements invite the tour participants to make pragmatic inferences for equivalent but prominent sociocultural values by virtue of analogy based on interdiscursivity through recontextualization (Bauman and Briggs 1990).

# Poetics and pragmatics: patterns of linguistic exclusion in the Indian Colonial Archive 1757-1877

Panel contribution

***Prof. Rukmini Nair<sup>1</sup>***

*1. Indian Institute of Technology Delhi*

A little researched body of colonial poetry found at the National Library in Calcutta by the author is analyzed in this paper. The poets under discussion range from Warren Hastings, Governor General of Bengal, to a host of middle and high level British officials who worked for the East India Company. Combining concepts and tools from pragmatics (Grice's theory of implicature; Austin and Searle's notions of perlocutionary effects and felicity conditions on speech acts classes) with insights from the work of postcolonial critics (Said 1979; Spivak 1988; Bhabha 1990; Nair 2002, who have developed the terminology of orientalism, subalternism, hybridity and sensuous theory to characterize the unequal interactions of 'self' and 'other' in colonial contexts), the paper seeks to fathom the ambiguous intentions and conventions of a nascent colonizing culture. Why should a colonial power expend so much labor on the production of unsaleable poetic goods and services? What sorts of gains did those who claimed to "love your India... [as] your India me" - anticipate when they staged their iterative poetic encounters between an 'English' and an 'Indian' self? Verschueren (2012) made an important intervention in this arena with his pragmatic study of historical corpora relating to the 1857 'Mutiny' or 'First War of Indian Independence'. Here, I suggest that the related new field of 'postcolonial pragmatics' can provide the tools to explain, for instance, how historical ideologies of conquest can be sustained by a literary genre like poetry. Poems constitute short, focused, imaginative and affective texts that, in particular historical contexts, can lay the ideological foundations for future interactions between putative rulers and the ruled. Long before the British Crown formally took over the country over in 1858, the hundreds of poems published by British administrators in India, I argue, staged what might be called 'rehearsals of conquest'. Code by code and stanza by stanza, they forged a morally loaded language of exclusion, creating the focal figure of a central, towering Englishman nobly dedicated to taking on the 'White Man's Burden' while the puny Indian natives became the very emblems of this burden. Over time, this discourse enabled a linguistically charged English 'self' to emerge as the most fitting ruler over a vast multilingual empire and, simultaneously, his Indian 'others' to be revealed as quite unfit to manage their own economic and intellectual resources. It was precisely this evocative idiom, my paper contends, that fed into the core institutional semantics of colonialism and, later, post-colonialism. Colonial contexts offer, of course, textbook examples of inequalities in communicative power and turn-taking status. They constitute large-scale, attested instances of historical phenomenon when unfamiliar cultural behaviors and new languages were imposed on local speakers and hearers, effectively silencing them. This paper suggests that while 'face-to face' spoken talk was certainly a primary focus in early pragmatics, studying written texts such as the ones examined in this paper demonstrates that there is significant potential to extend pragmatic perspectives to historical situations of 'language use' wherever the intentionality of the interlocutors remains a vexed issue.

# Pointing as a resource for narrative

Panel contribution

**Dr. Jakub Mlynář**<sup>1</sup>

1. Malach Center for Visual History, Faculty of Mathematics and Physics, Charles University

Attempts to operationalize the notion of “collective memory” frequently acknowledge that it is deeply tied to language and narrative. The link between memory and space is also often emphasized. Halbwachs’ foundational work asks for a study of the places of memory: “It is to space – the space we occupy, traverse, have continual access to, or can at any time reconstruct in thought and imagination – that we must turn our attention.” (1950: 93) Various research initiatives followed, most notably Nora’s “sites of memory” (1989).

This paper offers an ethnomethodological respecification of the link between memory, space and narrative, grounded in video-based analysis of three interviews from the USC Shoah Foundation’s archive (<http://vha.usc.edu>). They contain 75 minutes of “location video footage”, mostly in “the form of a walking tour conducted by the interviewee”. Surroundings are incorporated into the narrative in various ways. In addition to *captioning* (“this complex of buildings that the camera is focused on...”; INT2) and *positioning* (“now we are standing in front of...”; INT1), my paper studies *pointing*. I focus on two specific practices: *pointing with gaze* and *pointing with hand*.

*Pointing with gaze* appears to be more often produced in deictic reference to the currently occupied place. It indexically establishes *this* place as the “here” of the narrative. E.g., INT3 points with his gaze to the surrounding space while uttering “here on Charles Square (0.7) we were...”. *Pointing with hand*, in contrast, seems to be produced for incorporating *another* place. It literally “points out” something in the currently occupied environment – a “highly structured cultural entity” (Goodwin 2003: 218) – and indexically establishes that object as a “there” for the narrative. E.g., INT1 points with his stretched arm while saying “I was living over there in that corner”. A possible working maxim is that a hand is used when a particular aspect or feature of the surroundings has to be specified to overcome ambiguity, while eyes are used in reference to the surroundings in general.

The interactional work done by these practices during situated narration is specified by studying what happens next. In the analyzed recordings, they are routinely followed by panning and zooming of the camera, which seems to take the pointing as an *instruction*. Pointing thus serves to virtually direct the camera work. This can indicate that in co-presence, pointing invites the listeners to look at something relevant to the story (cf. Mondada 2014). In sum, by focusing on bodily incorporation of surroundings into an ongoing narrative, my contribution enriches our understanding of pointing and situates narrative practices firmly in their material settings.

# Policing masculinity: Constructing, commanding, and challenging masculinity in police interviews

---

Panel contribution

---

***Mr. Dakota Wing<sup>1</sup>***

*1. York U*

Police interviews present a speech event in which discursive strategies can be used to further contextual goals, especially the interviewing officer's goal to obtain a confession (as in the REID interviewing model). One such strategy found in male officer-male suspect interviews is the officer's construction and appeal to the suspect's masculinity. Drawing on excerpts from a corpus of American police interviews (collected by [www.ForensicLing.com](http://www.ForensicLing.com)), this talk investigates how masculinity is discursively constructed and used as a resource to achieve contextual and larger social goals. An Interactional Sociolinguistics and Critical Discourse Analysis framework are used to demonstrate the discursive construction of a contextual gendered masculine identity indexed by behaviors that can result in incriminating statements, such as taking responsibility and telling the truth. The analysis reveals various ways that officers appeal to the suspect's masculinity, including commanding speech acts (such as "man up" or "be a man"). These appeals to the suspect's masculinity rely on (and reinforce) gendered social norms in which men are expected to adhere to socially constructed masculine identities and the failure to do so has negative social and psychological implications. However, suspects often challenge the officer's contextually constructed masculinity and do not conform to the prescribed and commanded behaviors. I suggest that variable social and cultural understandings of masculinity that different suspects bring into an interview may result in different responses (perlocutionary effects) of the officer's speech acts. For example, suspects may view disobeying a command as a behavior that indexes their idea of masculinity, creating a communicative clash. In doing so, this also questions who some suspects perceive as having the authority to determine what makes "a man". This study also reveals ideologies of gendered language use.

# Polite insults vs. impolite familiarizers & terms of endearment: on the face work and social effects of vocatives in present-day Madrilenian Spanish

Panel contribution

***Ms. Fien De Latte<sup>1</sup>***

1. Ghent University

Vocatives, defined as (pro)nominal terms used to directly address the hearer (e.g. Hey *dude!*), are considered to be key strategies in the creation and maintaining of interpersonal relationships in interaction (Kluge & Moyna 2019). As intersubjective and social deictic markers, the notions of *face*, *face work* and *politeness* are central issues in the study of vocatives (Haverkate 1994). This analysis will focus on the Spanish vocative, shown to be highly productive in terms of both token and type frequency (Stenström & Jørgensen 2008).

Most research on Spanish vocatives has highlighted their usage as face enhancing or protecting strategies (i.a. Edeso Natalías 2005). However, some vocative uses seem incompatible with, if not contradictory to, their conventional meaning. In this regard, two observations can be made: vocatives constituting authentic insults (e.g. *gilipollas* ‘asshole’) are frequently used to enhance interpersonal relationships in everyday conversations (Bernal 2008). On the other hand, conventionally face enhancing familiarizers (e.g. *tío* ‘dude’) and terms of endearment (*cariño* ‘darling’) might occur in conflictive situations, acquiring negative values (Coulthard 1977). Given this complex paradigm, the present analysis aims at examining the face work of Spanish insults, familiarizers and terms of endearment, found in the *Oral Corpus of Madrid* (CORMA; Enghels et al. 2016-2019), which provides natural conversations between Madrilenian speakers. Following Hernández Flores (2013), the term *face work* will be defined as a psychosocial concept measuring the vocatives’ positive/polite, negative/impolite or neutral effect on the interlocutor’s face. Different socio-pragmatic variables will be taken into account: the participants’ age, gender, relationship (e.g. intimates) and situational role (e.g. friend), the interlocutor’s reaction (e.g. laughter), the type of speech act in which the vocative occurs (e.g. directive), and the (non-)conflictive character of the interactional situation. The general assumption is that vocatives’ social effects are a product of co(n)textual factors: they do not only occur as instances of (*anti*)polite, but also of *impolite* face work, irrespective of their conventional positive or negative meaning.

Preliminary results suggest that Spanish vocatives, even insults, mostly generate positive/polite effects. More specifically, the non-conventional uses of insults tend to occur in teenage talk, marking *in-group* identity, trust and solidarity.

# Politeness in Catalan Sign Language (LSC): Attenuation of criticisms in LSC discourse

Panel contribution

***Ms. Berta Moya-Avilés<sup>1</sup>***

***1. Universitat Pompeu Fabra***

The Deaf-as-Direct Stereotype [1] is rooted in hearing culture and it is a biased concept based on the conception of politeness from a hearing perspective. Politeness performance changes regarding culture [2] and this culture variation applies to the Deaf community. This study answers the following research question: how Catalan Deaf signers use polite linguistic markers and different attenuation discourse strategies in Catalan Sign Language (LSC)? Based on the proposal in [3] and focusing on particular non-manual markers (NMMs) [4], this paper shows the initial results of the first study about attenuation in LSC. From a pragmalinguistic and socio-pragmatics approach, we describe the performance of different polite NMMs (namely head tilt, tight lips, or avoiding eye contact), and the appearance of different attenuation discourse strategies that Deaf native signers use in spontaneous conversations in LSC, such as concession or el-lipsis.

To reduce the illocutive force of diverse Face Threatening Acts (FTA) [5], the signers use different discourse strategies. For instance, they use a mitigation strategy consisting of restricting the opinion to oneself, as shown in (1). Also, the signer simultaneously blinks and raises his shoulders as a NMM (indicated with the subscript *blink* and *sh.up*).

— blink

sh.up

1. I OPINION MINE FIRST SALAD BETTER CHANGE THIS.

‘In my opinion, it could be better to change this for the salad we ate first’.

When the sender is a woman, signs as OPINION or THINK are avoided, and female signers only use the 1rst person pronoun to restrict their opinion, sometimes prosodically emphasized with tight lips (*t.l*) and head tilt (*h.t*).

t.l                            t.l

h.t                            h.t

sh.up

2. I A-LITTLE-BIT STALE PASTRY, GOOD.

‘For me, the pastry was a little bit stale, but it’s good’

Deaf people use polite strategies, and some relations between discourse strategies and NMMs are being described. This contributes to understanding politeness in terms of sociocultural variation and multimodality. Furthermore, the analysis allows seeing differences regarding the gender of the sender.

# Politeness strategies in power discourse during COVID-19 pandemic: the case of the Pope and the Queen.

Panel contribution

***Mrs. Cristina Gadaleta<sup>1</sup>***

*1. Huddersfield*

This paper analyses political discourse by examining two speeches, one by the Pope and the other by the Queen of the United Kingdom at the time of COVID-19. It explores discursive strategies used in the speeches of Queen Elizabeth II, in English, and Pope Francis, in Italian, about the coronavirus pandemic. Their speeches are influenced by their charismatic role and are strictly linked with their power position. For both orators, the choice of the discourse form of video broadcast does not align with their standard communicative behaviour. Through the lens of speech act theory, this paper analyses politeness strategies and recognizes the linguistic markers used to realise them.

Data analysis was based on Austin and Searle's taxonomy of speech acts and Blum-Kulka's analysis of cross-cultural realisations of speech acts.

Concerning the concept of politeness, this research was founded on Goffman's face theory, on the classic theories of Brown & Levinson, Leech and Lakoff, on Bravo's studies about socio-cultural contexts of politeness and the frame-based approach to the politeness of Terkourafi.

This research aimed to assess whether the particular nature of these discourses unexpectedly influenced speakers in their choice of politeness strategies or rather whether the strategies adopted were in line with theoretical expectations.

It was expected that the adoption of politeness strategies should be determined by gender, the cultural background or the language used by the speakers. The results, on the contrary, contrast with the theoretical framework: the peculiar historical situation shaped gender and power discourses of the Pope and the Queen, going beyond conventions related to the ethnic origin and the gender of the speakers.

In particular, it was possible to notice a predominance of positive politeness strategies, used to underline nearness and to claim common ground with the hearers. This aspect accords to the main focus of their speeches aimed to include, to express closeness and thanksgiving and to reassure for the future.

Concerning the linguistic features, it was found that the positive and negative strategies, chosen to explicit the speech acts analysed, were expressed by similar linguistic markers.

# Political Speeches as a tool of crisis management?

---

Panel contribution

---

***Dr. Aleksandra Salamurovic<sup>1</sup>, Dr. Martina Berrocal<sup>1</sup>***

***1. Friedrich-Schiller-University Jena***

The Covid-19 pandemic is conceptualized in public discourse as a crisis par excellence. While some emphasize its global character (Bieber 2020: 1), others point to the intensification of negative societal developments based on strong exclusion and particularities such as nationalism and racism (Ozkirimli 2020, Krastev 2020: 38). Previous research on crisis discourses showed that when discourse participants conceptualize an issue as a crisis, they deduce particular consequences and possible actions thereof (cf. Krischer 2016: 390, Wengeler & Ziem 2014:61). Thus, a crisis functions in general as a performative speech act (Wengeler & Ziem 2014:61f). The effective (discursive) crisis management includes a legitimization (see Chilton 2004, Hart 2010:89-110) of the proposed measures and procedures and their communication to the general public. One of the frequent communication channels are political speeches, which are mostly consent-oriented, aimed to achieve approval from the population, and associated with the formation of positive public attitudes towards the proposed measures and the crisis management process (see Reisigl 2008: 251–52).

In the first part of our paper we will briefly present the results of the comparative analysis of initial speeches after the pandemic was officially declared in 29 countries across four continents, covering Global North, Global South and Global East (Müller 2018). The goal is to reveal the main discourse-linguistic means by which such general social phenomenon has been localized. In the second part, we will broaden our analysis by examining comparatively leader's speeches in Central Europe (Czech Republic, Slovakia) and in the Western Balkans (Serbia, North Macedonia) from the 1<sup>st</sup>, 2<sup>nd</sup> and eventually the 3<sup>rd</sup> pandemic wave. The contextual features build the rationale for this comparison, as in all four countries a state of emergency was introduced in the first phase of the crisis. Thus, the underlying research question is, how the contextual level is intertwined with the linguistic micro-level. Thereupon we will take account of the constraints and affordances of political speech as a crisis management tool. Methodologically, our research departs from the results of corpus-based quantitative analysis (keywords, collocations). We contextualise these results in a qualitative analysis examining the pragmatic features (speech acts: ordering, requesting, offering, promising, threatening and thanking) and discursive / linguistic aspects, particularly referential strategies (representation of threat, the use of the pronoun “we”).

# Politics and fan communication in football stadia in Germany - A discourse-pragmatic analysis of protest banners on the “Hopp Cause”

Panel contribution

**Prof. Marcus Callies<sup>1</sup>**

**1. University of Bremen**

The increasing popularization and mediatization of football as the dominant spectator sports in Europe has led to an ever growing media coverage and public attention. This has also sparked considerable research interest in the language and discourse of football that is, however, comparatively heterogeneous in nature and scattered across different academic disciplines. There is now a large number of reporting genres and other (multimodal) text types that represent an ideal basis for linguistic research. However, various forms of (multimodal) fan communication, e.g. choreographies, chants and banners have received relatively little attention in linguistic research to date (see e.g. Guschwan 2016). In particular, banners have received almost no attention despite the fact that they are one of the most visible and attention-getting forms of direct fan communication in the stadium and are frequently used by fan groups to protest the increasing commercialisation of the game and to express their views on other socio-political issues. It is only very recently that banners have been examined in research on linguistic landscapes and multimodality (Monaghan 2020) and as semiotic resources of visual communication (Sibetchieu 2016).

In Germany, the massive commercialization and marketization of football has been subject to fundamental criticism that has caused conflicts and tensions in which defiant fan subcultures, most notably the so-called “Ultras” with their explicit left-wing political agenda, protest the unwanted ‘modernization’ and sell-out of the game. Such criticism is often expressed through rather unconventional and creative forms of protest and provocation one of which are banners displayed in football stadia. In this talk I analyze the linguistic-semiotic characteristics and discourse-pragmatic functions of fan banners documented on the website “Faszination Fankurve” that were displayed in stadia across Germany during the so-called “Hopp Cause” in early 2020, i.e. fan protests against Dietmar Hopp. Hopp is the 79-year-old founder of the SAP software company and one of the richest men in Germany who pumped money into the amateur club of TSG 1899 Hoffenheim to gain promotion from the eighth tier to the Bundesliga. For many supporter groups, Hopp personifies the commercialization of football because he has bought sporting success, bypassing German football’s 50+1 rule, which prevents a single investor from holding a majority share of any club.

The banners will be described and analyzed with a view to the interplay of text (font, shape, colouring), images, position/placement, and materiality with a focus on the expression of the identities and socio-political stance of the supporter groups through linguistic creativity including various forms of humour (wordplay, allusion), but also insults.

---

## Positioning of ‘self’ and ‘other’ in political discourse

---

Panel contribution

---

***Dr. Luisa Granato Grasso<sup>1</sup>, Ms. María Moccero<sup>1</sup>***

*1. Universidad Nacional de La Plata*

The study of positioning has been taken up across different disciplines, the result being a vast array of publications discussing the identity and positions of human agents. The aim of this presentation is to look at how the president of Argentina positions himself and his addressees in two genres broadcast on television, namely political interviews and political speeches. The starting point of this work is Positioning Theory, an appropriate theoretical and methodological approach, where positioning has been defined “as the discursive construction of personal stories that make a person’s actions intelligible and relatively determinate as social acts, and within which the members of a conversation have specific locations” (van Langenhove and Harré 1999:16). The theory contributes to the study of social and cognitive processes through which participants in an interaction jointly construct and maintain moral orders by means of actions performed in the development of the discourse (Harré et al. 2009). The data emerged from a corpus of five speeches and five interviews conducted by different anchormen and interviewers, held in different institutional locations. For the examination of the data, a qualitative analysis was carried out. Both bottom-up and top-down approaches to the texts were performed; these led to a micro analysis interpreted against the macro and meso levels of discourse. The conceptual framework represented by the figure of a diamond (McVee 2019, refined after Slocum-Bradley 2009) was adopted. This framework includes Identity, Rights and Duties, Social Forces, and Storyline as the four mutually determining components which help a systematic analysis of meaning making in interaction. Our research question is: What are the aspects of ‘Identity’ constructed in our corpus in terms of *social* and *interactional identities* (Weizman 2008), of a psycho-biographical *Self-conception*, and of the *Relational self*, that is, the way people are seen by others (Agha 2007: 233-234)? Of particular interest in the furtherance of our aims are the analyses of the use of *person deixis* and *social indexicals*, more specifically the use of first and second person pronouns and references (Agha 2007, Fernández Soriano 1999, Fontanella de Weinberg 1999, Luján 1999), the notions of *role* and *status* as formulated also by Agha and of *categories* and *attributes* as described by McVee (2019). In these processes, the ‘Social force of the speech acts’ produced in the unfolding of the texts is an important facet of the diamond to be considered. We argue that positioning of self and other is manifested through various actions and practices performed by the president, his interactants, and audiences. Self and other construction in the two genres under study is closely dependent on various aspects such as the characteristics of the context, the general aims pursued by the politician in each case, the interlocutors’ diverse reactions in the development of the reciprocal interactions in interviews, and the differentiated linguistic and interactional patterns used in the production of the two genres. Further research on larger corpora, including the same and other political figures, will enrich the findings presented here and in Granato and Móccero (2020).

# Positioning the Self and Other in English Lingua Franca interactions: Reference systems and the dynamics of identification in a German-Tanzanian school exchange

Panel contribution

***Ms. Katharina Beuter<sup>1</sup>***

*1. Otto-Friedrich-Universität Bamberg*

Crossing borders makes people feel ambivalent “about exactly who they are and where they belong” (Block 2015, 528). When adolescents, in the middle of passing the land between childhood and the world of fully-fledged adults, set off on a school exchange to meet peers from different linguacultural backgrounds in another part of the world, identificatory work is hence expected to take place on a large scale. Questioning concepts of Self and Other has indeed been found to be particularly salient amongst adolescents (see e.g. Deppermann 2007) and in intercultural encounters (see e.g. Dervin & Risager 2014).

It is interaction, in intercultural communication often mediated through English as a Lingua Franca (ELF), which provides the site for the co-construction and negotiation of identities (see e.g. de Fina 2010). Interlocutors explore both their social belongings and their individual uniqueness against the backdrop of multiple reference systems such as age, ethnicity, gender or profession. Intercultural communication research has been criticised (see e.g. Baker 2015) for over-emphasising nation-based categories of difference, which bears the real danger of consolidating stereotypes, while interlocutors may in fact exhibit much broader orientations feeding into their comprehensive and malleable concepts of Self and Other.

The present study sets out to explore the dynamics of identification in a German-Tanzanian school exchange, in which English is used as a Lingua Franca. It seeks to investigate which particular reference systems adolescents activate for positioning themselves and their interlocutors in this context, and how orientations potentially change in the course of their encounters.

The study will build on the TeenELF corpus, which contains transcriptions of 26 hours of face-to-face interactions in ELF recorded during the school exchange, amounting to more than 190.000 words. In a mixed-methods approach combining quantitative corpus investigations with conversation and discourse analyses, the study will focus on the contextual use of pronouns in the corpus, but will also draw on information from questionnaire and interview data collected in the framework of the student exchange. The study is expected to thus contribute a speaker-informed picture of reference systems at play in identity construction through intercultural interaction in ELF.

# Positioning the self in recipes and video recipes: an investigation from a corpus of food blogs in English

Panel contribution

***Prof. Daniela Cesiri<sup>1</sup>***

**1.** “Ca’ Foscari” University of Venice

Positioning theory first emerged in the 1980s in the area of psychology studies to investigate how people occupy and negotiate their place – both physical and social – while interacting with other people (Harré and van Langenhove, 1999). Research in this area has later involved the linguistic and discursive practices that position writers and speakers in any form of communication and interaction. In fact, the way in which we construct our position determines our ‘self’ as writer or speaker; it influences the way in which readers and listeners react and, vice versa, the way in which our interlocutors position themselves affects our own perception of ‘the other’ (Beeching, Ghezzi, and Molinelli, 2018). This reciprocal positioning eventually shapes the actual communication and the lexico-grammar of discourse in any kind of communicative context. Furthermore, positioning becomes all the more crucial in digital communication, in which boundaries and perceptions of the ‘self’ and the ‘other’ are in a way distorted by the absence of a physical space that is replaced by a virtual, almost abstract, environment.

The study investigates strategies of self-positioning in a group of 32 food blogs. More specifically, the recipes and the corresponding video recipes will be examined to investigate the ways in which the food bloggers position themselves with respect to their audience. Particular attention will be paid to how self-positioning strategies are used to create a rapport with the public, thus creating a peculiar communicative space in a genre, the culinary recipe, that is rarely used to this purpose and is generally believed to have achieved static structure and features (e.g., Cotter, 1997; Görlach, 2004; Norrick, 2011). In addition, the recipes, and the corresponding video recipes, will be contrasted to ascertain if they show specific elements that might further differentiate them as two sub-genres of the main ‘recipe’ genre. Ultimately, the aim of the study is to find out if recipes in the corpus of food blogs confirm the assumption whereby the ‘recipe’ genre is a static one, or if we can hypothesise the emergence of a new genre, i.e. the digital recipe, in which self-positioning strategies are one of the elements that bring on some renovation to the traditional genre and, eventually, contribute to the creation of a new one.

# Power and Leadership: Female Primary School Teachers ‘Doing’ Discipline in the Classroom

Panel contribution

***Dr. Joanne McDowell<sup>1</sup>***

***1. University of Hertfordshire***

Classroom management problems are generally regarded as a local crisis for that community of practice, especially for the teacher when such issues are recurrent. Pupils who are disruptive in class can damage the learning environment for their peers by interrupting lessons, dominating the teachers' time and slowing down, or even stopping, the teaching process for everyone. This has led to classroom management as being perceived as one of the greatest challenges for teachers, and one of the main causes of job dissatisfaction. Indeed, the performance of discipline is an essential element of the classroom, but thus far has received little scholarly attention. How teachers are thought to react and discipline such violations of permitted classroom behaviour (e.g., a student is calling out without raising their hand) have been given gendered stereotypes. Leadership, aggression, and control are seen to be masculine characteristics, whilst care and nurturing are feminine attributes. Therefore, the numerical dominance of female teachers has been said to have led to a softer ‘liberal’ style of classroom discipline, with more men argued to be needed in the occupation to provide ‘hard’ discipline, especially to male pupils.

The persistent belief that women are not capable of ‘hard’ classroom management and leadership skills, nor of demonstrating power and control, only perpetuates harmful gendered stereotypes that women are not able to perform such discipline as they do not possess the speaking rights and control needed in order to hold power in their classroom. It also generates stereotypical ways of thinking about discipline; that it must be direct and aggressive in order to be successful, when in fact, such ‘hard’ discipline can eventually damage positive teacher-learner relationships. A balance of institutional and interpersonal goals must therefore be struck. Employing discourse analysis to examine real-life teaching discourse, this paper explores how 6 female primary school teachers from schools across Hertfordshire deal with important issues of discipline, decision-making and leadership when managing their classroom. In total, over 120 hours of naturally-occurring classroom discourse was collected via video recording, and analysed using Interactional Sociolinguistics and a social constructionist approach.

Their linguistic styles of the teachers found in the data were often direct, assertive, and used to exert control over pupils and demonstrate their power and authority in this context. However, they also employed ‘liberal’ discipline as well, mitigating their orders and criticism when delivering and performing classroom management to create a positive teacher-pupil relationship.

This calls into question the argument of primary school teaching as ‘feminised’, and that women cannot perform “tough” discipline. In the workplace, gendered stereotypes can have a profound negative influence on how participants perceive and perform their gendered identities. It is therefore important to challenge such persistent ideological barriers that women often face when it comes to them being thought ‘capable’ of playing a central role in leadership and decision making in workplace domains.

# Practice-embedded-demonstration in instruction sequences between an orientation and mobility specialist and a person with visual impairment

Panel contribution

***Dr. Yasusuke Minami<sup>1</sup>, Prof. Hiro Yuki Nisisawa<sup>2</sup>, Prof. Rui Sakaida<sup>3</sup>, Mr. Mitsuhiro Okada<sup>1</sup>***

*<sup>1</sup>. Seijo University, <sup>2</sup>. Tokiwa University, <sup>3</sup>. Future University Hakodate*

This study addressed the following research questions: 1) How does an orientation and mobility specialist (OMS) touch the body of a person with visual impairment (hereafter PVI) during orientation and mobility training sessions, and which parts of the PVI's body does the specialist touch? 2) How does each touch contribute to the organization of activities in instructional sequences?

If a white cane is an extension of the body, as Merleau-Ponty says, touching with it and being touched on it should constitute a significant research topic for the study of "touching and being touched" in interaction. This study included touching with the cane and being touched on the cane as subject matters, in addition to touching and being touched by hands.

The data comprise a corpus of 12.5 hours of video recordings of training sessions in Japanese between one OMS and one PVI, during which many cases of instructions were provided. Multimodal EMCA analyses were conducted of the video recordings.

The instructions for bodily movements were achieved when the OMS touched the body and cane of the PVI. We examined two cases in which an OMS had a PVI perform specific movements by guiding the PVI's hand and cane.

In the first case, the PVI was taught to open the lid of a dumpster. The OMS placed his hand on the PVI's hand and operated the handle of the lid. When he guided the PVI's hand to the handle, he grasped her wrist so that she could use her fingertips freely to grasp the handle when she touched it.

In the second case, the PVI was taught to detect changes in the height of curbstone by applying the so-called "three-point touch technique." The OMS grasped the middle of the PVI's white cane and guided its movement to demonstrate the trajectory that the white cane should take on the road's surface. When the OMS lifted his hand off the cane, it was a signal that the PVI should start walking while performing the taught movement by herself. Based on the above analyses, we make two arguments. 1) The movements guided by the OMS, namely the actual performance of gestural trajectories, serve to facilitate the PVI's own performance. 2) Guided actual performance offers feedback that constitutes sensorial inputs from touching the handle or the road surface, providing resources to evaluate future performances.

Touching and being touched are observed in the instructional sequences between the sighted and persons with visual impairment. Most research on touching and being touched has concerned interactions between sighted people. This study offers a new approach to study the essential features of touching and being touched.

# Pragmatic competence in English as a lingua franca (ELF) contexts: Constructing rapport building and discussion strategies

Panel contribution

***Dr. Yuko Iwata<sup>1</sup>***

*1. International Christian University*

What are the qualities required for EFL learners to acquire to interact not only with native speakers but also with people in lingua franca situations? Communication is beyond the exchange of information and sending of messages. The learners should learn to establish and maintain relationships with others. They need to know how to use language to demonstrate their “willingness to relate, which often involves the indirectness of politeness” (Byram, 1997: 3).

The purpose of this paper is to explore pragmatic competence necessary for Japanese EFL learners to develop to establish rapport with people from different linguistic and cultural backgrounds. This study also investigates how we can help them acquire rapport building and discussion strategies to clearly and politely exchange ideas with others.

This study's participants are four Japanese college students who are learning English as a foreign language in Nagoya, Japan. As for building rapport strategies, they had a training session and learnt to disclose about themselves as much as possible, give additional comments when they answered questions, make comments about what other participants have said, ask questions to elicit more information from the partners, and give lexical back channels to show empathy. After they practiced these strategies, two of them had an opportunity to interact with Korean college students in Seoul. The other two students had a chance to converse with Taiwanese college students in Taiwan. The analysis of their conversations in ELF contexts revealed that they disclosed themselves more deeply than before the training, made more comments, asked more questions, and gave more lexical back channels so that they were able to build rapport with their conversational partners in ELF contexts. Then, the same Japanese students had another training session to learn discussion strategies. They studied the importance of having an autonomous self. Without establishing their autonomous self, they cannot respect others who also have an independent self. They also recognized the importance of having polite clarity. Besides, they practiced language tips such as how to start a discussion, express their opinions, agree or disagree with conversational partners, express opposing views politely, and confirm or clarify what the others have said. Then, they had a chance to have discussions on controversial issues with Chinese students in Hong Kong. Their performance analysis revealed that some of the Japanese students succeeded in exchanging ideas with Chinese students and expressing their own opinions by using supporting evidence. On the other hand, some students had difficulty expressing their views or opposing their partners. This result is probably because learning to construct their ideas is a challenging task. Some may need more practice. As Kecske (2019:11) states, “intercultural interaction is a ‘success-and-failure’ process.” The results indicate that Japanese students can learn to express their thoughts clearly and politely but need a carefully designed curriculum and repeated practice.

# Pragmatic enrichment processes in L1/L2: Conjectural future in Catalan/Spanish bilinguals

Panel contribution

***Dr. Aoife Ahern<sup>1</sup>, Dr. Jose Amenos-Pons<sup>1</sup>, Dr. Pedro Guijarro-Fuentes<sup>2</sup>***

*<sup>1</sup> Universidad Complutense de Madrid, <sup>2</sup> Universidad de las Islas Baleares*

We present a study on the use of the future tense (FUT) for expressing conjectural evidential meaning by Mallorcan Catalan-Spanish bilinguals. In the Romance varieties, FUT can trigger conjectural interpretations (Squartini 2001, Escandell-Vidal 2014), which have been described as cases of contextual enrichment of a core semantics, common to all Romance languages. However, different cross-linguistic restrictions apply on such enrichment processes. Conjectural interpretations of Catalan FUT are rare, and tend to be limited to stative verbs; in Spanish they are merely favoured by statives. In Catalan, uses of conjectural FUT are infrequent, while in Spanish, they are more frequent than chronological ones. Additionally, conjectural FUT in Spanish may appear in concessive environments, while these constructions are uncommon in Catalan.

Contextual enrichment processes interfacing grammar and pragmatics have been shown to cause delays in L2 acquisition, even at advanced levels (Sorace 2011, 2012). Previous research on a Romance language pair analogous to that of Catalan/Spanish, namely the combination of L1 French and L2 Spanish, found that at different proficiency levels of L2 Spanish these speakers avoided using FUT to express conjecture, and often considered such constructions ungrammatical (authors, 2020). It was concluded that these data support the view that L1-L2 feature reassembly, associated with complex pragmatic enrichment, are sources of variability in the representations of the encoding and expression of evidential meaning that L2 speakers sustain.

The present study focuses on Catalan/Spanish bilinguals, whose sociolinguistic situation and degree of bilingualism are entirely different from those of the Spanish L2 learners mentioned above. These participants provide opportunities for analyzing the impact of the factors of language dominance, mode of bilingualism (early simultaneous vs. sequential) and of the varying degrees of proficiency in each language on the expression and interpretation of conjectural FUT tense uses in Spanish. 50 bilingual speakers from the Balearic Islands, with varying degrees of bilingualism according to the Bilingual Language Profile (Birdsong et al 2012), performed two tasks in both Catalan and Spanish: firstly, choosing between FUT and two other ways of expressing conjecture in specific utterances; and secondly, judging the acceptability of different conjectural uses of FUT (with various aspectual combinations). These participants' responses were compared to those of a group of 30 monolingual Spanish speakers matched in age and other external variables to the bilinguals. Our data indicates that more balanced bilinguals have more accurate and categorical judgements, since they clearly distinguished each languages' restrictions on conjectural interpretations; for Catalan-dominant participants, conjectural FUT in Spanish was relatively less accepted; finally, for simultaneous bilinguals identifying as Spanish-dominant speakers, more variability was found overall, plus lower accuracy in judgements on Catalan. Thus, the sensitivity to the factors determining the appropriacy of conjectural FUT uses can be correlated with more balanced bilingualism. The data will be considered in light of current views on the grammar/pragmatics interface and on bilingual variability as an indicator of contrasts in their two language systems (Kroll et al, 2012).

# Pragmatic equivalence in mental health interpreting: an alternative to the goal of accuracy

Panel contribution

***Dr. Natalia Rodriguez<sup>1</sup>***

***1. Heriot-Watt University***

In mental healthcare (MHC) settings, language is an essential tool that clinicians use to achieve goals such as assessment and intervention (Farooq and Fear, 2003). Therefore, when the mental health professional and the patient do not share a language, the work of interpreters is key to facilitate the fulfilment of the clinician's interactional goals (Hlavac, Surla and Zucchi, 2020). Language mediation in MHC is a complex undertaking due to the intricate connection that exists between language, culture and mental health (Tribe and Lane, 2009). For these reasons, among others, it has been posited that mental health interpreting should be seen as a field of study in its own right (Cambridge, 2012). Understanding MHC encounters as speech events shaped by a unique set of contextual features provides a useful analytical angle to examine how different levels of context may influence interpreting practice, and vice-versa. A topic that might benefit from this analytical angle is the extent to which interpreting in MHC may contribute to *inclusion*, understanding this term as the embracing of the *diversity* that linguistically and culturally diverse (LACD) patients bring into the consultation room. In this panel, I posit that professional interpreters contribute to inclusion by ensuring *equality of care*. That is, by safeguarding that LACD patients receive a standard of care similar to that of patients involved in monolingual MHC encounters. In order to demonstrate this argument, I draw on the findings from a discourse-analytic examination of a series of authentic interpreter-mediated consultations that took place in an MHC setting. These consultations were audio-recorded, transcribed and analysed as part of a recently completed doctoral research project (Rodríguez-Vicente, 2020). In order to articulate this discussion, I will focus on the notion of *pragmatic equivalence* in interpreter-mediated talk. More particularly, I will discuss how interpreters attempt to reproduce the linguistic, relational and clinical goals embedded in the primary participants' original utterances, and how these actions turn the notion of *accuracy* into a dynamic and context-dependent undertaking.

# Pragmatic frames and constructions across languages: German particles and their correspondents in Brazilian Portuguese

Panel contribution

***Mr. Oliver Czulo<sup>1</sup>, Mr. Tiago T. Torrent<sup>2</sup>, Mr. Alexander Ziem<sup>3</sup>, Mr. Alexander Willich<sup>3</sup>***

**1.** Universität Leipzig, **2.** Universidade Federal de Juiz de Fora, **3.** Heinrich Heine-Universität Düsseldorf

In this talk, we propose to introduce pragmatic frames as a supercategory including not only interactional frames, but also frames for stance-taking, among others. We report on results achieved in a shared annotation task addressing translated versions of the original English transcript of the TED talk “Do schools kill creativity” by Ken Robinson. Two languages, Brazilian Portuguese and German, with English as a point of reference, are analyzed from a contrastive and translational perspective, particularly focusing on varying interactions between frames and constructions. In order to describe similarities and differences on the whole scale from form to meaning, we propose an approach relying on the descriptive and explanatory power of a combined FrameNet Lexicon and FrameNet Constructicon. In Czulo et al. (2020), we focused on greetings and tag questions, assuming that such categories are highly interactive. Specifically, we showed that an alignment of these types of constructions across the three languages is not possible with the help of formal commonalities alone, but rather on the basis of their specific communicative functions in the text.

We take these findings as a starting point and turn our focus to the use of German particles from a contrastive point of view, aiming at clarifying the notion of a *pragmatic frame* (compared to *interactional frame*) which was left rather undefined in Czulo et al. (2020). We contrast the use of particles, which form a highly diverse and productive category in German, and their corresponding constructions in Brazilian Portuguese, as to their pragmatic information conveyed in the text. Sentences in (1) and (2) exemplify the phenomenon.

- DE: Im Grunde finde ich, dass sich **eigentlich** jeder für Bildung interessiert.  
 PT: **Na verdade**, eu descobri que todo mundo se interessa por educação.  
 (EN: **Actually**, what I find is everybody has an interest in education)
- DE: Finden Sie nicht **auch**?  
 PT: Vocês não?  
 (EN: Don't you?)

Particles may relate to stance-taking activities: in (1), the speaker reinforces that what is expressed is his perception, while in (2) he indicates his expectation that the answer to the question would be affirmative. Sometimes, particles will have corresponding lexical material in other languages, as in (1). But often, lexical equivalents are missing in other languages, such as in (2). We investigate how such constructions, frequently diverging in form, can be related to another across languages on a pragmatic level, and discuss to what extent the analysis of these constructions can motivate the definition of pragmatic frames beyond the cases with clear-cut interactional functions.

# Pragmatic inference and mind-reading

Panel contribution

***Prof. Diana Mazzarella<sup>1</sup>, Prof. Ira Noveck<sup>2</sup>***

***1. University of Neuchâtel, 2. CNRS***

Research in cognitive pragmatics aims at providing a psychologically plausible account of utterance comprehension by investigating the nature of pragmatic inference and its cognitive underpinnings. According to the seminal model of communication first proposed by Grice, and later developed by Relevance Theory, “pragmatic interpretation is ultimately an exercise in mind-reading, involving the inferential attribution of intentions” (Sperber & Wilson, 2002): This well-established assumption has led much research in cognitive pragmatics to examine the role of Theory of Mind (ToM) in utterance comprehension.

This paper presents the key findings of the last three decades of this investigation. These encompass i) experimental data on pragmatic inference in clinical populations with Theory of Mind impairments (e.g., ASD children and adults) and ii) neuroimaging data on the activation of Theory of Mind neural network during pragmatic processing. We argue that this growing body of evidence calls for a better understanding of its implications for pragmatic theory.

To achieve this, we first discuss Andrés-Roqueta and Katsos’s (2017, 2020) proposal for distinguishing between “linguistic-pragmatics” (which would not require ToM) and “social-pragmatics” (which would require ToM). Second, we examine the extent to which this proposal is compatible with Relevance Theory’s inferential model of communication. This model assumes that utterance interpretation is underpinned by the operation of a *specialized* inferential mechanism (the ‘relevance-guided comprehension procedure’), dedicated to the domain of ostensive-inferential communication. We argue that if pragmatic inference is thought of as a specialized form of mind-reading, it is in principle independent from the abilities targeted by standard ToM tasks, which involve intention reading and belief attribution in non-communicative contexts. The contribution of these ToM abilities to pragmatic inference would only be required when information about the speaker’s mental states directly contributed to the communicated content (as, for instance, in irony understanding).

This paper aims to reassess the implications of the experimental evidence on the role of Theory of Mind in pragmatic inference for inferential models of communication. While this kind of evidence is often interpreted as providing a direct test of these models (see, for instance, Kissine, 2020), we suggest that Relevance Theory allows for a more complex interplay between pragmatic inference and ToM, one which opens up foundational questions about the place of pragmatics in the cognitive architecture of the mind.

# Pragmatic markers in child language acquisition: a corpus-based study in a multilingual context

Panel contribution

**Dr. Katharina Salzmann<sup>1</sup>, Dr. Ruth Videsott<sup>1</sup>**

**1.** Free University of Bozen-Bolzano

The aim of this paper is to investigate the use of pragmatic markers in a multilingual corpus of child language collected in the Ladin valleys in South Tyrol (Italy). Pragmatic markers are typical elements of spoken language which fulfill different discourse functions: in particular, they can be used to structure a text, to connect elements within and between sentences and, most importantly, they express the position of the utterance in the interpersonal dimension and highlight cognitive processes (cf. e.g. Aijmer 2013). It has been argued that in contact-induced contexts speakers tend to prefer the set of elements of the pragmatically dominant language, in order to reduce the cognitive pressure they are exposed to, in particular in a minority language (Matras 2000). Yet, very little is known about the use of pragmatic markers in child language, even though the pragmatic competence, i.e. the appropriate use of language as well as the proper realization of speech acts in a particular situational context, is one of the key competences children need to acquire during the process of language acquisition (Tracy 2008).

The present study was carried out within the sociolinguistic framework of the Ladin valleys, which is characterized by a varied multilingualism both on the institutional level and in family contexts. Moreover, various language contact phenomena have been observed, especially as regards the use of interjections and pragmatic markers (Italian *ma*, *ecco*, *magari*, used in the South-Tyrolean dialect, cf. e.g. Dal Negro 2005; or *perché*, *allora* used in Ladin varieties, cf. e.g. Fiorentini 2017).

The corpus contains approximately 21 hours of spoken data from 42 children aged three to six across the three official languages Ladin, German and Italian. The recordings comprise spontaneous conversations, i.e. free play and dialogue, as well as semi-controlled conversations, i.e. describing children's books and story-telling, carried out by the interviewer.

Moving from the above considerations, the study focuses primarily on the categories of pragmatic markers used by children at kindergarten age (e.g. Ladin *ciara/cëla'look*, *muessa vester* 'must be'; Italian *magari*, *ecco*; South-Tyrolean dialect *glaub i*, *schaug*) and on the pragmatic functions which can be attributed to them. In this regard, language contact phenomena (Ladin-German-Italian) arising from the specific multilingual context of the Ladin valleys will also be discussed (cf. Fiorentini 2017).

# Pragmatic markers in deliberations of monetary policy

Panel contribution

***Prof. Gisle Andersen<sup>1</sup>, Dr. Christian Langerfeld<sup>2</sup>***

*<sup>1</sup>. NORWEGIAN SCHOOL OF ECONOMICS, <sup>2</sup>. NHH Norwegian School of Economics*

While the use and functions of pragmatic markers (PMs) in the general language has been well documented, much less is known about pragmatic marker usage in highly specialised discourse. In our paper, we focus on Language for Specific Purposes and specifically on deliberations within a domain of economics, namely monetary policy. There is relatively little corpus research devoted to the study of meetings (Vaughan 2008 and Andersen 2012 are notable exceptions). We focus on meeting discussions and contrast them with general spoken language.

The United States' Federal Open Market Committee (FOMC) plays a central role in US monetary policy. It makes key decisions about interest rates and the growth of the United States money supply and oversees the nation's open market operations, which include the selling and buying government bonds and other securities. Its deliberations are held during eight regularly scheduled meetings per year. The detailed records of these meetings are published as transcripts, 'lightly editing the speakers' original words, where necessary, to facilitate the reader's understanding' (FOMC website). For the purposes of this paper and subsequent research, we have compiled the records from 2002-2014 into a corpus of approx. 5.9 million words and made this available in the Sketch Engine.

Taking a broad perspective on the notion of pragmatic markers (Aijmer & Simon Vandenberg 2009; Fraser 1990, 2009; Schiffrin 2001), we first describe the corpus and problematise its authenticity as spoken data. Next, we account for pragmatic marker usage focussing on significant differences to and similarities with spoken data representing the general language. This is drawn from the spoken Open American National Corpus (OANC). Preliminary inspections of the corpus show that the interaction is constrained in ways that are characteristic of the meeting genre. The Fed's Chair acts as meeting chair, parts of the meeting are relatively interactive, while other parts are monologic, involving the reading of pre-scripted text. Although this has clear implications for pragmatic marker usage, it does not entail the absence of pragmatic markers. We explore this rich source with a view to documenting items used to manage subjective and interactional functions in deliberations of monetary policy. In such a formalised setting where the taking of turns is regulated, we expect the social interactional functions of markers to be downplayed while topic-oriented functions are highlighted through marker usage. With reference to Fraser's taxonomy we focus on restricted sets of commentary markers (*frankly, apparently, I think, etc.*), discourse management markers (*first, in addition, in summary*), topic-orientation markers (*anyway, incidentally, as far as X is concerned*), attention markers (*now, oh, okay, well*) and markers of turn management and listenership (*yes, right*). We inspect cases of over- and under-representation in the FOMC corpus *vis-à-vis* the OANC.

## Pragmatic variation across language varieties

---

Panel contribution

---

***Prof. Klaus Schneider***<sup>1</sup>

1. University of Bonn

Patterns of language use vary not only across languages, but also across varieties of the same language. The former type of variation is studied in contrastive pragmatics, the latter type in variational pragmatics. Both fields can be conceptualized as subfields of cross-cultural pragmatics. By contrasting data across varieties of the same language, research in variational pragmatics has shown that preferred ways of saying what you want to say may differ systematically between national cultures, regional communities and social groups. Specifically, work has focused on the impact of sociocultural variables such as nation, region and gender on e.g. the choice of discourse markers and the realization of speech acts and interactional sequences (for a summary, cf. Schneider, in press). Recently, metapragmatics has also been included in the analysis (Haugh 2018).

This paper is a case study in variational metapragmatics. Following the contrastivity principle, metallocutionary expressions such as *apologize* and *invitation* are compared across corpora of national varieties of English, specifically European (BrE, IrE), North American (AmE, CanE) and Oceanic varieties (AusE, NZE). The findings suggest diverging frequencies and distributions pointing to differences in communicative functions as well as markedly different constructions and patterns of use.

# Pragmatics of humour within political memes about the Spanish general elections

Panel contribution

**Dr. Ana Mancera Rueda<sup>1</sup>, Dr. Ana Pano Alaman<sup>2</sup>**

***1. Universidad de Sevilla, 2. University of Bologna***

This research is based on a pragmatic qualitative analysis of a corpus of 115 humorous memes published in the social network Twitter, during the general elections held in Spain in November 2019. The corpus has been compiled through the search of hashtags that became trending topic during the electoral campaign that took place between November 1<sup>st</sup> and 10<sup>th</sup>.

According to Shifman (2013), internet memes have become a continuous, daily, and universal communication code, hence the increasing number of discursive studies on this particular multimodal products. See, for instance, Blackmore (1999), Milner (2012), Miltner (2014), Gal, Shifman and Kampf (2015), and Kanai (2016) investigations on memes, social media, and the construction of a collective identity, or Yus (2018) analyses based on the Relevance Theory.

Although contents vehiculated through memes are extremely heterogeneous, this research is focused on those concerning political and electoral topics, which may have also humorous effects. These memes make possible to relativize and put a certain distance from the conflicts of the political scene (Yus, in press). Indeed, they find their continuity in political satire (Winckler, 2019; Mancera and Pano, 2020).

Based, thus, on the *General Theory of Verbal Humor* (Attardo and Raskin, 1991), as well as on the GRIALE group's pragmatic model (Ruiz Gurillo and Padilla, 2009; Ruiz Gurillo, 2012, 2016; Ruiz Gurillo and Alvarado, 2013), we aim to identifying the main features that characterize the pseudo-political discourses connected to certain memes and the discursive strategies adopted by Twitter users in order to rally the vote and guide the pragmatic interpretation of messages, making use of humour as a parodic mechanism.

# Pragmatics of verbal/visual ironies in political memes: A case study of Taiwan 2020 presidential race

Panel contribution

***Dr. Jennifer Wei<sup>1</sup>***

*1. English Department, Soochow University*

Photo-based memes are a subgenre of Internet political memes by re/mixing verbal and visual elements for effective phatic communication. Scholars have studied Internet political memes as forms of polyvocal political activism (Dynel and Poppi 2020; Wiggins, 2016). Some have looked into the incongruity in the texts in political memes as sources for humor and sarcasm (Dynel, 2011; 2016) as well as disparaging elements in texts and visuals as subversive strategies in political communication (Dynel and Poppi, 2020). Fewer studies have analyzed netizens' comments on a competing candidate's Facebook walls in a high-stakes race in which photo-based memes composed mostly of photoshopped images and stock character macros (stereotypical images/photos on top and lines of comments at the bottom) are prevalent.

Using netizens' comments found on a competing candidates' Facebook walls in the 2020 Taiwan presidential race, we study verbal and visual ironies found in the political memes. Specifically, we are interested in the pragmatics of how both visual and verbal ironies are constructed and re/mixed to refer to a competing candidate, the status quo of a concerning policy, and/or conflicting political ideologies. Focusing on the photoshopped and stock character macros, we analyze verbal, situational, and dramatic ironies. Our findings show that conventional wordplay such as puns, homophones, and dialects are common (cf. Sinina, 2014). In addition, Chinese antithetical couplets called duìlián (in Pīnyīn) are found. Specific colors, typography, and body parts are used as visual metonymy to refer to a competing candidate or a political party to contradict stereotypical un/expectations (cf. Theodoropoulou, 2016). The visual images in stock character macros are mostly constructed with (inter)national icons such as ex-presidents Trump and JFK, Chief Executive Officer of Facebook Mark Zuckerberg, and Chiang Kai-shek. The "intertextuality" between these stereotypical images is re/mixed with fake/quasi quotes (cf. Kirner-Ludwig, 2020) to mock comments on issues such as the credibility of a competing candidate, cybersecurity, and power struggle among the political parties during the 2020 presidential race.

The methods and results will not only fill the gap of the less-studied material on polyvocal FB commentaries but also contribute to how cultural, linguistic, and visual elements can provide insights for desired effects of de/legitimizing a competing candidate/political party in a high-stakes race.

# Pre-emptive repair: A procedure for addressing potential misunderstandings in social interaction

Panel contribution

***Prof. Chase Raymond<sup>1</sup>, Prof. Virginia Gill<sup>2</sup>***

***1. University of Colorado, 2. Illinois State University***

In this presentation, we show that while speakers are taking turns at talk, they may look ahead for how they might relevantly be misunderstood and shape their turns to prospectively address recipients' potential misapprehensions. They do not always wait for recipients' misunderstandings to emerge before addressing them. In contrast with third-position repair (Schegloff 1992), what we term *pre-emptive repair* is prospective: It occurs before the recipient has demonstrated a particular understanding of a turn of talk. In this procedure, speakers show they are aware how recipients are likely to interpret what they are saying or doing, and they use negatively formulated assertions, e.g., [It's not X] (Deppermann 2014; Deppermann/De Stefani 2019), to invoke these potential understandings and mark them as *misunderstandings* before recipients can respond. In this way, speakers work prospectively to head off misunderstandings that can affect ongoing courses of action and larger projects for which they are a constituent part.

In this example, journalist Maria Hinojosa is discussing immigration policy with political commentator Steve Cortes, who at one point makes reference to "illegals". Hinojosa responds by objecting to the use of such a reference form to refer to individuals living in the U.S. without documentation (1-2). After taking this position, Hinojosa orients to the possibility that Cortes will misinterpret the motive behind her sanction—specifically, that he may draw upon what is 'commonsense knowledge' for contemporary American conservatives, that such views are the product of radical, leftist indoctrination. She pre-emptively marks this as a *misinterpretation* with a negative assertion (3-6), and then issues a correction, asserting where she did in fact learn this, namely from Elie Wiesel (7).

01 MH: But what you CA:Nnot do::

02 .hh is to label a person illegal.

03 .hh and the reason why:I say this.=

04 =is not because I learned it from som:=

05 radical Latino or Latina Studies professor,

06 .hh when I was a college student,

07 .hhI learned it from Elie Wiesel.

08 (.) who survived the Holocaust.=

09 =who said You know what?

10 .hh The first thing they did...

When Hinojosa asserts that "som:e radical Latino or Latina Studies professor" was *not* the source of her views, she does more than address a possible misinterpretation that Cortes might relevantly make: She also constrains his response options by identifying and removing one counterargument he could marshal against her sanction. She further constrains his response options in lines 7-8, when she issues the correction component and references Wiesel's identity and experience, thereby accomplishing a footing shift to cite a well-known Holocaust survivor as the 'author' of the point of view being expressed. The ordering of the components of pre-emptive repair is thus crucial and will be discussed as part of our discussion of this procedure.

# Press release: How does the disclosure of price-sensitive information affect genre's textual realisation?

Panel contribution

***Prof. Cinzia Giglioni<sup>1</sup>***

**1.** University of Rome "La Sapienza"

The paper presents last step of a research project focused on one of the key genres in corporate communication – the press release – through both a theoretical perspective (Critical Genre Analysis as defined by Bhatia 2004) and a practical one (practitioners), in order to better understand what corporate writers aim to achieve communicatively. More specifically, in press releases which present financial data, the genre textual realisation is expected to be influenced on the one hand by the disclosure of price-sensitive information, and on the other by the (Italian) national regulatory framework.

CONSOB – the Italian government authority that regulates the Italian securities market – in line with other national organisations (e.g. U.S. Securities and Exchange Commission), requires Italian publicly-owned companies to disclose price-sensitive information: earning reports, acquisitions, public offerings, etc. These need to be communicated in a timely manner via press releases. At the same time, Borsa Italiana – which organizes and manages the Italian stock exchange – sets the guidelines for its constituents (Borsa Italiana, 2020).

In this paper, a corpus of English-language press releases issued by twenty publicly owned Italian companies during the first semester 2020 is investigated to verify if and how mandatory information disclosure affects the genre's textual features – both at the lexico-syntactical and the macro textual levels – also in the light of CONSOB and Borsa Italiana's guidelines regarding the disclosure of price-sensitive information. In fact, practitioners seem to be particularly careful in following the guidelines so as to avoid possible charges of wrong doing, which may also imply legal consequences.

As underlined by research in the field (Catenaccio 2008), the genre is organised in rhetorical moves, which are genre determinant. However, moves may also be expected to vary in terms of their frequency and textual realisation, depending on press release content[1] and the national regulatory framework.

In collaboration with expert informants from Borsa Italiana and a corporate communication agency based in Milan, the project has a twofold objective: to deepen genre analysts' knowledge of professional practice through the observation of empirical data and, at the same time, to make practitioners more aware of the genre's conventions and potentiality.

# Pretended and actualized speech events: two manifestations of intersubjectivity in pragmatic markers

Panel contribution

***Dr. Katsunobu Izutsu<sup>1</sup>, Dr. Mitsuko Izutsu<sup>2</sup>***

***1. Hokkaido University of Education, 2. Fuji Women's University***

We argue that two types of intersubjectivity should be recognized to account for the meaning of “pragmatic marker” in the broadest sense of the term adopted in Fraser (1996). For example, *frankly speaking* presupposes intersubjectivity, where one addresses another frankly. The addresser can alternate in declarative and interrogative sentences, as in *Frankly speaking*, (a) *it was a good idea.* / (b) *was it a good idea?*; the one expected to speak frankly is the current speaker in (a) but the addressee in (b) (Koguma & Izutsu 2017: 5). Here intersubjectivity pertains to an actualized speech event, involving “illocutionary force” (Berry 2011:150). The same is true of the Japanese and Korean counterparts (*hakkiri itte* and *solchighi malha-myeon*). Those markers all refer to actually occurring external interactions; their meaning concerns “the external described” as well as “the textual and metalinguistic situation” (Traugott 1989: 34-35).

Japanese *nazeka-to ie-ba* and Korean *wae-nya ha-myeon* ‘(lit.) if I say why’ also presuppose intersubjectivity, where one tells another why. However, they do not exhibit an alternation of the one expected to ‘say why.’ They can be used in declaratives but not necessarily in interrogatives, as in <sup>?</sup>*nazeka-to ie-ba takai-kara?* / <sup>?</sup>*wae-nya ha-myeon bissa-nigga?* ‘If I say why, is that because it’s expensive?’ Here intersubjectivity concerns a pretended speech event, involving “no illocutionary force” (Rhee 2014: 10). The speaker does not attend the addressee by the markers, only entertaining the conception of ‘saying why’ as a prompt for the ensuing utterance. The meaning of the markers is based on “the speaker’s subjective belief state/attitude toward the proposition” (Traugott 1989: 35), the proposition being the pretended speech event.

The two manifestations of intersubjectivity can be blurred in some pragmatic markers of Ainu, an indigenous language of Japan: *hawe ne yakun[kusu/korka]* ‘if you say (so)/because I say (so)/though I say (so).’ Each marker consists of *hawe* ‘one’s voice,’ *ne* ‘be,’ and a connective (*yakun* ‘if,’ *kusu* ‘because,’ or *korka*‘though’). The noun largely refers to the speaker’s voice with *kusu/korka*, but the addressee’s with *yakun*. These markers imply intersubjectivity (some speaker/addressee interaction), in which the absence of speech verbs makes it difficult to see them as involving illocutionary force. However, the markers refer to an actualized speech event in which the speaker or addressee hears the other’s voice.

The meanings of pragmatic markers are by nature textual and involve intersubjectivity in evoking an actualized/pretended speech event. Pretended intersubjectivity is more subjective than actualized intersubjectivity because it underlies an internal described situation (fictive speech event conception). The development of pragmatic markers (grammaticalization/idiomaticization), involving semantic change from actualized into pretended intersubjectivity, counts as “subjectivization” (Mori 1996: 216), which she demonstrates for Japanese *datte*. Therefore, the two grammaticalization clines “intersubjective > textual” and “textual > (inter)subjective” (Onodera 2020) are two sides of the same coin: actualized intersubjectivity [intersubjective/textual] > pretended intersubjectivity [textual/(inter)subjective]. This does not contradict the established cline: “propositional > textual > (inter)subjective” (*ibid.*). Pragmatic markers are, *par excellence*, textual rather than propositional, some of them with pretended intersubjectivity being more subjective than others with actualized intersubjectivity.

# Pro-Life and Anti-Mask? Magical Thinking and the Appropriation of Discourses of Bodily Autonomy

Panel contribution

***Mr. Louis Strange<sup>1</sup>***

**1.** Queen Mary University of London

In April 2020, an image from an anti-mask rally in Texas went viral on social media: it showed a person holding a sign reading “MY BODY MY CHOICE TRUMP 2020”. In the months that followed, this rallying-cry spread throughout the United States and further afield (see Ashley, 2020; Mayes, 2020), apparently co-opting the longstanding pro-choice slogan, “My Body My Choice”, to protest against mandated mask-wearing. The fact that there is a large cross-over between those who advocate a pro-life (or anti-abortion) stance and those who protest the wearing of masks to prevent the spread of COVID-19 begs the question: what sort of mental gymnastics – or “magical thinking” – could be involved in the appropriation of pro-choice discourse for anti-mask ends?

I draw on Gal’s (2019) concept of discursive “grafting” to argue that anti-mask advocates appropriate the bodily autonomy discourse, like a shoot “inserted into the trunk of a living plant, from which the shoot sucks life-giving sap that it uses for its own growth, not that of the trunk” (Gal, 2019, p. 454). While this may explain the discursive or sociolinguistic mechanism by which anti-maskers draw upon pro-choice rhetoric, it arguably leaves unanswered the question of why this grafting is possible. An answer might be found in Nancy Fraser’s (2019) *The Old Is Dying and the New Cannot Be Born*, where she argues that the contemporary convulsions in the global political and social spheres originate in a crisis of neoliberal hegemony. While progressive neoliberalism has long assimilated the discourse of bodily autonomy into an ideology based on the free-market, personal responsibility and individual “choice”, now Trump-supporting, pandemic-sceptic and pro-life reactionary neoliberalism has taken up this discourse and turned it on its head. In the same vein as Stroud and Mpandukana’s (2009, p. 364) “approach to language from the vantage point of the social circulation of languages across spaces and different semiotic artifacts”, I track this “grafted” rhetoric across different domains, from the political to street protests, and different semiotic manifestations, including social media, physical signage and political discourse.

# Problem recognition display: The use of *maa* in Japanese everyday interactions

Panel contribution

***Dr. Tomoyo Takagi***<sup>1</sup>, ***Dr. Emi Morita***<sup>2</sup>

**1.** University of Tsukuba, **2.** National University of Singapore

*Maa* is one of the most frequent filler-like interjectional expressions in Japanese. It seems to appear almost at any place in a turn-at-talk and in any sequential position. It has been often described as a marker of generalization (e.g., Kawakami, 1993, 1994), ambiguity (e.g., Togashi, 2004), or hesitation/mitigation (e.g., Kawada, 2010). However, it has been pointed out that *maa* can also be used prior to the presentation of factual information or something that the speaker is well-informed about, such as when the speaker talks about his/her own experiences or opinions in university lectures (Yanagisawa and Feng, 2019). Through the examination of *maa* in naturally occurring everyday social interactions, we find that what underlies the different aspects of *maa* that have been previously reported are second-order effects generated through the use of *maa* for the accomplishment of different types of actions.

For example, many of the collected cases of *maa* appear within a telling action, in which the speakers introduce a parenthetical insert with the adversative conjunction *-kedo* (but) at its end, explicating what is possibly problematic about the telling. Such formulations often indicate the speaker's admission of uncertainty of what is being stated ( e.g. *maa sorewa wakaranai kedo 'maa I'm not so sure about that but...'*). By displaying the speaker's own recognition of potentially problematic aspects in their own tellings through the use of *maa*, the speaker indicates a defensive stance that may serve to preempt the recipient's faultfinding questions.

When *maa* prefaces a response turn, speakers often indicate that while partially agreeing, they are resisting against the insufficient understanding or premature judgement subsumed in the prior turn, as in the following example.

((The son, who is a college student living alone, is calling his mother to ask her to send some rice to him.))

M: *nee zuibun mae- zuibun maekara: sa, nainja nai no?*

Hey, you have been out of rice for a long time, haven't you?

S: *u::n ano maa:: jisui shitenai kara iinda kedo.*

Well, *maa* it's ok 'cause I don't cook.

Yet, when the preceding turn of the *maa*-marked turn itself is a responding (as well as response-eliciting) turn that pointedly questions some problem with the *maa*-speaker's earlier proposing, suggesting or reporting turn, the turn in the third position often takes the form of *maa ne*, with the alignment particle *ne*, admitting that the *maa*-speaker also recognizes the problematic aspect of their own earlier action.

Based on these observations, we argue that *maa* essentially marks the speaker's recognition of the suboptimal nature of their own action or the action they are responding to. That, in turn, works as a second-order stance display relevant to the action the speaker is implementing. Simultaneously, by the very fact that such recognition is only interjectionally marked, *maa* signals the speaker's orientation to move the interaction forward, in spite of the speaker's full understanding of the possible problems, given that such explicit exposition of the problem may halt or delay the progressivity of the on-going interaction.

# Producing bad news communications (BNCs) for private customers: The unexpected challenges

Panel contribution

**Ms. Barbara Pizzedaz**<sup>1</sup>

1. WU - Vienna University of Economics and Business

Service providers face the need to send private customers bad news communications (BNCs) about changes to contracts, rejection of insurance claims, etc. BNCs can potentially play a strategic communications role in maintaining long-term relations with existing customers (Mast 2005). However, limited access to corporate settings means that little field research has been done on how they are formulated *in practice*, especially with regard to who is involved in the formulation and to what extent. The present paper attempts to fill this gap. To do so, it draws on fieldwork and interviews, not only with corporate managers and jurists and in-house authors, but also with external language experts and communication agencies. This enables description and analysis of the *text trajectories* (Lillis and Maybin 2017; Woydack 2019) of authentic BNCs regularly sent to non-business clients by a variety of insurance and telecommunications companies in Austria, Germany and Italy. Results show that BNCs are not the responsibility of any single department within companies. Indeed, in many cases the process of creating these communications involves a complex and dynamic interaction of contexts and authors ('voices'): some internal, whether professional writers or otherwise, others external (e.g., customers, national regulatory authorities). Moreover, all these authors work within institutional frameworks (e.g., corporate communication and language guidelines, legal requirements, content specifications). Consequently, as texts are *entextualised* and *recontextualised* (Bauman and Briggs 1990), linguistic tensions arise between different author groups. These tensions can be resolved only by "linguistic compromises" such as text elaborations, editing or incorporation, as my examples will show. These insights into the BNC production process can benefit the authors of such messages by raising awareness of the implications of writing activity, especially given that traces of recontextualisations can inevitably be found in the final, compromise text.

# Proffering the unsaid: A form of understanding check in Japanese

Panel contribution

***Prof. Makoto Hayashi<sup>1</sup>, Mr. Hayato Chuman<sup>1</sup>***

***1. Nagoya University***

Using the methodology of Conversation Analysis, this study aims to contribute to a growing body of research exploring various turn-constructional practices used for other-initiated repair (OIR) in Japanese (e.g., Suzuki 2010). To that end, we focus on one particular OIR format used for understanding checks in Japanese, which we refer to as *X ja nakute?* (“Not X?”; *ja* = copula, *nakute* = continuative form of the negative morpheme *nai*). A distinctive feature of this practice is that it is used to proffer the repair-initiating party’s understanding in a form that highlights what is *not* said (explicitly) by a prior speaker. The following simplified excerpts illustrate:

(1) ((K has just told H that she often uses a large mural of a world atlas on the wall of the Takashimaya Department Store building as a landmark for meeting people.))

1 H: takashimaya ni sekai chizu anno?

“Is there a world atlas at Takashimaya?”

2 K: ano kadokko ni.

“At the corner.”

3 → H: ***hankyuu ja nakute?***

“Not the Hankyu Department Store?”

4 K: a takashimaya ja nai hankyu ya.

“Oh, not Takashimaya, it’s Hankyu.”

(2) ((College students are talking about a mutual friend.))

1 C: shuushoku na n ja nai kana:.

“I think she’s going to pursue a business career (after graduation)”

2 → A: a:: ***kyooshoku ja nakute?***

“Oh:: not a teaching career”

3 C: mitaina koto o itteta.

“is what she was saying.”

In (1), in response to K’s claim that there is a mural of a world atlas at the corner of the Takashimaya Department Store (line 2), H produces an utterance in the format of *X ja nakute?* (line 3), presenting what was *not* said by K. By doing so, H proffers a possible alternative for the whereabouts of the atlas, which serves as an invitation for self-correction (see K’s response in line 4).

The target practice works rather differently in (2). Prior to the segment above, A mentions that the friend’s choice of Social Studies Education as her major was rather unexpected. Then, C states that she thinks the friend is going to pursue a business career (line 1). In response, A produces an utterance in the *X ja nakute?* format (line 2), thereby proffering her understanding of the unsaid implication of what C said, i.e., that A’s assumption that the friend is going to pursue a teaching career is incorrect.

Based on a close inspection of the diverse workings of OIR turns formatted as *X ja nakute?* observed in 30-hour recordings of ordinary conversations in Japanese, we argue that, at an abstract level that transcends all the diverse uses, *X ja nakute?* works to propose that X is in some contrastive relationship with what is treated as the trouble source in a prior speaker’s turn. We then show how this “context-free” function is mobilized to accomplish a variety of “context-sensitive” interactional work in each given context.

# Prosodic Cues in Reported Speech: The Case of Retellings

Panel contribution

***Ms. Rita Luppi<sup>1</sup>***

**1.** Università degli Studi di Milano

Reporting past conversations is far from being infrequent in everyday interaction. Indeed, speakers often stage past dialogues (Günthner 2002b) by decontextualising the reported utterance from its original context and by recontextualising it in the new communicative situation (Günthner 2002a). In such a polyphonic text (Bakhtin 1986; see also Günthner 2002a), prosodic cues play a paramount role in animating the staged characters, on the one hand, and in revealing the speaker's stance towards them, on the other hand (Couper-Kuhlen 1999).

Given that speaking involves a continuous process of formulating and subsequent reformulating (Schwitala 2013), linguistic recycling also comes into play when tellers resort to *retellings*, namely when they reconstruct and reproduce a story that has already been told by the same speaker (Schumann et al. 2015), thus having the opportunity to recontextualise and adjust it according to the new speaking situation.

Prosodic characteristics have been a neglected area in the research field of retellings (Barth-Weingarten/Schumann/Wohlfarth 2012). My purpose is to specifically focus on reported speech, in order to discuss how it is constructed and which prosodic characteristics are recurrent from one telling to the next.

The methodological framework that I follow is that of conversational analysis; transcripts of spoken data will be discussed with regard to their *Feintranskript* according to the GAT 2 transcription norms (Selting et al. 2009). My data is derived from selected interviews with second generation German-speaking migrants in Israel taken by Anne Betten (part of the so-called *Israelkorpus* project, cf. Database for Spoken German (DGD), IDS Mannheim: <https://dgd.ids-mannheim.de>; subcorpus ISZ). Segments extracted from these will be compared to retold stories recounted in subsequent interviews collected by me (2019), in which the same speakers thematise the same experiences again.

# Pseudo-cleft constructions in Swedish talk-in-interaction

Panel contribution

**Prof. Jan Lindström<sup>1</sup>, Prof. Sofie Henricson<sup>1</sup>**

**1.** University of Helsinki

In this talk, we present an interactional analysis of pseudo-cleft constructions in Swedish talk-in-interaction. The pseudo-cleft construction is an existing speakers' resource in Swedish interaction, and it displays regular structural patterns and characteristic interactional functions (Henricson & Lindström 2020).

Swedish pseudo clefts, such as *va ja inte gillar e hennes nasala röst* 'what I don't like is her nasal voice', are bipartite constructions where part A of the construction, *va ja inte gillar* 'what I don't like', is a nominal relative clause headed by the relative pronoun *vad* 'what' or the demonstrative *det* 'that', often combined with the relativizer *som*. The copula verb, *e* 'is', links part A with the subjective complement, part B, *hennes nasala röst* 'her nasal voice', which is traditionally analysed as the focus-bearing cleft constituent. As our presentation will show, in conversational, online speaking there is however some variation in the degree to which pseudo-cleft constructions are syntactically integrated: from fully integrated biclausal constructions to non-copular variants and further to variants in which the latter turn-part stands in a loose relation to the first turn-part or is aborted or even missing.

Our analysis is based on a collection of ca. 50 pseudo-cleft constructions excerpted from audio- and video-recorded casual interactions. We will account for the construction's functional properties that have to do with projecting actions and generating discourse events, e.g. showing that the A-part has an important turn-projecting function in that it often discloses the speaker's stance towards the issue at hand. The pseudo-cleft constructions are recurrently employed for marking discourse shifts, e.g. from a positive to a negative stance. These findings will be paralleled with previous studies on pseudo-cleft constructions e.g. in English, German, French, and Hebrew (e.g. Hopper & Thompson 2008; Günthner 2011; Pekarek Doehler 2011; Maschler & Fishman 2020). In addition to grammatical and sequential accounts, we pay attention to prosodic and multimodal features connected to the production of pseudo-cleft constructions in the data. Our findings shed new light on structural and functional properties of pseudo clefts in the Swedish language, but also more generally in spoken interaction.

# Psychiatric consultations with interpreters during COVID-19

Panel contribution

**Dr. Orest Weber**<sup>1</sup>, **Mr. Jonathan Klemp**<sup>2</sup>

**1.** Lausanne University Hospital, **2.** CHUV-UNIL, Lausanne

In this study, we investigated the collaboration between clinicians and interpreters in psychiatric consultations of allophone migrant patients during the period of the health crisis due to COVID-19. During this period, psychiatric consultations were either cancelled or continued remotely, by telephone or videoconference, or face-to-face with mask and barrier gestures (Association suisse pour l'interprétariat, 2020). If psychiatric consultations with interpreters by telephone and videoconference are frequent in some other countries (Regenstein, Trott & Huang, 2008 ; Karliner & Mutha, 2009) they are relatively rare in Switzerland, where the physical presence of the interpreter is usually privileged. In this exceptional situation, we expected the emergence of new practices among clinicians and interpreters, new modalities of collaboration and new relevant ideas regarding challenges and possible solutions.

In order to explore these aspects, we conducted two focus groups, one with four clinicians from a unit specialized in transcultural psychiatry in the canton of Vaud; and one with four interpreters working for two different interpreter services, who had all worked in the transcultural psychiatry unit of the interviewed clinicians. We used the IPA method (Interpretative Phenomenological Analysis) in order to construct a discourse that reflects as closely as possible the experience that the participants shared during the focus groups.

We identify seven crosscutting themes in the professionals' speech : Professional practices, between continuity and discontinuity ; Access and quality of care ; Defects and constraints of technological equipment ; Collaboration and professional identities ; Emotional impact ; Physical environment ; Institutional issues and proposal for the future. Throughout these themes, participants made comparisons between different consultation settings, namely by pointing advantages and disadvantages of using telephone or videoconferencing in given situations. For example, they experienced remote consultations as facilitating short useful exchanges between clinicians and interpreters before and after patient interviews. However, participants also noted restrained possibilities of psychotherapeutic work due to the constraints of the technological equipment, such as the absence of some sensory and non-verbal elements. It is noteworthy that the exceptional health situation had a different impact on issues related to professional identities in interpreters and clinicians. In addition to having stable working conditions, clinicians benefited from a positive image as a caregiver during this period. In contrast, the crisis hampered central aspects of interpreters' professional identity. Repeated cancellations of consultations confronted them with the precariousness of their work situation. They also expressed the feeling that they cannot meet their personal quality standards when interpreting remotely. Finally, both groups noted significant tiredness during and following consultations by telephone and videoconference, but they also emphasized the importance for non-native patients to have continued interpreter-mediated psychiatric care during lock-down periods.

# Public note-taking on a digital platform as a form of linguistic recycling

Panel contribution

***Prof. Esa Lehtinen<sup>1</sup>, Dr. Elina Salomaa<sup>1</sup>***

***1. University of Jyväskylä***

Note-taking is a form of linguistic recycling where some parts of speech by one or more participants are recorded in written form. As Reinig and Sprain (2019) point out, note-taking cannot be taken just as an objective practice where what is said is recorded as such; rather, note-taking is a constructive, communicative practice that is done for some purpose. In that sense, it is important to study the process of note-taking, how it actually happens in interaction.

An important aspect in the interactional accomplishment of note-taking is the participants' access to the note-taking activity. Usually, the other participants can see when the writing happens, but they cannot see what is written (e.g., Svinhufvud, 2016). However, in some cases the writing is publicly accessible. Often this is the case when, instead of hand-writing, digital technologies are used for the note-taking. In that sense, note-taking can be seen as a form of remediation (Prior et al., 2006), which highlights the fact that the process of recycling is contingent on the affordances of the different media used in the process.

In our presentation, we will investigate a case of public note-taking where a digital platform is used. Our data come from a development project in a business organization. We have collected video-recordings of face-to-face workshops and screenshots from a digital platform used for text production. Using multimodally oriented conversation analysis and deploying the notion of remediation, will analyze sequences of interaction where the facilitator of the project records the results of workshop discussion in the chat function of the platform.

We will answer the following research questions: How does the writer rely on the spoken resources in doing the note-taking? How does the publicity of the note-taking affect the recycling process? What is the role of digital technology?

Our results show, firstly, that the note-taker uses the resources selectively, sometimes recording a given part of the spoken discourse almost verbatim, while at times integrating the content of several turns of talk. Secondly, the publicity makes it possible for the other participants to monitor the note-taking. In the light of our analysis, they are more oriented to the content of the notes than their exact wording, thus showing that they see notes as unofficial documents that need not be overtly formal. Finally, the following affordances of the digital platform turn out to be particularly important for the purposes of note-taking: editability – the possibility to re-open and edit entries even after publishing; accessibility – the possibility to project the digital platform on a screen; retrievability – the possibility to easily find the entries for further use.

# Pursuing understanding or engaging the patient? “Making the body speak” as a dilemma-overcoming practice in triadic medical visit with unaccompanied foreign minors

Panel contribution

***Prof. Letizia Caronia<sup>1</sup>, Dr. Federica Ranzani<sup>1</sup>, Dr. Vittoria Colla<sup>1</sup>***

*<sup>1</sup>. Department of Education, University of Bologna*

The presence of unaccompanied foreign minors (UFMs) in the Italian healthcare system entails communicative challenges for the practitioners involved. We report findings from an exploratory case-study on medical visits involving a general practitioner, three UFM with low competence in the language of the visit, and two social workers institutionally in charge of them. A fundamental structural element of these institutional encounters is that neither the physician nor the social worker knows the UFM patient's L1; therefore, it is *not* a case of interpreter-mediated interaction.

As well documented by recent research (Bigi, 2016), involving the patient as an active participant is more than a moral matter, it is a condition maximizing the patient's compliance with therapies. However, in the case of UFM, pursuing such a goal is often incompatible with gaining relevant and reliable information and ensuring understanding: the more the professionals pursue information gathering and understanding, the more they have to interactionally exclude the UFM; the more they pursue the UFM's participation, the more they risk missing the full comprehension of the UFM's health conditions and medical history.

Adopting a conversation analytic informed approach, we illustrate the physician's communicative practices fostering UFM's *interactional agency* in the history-taking phase of the visit. We singled out five interactional practices through which the doctor recognizes UFM's K+ status while also acknowledging their low communicative competence in the language of the visit (Caronia et al., 2020). In this paper, we focus on the practice of “Making the body speak”, i.e. the physician uses his/her own or the UFM's body as an ostensibly available and intersubjectively sharable iconic counterpart of words to scaffold the patients in reporting their medical history. In the analysis, we illustrate the resources deployed by the physician to implement this practice, e.g. the use of deixis, touching and pointing (Enfield et al., 2007). We argue that through these embodied resources the physician helps the patient grasp what type of contribution is requested, thus fostering mutual understanding and facilitating the UFM's active participation.

In the conclusions, we advance that by engaging in such a recipient-designed practice, the physician overcomes the practical dilemma inherent to this kind of visits and contributes to defining the UFM's locally relevant identity: despite their low competence in the language of the visit, UFM are still (acknowledged as) competent patients. A status which – as literature advances – positively correlates with adherence to treatment recommendations.

# Qingwen-prefaced Requesting and Chinese Politeness: A Diachronic Perspective

Panel contribution

**Mr. Xu Huang<sup>1</sup>**

**1.** *Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies*

*Qingwen*(please tell (me)) conventionally consists of two aspects of meaning: *qingjiao*(please teach (me)) that encodes the manner of politeness, and *xunwen* (ask) that ritualistically indicates the speech act of request (Kádár & House, 2019, 2020). This study approaches the Chinese politeness by examining the use of *qingwen* in requests over different periods of history, in order to answer the call to investigate the diachronic development of ritual frame indicating expressions (Kádár & House, 2020). By drawing on two comparable datasets collected from the Ancient Chinese Corpus and the Modern Chinese Corpus respectively, the author found that the history witnessed a dramatic change of *qingwen* usage in terms of both its distribution and politeness connotation. In the ancient dataset, *qingwen* is more frequently used to request the socially superior, or the epistemically authoritative, and to sacredly request the immortals, so this type of usage denotes traditional Chinese politeness (i.e. *lì*), which helps to consolidate the hierarchical relation between interlocutors, and more broadly to uphold the social order in the ancient China (see also Gu, 1990). In the other dataset, however, its connotation of politeness is hard to detect with the predominant use of *qingwen*-prefaced requests in the press briefing, interviews, television shows and other social media, which ritualistically indicates the multi-party question-answer activity. Most surprisingly, *qingwen* is also increasingly used to counter the propositional content in requests with the negative implication of impoliteness. This research will contribute to speech acts theory and historical pragmatics in Chinese by focusing on the development of *qingwen*-prefaced requesting.

## Quasi-quotation in Japanese

---

Panel contribution

---

***Prof. Etsuko Oishi***<sup>1</sup>

1. Tokyo University of Science

Direct quotation is a sound/letter, word, phrase, sentence/utterance or text which is marked by quotation marks. Mainly five philosophical theories of quotation have been advocated: (i) the (Proper) Name Theory, (ii) the Description Theory, (iii) the Demonstrative Theory, (iv) the Disquotational Theory and (v) the Identity Theory. These theories differ in what is quoted (e.g. names or expressions) and what does the job of referring (e.g. quotation marks or the quoted material), and have strengths and weaknesses as regard the (in)ability of explaining unexchangeability of some co-referential expressions, and novel quotations. Against this background, Oishi (2019, 2020) proposes that quotation marks indicate specific types of expositive illocutionary act (Austin [1962]1975): (i) a word is interpreted, distinguished, analysed, or defined or (ii) an utterance is meant, referred to, called or understood. As its illocutionary effect, the interpreted word or the utterance referred to is imported to the discourse.

One issue of quotation is the effect that quoted words or utterances bring about in the discourse. Oishi (2014) analyses direct, indirect and mixed quotations in an article of a British newspaper on a phone hacking scandal, and describes effects the writers import to the newspaper discourse by quoting utterances with evidentials (Aikhenevald 2004). The writers refer to utterances of investigators, politicians and advertisers as the sources of accountability to give their picture of the phone hacking scandal and develop the discourse accordingly.

Ordinary people's utterances are quoted by journalists and politicians as the sources of accountability to raise a social issue, evaluating a policy, proposing a future action and so on. In this type of quoting, a layperson is referred to by her/his first name (cf. Fetzer 2019), or anonymously as "a single mother in her 30s." In quoting their utterances, journalists and politicians imply that (i) there are many other discourses out there in which ordinary people talk about the social issue, the policy, or the future action, and (ii) their accountability for raising the social issue or evaluating the policy lies in that they represent those whose voices are often unheard.

My speech focuses on a new type of quoting in the Japanese mediated political discourse, which can be referred to as a *quasi-quotation* or *mock-quotation*. Some politicians criticize their political rivals while relying their accountability on ordinary people's criticism, but they do not actually quote them. For example, the opposition leader, Yukio Edano, said "kokuminni yotoga damedayone toiukotoo shittemorau." *Ne* is a sentence-final particle, which is used to seek for the hearer's agreement. Edano's utterance basically means "[I would like] the Japanese people to know the ruling government is failing." By adding the particle *ne* in the clause-final position, he implied that the content (i.e., the ruling government is failing) is supported by ordinary people who criticize the government and seek for agreements from companions in their every-day discourses. The opposition leader's accountability for his criticism is based on *presumed* ubiquitous discourses of ordinary people.

# Question Design in Early U.S. Presidential Press Conferences: Tracking Journalistic Entitlements and Political Accountability

Panel contribution

***Prof. Steven Clayman<sup>1</sup>, Prof. John Heritage<sup>2</sup>, Dr. Tanya Romaniuk<sup>3</sup>***

*1. 1. UCLA, 2. UCLA, 3. Portland State University*

As a follow-up to previous longitudinal research on question design in U.S. presidential press conferences (Clayman and Heritage 2002, Clayman et al. 2006, 2007, 2010, Heritage and Clayman 2013), here we examine questioning practices in the earliest formal press conferences in U.S. history, those of Woodrow Wilson (1913-1916) and Franklin Roosevelt (1933-1936). Our methods combine conversation analytic case analysis with quantitative analysis of trends over time. Our primary objective is to chart the development of U.S. press-state relations in the early decades of the 20<sup>th</sup> century, while also demonstrating the utility of question design and response as a window into such processes of sociohistorical change.

We document the expansion of the journalistic “right to question” the president and the corresponding growth of political accountability this entails. These intertwined entitlements and obligations are evident in two patterns of questioning. First, *adversarial content* was absent throughout this period, with almost no critical or oppositional questions asked of either Wilson or Roosevelt. On the other hand, there was a significant increase in the *directness* of questioning, with indirect questions embodying reduced pressure for response (both grammaticalized indirectness in the form of modal interrogative frames and more substantive forms) more frequent for Wilson than for Roosevelt. The first pattern suggests that early press corps journalists did *not* treat themselves as entitled to disagree with or criticize presidents, and that presidents were not obliged to defend or justify their policies. The second pattern suggests that journalists at that time *did* treat themselves as entitled to seek information from presidents who were obliged to share it, but these entitlements and obligations were initially restrained and underwent a measurable expansion from the 1910s to the 1930s.

# Questioning meaning. Apparently.

Panel contribution

***Prof. Elwys De Stefani<sup>1</sup>***

**1. KU Leuven**

In line with Wittgenstein's phrase according to which "the meaning of a word is its use in the language" (PU 43), research in ethnomethodology and conversation analysis has brought to the fore the indexical and situated dimension of language. Recent studies (Deppermann & Spranz-Fogasy 2002, Bilmes 2011, among others) have shown that a variety of resources are available to speakers, as well as to recipients, to orient to problems of meaning. This talk zeroes in on resources by which speakers seem to overtly address a problem of meaning in prior talk, such as Italian "in che senso?" ('in what sense?') or "cosa vuol dire X?" ('what does X mean?'). Based on an extensive corpus (100+ h) of Italian talk-in-interaction collected in ordinary, institutional and service settings, this contribution examines the actions speakers accomplish by producing such a meaning-problematizing first pair part in response to a co-participant's previous portion of talk. When treated as addressing a problem of meaning (or understanding), recipients tend to respond with formally aligning turns-at-talk, such as "nel senso che" ('in the sense that') or "vuol dire che X" ('it means that X'). However, speakers may use these resources to accomplish a variety of actions that do not primarily address a meaning-problem, as in the following excerpt, taken from a business meeting:

- 01 ANN ((...))) si tratta di (.) costringerli a dare  
*it's about (.) forcing them to give*
- 02 dati e a risputare fuori dati. va beh.  
*data and spit out data again. whatever.*
- 03 (2.5)
- 04 ANN che (0.3) >cioè< (0.9) è assurdo ma va bene.  
*which (0.3) that is (0.9) it's absurd but it's okay.*
- 05 (2.4)
- 06 PAO no scusami, (0.7) perché è assurdo.  
*no sorry, (0.7) why is it absurd.*
- 07 ANN (5.1)
- 08 PAO cosa vuol dire assurdo.  
*what does absurd mean.*
- 09 (0.5)
- 10 ANN allora. (0.5) questa cosa serve (.) da un lato a  
*okay. (0.5) this thing is (.) on the one hand for*
- 11 fare analisi statistiche ((cont.))  
*making statistical analyses((cont.))*

Annina (ANN) comments on the utility of a software Paolo (PAO) has just recommended to use (ll. 01–02) and ends her turn with a negative assessment ('it's absurd but it's okay'; l. 04). At l. 06 Paolo, her recipient, elicits an account from Annina about the reasons for qualifying the software as 'absurd', but does not get an answer (l. 07). He then casts a question that is formatted as problematising the meaning of 'absurd' (l. 08). However, Paolo's previous turn (l. 06) shows that the lexical meaning of 'absurd' is not at stake and Annina's subsequent answer (ll. 10–11) is equally evidence that she does not treat Paolo's question as disputing the meaning of 'absurd'. Rather, Paolo's turn tackles a now overt conflict while at the same time pursuing a response from Annina. This contribution illustrates the variety of actions speakers accomplish with seemingly meaning-problematizing formats—which may be used to display disagreement, elicit explanations, etc.—thereby documenting the prag-

matic malleability of such resources.

# Questioning Practices in Executive Coaching: A Discussion of How to Integrate Practical and Scholarly Perspectives

Panel contribution

***Ms. Frédéric Dionne<sup>1</sup>***

**1.** University of Klagenfurt

Questions are omnipresent in human interactions. They allow us to express curiosity and expand our knowledge; they also initiate reflection and let us consider other viewpoints. Accordingly, for helping professionals such as therapists, asking questions is understood as an essential strategy to enable change in and for help seekers (Graf et al. 2020). This is also the case in the helping format executive coaching: coaching practitioners consider questions the silver bullet of clients' introspection (Loebbert & Wilmes 2013), a crucial intervention which guides the coaching process (Fischer-Epe 2012) and, more generally, coaches' most important tool (Schreyögg 2012) to enable change for clients. This perspective, anchored in long engagement in professional practice, has prompted the publication of a considerable amount of practice literature on the topic (e.g. Wehrle 2012). Unlike such pronounced interest in questions from coaching practice, coaching research has so far not engaged in much research. The interdisciplinary research project *Questioning Sequences in Coaching* seeks to remedy this situation by documenting and analyzing forms, functions and the interaction-specific change potential of questioning practices in coaching. This involves exploring both the local and global levels of effectiveness, meaning that the project needs to combine linguistic micro-level sequential analysis of questioning sequences and psychological insights into the contribution of questioning practices to goal attainment. In so doing, we clarify how and why questioning practices are considered essential tools for coaches (Graf & Dionne in press). Nonetheless, although the relevance of the project is justified by coaching practitioners' perspective on questions, the current interdisciplinary endeavour still represents a dialogue among scholars.

Beyond presenting the potential of such an approach, the focus of this talk is to address its limitations and concurrently discuss what a truly emancipated discussion on questioning practices by academia and practice must entail. It will thematize the requirements of such a transdisciplinary orientation, i.e. considering and integrating both coaching practitioners' and scholars' perspectives in all steps of the research process (Sarangi 2005), as well as the benefits and challenges of such a close cooperation among experts from various fields.

# Quoting Immediate Words in Japanese Conversation : Reconsidering Japanese Quotations in Interaction

Panel contribution

**Ms. Yuko Nomura**<sup>1</sup>

1. Juntendo University

The purpose of this study is to reveal features of Japanese quotations in conversation in the perspectives of Emancipatory Pragmatics. Quotation is a common language phenomenon, but various aspects of quoting as a communicative practice differ from language to language. However, previous studies on quotation in Japanese have paid little attention to how it is different from those in other languages. Thus, this study investigates how and what Japanese speakers quote in conversations and clarifies the features by comparing those in English conversations.

Quotation is defined as an act to insert utterances or thoughts from one context into a context currently being engaged (Kamada 2000, etc.). The primary focus in previous studies of quotations are on its structure and grammatical features (Coulmas 1986, Jassen&Wurff 1996, Fujita 1999, etc.), or on how a quotation creates a particular effect in conversations (Brown&Levinson 1987, Tannen 1989, Clerk&Gerrig 1990, Koda 2015, etc.). Comparative studies of Japanese and English quotations are still limited in the field of grammar (Yamaguchi 2009). These previous studies assumed the classification of direct/indirect quotations, which is a common basic classification of many western languages. Although some studies mentioned that Japanese quotation cannot clearly classified into the two categories (Kamada 2000, Yamaguchi 2009), how Japanese quotation differs from those in other languages, especially from the interactional perspectives, are not fully investigated. Thus, this study raises two questions; (1) how Japanese speakers differently quote in conversations compared to speakers of other languages (English), and (2) what are the features of those quotations?

The conversational data that this study analyzes consists of 20 Japanese and 20 English conversations in an experimental setting. In each conversation, two female native speakers of Japanese or English talked about experiences that they were most surprised at in their lives for about five minutes. The current study analyzes 244 Japanese and 132 English quotations found in these conversations.

The results showed that compared to English speakers, Japanese speakers more frequently used the thinking verb (*omou* (think)with variety of forms such as *omou*, *omotte*, *omotta*, etc.) to reproduce what they thought during their surprising experiences. Close analysis of the quoted contents revealed that they are immediate words that suddenly arise in their minds at a certain moment. For example, one of the typical quoted contents is an interjection *he* (an expression of a surprise) as in "*He tto omotte* (I thought "he=(an expression of a surprise)." It is also observed that this type of quotation helps listeners to simulate the experience that the speaker is reporting.

The discussion focuses on the Japanese quotations of immediate words, and considers how the features of this quotation can be interpreted in the context of Emancipatory Pragmatics.

# Racial or Racist? 25 hate-oriented communication processes

Panel contribution

***Prof. Gabriella Klein<sup>1</sup>***

**1. University of Perugia (emerita)**

For the EU co-funded project RADAR - Regulating AntiDiscrimination and AntiRacism, which aimed at laying the foundations for an analysis of the communicational mechanisms of 'hate speech' or better more broadly 'hate communication', the project team undertook the task of collection and analysis of different communication items, related to racist and xenophobic communication practices from newspapers, advertisements, propaganda, TV transmissions and social media. The purpose was to identify and understand the mechanism of hate-oriented (i.e. hate-motivated and hate-producing) communication practices in their articulation of techniques, procedures and strategies, conveying verbal, paraverbal (voice), non-verbal (body language) and visual (images) messages both in written and spoken discourses and interactions.

To this end, sixty case study analyses were carried out in each project partner country (Finland, Greece, Italy, Netherlands, Poland, and United Kingdom) on:

1. 20 articles from newspapers
2. 20 pictures from advertisement context (i.e. commercials)
3. and/or pictures from another context (mainly propaganda pictures)
4. 5 advertisement videos
5. 5 other videos
6. 5 talk-shows
7. 5 sequences of posts/discourses from social media.

From the analyses, 25 hate-oriented communication processes (without pretending this list to be exhaustive) were identified

1. Animalisation
2. Banalisation
3. Criminalisation
4. Dehumanisation
5. Demonisation
6. Denigration
7. Ethnisation
8. Exclusion from citizenship
9. Humiliation
10. Infantilisation
11. Intimidation
12. Minimalisation
13. Missionisation
14. Militarisation
15. Nationalisation
16. Patronisation
17. Physiognomisation
18. Polarisation

19. Racialisation
20. Reification
21. Religionisation
22. Ridiculisation
23. Sensationalisation
24. Sexualisation
25. Victimation

These processes may overlap or sometimes include each other, but they are mainly based on membership categories belonging to what we could call a ‘racist/ethnic’ collection, where the ‘ethnic’ and the ‘non-ethnic’ constitute, in the collective imagination, an asymmetric standardised relational pair associated to the perpetuating paradigm of an imaginary existence of human races. This emerges also from analyses of legal texts (laws, directives, judgments).

In each of the different communication processes we can distinguish between communication technique, procedure, and strategy (based on a distinction usually made in Conversation Analysis). These terms can be also transferred to a wider communicational activity, highlighting different aspects of the same identified communication object. Technique means the implementation of a communication phenomenon, made by the communicator (what is used: a word, a sentence, a picture, a particular tone of voice, a gesture, a gaze, a symbol, an image etc.); the definition of procedure, in this broader sense, highlights the method of implementation of a technique in its sequential and contextual development (how, where and when the technique is used); the term strategy highlights the method of reaching a specific communicative purpose (why the technique is used).

For the purpose of this presentation some examples will be given from different communicational and cultural/national EU contexts, starting from a critical reflection of the use of the category ‘race’ in legal texts.

# Racist discourses of discrimination and assimilation in an anti-racist corpus

Panel contribution

Dr. Vasiliki Tsami<sup>1</sup>, Dr. Rania Karachaliou<sup>1</sup>, Prof. Argiris Archakis<sup>1</sup>

1. University of Patras

Racist views against refugees and migrants coming in Europe are not only disseminated via hate speech, which overtly demonizes the newly arrived ‘foreigners’, but also via anti-racist discourse, which, although designed to fight racism, ends up reproducing inequalities (Archakis et al. 2018, Tsakona et al. 2020). This ambiguity is captured in the concept of *liquid racism*, a ‘new’ and ambivalent form of racism which may be difficult to trace and/or it may yield multiple interpretations (Weaver 2016). In order to examine liquid racism in Greek public discourse, we have compiled an anti-racist corpus (around 460.000 words). The aim of our presentation is to show how this corpus was created, to provide some descriptive meta-data about the anti-racist texts and to explore how racist views infiltrate anti-racist discourse.

Specifically, we collected texts concerning migrant/refugee issues and published between 2015-2020. The data come from three major sources of the Greek public sphere: i) organisations which promote migrant/refugee issues, ii) news media and iii) political discourse. These are texts of various *genres* (news articles, stories, TV shows, tweets etc.), *rhetorical modes* (narrative/non-narrative, humorous/non-humorous) and *channels/media*(oral, written, multimodal).

Drawing on Halliday’s Systemic Functional Grammar (1994) and adopting a critical perspective, we detected two main discourses connected to liquid racism: *discrimination* and *assimilation*. In the first case, anti-racist texts seem to cultivate the distance between ‘us’ and ‘them’. For example, in most of the texts, the migrants-refugees are positioned as backgrounded individuals through the role of the *goal*(who receives an action). On the contrary, the majority group undertakes the role of the *actor*(who acts on migrant/refugee issues) or the *sayer*(who talks about migrant/refugee issues).

In the case of assimilation, anti-racist texts seem to promote migrants’ adoption of the Greek dominant norms and practices as a prerequisite for their integration. In other words, their linguocultural identities are devalued. For instance, in our data Greek language learning can be methodically dictated through *appreciative* and *deontic* modality.

Given the overwhelming presence of racist discourses in our corpus, we consider the sensitization of both the producers and the recipients of anti-racist texts in the particularities of liquid racism to be highly significant. In view of the above, it is also important to consider the redefinition of the term ‘anti-racism’.

# Radiation safety expert, communication and stakeholders: The challenges for communicating with citizens, corporations and authorities on radon

---

Panel contribution

---

***Mr. Henrik Rahm<sup>1</sup>***

*1. Lund University*

I would like to present my ongoing work in a transdisciplinary research group at the Pufendorf Institute at Lund University, Sweden. Our focus is communication anchored around radiation safety experts and the communicative challenges: <https://www.pi.lu.se/en/themes-0/expert-radiation-safety-expert-post-trust-era?q=activities/theme-expert-the-radiation-safety-expert-in-a-post-trust-era>

The group consists of researchers from medical radiation physics, ergonomics, nuclear physics, strategic communication, environmental science, service management and Scandinavian languages. One theme of interest is radon communication in Sweden, both radon in the ground and in houses.

In my presentation I will discuss perceptions and expectations of radon communication in Sweden among stakeholders such as experts at authorities, academic experts, radon measurement corporations, representatives for municipalities and citizens. The communicative challenges for these stakeholders will be outlined based on different communication ideals and conflict of interests e.g. on the content, extent and adaption of the communication for different target groups. Important stakeholders are Swedish authorities such as The Swedish National Board of Housing, Building and Planning and The Swedish Radiation Safety Authority and their communication work on radon. Of special interest is the connection to the Swedish ideals for clear language developed and promoted by the Swedish Language Council: <https://www.isof.se/sprak/klarsprak/in-english.html>

Of specific interest are if and how the communication is planned for different target groups, including communication in different languages.

# Radical hope on the roads: rewriting hegemonic narratives of traffic violence from a feminist perspective

Panel contribution

***Dr. Naomi Orton***<sup>1</sup>

**1.** PUC-Rio

Year on year, traffic crashes leave millions bereft of loved ones and yet millions more with life changing injuries. Although a global public health problem, until recently, little scholarly attention has been directed to the way in which such violence is discursively neutralised. Based on the assumption that public perceptions of traffic violence as an inevitable malaise of contemporary society may similarly be challenged in discourse by catalysing a “radical reorientation of knowledge” (Miyazaki, 2004), this presentation forms part of a broader, ongoing investigation which critically interrogates the articulation of blame in the narratives this violence gives rise to. Taking Brazil – where this problem is amplified – as a case study, it draws on audio recordings of public debates held by a group of feminist bicycle advocates in Rio de Janeiro, of which I am a participant, zooming in on narratives of resistance – discomforting stories of everyday urban violence and misogyny, told by unconventional narrators who are frequently silenced. Contemporary Brazilian norms of femininity dictate that, on venturing beyond the domestic sphere, women should remain subdued and demure, while simultaneously adhering to crippling aesthetic standards. Faced with such adversity, the reimagining of public space by these activists may be understood as a means of engaging in radical hope, by fashioning a type of *concrete, present-day utopia* (Silva & Lee, in press), which, though ephemeral, exceeds the moment of its enactment through the potential futurities it alludes to (Heller & McElhinny, 2017). Yet since the acceptance of displays of physical prowess – including cycling in traffic – is largely contingent on their appealing to the male gaze, “transgressions” such as these may be met with specifically gendered sanctions, or forms of “bikelash”, from those who subscribe to conservative ideologies. In order to reconcile their experiences of this violence with common-sense beliefs related to the use of public thoroughfares, narrative practice acts as a central force in the group’s articulation of hope as participants re-signify gendered slurs, confronting the territorial norms which simultaneously constrain their agency. The discursive struggles over meaning making which punctuate both the narrated and narrative world highlight the tension between competing interpretations of gendered traffic violence and the “injurious signs” (Butler, 1997) by which this is framed. This oscillation between acts of hope and resignation to the sanitised violence which characterises their daily commutes suggests an urgent need to broaden debates on the inevitability of modern-day violence and the ways in which cities around the world may eventually be reconstrued as inclusive spaces.

# Re-framing precarity: Younger Japanese adults' discursive negotiations of desirable lifeways

Panel contribution

***Prof. Judit Kroo***<sup>1</sup>

**1.** Arizona State University

This presentation analyzes the potential for 'radical hope' among younger Japanese adults under conditions of marginalizing neoliberal capitalism (Brinton 2010). It uses discourse analysis to examine data gathered during extended fieldwork at a university in Yokohama, including 60+ hours of sociolinguistic interviews and natural conversations with over 20 male and female speakers. Interrogating the potential for contemporary younger adults to pre-figure alternative subjectivities linked to future lives (Lear 2006), this presentation demonstrates how individuals can productively re-formulate and re-imagine what counts as a 'good life' (Berlant 2011). Contemporary university students in Japan face difficult circumstances, including a prolonged recession that has left many without stable employment. The 'exhaustion' (Povinelli 2011) of life in extended precarity (Allison 2013) has further given rise to narratives of disaffected younger adults who are seen as lacking will or ability compared to 'hardworking' older adults. At the same time, university students inhabit a liminal space where post-graduation life still constitutes a horizon of multiple potential futures.

For these younger adults, the discourse of *futsuu*'ordinariness' emerges as a locus of aspiration and fear. Individuals describe their parents' generation as one in which doing things *futsuu ni*'ordinarily' was enough to guarantee *shiawase*'happiness'. Being *futsuu ni shiawase*'ordinarily happy' structures a desirable future horizon, but also one that has disappeared; for younger adults *futsuu ni shite mo umaku ikani*'even if you do things ordinarily, they won't work out'. That is to say, *futsuu ni sureba*'doing things ordinarily' is no longer sufficient to achieve an ordinary 'good life' (Berlant 2011).

However, contrary to stereotypes of defeat and disaffection, analysis of younger adults' discussion of future lives and selves points to the ways in which they construct narratives of 'radical hope' with respect to their future horizons. Analysis of younger adults' discussion of the parameters of a 'good life' suggests that they re-frame the future along axis of personal value; individuals argue that *sono shigoto tanoshikunakattara ikite imi nai nai mitai na* 'if that work isn't fun, it's like there's no point in living!'. While such re-framings have been previously interpreted as naivety regarding work life, analysis shows how the precarity brought on by loss of ordinary lives motivates the search for alternative value schema: *yappa doo naru ka wakaranai shi[...] kimatta michi igai no michi mo dekitara soo iu tanoshisa mo moshikatara aru*'[for us] we don't know how it's going be after all ... [so] if we are able to do paths outside of these kinds of settled paths, then perhaps there is a kind of enjoyableness'.

Investigating how younger adults invoke schema of personal value to re-frame future life practices, this presentation shows how discourse re-framing can be a linguistic strategy for enduring (Povinelli 2011) in the face of social precarity and marginalization.

# Re-orientating activities in emergency care interactions in Japan and the UK: Senior and junior doctors' requests and repair practices in team communication

Panel contribution

***Dr. Keiko Tsuchiya<sup>1</sup>, Dr. Małgorzata Chalupnik<sup>2</sup>, Dr. Sarah Atkins<sup>3</sup>***

*1. Yokohama City University, 2. Nottingham University, 3. Aston University*

In the context of emergency care, a team leader's requesting practice is of crucial importance to successful team interaction, playing a key role in the orchestration of care provision and being of key importance to patient safety. In this presentation, we will report on a multimodal analysis of trauma team leaders' requesting behaviour observed in the context of emergency care simulation in Japan and the UK. The focus will be specifically on repair practices (Schegloff, Jefferson, & Sacks, 1977), in which the team leader and members recognise an error or misunderstanding in their communication and orientation of activities.

West (1984) examines question-answer sequences in doctor-patient interactions and distinguished requests for confirmation and those for repair. Egbert (1996) multimodally examined various forms of other initiation of repair in everyday conversation in German and found no mutual gaze between the interlocutors was observed when the repair initiator *bitte* (partdon?) was used. In this study, trauma leaders' making requests to repair the orientation of activities is focused, concerning *projective pair* (Clark, 2012), which consists of verbal/non-verbal pair parts. In the context of each site, Japan and the UK, two emergency care simulation sessions were examined, one involving a senior doctor (SD) and the other a junior (JD). In each case, the team leader's requesting behaviours were examined and compared both quantitatively and qualitatively, applying multimodal analysis and a conversation analytic approach. Here, we will focus on team leaders' verbal and non-verbal practices, examining what is being said but also the direction of the team leaders' gaze, captured through the means of eye-tracking technology.

There are four types of request sequences identified in both sites – first position requests uttered by the team leader that are either accompanied by mutual gaze or not and second position requests that can be, at times, prompted by team member's verbal and/or non-verbal prompts. In the talk, we will discuss the distribution of these across the four data sets, as well as addressing in detail the types of sequences and the implications of their occurrence for the quality of interaction. Particular focus will be placed again on sequences that entail an element of repair. The talk will report on this comparative analysis, shedding light on how such requests are delivered multimodally across different geographical contexts and across different levels of seniority of those placed in the team leaders' roles.

# Reaction videos as sites for narrative practices

Panel contribution

**Dr. Maximiliane Frobenius**<sup>1</sup>

1. Universität Hildesheim

My contribution will analyze how reaction videos in vlogs provide ample opportunity for narrative materials to appear through a range of modes and practices.

‘Reaction videos’ are a sub-genre of vlogs, where vloggers watch another video and comment on it. The video that is being commented on (*base video*) fills most of the video space of the video being recorded (*secondary video*). The vlogger is edited into the foreground in a separate window. Reaction videos can also be made on vloggers’ own previously posted videos. In the example cited below, two vloggers (in separate windows in the upper left and right corners) are watching and discussing their own video (background).

This genre of CMC enables story-telling practices that operate on several spatio-temporal planes. The result is a multilayered story whose teller(s) tap into the resources of a variety of modes. This contribution argues that vloggers use this layering to create a constant flow of opportunities to launch related stories or story elements. The base video is used as a substrate which provides occasions for practices in the secondary video, for example, evaluative commentary, justification through narrative, discussion of the visual storytelling, etc.

This example illustrates such a practice (translated from German; *italics for base video* )

v1: [(laughter)]<sup>1</sup>

*character: I'm now softening it [a little.]*<sup>1</sup>

{points at a piece of butter placed on a hot toaster} [then I need .. a hundred and fif-]<sup>2</sup>

v2: [(laughter)]<sup>2</sup>

{base video is stopped}

I have done that before,

I used to do that in the past.

v1: (laugh pulse)

v2: when I fixed myself a sandwich.. with butter?

I also always held it over the toaster so it would become a bit softer=

v1: =didn't really work but,

v2: well, it usually works.

v1: well.. ('rather°)

{base video continues}

The vloggers use the substrate narrative, which features the misuse of a kitchen appliance, to relate a story of another case of this misuse. The visuals of butter on a toaster prompt laughter, and the subsequent stopping of the base video introduces a shift in focus. The cessation of the substrate narrative provides time and space for the similarly themed story by v2. v1, however, continues the narration of the substrate story, by adding the evaluative comment “didn’t really work”. Not only is there a complex use of modes and the stopping of narrative progression in one video to enable a narrative strand in the other video, but in the verbal interaction between the vloggers the two stories are mixed. v2 employs a modal shift, from visual to verbal, to add an evaluation (which is otherwise not told in the remainder of the video) to the substrate story, after v2 has launched his story. Their disagreement regarding the success of the cooking method under discussion ends the passage and the substrate narrative in the base video is continued.

Reaction videos provide ample opportunity for narrative materials to appear through a range of modes and practices. This contribution discusses these complex phenomena.

# Reactive and Proactive Style-shifting: Audience and Speaker Designs in the Intra-Speaker Variation of Late Middle English Written Correspondence

Panel contribution

***Dr. Juan M. Hernández-Campoy<sup>1</sup>***

**1.** University of Murcia

Historical Sociolinguistics is applying theoretical assumptions and findings of present-day research to the interpretation of linguistic data from the past. This interdisciplinary field is favouring the study of heterogeneity and vernacularity in the history of languages, reconstructing patterns of language variation and change in chronologically remote speech communities. Unfortunately, intra-speaker variation has not been given the same relevance as inter-speaker variation until recently, especially when style constitutes an essential component for the non-referential indexicality of speakers' sociolinguistic behaviour in interpersonal communication. After all, linguistic variation and change interact in complex ways with patterns of stylistic variation, since the diaphasic range of a given language is one of the most sensitive sociolinguistic symptoms of social change and differentiation.

The current prolific research output in the field is reflecting the growth of interest in style and register, highlighting the role of ego-documents as new genres and text-types as materials worth studying for both inter- and intra-speaker variation: letters, diaries, travel accounts, court records, memoranda, wills, indentures, or recipes. With the study of their interactional communication in private letters from historical corpora, informants are put under the lens of the microscope and their sociolinguistic behaviour is observed on the basis of the social (a)symmetries between addressers and addressees as well as context types. Stylistically, as letters were not produced for publication, collections of epistolary documents provide a rich source of information on less carefully monitored styles and levels of scripturalness in contexts of communicative immediacy/distance: they belong to the written level from a medial perspective, although conceptually closer to the immediacy end of the continuum.

The aim of this paper is to show results obtained from the investigation of style-shifting processes in late medieval England by applying contemporary models of Audience Design and Speaker Design to diaphasic variation from historical corpora of written correspondence. The corpus used as linguistic material for the present study is the *Paston Letters*, a collection of 422 authored documents (246,353 words) written from 1425 to 1503 by different generations of this minor gentry Norfolk family. The study is carried out through the analysis of the use of the orthographic variable (TH) by male members of the Paston family when addressing recipients from different social ranks. The data show addressee and referee-based accommodation patterns in the communicative practice of a marked linguistic variant by medieval individuals. In addition to tracing language variation and change in speech communities, private letters may also shed light onto the resources and driving forces for sociolinguistic variability and stylistic choice by individuals. Private written correspondence is intended as a dialogic exchange where addressivity, recipiency and relationality are key elements. As a result, they reflect the personal communicative style of an author who maintains and negotiates a particular social relationship with their addressees in the situation and purpose of the letter and often as part of the accommodative competence available to the members of the speech community.

# Reasoning with topoi in dialogue

---

Panel contribution

---

**Dr. Ellen Breitholtz<sup>1</sup>, Dr. Christine Howes<sup>1</sup>**

***1. University of Gothenburg***

Interacting with others frequently involves making common-sense inferences linking context, background knowledge and beliefs to utterances in the dialogue.

These inferences are often enthymematic, that is, the premises given do not by necessity lead to the conclusion [Breitholtz, 2020]. For example, consider the utterance in (1) from the BNC:

(1) A: the monarchy are non political <pause> and therefore, when they choose to speak it's usually out of a genuine concern for that problem. [BNC: FLE 233]

In the example above the premise that “the monarchy are non political” does not necessarily lead to the conclusion that when (representatives of) the monarchy speak, it is out of genuine concern. If a dialogue participant accepts certain assumptions regarding the independence of elected officials the enthymematic argument makes sense. However, an interlocutor involved in this interaction with A must themselves provide a warrant linking not being political to speaking only out of genuine concern. These warrants are often referred to as topoi [Aristotle, 2007, Ducrot, 1980].

In this talk we will show that topoi are often essential to the production and interpretation of utterances involving inference – even assuming overarching principles of pragmatic reasoning such as Gricean maxims [Grice, 1975] or the principle of relevance [Sperber and Wilson, 1986]. Drawing on topoi allows a speaker to communicate implicit meaning and sometimes also social meaning [Eckert, 2012, Breitholtz and Cooper, 2018].

Using dialogue gameboards [Ginzburg, 2012] to track dialogue updates, our approach allows us to account for interactions involving disagreement and misunderstanding in a precise way. This means we can explain mismatches in inferences, in argumentative dialogues as well as in cases of misunderstanding as participants having access to, or accepting, non-identical sets of topoi.

# Reassuring Signage: Collective Responsibility in Public Retail Space

Panel contribution

***Ms. Matilda Vokes<sup>1</sup>, Dr. Colleen Cotter<sup>1</sup>***

***1. Queen Mary University of London***

The Covid-19 pandemic has brought about the need for signage about social distancing in public and commercial spaces with businesses obliged to signpost their social distancing measures playing an integral role in public health message transmission. While there are some regulations, commercial retail spaces in the UK have had a fair amount of freedom as to how and what they display in their public signs. Alongside the required government Covid protection messages about distancing, curtailing crowds, hygiene practice, and mask-wearing, which tend to deter interaction as much as they reassure, commercial entities also have a directly competing motivation to encourage shoppers into their premises.

On one level, the signs convey public health information for the common good, and on another, they show the public how to be a consumer in that environment. This co-occurring framing and double-voicing (Goffman 1974, Bakhtin 1984) projects a sometimes at-odds sense of social responsibility alongside a neoliberal capitalist foundation. The tensions between public health and commerce, and how language operates to allow and resolve that contradiction, present somewhat differently across community contexts, as we show.

This study compares the Covid-related signage in two commercial spaces in the East End of London: one is the fourth largest shopping centre in the UK and considered to be part of the recent gentrification of the traditional East End; the other an older neighbourhood market that hosts market stalls as well as shops, primarily local businesses and services, with a much smaller reach. The two locations provide the opportunity to show parallels between language and signage conventions in larger chains and local stores and services as well as highlight these parallels in the socioeconomic context of each centre.

Our evidence shows variation in the messaging discourse with some shops using it as an opportunity to brand themselves as “responsible” alongside a reassuring encouragement to go shopping (even though the motive to increase customers, and sales, is often contrary to social distancing measures). Commands and directives in second-person or generic form (“You must wear a face-covering”, “Contactless payment encouraged”, etc.) provide the functional purpose and are also a symbolic gesture toward responsible practice. The data show that in commercial spaces there are not predictable distinctions between signs; while the regulations come from the government and some businesses directly using these templates, others are more corporatized or localized, co-functioning as “ideologically charged constructions” (Leeman and Modan, 2009).

These signs in the linguistic landscape provide a glimpse into how the Covid pandemic has been handled by institutions and commercial establishments, the language also contributing to the political narrative that portrays managing Covid as a balancing act between the economy and safeguarding public health.

# Recent diachronic changes in the use of hedged performatives in spoken British English: report on a case study

Panel contribution

**Ms. Lucie Latouche<sup>1</sup>, Prof. Ilse Depraetere<sup>2</sup>**

**1.** University of Lille, **2.** Université de Lille

In this presentation we will investigate the diachronic changes in frequency in the use of hedged performatives in spoken British English. The term *hedged performative* (HP) was coined by Fraser (1976). A HP is a construction that consists of a (semi-)modal verb and a ‘performative’ verb, as illustrated in the examples below:

- (1) **I can promise** you that we will be there on time. (Fraser 1976: 187)
- (2) **I have to admit** that you have a point. (idem)

We will analyse the results of a corpus-based study that examines their frequency and use in the spoken part of the British National Corpus and the Spoken BNC 2014. Taking frequency and mutual information score as a starting point, we selected fifteen HP: *can* combined with *assure*, *confirm*, *promise*, *say*, and *tell* and *have to* and *must* combined with *confess*, *admit*, *say*, *tell* and *ask*.

The main trends will be described and the changes in frequency will be analysed from two angles, which inform two research hypotheses: one is concerned with the impact of the modal verb, and the other with the impact of the type of performative verb (assertive vs. commissive).

With respect to the first hypothesis, general changes in frequency of use of modal verbs across time (see e.g. Mair 2015) are expected to be reflected in their use in HP. That is, HP with *have to* are expected to increase proportionally faster than HP with *must* in spoken English, which are expected to decrease in use. Our data set only partially confirm the general trend (contra the findings in Smith and Busse (2019)). While HP with *must* indeed decrease, so do HP with *have to*. Quite strikingly, *must* features more commonly in most HP in our sample than *have to*. The frequency of HP with *can* is stable across time and this reflects the general trend that has been observed for this possibility modal.

With respect to the second hypothesis, we will show how the semantics of the performative verbs impact on the evolution of the HP in which they appear: semantically more neutral and more non-committal verbs such as *say/tell*, as opposed to *admit/confess*, seem to be more likely to increase over time. We will argue here that the lower degree of commitment and semantic weight of *say* and *tell* turns them into more malleable verbs that can be exploited for delicate face work and rapport management and a large range of discursive purposes.

# Recurrent trajectories from teleological modal to protasis connective in Chinese

Panel contribution

***Mr. Yueh Hsin Kuo<sup>1</sup>***

*1. University of Edinburgh*

This paper shows that teleological modals of necessity have developed into protasis connectives ('if') in Chinese and considers this observation in terms of the tendency in semantic change, 'intersubjective > textual', with data from the Academia Sinica Ancient Chinese Corpus.

Teleological modals of necessity indicate that a proposition is necessary regarding the accomplishment of some goal(s) (Narrog 2012: 8-9). Such modals are often used indirectly as a speech act of 'advice' to direct the addressee to achieve their goal(s), similar to Traugott & Dasher's (2002: 127) 'modals of advisability'.

In the history of Chinese, there have been at least two cases of teleological modals developing into protasis connectives. The 'critical contexts' (Diewald 2002) from which these modals develop into connectives are typically preceded and followed by similar kinds of discourse contexts. The addressee looks for answers to their questions, before the speaker performs 'advice', using teleological modals. After the performance, the addressee may do what the speaker advised.

(1)-(2) are critical contexts where *bì* and *xū*, originally modals, may invite inferences that they are protasis connectives ('if'). (3)-(4) show that *bì* and *xū* are protasis connectives because they are pre-subject, a position that modals do not occur in but connectives do.

(1) 必順於典刑,而訪諮詢於耆老,而後行之

**bì** shun yú diǎnxíng ér fǎngzī yú gǒulǎo, ér hòu xíng zhī

must follow LOCATIVE penal.code and consult LOCATIVE venerable and afterwards undertake it

'One must follow the penal code and consult the venerable, and then one can take action.'

'Inference: only if one follow... and consult... can one...'

From 左傳 Zuōchúán (ca. late 4<sup>th</sup> century BC)

(2) 汝須禮拜始得

**rǔ** **xū** lǐbài shǐ dé

you must worship only-then possible

'You must worship; only then is it possible.'

'Inference: Only if you worship is it possible.'

From 祖堂集 Zǔtángjí (ca. 10<sup>th</sup> century)

(3) 必壤地美然後草木碩大

**bì** rǎngdì měi ránhòu cǎomù shuàdà

only.if farmland beautiful then vegetation great

'Only if the farmland is fertile will the vegetation thrive.'

From 韓非子 Hánfēizi (ca. 3<sup>th</sup> century BC)

(4) 須你承許下,我才起去

**xū** nǐ chéngxǔ xià, wǒ cái qǐ qù

if you promise down I only-then rise go

'(after being asked to get up) Only if you make a promise will I get up.'

From 歧路燈 Qīlùdēng (18<sup>th</sup> century)

Assuming Searle's (1969: 67) characterisation of 'advice', whereby in performing 'advice' the speaker has the addressee's best interest at heart, teleological modals in (1)-(2) may be considered intersubjective. (1)-(4) therefore

stantiate ‘intersubjective > textual’.

However, there may be points of contention over how to characterise the performative meanings that are prominent in (1)-(2): whether they are to be regarded as semantic or pragmatic. The answer has implications for how to construe the starting point of the developments exemplified in (1)-(4), as ‘subjective’ or ‘intersubjective’.

# Recycled emotions and their meta-discursive evaluation

---

Panel contribution

---

**Dr. Karina Frick**<sup>1</sup>

*1. Institute of German Studies, University of Zurich*

Digital practices of emotionalization are omnipresent on the internet: Shitstorms, cybermobbing, solidarity statements, declarations of love, expressions of fear – to name but a few. Most of them are recycled in multiple contexts: sometimes with slight adjustments, sometimes verbatim. A prototypical example is the *jesuisX* pattern which is used in various language versions in the wake of tragic events on social media (cf. Giaxoglou 2018). In these contexts, not only verbal but also pictorial material is re-used with different degrees of adaptation. But recycled linguistic resources – as digital replication-practices – also occur in other emotional contexts: the indication of love with the heart emoji or the indication of anger with the repetition of exclamation marks may serve as other examples (cf. Frick 2014; Androutsopoulos 2020). However, when it comes to digital emotional practices this aspect of recyclability is repeatedly and critically examined in the meta-discourse: emotions are expected to be individual and unique. As a consequence, the (exact) re-use or recycling of emotional resources is evaluated as inauthentic.

Therefore, the planned contribution is dedicated to the aspect of the recyclability of digital emotional practices such as grief, anger or love, and their meta-discursive evaluation. To this end, empirical examples and their follow-up communication will be qualitatively examined.

# Recycling ‘winning’ and ‘losing’ types and tokens in USA campaign ads

Panel contribution

***Prof. Karen Adams<sup>1</sup>***

***1. Arizona State University***

This presentation will consider the recycling of linguistic material in the deliberate dispute genre of campaign ads from the 2018 and 2020 elections in the United States of America. Campaign cycles are long and millions of US dollars are spent on advertising on different media platforms including TV, radio, YouTube and Facebook with Television accounting for about 60% of the ads. TV campaign spots are more likely to appeal to older audiences who are reliable voters. The data analyzed here are over 80 campaign ads for national and statewide offices in Arizona, a battleground state in both the 2018 and 2020 elections.

Each televised ad, typically 30 seconds in length, recycles the spoken word in an often slightly altered written format in a form of cross-cycling. The written message and the spoken together help draw both the reading and hearing audience whose attention may be distracted. These double-voiced statements can vary in the time they occur in the text with the spoken normally first. The written version also takes advantage of the semiotics of color, size, font, underlining and quotation marks for emphasis. The written text is also used to upcycle the spoken claims by providing a second written or spoken source for a particular claim. For example, in a 2018 TV ad, the Democrat candidate for the AZ Senate seat stated she was an independent Democrat and the written text quoted a Washington based publication as ranking her the third most independent member in Congress. The written text upcycled her spoken statement in the ad by voicing a separate and independent perspective as to the validity of her spoken claimed identity.

These texts also upcycle digitized/recorded statements from other speakers made at earlier points in time. Many of them are statements from the other candidate, re-contextualized in the opponent’s ad to be used against them as an indication of lack of suitability for office and an ideological threat. Such an example is when a Democrat organization in their ad shows a clip of the Republican opponent claiming that Social Security, a mainstay of retirement income in the US, should be eliminated. This program has bipartisan support more generally. These single tokens are part of a type of recycling in the competitive election context and may be recycled in more than one ad. Such upcycled instances attacking an opponent with their own words, typically include a digital image of the candidate speaking at an earlier time, but leave the time of speaking unspecified thus allowing on some occasions for an inaccurate reframing. Moreover, for the opposition candidate this recycled token is an attempt and possible successful denigration of their position. Even if the recycling has a problematic contextualization, the upcycling creates the potential need for the quoted opponent to address their statement should the upcycle negatively affect their winning identity. So, this is an upgrade for the opponent also, but possible negative consequences.

The presentation will focus on the strategies of cross-, up- and down- cycling including required legal quotations.

# Reference construction in interaction: The case of type-indicative “so”

Panel contribution

***Dr. Angeliki Balantani***<sup>1</sup>

**1.** University of Lausanne

This paper examines an embodied practice in German. The practice investigated is the use of the German particle “so” in conjunction with a noun phrase and accompanied by a pointing gesture (hereafter “so”+NP+PG). With regard to gestures that accompany this particle, previous work has mainly examined the occurrence of “so” in conjunction with iconic gestures (Ningelgen & Auer, 2017; Streeck, 2002; Stukenbrock, 2010, 2014). The use of this particle coupled with pointing gestures has not been dealt with in depth (see, however, Stukenbrock, 2010, 2015, for use with presentative gestures). Based on the methodological principles of Conversation Analysis, I investigate the use of “so” combined with a pointing gesture and demonstrate that in the construction “so”+NP+PG the particle features as a type-indicative token (Knöbl, 2014).

Focusing on the interplay between linguistic and multimodal resources in the construction of reference, I will demonstrate that “so”+NP+PG functions as a resource that interlocutors use in order to point at physically present entities, directing the addressees’ attention to an actual object in the participants’ perceptual space. However, they are not making reference to that specific object. Instead, they are using the present object merely as a concrete perceivable token of an imagined entity with the same features. Interlocutors, in other words, use the resources of the actual world in order to refer to something that is absent and can, at that particular moment, only be imagined.

The data utilised for this study is part of a larger corpus on multimodal interaction collected for the research project “DeJA-VI” (Deixis and Joint attention: Vision in Interaction) funded by the SNSF. The recordings were conducted with the use of mobile eye-tracking glasses (Tobii Pro Glasses 2) worn by the participants and an additional third camera to account for embodied conduct not visible through the eye-tracking. I hope to illustrate that, in the study of reference construction, the use of eye-tracking technology, while not a necessity, can nevertheless be a great asset in examining addressees’ visual perception of a referent and assist researchers in avoiding generalised assumptions about participants’ gaze direction.

# Referencing Vocabulary as Door-Opening Practice and the Compulsion to Speak—On Perceived Exclusion and Self-Inclusion in the Discourse on Covid-19

Panel contribution

***Prof. Ingo Warnke<sup>1</sup>***

**1.** University of Bremen

How can members of the academic and literary world contribute to the public discourse on Covid-19 if they do not belong to the system-relevant fields? It cannot be denied that Covid-19 is a matter of medicine, virology, politics, and administration. However, scholars and intellectuals from fields that are not involved in research on the virus are now also making explicit statements in the Covid-19 discourse, offering multidisciplinary evaluations of the current situation. A special issue of the linguistic journal *Aptum*, for example, is devoted entirely to the pandemic and in the social sciences, the topic has already been treated essayistically as *12 Perspectives on the Pandemic* in April 2020.

Against this backdrop, the paper will present an analysis of a vodcast that was staged as a discussion by members of the *Deutsche Akademie für Sprache und Dichtung* in cooperation with the *Digitales Wörterbuch der deutschen Sprache* (DWDS). Writers, a historian, linguists, a legal expert, and a medical historian as well as a literary scholar are given the opportunity to speak. The videos are each staged as a conversation between two experts who deal with one or two words of the Covid-19 discourse. The title of the vodcast speaks for itself: *Coronas Wörter*.

Two hypotheses (H1 and H2) and related questions (Q1 and Q2) structure the lecture:

**H1** Making public statement about Covid-19 from the circle of non-system-relevant fields is a reactive practice resulting from a **perceived exclusion** of the circle of important experts with the goal of **self-inclusion** into discourse.

**Q1** Which actors speak in this discourse and in which medium do they stage themselves as relevant voices in the sense of a self-fashioning as experts?

**H2** The focus on vocabulary is a **reductionist practice** with the aim of reaching a broad public by confirming the **implicit assumption** that language is primarily about word use and the meaning of words.

**Q2** What aspects of word use are considered in this discourse and what pragmatic function does this have in stance-taking?

These perspectives result in two discussion points (D1 and D2) for the panel which are located in the framework of a *Linguistics of Listening* (Warnke 2020).

**D1** **Referencing vocabulary is a door-opening practice**, also at the cost that speaking about speaking about Covid-19 is a reduced way of speaking. The metapragmatics of vocabulary acts as a bridge between experts and laypersons.

**D2** Covid-19 is a discourse with the **social demand to speak and take a position**. The IPrA panel itself, as it calls for a speaking about speaking about speaking, is an expression of this. We cannot escape Covid-19 any more than we can escape the discourse on it.

## Reflecting on media as procedures

---

Panel contribution

---

***Prof. Jannis Androutsopoulos<sup>1</sup>***

*1. University of Hamburg*

This presentation critically reflects on the foregoing panel contributions, especially in terms of their empirical, methodological and epistemological perspectives, and draws lines of comparison and difference. This provides the basis for a joint final discussion involving all panelists and the audience.

# Reflexive historical and methodological media practices: On the analysis of archival material on interrogations and secret monitorings of German POWs in the Second World War

Panel contribution

***Dr. Mark Dang-Anh<sup>1</sup>***

*1. Leibniz-Institute for the German Language*

Media and practice are in a reciprocal constituting relationship: The mediality of media is inseparably tied to the media practices that are brought forth in and by media. Not only do media become media through practices (cf. Dang-Anh et al. 2017). Moreover, certain characteristics of media only become relevant in connection with the practical accomplishments within social practices, even if they, as infrastructural arrangements, do not always appear on the surface. Practices, on the other hand, are dependent on their medial and semiotic mediation, through which they can only become social practices (cf. Habscheid 2016). Considered as media practices, they are reflexive in that they refer to themselves as both intelligible and mediated practices alongside their operative doings (cf. Garfinkel 1967).

I would like to discuss this very general thesis by methodologically reflecting upon a research project on political positioning in World War II. The data in question originate from a secret US military intelligence facility where German prisoners of war were interrogated and secretly monitored during the Second World War. These practices were both carried out and documented through medial procedures (cf. Luginbühl/Schneider 2020) and have left their semiotic and material traces (cf. Bateman et al. 2017) in the archive material in various ways. The material, for its part, is subject to several transformations in the course of the research process practiced: from the archived originals and copies, to scans as digital facsimiles and on to digital full texts and a structured corpus.

When considering what can be linguistically examined at all on the basis of historical data and how to arrive at answers to one's research questions, it is important to include both the practices of those being investigated and the practices of the researcher, which affect the materiality of the analyzed data at different levels. In order to methodically sensitize to these complex interrelationships, I will discuss different practices of listening, interrogating, transcribing, annotating, digitizing texts, and structuring data and elaborate them as nuanced reflexive media practices. The interactional practice that is actually the focus of the research project presented, the political positioning and production of social identity of prisoners of war and military officers, will, I hope, be methodologically grounded by this praxeological reflection on how mediality comes into play when sociality is being negotiated.

## Reformulation: Elaborating a Sacks' Analysis

---

Panel contribution

---

**Prof. Jack Bilmes**<sup>1</sup>

1. University of Hawaii at Manoa

In an important lecture, Sacks (1992, vol. 2: 126-136) shows how a narrator who initially formulates herself as a 'gal' goes on to reformulate herself as a 'den mother'. He shows how the initial formulation and the reformulation are sensitive to the situation as described in the story. Using an occasioned semantic approach, which I view as a further development of Sacks' membership categorization analysis, I find that the narrative has a clear taxonomic structure of person categories, developed through the course of the story. Building on Sacks' original analysis, I find a degree of systematicity that was not apparent in that analysis. The taxonomy has what might be termed a componential composition—there is an initial set of distinctions based on sex and a second set, more elaborate and more specific, resulting from the addition of an age component. Moreover, the brief response of the interlocutor to the narrative supports the notion that age was a central consideration as well as suggesting that the persons involved were students. The taxonomic analysis accounts for the overall categorical structure of the story but not for all its details. It is important to note that what is being offered in this study is not an ethnosemantic analysis, despite the use of such terms as *taxonomy* and *componential*. Although the analysis has certain cultural elements, the object is not to discover linguistic, cognitive, or cultural structures. The structure that I reveal is, demonstrably, in the talk itself. It is produced, on the spot, by the teller and oriented to by the hearer. In the course of carrying out this analysis, I discovered certain categories and structural relations that Sacks missed, but I found them, in large part, using techniques pioneered by Sacks. In particular, Sacks sensitized us to the notion of reformulation and led us to look for the consequences of such reformulation. And, although ethnosemantics was already concerned with category structure, it was Sacks who saw how those structures were produced in and constructive of meaning in talk. Sacks, in at least some of his writings on categorization, seemed to be aiming at a systematized account of meaning in talk. This is the project that I have been pursuing. The presentation is a rudimentary demonstration of the utility of a particular occasioned semantic technique.

# Reframing Water: Emergence of Meaning in the Cinematic Discourse

Panel contribution

***Prof. Eduardo Urios-Aparisi<sup>1</sup>***

**1.** University of Connecticut

In this presentation I analyze the presence of water in cinema in order to understand how meaning is created in the dynamics of cinematic discourse. In particular, I show how water becomes a symbolic resource that have diverse figurative meanings by focusing on a case study of Barry Jenkins' *Moonlight* (2016). This film is a paradigmatic example of how the presence of water is correlated to experiences of water in daily life. The close analysis shows that its meaning emerges out of the interaction of the constituents in a film.

Studies on metaphor in discourse (Cameron and Deignan 2006, Spivey 2007, Cameron et al. 2009, Gibbs & Colston 2012, Gibbs 2019), have shown how metaphorizing is a dynamic process in which the surface multimodal representation and the underlying figurative meaning interact. Following Semino et al. (2018) metaphor emerges in discourse from the multimodal sources of the filmic context and using those meaning making tools, filmmakers are able to reframe the meanings in line with their own worldviews.

The nature of cinema renders water and other items of the multimodal narrative of the film as a metaphoric token and also input for the underlying cognitive schemata. This interaction expands the traditional view of metaphor as a matter of thought as if the multimodal materiality of the film would just be reduced to a simple representation of an underlying metaphor. A film integrates a diversity of multimodal constituents in order to narrate the story and at the same time have an emotional impact on the viewers require a dynamic perspective. # Refugee voices in antiracist clips: (Non-)eliteness as a form of liquid racism

Panel contribution

***Dr. Anastasia Stamou<sup>1</sup>, Mrs. Konstantina Katrana<sup>1</sup>***

***1. Aristotle University of Thessaloniki***

Several studies have shown that the media and political discourse on immigrants and refugees tends to stigmatize them (e.g. Gabrielatos & Baker, 2008). Besides, education policy texts on refugees tend to exclude their own voices and concerns (Stamou & Kiliari, 2020). In light of this, antiracist discourses, as a nexus of counter-discourses to racism, have also gained currency. However, it has been indicated that even a text overtly characterized as ‘antiracist’ may also adopt an assimilationist perspective (Tsakona et al., 2020). Hence, racist ideas are still reproduced, though in a more latent and implicit way, what is called “liquid racism” (Weaver, 2016). Drawing on the concept of liquid racism, we focus on five video clips recently launched as part of ‘antiracist’ campaigns in Greece and Cyprus, which all have included refugee voices. Departing from a Critical Discourse Studies perspective and employing a synthetic framework for the analysis of identities (Stamou, 2018), our analysis indicates that refugee voices are framed as non-elite in relation to the majority ones, which are constructed as elite. Specifically, drawing on Thurlow & Jaworski’s (2017) definition of eliteness, our analysis shows that the majority voices are systematically represented as having material (e.g. offering jobs), cultural/ emotional (e.g. showing empathy, being admired) and epistemic (e.g. exhibiting knowledge) superiority in comparison to the refugee ones. Thus, we would like to claim that eliteness is another form of liquid racism, as it normalizes the privilege of the elites in relation to the non-elites and leads to the deepening of social inequalities and material injustices. As long as the majority is the creator of antiracist videos, it is constructed as the only privileged voice to decide about which refugee voices to include (and which not), and more importantly, about how to represent them.

# Refusal in Chinese Political Language Use: A Historical Pragmatic Approach

Panel contribution

**Ms. Dan Han<sup>1</sup>, Prof. Fengguang Liu<sup>1</sup>, Prof. Daniel Kadar<sup>2</sup>**

*1. Dalian University of Foreign Languages, 2. Hungarian Academy of Sciences ; Dalian University of Foreign Languages*

The aim of this paper is to examine the ways in which the speech act of refusal is realized in Chinese political language use. I pursue particular interest in the historical pragmatic development of this speech act category, considering that its present-day realizations are significantly different from its 'Western' counterparts. Conventionally, refusal is regarded as a highly face-threatening speech act in interpersonal communication, and it is actually a 'dispreferred' speech act in the Chinese linguaculture, which often has to be ritually downgraded in ordinary face-to-face encounters. The present research will show that the situation is far more complex when it comes to refusal in Chinese political discourse, considering that in this context conflicts are not always dispreferred and various contextual factors holding for interpersonal interaction are absent. I will argue that, in the study of refusal in Chinese language and politics, it is necessary to consider the historical trajectory of this phenomenon. Because of this, in my research a historical pragmatic analysis will be used to corroborate the model of Chinese political refusal developed on the basis of present-day data.

# Refusals in English as a lingua franca: The role of nonverbal interactional resources in showing politeness

Panel contribution

***Mr. Xianming Fang<sup>1</sup>***

***1. Mon***

Traditionally, politeness research has heavily relied on speakers' verbal aspects such as politeness words and linguistic forms. Yet, in recent years, researchers have already realized that the negotiation of politeness is usually constructed through various modalities, not only talk, but also prosody, gestures, facial expressions, and gaze. This study investigates how Chinese English as a lingua franca (ELF) users make refusals multimodally, specifically, how they use nonverbal interactional resources to avoid misunderstandings, save mutual face, and maintain interpersonal harmony. Ten Chinese ELF users and ten Indonesian ELF users conducted dyadic role-plays involving refusals and requests. After the role-plays, they had an individual stimulated recall interview with the researcher. The role-plays were video-recorded and analyzed via multimodal conversation analysis (CA). Results show that when making refusals, Chinese ELF users adopted rich nonverbal behaviors to save face and maintain interpersonal relationships, such as withholding gaze, smiling, standing, guessing, etc. Also, in the ELF context, nonverbal interactional resources are deployed to avoid misunderstandings and non-understandings. Participants used rich gestures to convey meanings as supplements to their speech in case of any non-understandings and misunderstandings, such as pointing and manipulation of objects. This study's findings suggest the importance of nonverbal interactional resources in ELF interactions and the need for applied linguists to take more attention to multimodality politeness.

# Relatability and the shared stories of social media influencers

Panel contribution

***Dr. Ruth Page<sup>1</sup>***

*1. University of Birmingham*

In this paper, I analyse the discursive construction of ‘relatability’ in the shared stories (Page, 2018) posted by social media influencers. ‘Relatability’ is a non-linguistic concept which has become a ‘buzzword’ for social media marketing particularly associated with social media influencers (Abidin, 2016), and has shifted its meaning over time from the evaluation of a narrative text to the evaluation of the narrator’s interpersonal qualities. I explore relatability in a dataset from the Instagram interactions of 10 British influencers, consisting of 314 posts and 43,915 comments collected between November 2019 and January 2020. Using corpus-assisted pragmatic analysis, I map out

- the dimensions of relatability as these are realised linguistically by the commenters who respond to SMI posts;
- how these dimensions relate to each other;
- What kinds of stories produced by social media influencers is evaluated as ‘relatable’.

I used the collocations, word sketch and thesaurus functions of Sketch Engine (<http://www.sketchengine.eu>), in the English Web2015 corpus to identify the pragmatic dimensions of relatability: projecting authenticity, aspirational facework and rapport-enhancing humour. These dimensions are realised lexically through the synonyms for ‘relatability’ in the 155,867 word corpus of comment threads from the influencer Instagram posts. I used the frequency of the synonyms of relatability to identify which posts were most frequently evaluated as ‘relatable’ by the commenters, finding that they contained self-deprecating narratives, which were framed as humorous or appealed to positive affect.

The stories most often evaluated as relatable operated across different levels of tellability, from serious troubles which the influencer has overcome through to mundane stories of everyday failings. These correspond to the different dimensions of relatability, where the success after failure is evaluated as aspirational while everyday stories of self-deprecating humour are used to perform authenticity for the influencer. A quantitative analysis of the synonyms used for these different aspects of relatability shows that these two dimensions correlate with each other: the more often the influencer is evaluated as aspirational, the more often they are also evaluated as authentic. This is framed by and capitalises on the affective economy of Instagram interactions, which is driven by the illusion of interpersonal intimacy between these influencers and their follower and is evident in the second stories (Sacks, 1995), which the audience post in their comments, as a rapport-enhacing strategy. This feeds into and acts as a counterfoil to the influencer’s promotional self and product branding.

I interpret relatability as a discursive performance which highlights the ‘double bind’ for social media influencers to appear both aspirational and authentic, and which collapses social connection with quantification and commercial imperatives (Georgakopoulou et al., 2020 in press). This allows the influencers to market the products and their personality as aspirational ‘life-style gurus’ (Baker and Rojek, 2020) while complying with Leech’s (2014) modesty maxim (to minimize praise of self).

## Remarks on the folk-concept ‘face’ in Romanian

Panel contribution

**Dr. Mihaela-Viorica Constantinescu**<sup>1</sup>

1. University of Bucharest

The presentation explores metaphorical and metonymical conventional uses of the folk-concept *face* in Romanian, in a diachronic perspective. In Romanian, the lexemes *față* or *obraz* ('face') are used in idiomatic expressions which concern different types of social interaction. The presentation thus follows a recent powerful trend of disentangling *face* from *politeness* (see Haugh 2013, O'Driscoll 2017 for an overview). The examples will be provided from seventeenth-nineteenth century Romanian literature, as well as from a present-day large corpus of Romanian (CoRoLa, <http://www.racai.ro/p/corola/>) which contains twentieth-twenty first century literature, press, online texts (blogs, posts), etc.

In the analysis, one reference point will be Ruhi/Kádár (2011) and Sifianou (2011, 2013), mainly in their discussions on the equivalents of *face* both in Ottoman and in present-day Turkish, and present-day Greek, respectively. To mention only one case, among the six words which could work as equivalents for the English *face* (*yüz*, *sima*, *surat*, *çehre*, *bet*, and *cemâl*), *yüz* seems to have metaphorical and metonymical conceptualisations which are similar to that of *obraz* in Romanian: *yüz* could metaphorically designate a person, emotions, etc. (*yüzlü* 'having honour, prestige'; *yüzsüz*lit. 'faceless', i.e. 'without shame' Ruhi/Kádár 2011: 31; 35), while *obraz* designates in old Romanian (apart from a part of the face – the cheek) a person (*obraz subțire-* 'an aristocrat') or 'social rank' or even a character in theatre plays; *obraznicor fără (de) obraz* (lit. 'without cheek', i.e. 'cheeky', 'without shame') are similar to *yüzsüz*.

Although Romanian, Greek and Turkish are unrelated languages, due to historical and geographical circumstances, Romanian, Greek and Turkish cultures share some patterns (for example, they are collectivistic cultures) that could be interesting to analyse in order to see how the region placed between Western and Eastern influences has created means to express the functioning and the rules of social interaction.

# Reminders from non-experts: Can an emerging genre of COVID-19 signs challenge the concept of risk communication?

Panel contribution

***Prof. Catharina Nyström Höög<sup>1</sup>, Prof. Annelie Ädel<sup>1</sup>, Dr. Per E. Ekwall<sup>1</sup>***

***1. Dalarna University***

In the communication of risk in public spaces, the sign is a commonly used format. Directive signs are those which “warn us of potential dangers and indicate proscribed behaviour” (Mautner, 2012, p. 190). A new genre that has emerged in response to a societal event—the COVID-19 pandemic—is what we call here the “COVID-19 sign”, which has spread rapidly, at least in Sweden. Such signs are posted in businesses and typically involve an instruction to customers to maintain their physical distance. There is a great deal of variation in what the signs look like, but they are sometimes placed on the floor, in which case they often form round stickers with limited verbal material, carrying the main message that we all need to remember to keep our distance.

The COVID-19 signs represent an emerging genre (e.g. Miller & Kelly, 2017). Based on an analysis of approximately 100 signs, we found that the genre has compulsory as well as optional features, which draw on either verbal or visual resources, or both. One aspect of the signs that has especially attracted our attention is that they capitalise on somebody else taking responsibility. All of the signs are, more or less explicitly, intertextually informed by the Public Health Agency of Sweden, and to the authority’s verbal directives to keep a safe distance. Some signs also allude to the visual design of the messages from The Public Health Agency. The signs, as multimodal ensembles, seem to have a twofold purpose: to communicate risk and to strengthen the brand of the sender. This raises the issue of how this type of branding affects the seriousness of the risk communication. The status of the signs as directive signs is, in fact, somewhat questionable. Previous research stresses the need “for a directive sign to have the desired effect in both practical and legal terms, it not only has to be in the correct place, but it must have a right to be there as well” (Mautner, 2012, p. 193). The legal status of the signs is unclear/weak in the sense that, if a customer were to violate a directive such as ‘hold your distance’, no legal consequences would ensue. This can be compared to a traffic sign stating a speed limit, which could be costly if violated. Furthermore, while the signs target the general public, they do not conform to typical ‘risk communication’ in that they are not communicated by an expert (cf. definitions from e.g. WHO <https://www.who.int/news-room/q-a-detail/risk-communication-frequently-asked-questions>). Serving essentially as reminders of social distancing, the signs are produced by non-experts on risk, and most typically by local business owners. This prompts us to discuss to what extent this has a bearing on the very concept of ‘risk communication’.

# Removal of the self/other boundary through cross-speaker repetition in informal Japanese conversations

Panel contribution

***Ms. Saeko Machi***<sup>1</sup>

**1.** Rikkyo University

This study analyzes informal triadic conversations that are taken from a Japanese television talk show and investigates how Japanese cross-speaker repetition connects participants, often resulting in the removal of the self/other boundary in the course of a conversation. Repetition creates rapport and interpersonal involvement among participants in a conversation (Tannen, 1989; Johnstone, 2002; Machi, 2012, 2019, 2020, Forthcoming). While this phenomenon is observable in English and probably in many other languages to some extent, it is highly prominent in Japanese informal conversation. In fact, cross-speaker repetition is a critical device in the Japanese language in managing participants' harmonious relationships (Machi, 2019, 2020). This study explores how cross-speaker repetition removes the boundary between the participants and creates a sense of connectedness in a conversation.

First, this study explains how frequently and spontaneously Japanese speakers in an animated conversation access and repeat one another's words, including each speaker's subjective and internal statements, as though they are interweaving their utterances (as Machi (2020) terms it, a "braid structure" conversation). During this process, the three speakers' utterances are tightly and intricately intertwined to the degree that there is no clear boundary between utterances, or even distinction between individual speakers. Consequently, a strong sense of connectedness emerges in the conversation.

The study further shows that removal of the self/other boundary through cross-speaker repetition applies to cases in which there is a mild vertical (*senpai* 'senior' vs. *kōhai* 'junior') relationship among the participants. In some of the conversations, *kōhai* (junior) participants keep using honorific forms to *senpai* (senior) participants throughout the conversation, such as *desu* (polite copula) and *masu* (polite verb suffix) expressions, in order to display *wakimae*, or one's sense of place (Ide, 2006). Even in such conversations, when *kōhai* participants repeat *senpai*'s utterances to show agreement and sympathy, they drop honorific forms temporarily and speak in a less formal, relaxed manner. Even though *kōhai* participants can repeat using honorific expressions, they often simply repeat the *senpai*'s words to show that they share the same perspectives, opinions, and feelings, without being rude. In other words, cross-speaker repetition even removes the boundary that exists in a vertical relationship, and thereby creates harmony and a state of non-separation among the participants.

In addition, the study briefly shows why the cross-speaker repetition device is so contributive in terms of connecting Japanese speakers from *ba*-based thinking, especially by focusing on the correspondence between the nature of cross-speaker repetition and the Japanese notion of self. In *ba*-based thinking, all entities are connected and mutually influential, creating an inseparability of self and others (Ueno, 2017; Fujii, 2019). Similarly, repetition of another's words also entails the inseparability of two (or more) speakers' utterances, ideas, and feelings. This study explains that both the Japanese notion of self and cross-speaker repetition are oriented towards the participants' connectedness, which makes the device suited for building and reinforcing the participants' relationship in Japanese.

# Rendering Ability Visible: (Emblematic) Gestures in Severely Impaired Patient-Initiated Activities during Physical Therapy

Panel contribution

***Ms. Ria Citrin<sup>1</sup>, Dr. Ignasi Clemente<sup>2</sup>***

***1. New York University, 2. Hunter College, CUNY***

Drawing inspiration from Kendon's characterization of gesture as visible action, I argue in this paper that an examination of the ability and of the agency that severely impaired people (SPP) exert on their everyday life activities must focus on their multimodal communication, rather than narrowly focus on a single modality (i.e. speech). With the goal of rendering SPP's abilities visible through their rich and complex multimodal communication –rather than focusing squarely on their impaired speech–, I analyze the communicative challenges and successes of Alan, a young man in his mid-twenties with a very reduced ability to speak and also who also suffers from spastic tetraparesis (weakness in all four limbs). In particular, I examine how Alan combines several multimodal resources, such as finger snapping, vocalizations, touch, and gestures, in order to overcome multiple asymmetries as he tries unremittingly to initiate “small talk” sequences (i.e. jokes, teases, musings, non-serious complaints) during regular physical therapy sessions. These data come from an ethnographic study of seven persons with acquired brain injury and their families during 18 months in Barcelona, Catalonia, Spain.

# Repeating Prior Speaker's Assessment as Response in Mandarin Conversation

Panel contribution

**Dr. Yanmei Gao<sup>1</sup>, Mr. Xiaohua Ren<sup>1</sup>**

***1. Peking University***

Assessment is an important social action frequently conducted in daily communication. When a speaker gives his/her evaluation of an object, event, or a person, the recipient has available to them a variety of options, responding with agreement, disagreeing, rejecting, or not responding. Responding to assessment with another assessment (second assessment, including repeating the same assessment) is one of the frequently adopted option. Previous studies on second assessment have examined the turn design of given instances in light of preference organization. The present study aims to examine in detail a particular form of second assessment, i.e., repeating prior speakers' assessment as response, and explores its possible interactional import in the sequences they occur. The data for this study is about 30 hours of telephone and face-to-face conversations and the method adopted is conversation analysis.

Our data reveal four types of repeating a prior assessment: (1) full/partial repeat only; (2) repeat prefaced by the token “dui” (right); (3) repeat followed by the token “dui” (right); and (4) repeat prefaced and followed by the token “dui” (right). All these formats contribute to recipients' expression of agreement with prior speakers. We argue that with repeats only, recipients express mere agreement; the preface “dui” (right) in the [“dui” (right) + repeat] format serves to mark speakers' displayed epistemic independence; the same “dui” (right) produced after repeat serves as a self-confirmation token by which the speaker reinforce his/her own assessment; repeat prefaced and followed by “dui” (right) display both epistemic independence and reinforcement of the repeat-formatted second assessments.

The findings from our study provide supporting evidence that responses are constrained and mobilized by the prior initiating action (e.g. Luke & Tanaka 2016; Xian Lixia 2018). At the same time prior speakers' utterance may be reused or modified for the current speaker's own interactional ends (Goodwin 2013, 2017). It is hoped that findings from this study will enrich our understanding of the action of responding to assessment in Mandarin Chinese conversation, and contribute to comparison in cross-language interactional linguistic studies.

# Repeats as responses to requests for confirmations in Low German and Yurakaré

Panel contribution

***Dr. Kathrin Weber<sup>1</sup>, Dr. Sonja Gipper<sup>2</sup>***

***1. Friedrich-Schiller-University Jena, 2. Universität zu Köln***

Repeats in second position are mainly treated as *non-conforming response types*, which deploy other actions than just confirming (Raymond 2003). Research in this field has shown that repeats problematize the action of the first speaker (Bolden 2009) or display epistemic primacy (Stivers 2005), among others. Although the cross-language study of Enfield et al. (2019) reveals that languages differ in their preference for interjection-response-types versus repetition-response-types to polar questions, repeats are still considered as pragmatically marked. Methodologically, the study of Enfield et al. (2019) mainly concentrates on a quantitative comparison of polar answers disregarding a more detailed action-based perspective and the differences that languages might show in using repeats in second position. Our presentation will stress that an in-depth qualitative approach is required to gain important insights about repeats as pragmatically marked or unmarked resources in second position. We base our data analysis on around 130 instances of confirmations offered as responses to requests for confirmation in everyday interactions of Low German and Yurakaré (isolate, Bolivia). Methodologically, we pursue a combined quantitative and qualitative analysis. From a quantitative perspective, both languages show a clear tendency towards repetition-type answers albeit to varying degrees. Beyond this quantitative tendency, the actions that these repeats deploy differ in both languages. Moreover, the talk will address the question if all repeats have to be categorized as pragmatically marked in advance or if especially languages with a high proportion of repetitions do have instances, where repetitions are conducted as response types indicating confirmation only.

# Repetitions as practice of taking part in child-child-interaction

---

Panel contribution

---

***Dr. Birte Arendt<sup>1</sup>, Dr. Sara Zadunaisky Ehrlich<sup>2</sup>***

*<sup>1</sup> Universität Greifswald, <sup>2</sup> Haifa University*

Repetitions are a common pattern in everyday communication (Tannen, 2007). They serve various purposes: they can signal misunderstandings and be dealt with, make responsiveness clear and establish thematic coherence.

Even kindergarten children make use of repetition in their peer discussions and thus develop literacy skills (Arendt/Zadunaisky Ehrlich, 2020).

The present talk examines how children use repetition as a resource for negotiating and establishing participation. We assume that by repeating selected linguistic elements of previous utterances, equality among the participants and synchronicity in the structure of the conversation can be established.

Using authentic data from child-child interactions of Hebrew- and German-speaking children aged 3-6 years, we will investigate different forms of minimal, partial and complete repetitions in their different relevance for enabling participation.

On the one hand, our results show that minimal and partial repetitions are used by the children in an inclusive way by building thematic and functional coherence, creating closeness between the participants. On the other hand, children use complete repetitions as a rather excluding technique for challenging and even mocking purposes.

This phenomenon has been observed in peer interactions of both German- and Hebrew-speaking children, indicating that beyond linguistic and cultural differences, there is a universal aspect in the act of repetition between peers that needs to be pointed out.

# Reporting a Rant

Panel contribution

**Dr. Liz Holt**<sup>1</sup>

1. University of Huddersfield

Reporting speech is one occasion in interaction where speakers formulate what they or others were doing through their talk. This can be conveyed both in the report itself, but also through the quotative marker and accompanying talk. Speakers can use formats that convey the report in what appears to be a neutral manner, e.g. by using a direct form to purport to report it as it was said, but they can also employ techniques that implicitly convey both what was said as well as their stance towards it. Thus, in the first of the following instances the inclusion of 'blah, blah, blah' implicitly conveys the realtor's words as recurrent but empty reassurances, while in the second instance, Lesley follows the report with a formulation of her mother-in-law's actions as 'moaning on'.

(1) [A21ME:4]

(Pam and her partner are trying to buy a house. Originally the realtor was optimistic that the sale would go through, but then becomes more cautious.)

Pam: .hhh And I'm really freakin out because: all  
along our realtor has told us don't worry  
don't worry don't worry you guys are (.) you  
know perfect candidate**blah blah [blah]**

(2)[Holt:1:1:7]

(Lesley is reporting her mother-in-law complaining to her son [Lesley's husband].)

Mum: Oh: ( ) what'd she say to'im.

(0.7)

Lesley: Oh::: all about sh:-he lea:ves'er too l:on:g  
an:d um .tch.hh An' I: wz RUDE tuh MISSI:Z  
uhm:: someb'ddy or other once ↑SIX YEARS AGO  
this was hhuh hah[h°ah]

Mum: [Oh:.

Lesley: **.hh She wz moaning on about m-me:: an:' (.)**

**m:oaning on about him'n[ohh**

Based on investigation of a collection of such reports in ordinary interaction I show how speakers design their talk to convey both the report itself but also formulations of its action, for example that the reported speaker was 'moaning on'.

In the collection analysed, the reports contribute to complaints about a third party, and involve the current speaker reporting criticisms of them made by the reported speaker. Insight is given into how speakers construct these complaints in ways that display attention to the moral and accountable dimensions of complaining - especially since speakers are reporting complaints made about themselves. The design of these sequences demonstrates orientation to the way recipients respond to these complaints which, in several instance reveals some lack of affiliation both prior to, and following the report. In this way, the analysis throws light on how formulations of what prior speakers have said are designed to convey their actions in ways that fit with the action of the current telling.

# Reporting and responding to trouble about children in first-time mothers' interaction

Panel contribution

***Dr. Stephanie Kim<sup>1</sup>***

***1. California State University - Northridge***

This study examines the interaction of first-time mothers in a multi-party online chatroom. Becoming a mother is a significant life changing experience that creates new needs for information, support and socialization (Carolan, 2007; Loudan et al., 2016). Although first-time mothers experience joy and happiness at becoming parents, they also face considerable emotional and physical challenges as they navigate the world of parenting for the first time. For this reason, many new mothers seek parent communities for information and social support (Hall & Irvine, 2009). Increasingly, one of the most popular sites new mothers look to for receiving such support is internet forums, which has been studied as having mostly a positive effect on mothers in various ways (e.g., Drenta & Moren-Cross, 2005).

The present study draws data from “quasi-synchronous interaction” (Meredith, 2019) of six mothers who began texting each other in a private chat room (in KakaoTalk) since their first children were 3 months of age. This group began as an offshoot of a bigger online forum popular among Korean mothers living in North America. Their interaction is unique in that it has occurred in a private group restricted to the six mothers from the outset and the mothers in the group have maintained a close, continual relationship over a 5-year period. In other words, different from internet forums where members come and go, the group shares a history.

Using conversation analytic methods (and taking into consideration the distinct method of “digital CA” discussed in Giles et al. [2015]), I show how the mothers in this group collectively construct what it means to be a “good, responsible mother”. In particular, I focus on their practices of reporting trouble on, and seeking advice about, their children’s development (e.g., sleep issues) and of responding to the report of trouble. The analysis shows how mothers address responsibilities for their children in their report of trouble, including expressing guilt about not fulfilling their responsibilities, justifying their choices that are different from others, and seeking assurance. As the data cover their interaction over the span of 5 years during which their children grew from infants to preschoolers, the study also examines how/if their practices of handling responsibilities changed over time as they also grew as “mothers”.

# Reporting tokens and dialogues during psychiatric nurses' handovers : recycling aspects of the patient's speeches as a way to create cohesion within the team

Panel contribution

***Mr. Louis Maritaud<sup>1</sup>***

***1. ICAR Laboratory, Lyon 2 University***

Why do nurses, in a psychiatric context, recycle various aspects of patients' speeches? The reform of the health system organization steered towards new modes of cooperation encourages medical teams to be efficient when dealing with communication issues. Considering the specificities involved in nursing practice in mental health through relational care and the continuity of care, there is an increasing number of caregivers dealing with patients. From an Ethnomethodology and Conversational Analysis perspective, we want to analyse the nurses' practices, especially reporting speech or dialogues, during their work shift meetings.

In this paper, we propose on the one hand to focus on a recycled token from a patient's speech, to understand why caregivers keep this one token intact from one meeting to another ; and on the other hand to describe the role played by such recontextualisation. Indeed, we have observed in our data that participants embody the whole team's virtual knowledge by doing so, to mutualise information, and create a common background for all the other participants to share, whether they were working at the moment this token first emerged, or not. Various professions attended to the meetings we analysed, such as a psychiatrist, a psychomotor therapist, and nurses. These different participants do not share the same knowledge originally, and do not have the same relation to the patient (nurses see them daily, whereas psychiatrists meet them about once a week). Recycling tokens or recontextualising help caregivers to work together, as a group. In a more concrete aspect, we'll focus on how cohesion is built by caregivers with recycling specific tokens, such as ones that result from a patient's error (for instance, "colit" instead of "colic"), and how mutualising information with reported speech is actually useful to understand the patient's evolution, problematics, and take care of them efficiently.

This research - lead with a nurse and in partnership with health professionals - is based on 15 hours of work shift meetings recorded every Monday during 5 weeks, in a public psychiatric hospital (Centre hospitalier Le Vinatier), in Lyon, France. Each meeting involves between 4 and 20 participants. The data are transcribed according to the ICOR conventions (ICAR Laboratory, Lyon).

# Representation of emotions in Iranian and Dutch crime news

Panel contribution

***Dr. Ad Foolen<sup>1</sup>, Ms. Afroz Rafiee<sup>1</sup>***

***1. Radboud University Nijmegen***

## Representation of emotions in Iranian and Dutch crime news

Emotion is an increasingly “important dynamic in how news is produced and consumed” (Beckett & Deuze, 2016: 1), which has an impact on form and content of news texts and images. The entrance of emotion into journalistic products also challenges the broadly-accepted Anglo-American journalistic value of objectivity (Jukes, 2020). Cultures differ, however, in this respect. In a comparative analysis of hard news in British and Italian media (Pounds 2010) and British and Spanish media (Alfonso Belmonte 2019), it was found that the British newspaper items were more objective, whereas the Italian and Spanish items featured stronger subjective engagement of the journalist and more references to the emotional impact of the events on the participating parties. Or, in Bednarek’s (2008) terms, the Spanish and Italian data contain more emotional talk and emotion talk.

In this paper, we expand Pound’s and Alfonso Belmonte’s study by including newspaper articles from a non-European culture, Iranian. Taking a (cross-)cultural perspective, we focus on a sub-genre of hard news that is, crime news reports, in which emotion is expected to play a relatively strong role. We focus on the question which emotions are referred to in the news texts, whose emotions they are, and what the function of the reference to these emotions is.

In order to answer the research questions, a corpus of 200 Dutch and Iranian crime news texts was collected from high circulation national newspapers. The analysis focuses on terms and content explicitly referring to emotions. In the discussion, we will relate the findings to aspects of the broader cultural discourse (of journalism) in the two countries. We argue that the function of crime news is different in Dutch and Iranian culture (cf. Rafiee, in preparation), and that this explains at least part of the findings.

# Request preambles in hospital nurses' unscheduled corridor interactions

Panel contribution

***Mr. Bastien Taverney***<sup>1</sup>

**1.** University of Fribourg

We are conducting a research project on recruitment practices in hospital nurses' unscheduled corridor interactions. We are attempting to answer two research questions: 1) How is recruitment sequentially organized, on the spot and in real time? and 2) How is recruitment connected to the social organization of nurses' work practices at the hospital? The project is based on a corpus of audiovisual recordings collected in the out-patient clinic of an acute-care hospital in the French-speaking part of Switzerland. This corpus consists of 331 hours of video recordings made in the clinic's corridors, supplemented by ethnographic material resulting from 51 days of fieldwork. These recordings document the work interactions of the clinic's staff, which is made up of several nurses, aides and physicians as well as one secretary.

During our review of the data, we identified 147 recruitment sequences, most of them requests. We realized that participants are very often not co-present before producing the request itself, but are located in different rooms of the clinic. Before uttering the request, they engage in locating the prospective coparticipants, move in their direction, secure their attention, make sure that they are available and so on. I have decided to investigate these request preambles for my PhD dissertation and have so far assembled a collection of 53 excerpts for this purpose. For the analysis, I am relying on the multimodal conversational analytic approach (Sidnell, Stivers, 2005). The literature on moving from unfocused to focused interactions (Goffman, 1963) and beginning co-present interactions (Pillet-Shore, 2018) is of particular interest for my study. De Stefani and Mondada (2018) show for instance that preambles are crucial in establishing a common interactional space and a participation framework. They can be generic or type-specific pre-sequences (Schegloff, 2007) laying the groundwork for an upcoming request (Couper-Kuhlen, Drew, 2014; Fox, 2015).

In the paper, I will first present the most common preambles in my collection. Then I will draw a distinction between two different types of sequences: locating summons - through which participants locate coworkers in the premises of the clinic, and attention-getting summons (Schegloff, 1968) - through which participants solicit coworkers' perceptual orientation towards them. The paper will provide insight on the specifics of recruiting colleagues in a spatially distributed work team. In connection to the panel's rationale, the paper will elaborate on the theme of "locating activities" as moments in which participants interactionally achieve the team, membership and reciprocal obligations. Furthermore, it shows that preambles are instrumental in soliciting participants' involvement in an upcoming course of action, and therefore act as a practice of inclusion.

# Requests for (re)confirmation in four languages

Panel contribution

**1.** Universität zu Köln, **2.** Westfälische Wilhelms-Universität Münster, **3.** University of Oulu, **4.** Friedrich-Schiller-Universität Jena

In mundane conversation, request for confirmation [RfC] sequences are a powerful tool for establishing inter-subjectivity and claiming epistemic rights and access. For English, Thompson et al. (2015: 50–138) demonstrate that different formats in responses to informing actions have different implications for the continuation of the sequence. In particular, requests for reconfirmation are backward-oriented in that they refer to an utterance by the previous speaker and acknowledge its newsworthiness. Frequently, they also project further topic talk. While some conversation-analytic studies treat requests for reconfirmation or newmarks as subforms of RfCs (Stivers/Enfield 2010, Raymond/Stivers 2010, Steensig/Heinemann 2013), we argue that especially for cross-linguistic research a finer-grained differentiation offers new insights into the particularities of formatting question and answer turns.

In this presentation, we investigate the forms and functions of requests for reconfirmation in everyday talk across four languages: Czech, Standard German, Low German, and Yurakaré (isolate, Bolivia). In all four languages, requests for reconfirmation can be formatted as full or partial repeats of a preceding utterance or in non-repeat format (e.g. *echt?* ‘really?’ in German, *jo?* ‘yeah?’ in Czech, *achama?* ‘is that so?’ in Yurakaré). We examine how the differences in formatting – including formulation, prosody, prefacing elements, and embodied resources – work to make relevant different kinds of sequence continuation in the given languages.

We furthermore offer a comparison of the types of responses given to requests for reconfirmation with those given to requests for confirmation, showing that in all four languages requests for reconfirmation get more minimal responses (response token only) than requests for confirmation, albeit to different degrees. Moreover, the proportion of cases where no verbal response is given is higher for requests for reconfirmation in all languages. Another important difference is that in the three Indo-European languages, requests for reconfirmation in repeat format project further talk more frequently than those in non-repetitional format. This is different in Yurakaré, however, where requests for reconfirmation in both formats receive minimal responses in the form of response tokens most frequently. This indicates that there are essential differences regarding the functions of different formats across languages.

# Requests for commitment in Arabic and English conversation

Panel contribution

***Dr. Michal Marmorstein<sup>1</sup>, Prof. Beatrice Szczepek Reed<sup>2</sup>***

*1. The Hebrew University of Jerusalem, 2. King's College*

Tokens such as *really* or tag questions such as *is it* often act as newsmarks: they acknowledge the receipt of prior talk as news while also projecting their re-confirmation (Thompson et al. 2015). Previous work has therefore identified newsmarks as requests for confirmation (Stivers & Enfield 2010). In this paper we will interrogate this classification and show that newsmarks can elicit (re-) commitment rather than (re-)confirmation.

The paper will use examples from Arabic and English to show that in both languages participants distinguish between requests to confirm a proposition put forth by the requester, and requests to confirm a previous speaker's commitment to their contribution. The paper will present an analysis of the Arabic token *wallāhi* 'by God', which originates in an oath expression and which in ordinary conversation serves to index greater or lesser commitment toward a proposition. *Wallāhi* occurs in a range of turn and sequential positions; this paper is concerned with responsive *wallāhi* in second or third position, where it typically follows an extended informing or telling. The paper will present a range of sequential formats that contain *wallāhi* followed by minimal, upgraded or extended responses and discuss the phonetic-prosodic realizations of the token in each.

For instance, in the cited telephone conversation, speaker A in Egypt is asking his friend in America about the doings of common acquaintances. In line 3 he issues a question about a specific person who he assumes to be in America. The minimal affirmation of B is treated as unexpected news, as indicated by *wallāhi* delivered with a high pitch step-up on the second syllable (*wa<sup>1</sup>llāhi*). The token is followed by a more-than-minimal response: B introduces a modification of his prior 'yes' – i.e., not only is this person there but also her mother.

01

A:

wi-?axbār il ?e SOCIAL LIFE,

**and how is the uh social life**

02

?ēh nādia yusri wi l-ṣālam di-

**how is Nadia Yusri and those people**

03

Amāl Abīni hināk?

**is Amal Abini there?**

04

B:

(0.3) ?āh-

**yes**

05

A:

(0.3) **walla[hi?]**

**really**

06

B:

[wi-m]amitha kamān;

**and her mom too**

07

A:

(0.6) wi mamitha?

**and her mom?**

08

B:

?āh-

**yes**

Unlike propositional requests which make either confirmation or disconfirmation relevant, *wallāhi* indexes the unexpectedness of the just delivered information and thus prompts the informer to express further commitment with regard to their contribution. Besides being a request for commitment, *wallāhi* can also be treated as an index of greater or lesser affiliation and thus as continuation or closure relevant.

The paper will relate findings concerning *wallāhi* to English forms including *really* and question tags and explore the extent to which the semantics and different language ecology of the tokens effect differences in their distribution and use. The paper will argue that an analysis that starts with a (linguistic) form can open up perspectives and insights regarding the social actions being performed, and that such an analysis can fruitfully complement an analysis that starts with social actions, such as requests for confirmation.

# Requests for confirmation across languages – A first quantitative overview

Panel contribution

***Dr. Martin Pfeiffer<sup>1</sup>, Dr. Katharina König<sup>2</sup>***

*1. University of Freiburg, Department of German Linguistics / Freiburg Institute for Advanced Studies (FRIAS), 2. University of Münster, German Department*

In the last decade, question-response sequences have become an important topic of cross-linguistic conversation-analytic research (cf. Stivers & Enfield 2010). Several studies have provided insights, for instance, into the coding of interrogativity, the preferred types of responses, and the social actions accomplished by questions in a broad range of languages (e.g. Enfield et al. 2010; Enfield et al. 2019).

In our contribution, we add to this line of research by focusing on one social action performed by polar questions, namely requests for confirmation (cf. Bolden 2010; Seuren & Huiskes 2017), across ten typologically diverse languages (Arabic, Czech, English, German, Hebrew, Korean, Low German, Mandarin Chinese, Spanish, and Yurakaré). Drawing on the collaborative work of the members of the scientific network “Interactional Linguistics – Discourse particles from a cross-linguistic perspective”, funded by the German Research Foundation, we present a first quantitative survey of the different ways of designing requests for confirmation and their confirming or disconfirming responses across languages. We will conclude by laying out qualitative research questions that this comparative overview engenders.

# Requests for Confirmation in Korean Conversation: Question design, Sentence-Ending Suffixes, and Sequential Positioning as Interactional Resources

Panel contribution

***Dr. Kyu-hyun Kim<sup>1</sup>***

*1. Kyung Hee University*

From the perspective of CA/interactional linguistics, this paper undertakes an analysis of requests for confirmation (RfCs) in Korean, a type of question that makes confirmation or disconfirmation a relevant next action in the slightly recipient-tilted epistemic domain. A total of 200 tokens of RfCs were culled from audio- and video-recorded Korean conversation, and were analyzed in terms of turn design, epistemics, and sequential position.

RfCs in Korean are predominantly formatted with pseudo-tags, the SESs *ci* 'committal' and *canha* 'ci+NEG'. The *ci*-marked RfCs embody the questioner's orientation to prompting the recipient to raise the questioner's commitment to the proposition being enquired about with reference to its factual status. *Canha*-marked RfCs, by contrast, are more discursively geared to raising/restoring the recipient's commitment shown to be latent or momentarily lowered (cf. Enfield, Brown, & de Ruiter 2012). Tags, such as *kulehci?/kuchi?/kuci?* "right?", which also involve 'committal' *ci*, were observed to be employed only sporadically in RfCs. Rather than making confirmation or disconfirmation a relevant next action, they were mostly used in the context where the speaker pursues the recipient's affiliation with his/her affectively loaded (e.g., sympathizing, griping, ironizing, etc.) stance embodied in the host TCU (cf. Hepburn & Potter 2010), whose "delicate" character is retrospectively claimed to be commitment-worthy.

Two forms of negative questions serving as RfCs, the pre-verbal (*an* + V) and post-verbal (V + *ci anh*) negative questions, were found to differ in that the latter indexes a more modulated epistemic claim, whose relevance is limited to a specific domain where the questioner's claim of epistemic rights is more likely to be endorsed by the recipient.

As part of question design, diverse forms of SESs are employed to qualify the speaker's epistemic claim. For instance, RfCs may be formulated as doing "noticing" (with *-ney* 'factual realization'), "inferencing" (with *-kwuna* 'discovery through inferencing'), or "doubting" (with *-nka* or *-na* 'dubitatively'). Interrogative particles such as *-nka*, *-na*, or *-lkka* ('I wonder') are employed in RfCs as a resource for qualifying/modulating the questioner's claim of epistemic rights in such a way that the inquiry is ostensibly formulated as being self-directed, i.e., in the form of "musing aloud" (Sacks 1992).

RfCs may take the form of a nominalized construction (*-nke* 'attributive + thing'), embedded in the identificational structure of 'Is it the case that/isn't it the case that ...?'. They were found to serve as a device with which the questioner shows himself/herself capable of making access to the recipient-tilted domain on grounds of some "normative" reasoning. The negative version (*-nke* + *ani* 'NEG') indexes a stronger epistemic claim.

Finally, RfCs produced in the form of full or partial repeat of the prior utterance were analyzed in terms of the sequential function of eliciting further on-topic talk. Their status as an RfC is shown to be constructed through the way the prior utterance is subtly modified, e.g., with extreme case formulations, which makes relevant an upgraded form of confirmation with finer granularity.

# Requests for verification across varieties of Spanish. A comparative approach to gaze behavior and response mobilization.

Panel contribution

***Mr. Ignacio Satti<sup>1</sup>***

*1. Albert-Ludwigs-Universität Freiburg*

The present contribution focuses on a subtype of requests for confirmation, namely requests for verification. This type of request has been first described by Charles Goodwin (1981, pg. 151) and is specific to multiparty interactions where both knowing and unknowing recipients are co-present, such as collaborative storytelling. In this context, a teller can request a knowing co-participant to verify some aspect of the story-in-progress before its final delivery to the unknowing story recipient (cf. Goodwin, 1981; Lerner, 1992; Mandelbaum, 1987). Drawing upon Interactional linguistic methods (Couper-Kuhlen & Selting, 2017), this paper explores how participants design requests for verification in collaborative storytelling across three varieties of Spanish: Bogotá (Colombia), Buenos Aires (Argentina) and Cochabamba (Bolivia). It will address the following questions: Which resources are available to tellers for making this type of action recognizable for the knowing recipient? What is the role of gaze behavior? Are there systematic differences in how speakers from these regions design these requests? The paper will answer these questions by looking at a collection of requests for verification that provides both qualitative and quantitative results.

The analysis will show that tellers design requests for verification with different response mobilizing features (Stivers & Rossano, 2010), such as gaze behavior, epistemic markers and tag questions. By pursuing a comparative perspective (Sidnell, 2009), some differences can be shown between the varieties under study, particularly in speakers from Cochabamba. As opposed to speakers from Bogotá and Buenos Aires, these speakers rarely establish mutual gaze or use facial expressions during the verification sequence. Instead, they deploy more frequently other resources for obtaining verifications, such as tag questions, repair initiations and prosodic contours. An aggregation of cases shows that speakers from Cochabamba design requests for verification more frequently with tag questions. Furthermore, these are more frequently integrated in the design of the request and are almost always produced with same lexical item (*no*, Engl. ‘no’). These results support the analysis of tag questions having a high degree of conventionalization in speakers from Cochabamba, which can explain why they rarely establish mutual gaze during the verification sequence. The data stems from video recorded conversations that are part of the Freiburg SofaTalks corpus.

# Resistance and hope: Brazilian mothers of victims of police brutality fighting for justice

Panel contribution

***Ms. Etyelle Araujo<sup>1</sup>, Dr. Liliana Cabral Bastos<sup>1</sup>, Dr. Liana de Andrade Biar<sup>1</sup>***

***1. Pontifical Catholic University of Rio de Janeiro (PUC-Rio)***

In Rio de Janeiro, young black people in poor communities are frequently the victims of state violence during police operations in their search for criminals in these areas. In 2019 1,814 deaths were classified as homicide due to police intervention in the state of Rio de Janeiro, 70% of the victims were black. The death of these young people is often accompanied by accusations of resistance to some police command or involvement with criminal actions. The mothers of these victims struggle for justice in Rio de Janeiro by engaging in a social movement known as "*Rede de Comunidades e Movimentos contra a Violência*". This struggle is a clear engagement in a practice of hope, as a collective action of survival in face of police brutality. By analyzing the narratives produced by them, this study explores how grief is converted into political fight (or into a practice of hope) by examining (i) how emotions and suffering are organized in these mothers' narratives; and (ii) what discursive strategies are used in the process. This study aligns itself with Narrative Analysis (BASTOS; BIAR, 2015) and interpretative qualitative research methodology. The data were generated from narratives told by mothers during demonstrations in Rio de Janeiro. Understanding narrative as a form of organization (BRUNER, 1990), the analysis was guided by the notion of moral shock (JASPER, 1997), which includes events that provoke indignation and lead individuals to engage in mobilizations. The analysis suggests that it is by turning the pain of losing a child into political insurgence that mothers narratively organize their emotions. As stories get told, events surrounding the murders are recontextualized and experiences are collectivized. Their narrative practice, for example, has more space for collective fight of justice than for their particular stories of pain and violence. This is how hope is constructed. Mothers' stories become narratives of resistance, which project hope as a resource (LEAR, 2006) to oppose institutional racism, as well as narratives of "re-existence" (SOUZA, 2009), which recast the deaths of their children as an effect of a necropolitical logic of state organization. Even when cases are archived, or the police officers involved are not found guilty these mothers continue fighting to prevent other mothers shedding further tears. Bearing t-shirts with their children's photos, they articulate hope by grounding their lost ones' voices in the present. This sustained activism can be understood as tactical cooperation to deal with grief and fight racism as well as new forms of recasting temporality as the mothers' struggle to maintain their children's memory alive.

# Resolving progressivity troubles in interviews between social workers and persons with dementia

Panel contribution

***Mr. Keisuke Kadota<sup>1</sup>, Dr. Ryosaku Makino<sup>2</sup>, Mr. Atsushi Yamamoto<sup>1</sup>, Mr. Kazuhiro Uchida<sup>1</sup>, Prof. Hiroko Kase<sup>1</sup>***

***1. Waseda University, 2. Hiroshima Institute of Technology***

Dementia can have various negative effects on communication. Especially, difficulties in word-finding (Mok & Müller, 2014) can cause troubles in the progressivity of conversation. Such troubles are often resolved through cooperation between the person with dementia and other participants. However, this could expose problems the person with dementia faces. For instance, suggesting appropriate words while the person with dementia is word-searching may infringe on their right of telling as it hinders an opportunity for self-repair (Schegloff, et al., 1977). Moreover, such conducts may even make cognitive impairment conspicuously in local interaction. Examining interactions between a person with dementia and an aged health care social worker, we found numerous troubles in progressivity, which result from the word search. Interestingly, they were quickly repaired and rarely appeared to lead to critical situations. Thus, this study aimed to reveal the practices that participants employ to resolve the troubles in the progressivity of conversation between a person with dementia and a social worker.

The data for this study were collected from video-recordings of social work interviews at an assisted living facility in Japan. Social workers surveyed the living conditions and needs of the elderly, and two of them interviewed three persons with dementia, once each. The screening of the Mini-Mental State Examination (Folstein, et al., 1983; Japanese version) showed all three elderly residents could be diagnosed with dementia. After transcribing the interviews, we extracted the cases of word-searching in the elderly's turn and analyzed some cases with conversation analysis. Data were in Japanese.

The analysis shows that social workers' operation had the following sequential structure: (1) the occurrence of troubles in progressivity in the elderly's turn, (2) operation by a social worker, and (3) acceptance of the operations by the elderly. In addition, two features of the operations were as follows. First, it was before the elderly abandoned their turn that the operations were initiated. Second, when it was inevitable to refer to the cause of troubles in progressivity, social workers attributed it to non-serious causes (e.g., the difficulty of hearing their voice) rather than the cognitive characteristics of the elderly. These features may enable the in-situ social work interviews to appropriately progress by making communicative troubles as inconspicuous as possible or treating them as being interactional rather than caused by dementia.

# Resonance as an applied predictor of cross-cultural diversity and a resource for AI conversational interfaces

Panel contribution

***Dr. Vittorio Tantucci<sup>1</sup>, Dr. Aiqing Wang<sup>1</sup>***

*<sup>1</sup>. Lancaster University*

This paper is centred on the pragmatic and cognitive dimension of grammatical and lexical similarity across utterances in naturalistic interaction. In particular, we focus on the relationship between constructional affinities across turns of speech and whether such similarities correlate with dialogic engagement among interlocutors. This phenomenon has been defined as resonance (cf. Du Bois 2014; Tantucci et al. 2018; Tantucci & Wang 2021) and involves the on-going repetition or creative variation of a linguistic item that occurs in some previous or on-going turn of spontaneous interaction. We analysed 1000 occurrences of (dis-)agreement involving either lexical or syntactic resonance respectively in the Callhome corpora of American English and Chinese telephone conversations. A mixed effects multilinear regression (cf. Baayen et al. 2008) model indicates that resonance is a very important dimension of Mandarin conversation, as it tends to significantly correlate with intersubjectivity and dialogic engagement. Conversely, English conversation is characterised by a significantly lower degree of lexical and constructional affinity across turns, also underpinning a lower degree of association with sentence peripheral marking of intersubjectivity and dialogic engagement. Most crucially, we fitted a hierarchical clustering model (cf. Gries 2010; Tantucci 2020) showing that resonance, in combination with sentence peripheral marking of intersubjectivity, allows to predict language diversity. This result has important implications for AI and cognitive architecture modelling, as it indicates that similarity across utterances inherently defines the interactional pragmatics of different languages and cross-cultural interactional practices. This study, in turn, aims to inform the design of conversational interfaces (Klopfenstein et al. 2017) by accounting for the role played by resonance in the dialogic accommodation of meaning in naturalistic conversation and its cross-cultural variation. Machine-to-human interaction can be enhanced by the usage-based intersection of resonance and pragmatic marking and the way this persistent concurrence contributes to dialogic engagement and on-going negotiation of meaning among interactants. The applied impact of this endeavour can lead to devising increasingly sophisticated ability of AI to simulate culture-specific empathy and engagement, i.e. through conversational strategies and dialogic patterns that underpin human naturalistic conversation at the interactional pragmatic level, and not merely at the propositional one.

# Responding playfully: taking sides and displaying stance towards (reported) trouble

Panel contribution

***Dr. Xin Peng<sup>1</sup>, Dr. Wei Zhang<sup>2</sup>***

***1. Xiamen University, 2. Tongji University***

This study examines how a speaker's talk is playfully responded to by its recipient. It has been reported in the literature that in conversational storytelling or joke-telling, recipients sometimes respond with playful remarks. One way of doing so is to provide a hypothetical scenario as what might have happened next in the activity currently being reported. The following example illustrates an instance from our Mandarin data:

(1) Drinking beer

((Ta 'he' at line 20 refers to a friend of Fen.))

- 20 FEN: ta xiaoxue de shihou (0.3) gen- (0.3)  
 he primary.school PRT time to  
 'In the primary school (0.3) he to- (0.3)'  
 21 qu: gen wo baba gaozhuang shuo,  
 go to my dad report say  
 '(he) went to *report to my dad and said,*'  
 22 Fen ti zhe ge pijiu pingzi dao:chu pao(h)  
 NAME carry ASP CL beer bottle everywhere run  
 '*Fen carried a beer bottle and ran around everywhere*'  
 23 [huh huh  
 24 WAN: [huh huh huh huh huh huh  
 25 LIN: -> [huh huh huh huh ni ba shuo huh(.) wo gei ta mai de(h)  
 your dad say I for her buy PRT  
 '*huh huh huh huh Your dad says huh(.) I buy it for her(h)*'  
 26 [[huh huh huh huh (. ) huh huh huh huh  
 27 FEN: [[huh

Following the conversation-analytic approach, and drawing on about 10 hours' video recordings of Mandarin conversations, we aim to systematically investigate playful responses in Mandarin talk-in-interaction for their sequential distribution and possible interactional ends they are designed to achieve. Our analysis shows that the majority of the cases are in the format of [someone says + something]. They recurrently occur in two sequential environments: (i) when the ongoing telling or informing involves some trouble, e.g. in the above example, Fen reported a complaint against her; (ii) when a participant in the conversation is put into a difficult situation, e.g. being asked to answer an embarrassing question. In contrast to other types of recipient response which orient to the actual details in the unfolding story and thereby display alignment to the telling activity, playful responses, we argue, is a practice by the recipients to position their affiliative stance towards the teller or a story character, and may also provide a 'playful' (rather than practical) solution to resolve the trouble arising from the interaction. It is hoped that the findings from the study contribute to better understanding the interactional import of responding with playful construction of unreal (i.e. hypothetical) scenarios or making other 'non-serious' types of response in ongoing sequences of action.

# Responding to informings in American English conversation: Recent changes in the use of OKAY

Panel contribution

*Prof. Elizabeth Couper-Kuhlen<sup>1</sup>*

*1. University of Helsinki*

The present study grew out of a large-scale conversation-analytic project examining the particle OKAY in interactions across thirteen languages (Betz et al, eds., 2021). I report here on findings from the American English part of the project, which uncovered a number of recent changes in the use of OKAY.

The data for this report come from two collections of everyday informal conversation, one from interactions taking place in the 1960s (the “older” data) and one from interactions taking place in the 1990s and early 2000s (the “newer” data), which were analyzed separately. The focus here is on informing sequences – news deliveries, tellings, and other kinds of information transfer from knowing to unknowing parties – and specifically on the use of OKAY in response to such informings, whether volunteered or elicited.

In the older data, OKAY is not widespread in response to an informing turn. It is reserved for special occasions when the information being transferred is consequential for the recipient, with implications for their agenda or beliefs. For example:

(1) “Hear you fine” (Older data)

((Stan has called his sister Joyce to ask for shopping advice.))

4 STA: HI.=can you HEAR me okay?=

5 =cause the REcord player’s on.

6 JOY: O:H yea:h;

7 i hear you FI:N[E.

8 STA: [Okay;

9 GOOD.

Stan responds with OKAY (line 8) because the information that Joyce can hear him well (line 7) is consequential for him: it means that he does not have to turn his record player off in order for the call to succeed.

But in the newer data, OKAY is increasingly found as a generalized means for registering receipt of any piece of information, even if that information has no implications for the recipient:

(2) “Weight Watchers” (Newer data)

(Mom and her daughter Laura are telling their neighbor Donna about the recommendations they get at Weight Watchers.)

1 DON: wh[ere do you- where do you GO for thA:t.

2 LAU: [WHA:T?

3 (0.4)

4 DON: WEIGHT watchers.

5 (.)

6 MOM: u:m, (0.3) at- (0.8) behind SAFEway-

7 at a (.) it’s Actually at an OLD folks home

8 in their (0.2) [like recreAtion:

9 LAU: [hhh heh °hhh

10 MOM: cEn[ter

11 DON: [Oka:y-

Donna responds with OKAY (line 11) although there is no evidence that the location of Weight Watchers is consequential for her or her agenda: she does not express any interest in going there herself nor in recommending

it to others but instead appears to have asked merely out of curiosity.

In this presentation I will discuss evidence for the increased frequency of OKAY as a response to informings in the newer data and the implications of its new use as a generalized news receipt for competitors such as OH (Heritage 1984).

# Responding to non-human animals: mental state attributions, questions, and recycled vocalizations

Panel contribution

***Dr. Katariina Harjunpää<sup>1</sup>***

**1.** University of Helsinki

This study employs the methods of conversation analysis and interactional linguistics to investigate interaction between humans and non-human animals in their daily life. The study focuses on the linguistic resources that human participants use when responding to non-human animal participants' vocal or embodied conduct. Three types of actions are examined: i) attributions of mental states to the animal ('he is jealous'), ii) question-formatted turns ('what are you sniffing'), and iii) turns delivered as second pair parts to form a vocal, greeting-like sequence with the animal ('woof woof'). The attribution of mental states (Harjunpää frth) (i), such as emotions, intentions or personal characteristics, to the animal serves to account for the animal's local behavior. The questions (ii) display the speaker's noticing that the animal has perceived something in the environment and that the perception motivates the animal's current action, while the human does not have access to the same stimulus (e.g. smell). In the greeting-like sequences (iii) the human participant recycles the animal's vocalization, using lexical reduplication and prosodic matching (Szczepek Reed 2007), which serves as a routine to acknowledge the animal's co-presence.

With the three types of responses, human participants display their interpretations of the non-human animal's conduct and its local relevancies, giving it specific kinds of meaning (Goode 2007, Mondémé 2018, Sanders 1993). Human language is thereby adapted as a tool to approach the world of another species, in varying degrees of cooperation as well as imposition of human-centered meaning (Karlsson 2012). The study demonstrates the human participants' linguistic, prosodic and embodied resources for responding to the non-human participants, and the sequential contexts and broader circumstances in which the responses occur. It discusses the participant roles and constellations that emerge in the multiparty, interspecies situation, and how they are coordinated with various semiotic resources. The data consist of video-recordings of Finnish and Brazilian Portuguese everyday interactions and some instances of waiting at a veterinary clinic. In these data, the humans and non-human animals are not engaged in focused joint activities but their brief moments of interaction emerge on the side of other activities, rendering observable some of the constant, yet easily overlooked social life in our daily interspecies environment.

## Responding to trouble reports at work

---

Panel contribution

---

**Dr. Angela Chan<sup>1</sup>**

**1.** Shantou University

Reporting a trouble has been regarded as a common method to seek assistance. In response to a report of trouble, the recipient may offer help, offer advice, or give a directive. In institutional settings, responding to trouble reports has been widely studied in contexts of healthcare, emergency call, and psychotherapy. However, the literature concerning workplace settings is rather limited.

In a workplace setting, participants have different responsibilities and obligations as defined by, for example, organizational identities, job descriptions, and daily routines. Some participants have the responsibility to allocate tasks while some other participants have the obligation to perform the allocated tasks. Under such a contextual background, it is possible that participants with different responsibilities and obligations respond to trouble reports in different manners.

The present study aims to examine and compare different ways of responding to reports of trouble in workplace interaction. It draws on over 20 hours of audio-recorded daily interaction between the laboratory supervisor and his junior staff members in a medical laboratory in Hong Kong. The interaction was conducted in Cantonese. Adopting a conversation analytic approach, this study focuses on trouble reporting sequences, particularly on how the supervisor and the junior staff members deal with reports of troubles.

The analysis shows that although both the supervisor and the junior staff members report troubles to the other party, the activity of trouble reports appears to serve different interactional functions when it is initiated by different parties. The supervisor routinely allocates tasks to his junior staff members and often uses troubles as accounts for his task allocation. The report of a trouble initiated by the supervisor is often treated as a preamble to a directive. On the other hand, when a junior staff member reports a trouble to the supervisor, it is frequently followed by clarification of the trouble and the supervisor's response to the trouble. While the supervisor may offer assistance or advice, he tends to respond to the trouble with a directive or a series of related directives. Moreover, it is also observed that the directives issued in the trouble reporting sequences initiated by the subordinates tend to be linguistically formulated in a more direct and less mitigated form than the directives issued in the trouble reporting sequences initiated by the supervisor. The presentation also discusses possible explanations for the functional distribution differences observed.

# Response cries, but response predicates: A cross-linguistic analysis of interjectional expressions in Japanese and English

Panel contribution

***Dr. Mitsuko Izutsu<sup>1</sup>, Dr. Yongtaek Kim<sup>2</sup>, Dr. Katsunobu Izutsu<sup>3</sup>***

***1. Fuji Women's University, 2. Georgia Institute of Technology, 3. Hokkaido University of Education***

Interjections (or more generally, interjectional expressions) such as *Oops!* and *Gosh!* are often uttered when the speaker is in solitude. These expressions represent examples of what Goffman (1978) calls “response cries.” Response cries are characterized as “exclamatory interjections which are not full-fledged words” (p. 800). They are a verbal representation of the speaker’s emotional display in response to his/her unexpected or uncontrolled situation.

Goffman (1978) claims that response cries involve “mere expression” (p. 807) and “in the linguistic and propositional sense, they are not statements” (p. 805). He identifies two sources of utterances used in response cries: “taboo but full-fledged words” and “non-word vocalizations” (p. 809), neither of which can be considered “a statement in the linguistic sense (even a heavily elided one)” (p. 800). These accounts seem to suggest that response cries are not represented as any statements or, more precisely, descriptions of either the speaker’s emotion or the social situation that elicits it.

The present study explores linguistic forms used for response cries by comparing two typologically contrastive languages: Japanese and English. A questionnaire survey was administered to speakers of Japanese and American English in order to investigate what kinds of expressions they would produce under the eight circumstances of Goffman’s response cries (the transition display, the spill cry, the threat startle, revulsion sounds, the strain grunt, the pain cry, floor cues, and audible glee). The results show that the two languages differ in the linguistic realization of response cries. For example, when American English speakers accidentally catch their finger in a door (the pain cry), they tend to produce non-lexical vocalizations or taboo words such as *Ow!* and *Ouch!*, which belong to either of “primary” or “secondary” interjections (Ameka 1992). However, in such an occasion, Japanese speakers prefer to use adjectival predicates such as *Ita(i)!* and *Itta!* ‘Painful’ and describe the speaker’s physical sensation. The results of the questionnaire survey reveal that about half of the Japanese responses contained these “descriptive” predicates, in contrast to less than 20 percent of the American responses.

Our research also attempts to explore the issues of sociality and/or dialogicity of response cries in the two languages. Goffman argues that response cries are “creatures of social situations” and thus “make a claim of sorts upon the attention of everyone in the social situation, a claim that our inner concerns should be theirs, too” (p. 814). People “censor” their cries according to who is present in the surrounding (p. 799). Not only the presence of bystanders (“gathering” in Goffman’s term) but that of addressees is often presupposed in relevant research. It is widely assumed, especially in the Western academic context, that response cries and private talk are “dialogically constituted” (Du Bois 2009: 323). However, some researchers consider that such cries or talk is “not necessarily in the form of dialogue” (Hasegawa 2010: 193). Our questionnaire survey adds to the understanding of how the presence of others is conceptualized in the production of response cries in the two languages.

# Response to Mandarin rhetorical interrogatives

Panel contribution

**Dr. Yaqiong Liu**<sup>1</sup>, **Dr. Xinyang Xie**<sup>2</sup>

1. Shanghai Maritime University, 2. 上海财经大学

Rhetorical interrogatives have the form of interrogatives, but not for seeking information or confirmation. It was proposed that most Mandarin rhetorical interrogatives index the speaker's negative evaluative stance and express primarily reminding, surprises, opposing, or blaming (Tao and Liu 2011). Existing literature on responses to rhetorical interrogatives in Mandarin tends to focus on whether they need an "answer" and whether there is an "answer" (Yu 1984; Shao 1996; Guo 1997; Hu 2010; etc.). Such studies often emphasize on the syntactic forms of the rhetorical interrogatives rather than the action they implement in talk-in-interaction. So far, there has been very limited research on the response to rhetorical interrogatives in naturally occurring Mandarin conversation. The following excerpt provides a token from Mandarin data.

Excerpt 1: Weight of newborn ((CallFriend zho-m-4270))

((A1 and B are talking about the weight of A1's son when he was born.))

54 A1: 他是七磅多.

*ta shi qi bang duo*

3sg be 7 pound more

'He was more than 7 pounds.'

55 就是 正常 吧.

*jiu shi zhengchang ba*

just be normal PRT

'(His weight) is normal.'

56 B: 七磅啊, 他有七磅.

*qi bang a ta you qi bang*

7 pound PRT 3sg have 7 pound

'(It was) 7 pounds. He weighed 7 pounds.'

57 → 我怎么记得他才六磅?

*wo zenme jide ta cai liu bang*

I how remember 3sg only 6 pound

'How did I remember he's only six pounds?'

58 A1: → 他是七磅三两还是二两.

*ta shi qi bang san liang haishi er liang*

3sg be 7 pound 3 CL or 2 CL

'He was 7.3 pounds or 7.2 pounds.'

59 B: 噢.

*o*

oh

Adopting the methodology of conversation analysis and interactional linguistics, this study explores 1) linguistic forms of responses to rhetorical interrogatives in Mandarin; 2) possible distribution of such forms in relation to the sequential environment where they are produced; 3) possible relevance of these responsive forms to the social action the prior rhetorical interrogatives implement.

A cursory examination of 8 hours of everyday Mandarin conversational data shows that: i) the prior speaker expresses unexpectedness to certain information with a rhetorical question (Excerpt 1, Line 57), then the speaker

responds with more precise information ( comparing Line 58 to Line 54 ), or some components expressing certainty such as "就*jiu* (是*shi*)", to confirm that preceding information before the prior turn. ii) the prior speaker produces rhetorical questions to express blaming to recipients, then the recipient may defend himself/herself with a couple of utterances, such as "negation + account". This study will also discuss the preference organization of responses to Mandarin rhetorical questions.

# Responses to polar questions in Chinese sign language

---

Panel contribution

---

**Ms. Yaqi Wang<sup>1</sup>**

**1.** Fudan University & Yuzhang Normal University

Sign language is a visual linguistic system which makes uses of visible resources including manual resources (e.g. hands) and non manual resources (e.g. facial expressions, head and body movements) as means for communication. While face-to-face spoken interaction also makes use of visible resources in addition to verbal resources, sign languages differ in that the visual modality is the basic interactional channel in the system. Responses to polar questions are taken as an important part in social interactions across languages. Research has shown a wealth of insightful understanding of responses to polar questions in many spoken languages. Existing studies of polar question in sign languages mainly focus on the manual or non-manual interrogative markers in the question sentence from a lexical-syntactic perspective; however, responses to polar questions, especially, the distribution of responsive forms in relation to their interactional functions are rarely explored. This study examines responses to polar questions in Chinese sign language (CSL). The analysis is based on data from the Chinese Sign Language Corpus being developed at Fudan University, including three hours of annotated recordings of dyadic conversations with 50 participants. Following the approaches of conversation analysis and interactional linguistics, polar questions and their responses are transcribed, annotated and analyzed. We first surveyed the range and distribution of the forms used by the signers in their response to polar questions, and we also looked for patterns of using particular responsive forms.

Our analysis shows that while negative responses were all produced manually, positive responses were produced either by manual or non manual resources. Based on this finding, we further examined forms of positive responses in their interactional context for possible systematic correspondence between the forms' functional distribution and the manual and non-manual divide observed in the data. It is found that signers tend to respond with manual signs when polar questions are asked to seek information. In contrast, signers tend to respond with non-manuals only, when the polar questions are produced for interactional management, such as seeking alignment, upgrading common ground or otherwise securing intersubjectivity.

The findings will be discussed in comparison with negative responses to polar questions, and in comparison with findings from spoken languages reported in the literature. It is hoped that the current study on responses to polar questions in CSL fills a gap in the study of sign language from an interactional linguistic perspective and contributes to the understanding of response in human interaction across cultures and languages in general.

# Rethinking linguistic relativity from the perspective of *ba* theory

Panel contribution

***Dr. Sachiko Ide***<sup>1</sup>

1. Japan Women's University

Linguistic relativity was born of the observation that languages provide different ways of describing the world. On that assumption, the hypothesis was made that speakers, depending upon their languages, may see the world differently and pay attention to different aspects of reality (Duranti 1999).

This paper proposes a new way of looking at linguistic relativity. That is, while this issue has been discussed for quite some time, it has never been discussed from the deep/unconscious consciousness level that plays an important role in the process of the emergence of linguistic forms in an utterance. How are unconscious patterns of behavior reflected in the forms of language?

In order to find the answer to this question, we should look into the *ba* based approach to pragmatics. What is unique to the *ba* based approach is that it breaks away from the individual as an agent of a speech act, which is the understanding of speakers of western languages, and introduces the fundamental concept of the *ba* in which speakers are embedded in an interactive integrated whole.

Hanks formulated the *ba* theory which consists of two levels of *ba*, termed primary *ba* and secondary *ba*. (Hanks et al. 2019). Primary *ba* is the ontology of mutual dependence, impermanence and non-separation. It lies on the unconscious level. The theory was motivated from Izutsu, who postulated how meaning, existing in the deep/unconscious level, comes to be articulated on the surface level. It is in this process of articulation that we find the mechanism whereby the cultural or collective patterns of behavior are reflected in language forms. When meaning in the deep conscious level rises to be articulated on the surface level, it has to go through the frame of *wakimae*, which exists in the deep conscious level. *Wakimae* is an intuitive sense of what is called for in interactional behavior and in language use. *Wakimae* is not subject to the speaker's volitional intention, but rather is the sense of place that the speaker perceives in the *ba*. Going through the 'algorithm' of *wakimae* at the deep conscious level of the primary *ba*, what the speaker wants to say is given linguistic form and becomes an utterance on the level of the secondary *ba*, i.e., on the conscious level where face to face interaction takes place. Speakers of each society share a cultural and collective deep consciousness that is realized by the algorithm that converts the *wakimae* into the appropriate surface form. In the case of the Japanese speech style, the speaker senses, at the deep conscious level, the appropriate *wakimae*, that is, whether the interactional context is one of communication within the *uchi* (in-group) or the *soto* (out-group). The algorithm then automatically produces an utterance with addressee honorifics as required in the *soto* context, or without them, as is appropriate in the *uchi* context. This is how cultural/collective patterns of behavior in Japanese are reflected in language use.

# Rethinking of deficit of alignment skills of people with Autism Spectrum Disorder in the interaction

Panel contribution

***Dr. Kyoko Aizaki<sup>1</sup>***

*1. Japan Society for the Promotion of Science/Tokyo Gakugei University*

DSM-5, the key international diagnostic manual for mental illness, defines the core features in Autism Spectrum Disorder (ASD), namely (1) persistent deficits in social communication and social interaction across multiple contexts and restricted; and (2) restricted and repetitive patterns of behaviour (RRB) and perseveration of interests, or activities (APA, 2013). Most neuroscientific or psychological studies which examine these deficits were interpreted as manifestations of an underlying disorder located within the individual, generally characterized by social withdrawal, egocentrism, and impairment of abstract thinking. Despite the accumulation of scientifically respectable evidence that appears to provide some support for the theory, such as Theory of Mind or Executive Function, it has not provided a complete understanding of what autism is or a strategy to respond to its experiences. Consequently, the relationship between the nature or symptoms of ASD and social communication and RRB is still unclear, nor do we know how these are embodied in everyday conversation. So that the researchers' central concern has been to identify the parameters of the severity of the symptoms, they limit the context to controlled settings and their analyses focus only on participants' action as individuals (e.g., Baron-Cohen, Leslie, & Frith, 1985; Pennington et al., 1997).

Approaches from intersubjectivity, on the other hand, locate language communication and cognition within a sociocultural and/or socio-cognitive perspective (Bruner, 1986; Clancy, 1999; Du Bois, 2007; Hobson, 1993; Tomasello, 1999; Trevarthen, 1977) and describe how autistic communication affirms difficulties in the functioning of self-in-relation-to-other in actual daily interaction. Drawing on such a perspective, some research has investigated competence and deficits in individuals with ASD from research based on ethnometodology (e.g., Ochs, Kremer-Sadlik, Sirota, et al., 2004; Ochs & Solomon, 2005; Sterponi, 2014). This has contributed to a rethink of traditional views of communicative competence of ASD. However, the vast majority of this database focuses on infants or children. A more stringent test would involve the language use of verbally able adults with ASD who engage in more mature social skills.

This research examines verbal and non-verbal behaviour of British adults with ASD involved in everyday conversation and attempts to discover 1) how the two diagnostic criteria of ASD, i.e., social communication and restricted and repetitive behaviours, might be articulated together in everyday interaction and 2) how issues of intersubjectivity of ASD arise within the context of self-in-relation-to-other. This is contingent upon the moment-by-moment actions of at least two parties in social interaction. This aim is to deepen our understanding of social-communicative competence in ASD, in terms of the characteristic communicative, social, and affective features enacted by adults with this diagnosis and to revisit the design of studies of the two core problems identifying the disorder.

# Rethinking reversed word order in Japanese conversation from the perspective of the pragmatics of *ba*

Panel contribution

*Prof. Yoko Fujii*<sup>1</sup>

1. Japan Women's University

This presentation demonstrates the reanalysis of reversed word order (so-called “postposing”) in Japanese from the perspective of the pragmatics of *ba*. According to Fujii (1991, 1995), “postposing” in Japanese is actually considered to be preposing and the preposed elements convey pragmatically the most important or prominent message in communicative interaction between the speaker and the hearer in conversation. In this reversed, thus marked, word order, some pre-predicate element(s) including the predicate is/are stated first, even if the result breaks the rigidity of the final position of the predicate in SOV language. The resulting constituent ordering breaks the normal pragmatic ordering of theme-rheme or topic-comment which Japanese usually holds in unmarked constituent ordering. Based on the results of the analysis, the next issue to be pursued is how the pragmatically important and prominent message is induced to the first-stated part in the course of communicative interaction. A principle of the pragmatic theory of *ba* explicates the emergence of this marked ordering of articulation.

Japanese is an SOV language and has a relatively free word order in the preverbal position. However, it has a seemingly rigid constraint that the predicate must appear in the clause final position. In conversation, however, this rigidity of the predicate is violated and some constituent(s) sometimes come(s) after the predicate, as shown in the following example.

- (1) a. *yonda, kinou -no shinbun?*  
 read, yesterday -GEN newspaper  
 ‘[Have you read] yesterday’s newspaper?’  
 b. *kinou -no shinbun yonda?*  
 yesterday-GEN newspaper read (PST)

(1a) shows non-canonical word order and (1b) illustrates canonical word order. In (1a), the object, *kinou no shinbun*, “yesterday’s newspaper,” comes after the predicates, which should be placed first in canonical word order as shown in (1b). Detailed analysis of the conversational data reveals that reversed word order is a result of the fact that the speaker pragmatically places the most important and prominent message in discourse in the earlier position. As a result, the normal SOV word order is broken and some element with relatively less importance and prominence comes after the predicate.

Thus, reversed word order is the result of the dynamic communicative interaction between the speaker and the hearer. *Batheory* provides a principle for a holistic sketch of the *ba* of interaction in which subject-object are non-separable. The holistic perspective starts from the subsuming context in which the actors, their actions, and the objects they relate to are all non-separated, so deep is their mutual interdependence (Hanks et al. 2019). The non-separable speaker and hearer interdependently act out the “improvisational drama” where interaction of the self with others emerges from the social field in which the self is a part in a holistic *ba*. The holistic perspective and the “improvisational drama model” of the pragmatic theory of *ba* provide us with a clear understanding of pragmatically-induced marked word order in communicative interaction in Japanese. Hanks, et. al. 2019. Communicative interaction in terms of *batheory*: Towards an innovative approach to language practice. *Journal of Pragmatics* 145, 63-71.

# Retrospect and prospect: studies on Chinese media discourse within the framework of Linguistic Adaptability

Panel contribution

**Prof. Yunlong Qiu<sup>1</sup>**

**1.** Northeast Normal University

The Belgian pragmaticist Jef Verschueren published *Understanding Pragmatics* in 1999, in which the framework of Linguistic Adaptability was systematically proposed. It has been 20 years since its publication and the influence of the framework has been worldwide. In particular, this framework is considerably popular in China. In the past 20 years, quantities of researchers have been actively involved in the investigations of the framework, either theoretically or empirically. The studies in relation to this framework have been developed on macro-level and micro-level, involving a vast range of discourses such as academic discourse, pedagogic discourse and political discourse and revolving around the meaning generation in such discourses.

This article is focused on the academic studies about media discourse. To be specific, it is intended to look back into the earlier studies on Chinese media discourse within the framework of Linguistic Adaptability in the past 20 years, reflect upon their merits and demerits and seek the research potentials in this field.

This article will have the studies about Chinese media discourse examined against the research background concerning all the studies applying the framework of Linguistic Adaptability in China so that the location and landscape of media discourse studies within the framework of Linguistic Adaptability can be figured out clearly. In order to have the survey objective and systematic, this article makes a bibliometric analysis with the tool CiteSpace. The research data (the articles in relation to the framework of Linguistic Adaptability) are to be retrieved from the core collection of CNKI (China National Knowledge Infrastructure). The key notion to be searched is the Chinese equivalent of “the framework of adaptability” (*shunying lun*). And then, the irrelevant articles will be manually identified and excluded. With the data qualified for this survey, this article is intended to identify the high-impact references, present the research trend, list the central issues of investigation, show the ways in which the framework of Linguistic Adaptability is interpreted and applied.

# Revisiting intersubjectification through Sicilian discourse markers

Panel contribution

***Dr. Giulio Scivoletto***<sup>1</sup>

1. University of Catania

As an overall tendency, intersubjectification has found general agreement among scholars, and it has been examined in many different constructions and languages. The notion of this semantic-pragmatic process was first proposed by Traugott (1982: 257), as in (1), and elaborated over the years to the latest version (2010: 35), as in (2):

- (1) propositional > (textual >) expressive
- (2) non-subjective > subjective > intersubjective

Despite agreement on the general tendency (whereby meanings come to be centred on the speaker's or hearer's point of view), if trying to posit a cline, the ordering of the stages remains a pending issue (cf. Narrog 2015, among others). This issue includes two crucial points: a) in respect to (1), the place for textual meanings, namely whether they are followed or comprehended by subjective ones; b) in respect to (2), the relation between subjective and intersubjective meanings, that is, whether the former precedes the latter.

The case of two Sicilian discourse markers (cf. Scivoletto 2020) offers relevant insights about this twofold issue. On the one hand, *arà* derives from the imperative of 'give', and evolves as a discourse marker first with an exhortative function, and later with an expressive and a cohesive one. On the other hand, *bì* originates from the imperative of 'see', first with a warning function, and then developing a mirative and finally a reformulative one. The semantic-pragmatic evolution of *arà* and *bì* can be summarised as follows:

- (3) non-subjective > intersubjective > subjective (> textual)

As the analysis of the case-studies shows, the intersubjectification cline in (1) and (2) is questioned, in regard to both the aforementioned points: a) intersubjectified meanings do not necessarily follow subjectified ones (contrary to Traugott 2010); b) intersubjectified meanings can further develop into textual ones (as pointed out by Narrog 2015, among others).

A process such as (3), rather than rejecting the hypotheses in (1) and (2), suggests an inclusive understanding of intersubjectification. Out of non-subjective items, subjective so as intersubjective and textual meanings may arise. In the overall tendency from the ideational to the textual and interpersonal functions of language, the ordering of the cline would not be general but construction-specific, depending on the source each element originates from. Thus, the tendency may be conceived more broadly, as a process of semantic-pragmatic change according to which meanings become centred on the main elements that constitute the interaction, that is, on the speaker as well as on the hearer and on the (con)text itself.

# Rewriting and manipulation in journalistic translation: a corpus-based multilingual study of news on Covid-19

Panel contribution

***Dr. Cristina Perna<sup>1</sup>, Dr. Yuqi Sun<sup>2</sup>, Dr. Karina Molsing<sup>1</sup>***

***1. Pontifical Catholic University of Rio Grande do Sul, 2. University of Macao***

The news translation frequently makes use of peculiar interventions, largely due to the displacement of a text to different cultural communities. In the present study we attempt to describe, categorize, and understand the translation strategies found in journalistic texts related to Covid-19 by analyzing a multilingual corpus in English, Chinese and Portuguese. The Corpus is compiled from the biggest news website and official social network accounts, such as CNN, Folha de São Paulo and Xinhua News, collected from February to August 2020. We found that the texts are rewritten, and the languages are manipulated when various media translate the same event or the same official statement in the languages aforementioned. For this reason, we will focus on pragmatic strategies and discuss the main factors that act as motivators for the use of these strategies in journalistic translation as well as some terminological issues. Preliminary analysis shows that the main translation manipulations are explicitness change, interpersonal change, illocutionary change, and partial translation. Some other translation strategies, such as information change, coherence change, visibility change and transediting do not appear very often in our corpus. Our research is being conducted cooperatively between scholars from Macau University (China) and the Pontifical Catholic University of Rio Grande do Sul (Brazil) and we believe that our work may serve as a reference for researchers in the area of additional languages as well as for professionals who want to specialize in journalistic translation.

# Risk, danger and safety in Swiss and Austrian discourses on car accidents. A case study

Panel contribution

***Prof. Martin Reisigl<sup>1</sup>***

***1. Department of Linguistics, University of Vienna***

Our society is strongly influenced and shaped by cars. This becomes also manifest in our language. Numerous metaphors from the field of driving testify to it. They have crept into our everyday language use as collective symbols and frames. They have a significant impact both on our perception and our actions. Even those who are not at the wheel of a motorized vehicle or who do not even have a driver's license may want to metaphorically step on the gas. Even in car-distant contexts we hear or read that someone is moving in the fast lane, down-shifting a gear or applying the brakes to get the curve and to avoid driving against the wall. Such metaphors indicate the dominance of car mobility in our life world.

This significance of cars in our modern societies brings about a plenty of risks and damages. The ecological effects of car traffic are disastrous. Individual motorized mobility is one of the main causes of the anthropogenic climate crisis. Car traffic devastates rich natural biotopes and aggravates the dramatic loss of biodiversity. Global car traffic worsens the quality of life for many living beings. Due to air and noise pollution and the lack of body movement, automobility exposes people and animals to numerous health risks. Car traffic endangers the safety of pedestrians, cyclists, and bikers, but also of car drivers themselves. According to the World Health Organisation, the road traffic is responsible for accidents causing 1.35 million deaths per year ([https://extranet.who.int/roadsafety/death-on-the-roads/#ticker/car\\_passengers](https://extranet.who.int/roadsafety/death-on-the-roads/#ticker/car_passengers)) and many millions of injured persons every year.

The present contribution analyses whether and how these risks, dangers and related issues of safety are dealt with in two specific segments of the Swiss and Austrian media discourse on automobility. The paper will be composed of four parts. After a short introduction, the methodological approach will be explained. It combines Critical Discourse Studies and Ecolinguistics. The third part presents the case study on the Swiss and Austrian newspaper articles. The two analytical foci will lie on the representation of social actors involved in car accidents and on argumentation evolving around the covered accidents. I will try to answer the following questions: Which risks and dangers relating to automobility are dealt with in the analysed discourse fragments? How are the involved social actors represented in the texts? How are these risks and dangers linguistically depicted? How is safety dealt with discursively in the articles and which proposals are uttered by whom in order to remedy or mitigate car-related risks and dangers? In the final section, the paper will be rounded off by concluding remarks. They will summarise the similarities and differences of the Swiss and Austrian articles and also enclose constructive criticism suggesting a language use that supports a risk-reducing as well as risk-avoiding, resource-saving and sustainable mobility.

# Role construction in 18th-century newspapers: A case study of an editorial battle

---

Panel contribution

---

***Prof. Birte Bös***<sup>1</sup>

1. Universität Duisburg-Essen

This study takes a critical discourse perspective on the self-presentation of 18<sup>th</sup>-century newspaper editors and their (de-)construction of contemporary competitors, political opponents and other adversaries. Drawing particularly on Reisigl/Wodak's framework (2001), this paper investigates the use of discursive strategies of role construction employed by the newsmakers in their editorial comments. It looks at person references and deals with the traits and qualities ascribed to the parties involved, all of which typically contribute to a positive self-presentation and a negative other-presentation.

Furthermore, a case study of the adversarial separation of Edward Topham and John Bell, the makers of the highly successful newspaper *The World and Fashionable Advertiser*, will reveal the complexities of interdiscursive and intertextual practices in negotiating positions and responsibilities. Bell released his own newspaper, *The Oracle*, only a fortnight after *The World* had been withdrawn from him by Topham in May 1789 (cf. Morison 1930, 1932). Their struggle was made public in various editorial comments, which provide evidence of the self-serving bias, i.e. "a tendency for people to take personal responsibility for their desirable outcomes yet externalize responsibility for their undesirable outcomes" (cf. Shepperd/Malone/Sweeney 2008: 895f). Their comments influenced the formation of public opinion and had probably well-calculated marketing effects.

## Roman notions of “FACE”

---

Panel contribution

---

**Dr. Luis Unceta Gómez<sup>1</sup>**

**1.** Universidad Autónoma de Madrid

The aim of this paper is to look for the Roman localization of the concept of “face”, as it is conveyed in the Latin language. From the first reactions to Brown and Levinson’s (1987) universalistic claims for “face” (Matsumoto 1988; Mao 1994), the search for local features of the concept of this analytical tool —and its implications on im/politeness research— in different languages has sparked great interest (see e.g. Held 2016; Labben 2017, among others). However, little work has been done from the perspective of historical pragmatics (see an exception in Ruhi and Kádár 2011), and it is a neglected area in research on remote cultures.

Adopting an emic approach in the scrutiny of ancient texts, I will focus on the Latin term *persona*, which first meant ‘mask’ and developed a rich polysemy (Moussy 2001). Even if it never came to mean ‘face’ —unlike Greek *prosópon*, which *persona* sometimes translates into Latin—, it has connections with the anatomical face and oneself “image” (Brouwer 2019). In fact, the concept of *persona* underwent a sound philosophical and rhetorical theorization by authors such as Cicero (specially in *De officiis* [On Duties]) and Seneca (Guérin 2011). In its semantics, besides the notion of “self-image”, *persona* includes a content of behavioral norms dealing with social management, so approaching it from the point of view of modern im/politeness theories could help to better assess it. Conversely, taking into account the impact of Greco-Roman philosophical ideas on the Western world, a better awareness of the Roman concept of *persona* could help in the reexamination of the concept of “face”.

# Rule violations in board games

Panel contribution

***Mr. Laurenz Kornfeld<sup>1</sup>***

***1. Leibniz-Institute for the German Language***

I present a study of how rule violations during board games are pointed out by players and how the rule is discussed (or not discussed) in consequence. Players can respond to rule violations in different ways: Ignore the violation and let the game go on, treat it as a lack of knowledge of the relevant rule, treat it as a mistake made by another player or as an act of cheating. My main question is: What are the reactions to a rule violation and how is the rule in question negotiated? As a method I use conversation analysis.

As an example, consider the situation below: At line 8 Lindsey wants to throw the dice again although she has already thrown the dice and completed her move. Sandra reacts directly (line 11) and points out that she may only throw the dice once.

**PECII\_DE\_Game1\_20150820\_2000647**

‘Du darfst nur einmal’ (‘you may only once’)

**01 Lindsey: jetzt würfel (ich wahrscheinlich) ne sechs**

Now I probably throw a six

((6 lines omitted))

**08 Lindsey: jawoll:::+**

yes

+picks up dice again->

**09 +(0,4)**

+moves dice in her hand

**10 Lindsey: dank Sandra**

thanks to Sandra

**11 Sandra: du darfst nur einmal**

you may only once

**12 Lindsey: [+äh kh + Hehehe**

+dice down+

**13 Sandra: [H(h)hhhh**

**14 Lindsey: [stimmt**

right

**15 Sandra: [Hahaha**

**16 Lindsey: .Hhh schade ich dachte ihr merkt's nicht**

pity I thought you wouldn't notice

What I am interested in are the reactions to a rule violation and the consequences. In the example Lindsey seems to understand her rule violation (l. 14): She reacts by saying *stimmt* ('right') (Betz 2015) and makes a joke afterwards (Zinken, Kaiser, Weidner, Rossi, Mondada, Sorjonen in prep.). Another reaction could be that players instead discuss the rule because they think or claim that the rules are flexible in this moment of the game (Hofstetter 2019). In my project I am interested in when and how rule violations are addressed, how this is linguistically realized, and how rule violations are negotiated and accounted for.

# Running by numbers: Exploring the semiotic dynamics of COVID-19 quantification

Panel contribution

***Dr. Tom Van Hout<sup>1</sup>, Dr. Colleen Cotter<sup>2</sup>***

*<sup>1</sup> University of Antwerp, <sup>2</sup> Queen Mary University of London*

The pandemic is a hypermediated tale of quantification (Milan & Treré 2020). Numbers, figures, and charts dominate the news, documenting the viral spread, economic impacts, mortality rates, ICU saturation numbers, and national testing capacity as well as the availability of face masks, vaccines, and other equipment. Numbers, as we show, are an essential element in reporting about and developing policy for the pandemic. Since quantification requires interpretation and narration, we have seen “magical thinking” in numbers, particularly as they are reported and repeated in news stories, policy pronouncements, and on social media. Building on ergoic framing, brand semiotics, and discursive iterativity, this paper examines how COVID-19 numbers can be recontextualized to magically – indexically – rethink and unthink pandemics.

Ergoic framing (Procházka & Blommaert 2020) refers to the replacement of rational knowledge with “reasonable” (but verifiably false or misleading) knowledge claims. Pandemic deniers, for instance, replace rational knowledge about disease spread with misleading claims (e.g., ingestion of bleach to kill Covid) or reframe public-health practice as indexing weakness and fear-led overreaction. Central in this process is citationality (Nakassis 2012) – the ways in which an event indexes and replicates another event – and discursive iterativity (Cotter 2010), whereby textual repetition motivates and constrains social meaning and suggests a neutrality that in reality is anything but. Putting aside the recent ascent of journalism that actively uses “big data”, numbers for most journalists are an unquestioned reduction of factuality, neutrality, and authority – underlying rhetorical goals that also background the stance, position, and political and economic framing that is also present. Covid has upended this orientation. Not only are people’s daily lives and livelihoods affected by numbers, but alongside masks, they have become key political drivers, as our data show.

Our comparative discourse and interactional data – tabloid and traditional news coverage of daily briefings in the US and UK alongside social media reactions (and supplemental data from China) – make many pragmatic dynamics evident, especially as we investigate what the public-health bodies actually say. The multifunctionality of numbers, used to mislead, persuade, and inform, contributes to their primary role in pandemic discourse overall, and in government strategies and news coverage more specifically. On another level, the structural patterns of public-health messages have their own quantification set-ups, e.g., following the “rule of three”, with messages like “Hands Face Space” also vectors for satire. The data demonstrate the extent of the semiotic dynamics behind quantification and its pervasive role in public discourse.

# Same here: Second stories and their argumentative function in child talk

Panel contribution

**Ms. Joanna Wala<sup>1</sup>, Prof. Kati Hannken-Illjes<sup>1</sup>, Prof. Ines Bose<sup>2</sup>, Dr. Stephanie Kurtenbach<sup>3</sup>**

**1.** Philipps Universität Marburg, **2.** Universität Halle-Wittenberg, **3.** Martin Luther University Halle-Wittenberg

Conversation circles can become relevant for the development of discursive abilities such as argumentation. Through the facilitation of explorative argumentation with the goal to solve lifeworld problems, the children reason their way from problem to possible solutions. In this talk, we will analyze argumentation in conversation circles in a kindergarten with regard to its relation to narrative. More specifically, we will analyze the argumentative role second stories play as a form of thematic and experiential synchronicity. The notion of synchronicity in argumentation has already been studied for the linkage between cooperative argumentation and vocal and bodily synchronicity. Rendering multimodality an essential part of understanding argumentation and acquisition of argumentation (Kreuz / Mundwiler 2017, Bose / Hannken-Illjes 2020) has been evolving in the study of argumentation in interaction. When studying argumentation among preschool children cooperative argumentation is marked by vocal and bodily synchronicity (Hannken-Illjes / Bose 2019). The link of narrating and arguing in conversation, although studied for institutional (Hannken-Illjes 2016) and everyday argumentation (Deppermann / Lucius-Hoene 2013, Schwarze 2019), has not been looked into for children. One form of narrative, among others, that is put to an argumentative purpose is the second story. Telling a second story (Sacks 1992) functions in these conversations as a practice that by relating to a first story in a supportive way is a form of resonance in conversation and a form of synchronicity.

In this paper we will analyze videographed conversation circles in a kindergarten (16 circles in with children aged 5-6 years old, total length 4,5h and 5 circles with children aged 4-5 years old, total length 1,5 h). Every two weeks, the children can participate in a conversation circle to discuss problems –stumbling stones – and wishes – wishing stars – of their life world. They develop joint solutions, implement them in their home or institution, and reflect on the viability of this solution. Our methodological approach is informed by conversation analysis, combined with Bamberg's (2020) notion of narrative practice and the analysis of vocalics and prosody (Bose 2003). We will argue that preschool children use second stories for argumentative purposes in cooperative argumentative exchanges and that this use marks a form of interactional synchronicity.

# Same same but different – Navigating knowledge asymmetries and face in students' small groups

Panel contribution

***Dr. Julia Sacher<sup>1</sup>***

**1.** University of Cologne

One popular form of organizing students' learning at school or universities consists of work in small groups. Here, students are responsible for their learning process: they have to organize the overall group process and participation, negotiate their understanding of the task they work on and produce results to present or discuss – without a teacher/ lecturer present to facilitate discussions, or to act as an expert for the contents discussed and the solutions developed. In sum, the individual responsibility for participation and engagement is much higher than in plenary discussions where single students can (try to) „hide in the crowd“, as they might not feel the same necessity to contribute as in small groups.

Interrelated with these structural aspects of small group work are questions of interactional knowledge negotiation, knowledge displays and epistemic stances. Being able to assess the epistemic status of fellow interactants is a crucial element to navigate interactions, but knowledge asymmetries can be potentially face-threatening and dangerous for the ritual balance of interactions (Goffman, 1967). Therefore, they can be regarded as a possible constraint to interaction among peers.

Past research in the context of higher education has shown that students tend to distance themselves from academic identities by displaying an overall uninterested attitude towards their academic subjects (Stokoe et al., 2013). In my talk, I want to explore how Goffman's concept of face and the perspective of politeness theory (Brown & Levinson, 1987) might help to make sense of these displays of attitude towards academic knowledge. Applying an EM/CA approach, I work with video recordings of small groups of teachers in training who participate in the same university seminar. In these small groups, participants try to make sense of a transcript of classroom interaction by discussing it and referring to knowledge from different epistemic domains. The corpus currently consists of data from nine groups (3-4 students; 20-30 min.).

Central for my talk is the question of how face-saving, knowledge displays, and „doing group work“ are intertwined. I consider students' interactional management of (their own and other's) knowledge as relevant for the overall inclusiveness of the small group work, as it contributes to the constitution of interaction among peers. Consequently, my main question is: Which interactional practices do students deploy to orient to and navigate the structural requirement to present as „knowing“ – while at the same time minimizing threats to their fellow students' face wants and orienting to the group process? I will try to show that bringing in knowledge – whether self-initiated or as a form of other-repair – is a delicate issue that depends on balancing sameness and difference in the small group interaction.

# Scenarios in metaphors about political conflicts – A comparison of news in Taiwan and China

Panel contribution

***Mr. Wei-Ting Hsieh<sup>1</sup>, Dr. Shuping Huang<sup>1</sup>***

***1. National Sun Yat-sen University***

Since the Chinese Civil War, the citizens of Taiwan and China have conflicting emotions and attitudes towards one another, tangled with historical trauma, political conflict, economic liaison, cultural differences, and sovereignty dispute across the strait. Recently, the sovereignty dispute has heated up to another level which led to a cold war. Critical analysis of metaphor can help uncover the social and/or political issues it reveals, e.g. ‘othering’ and stigmatization of social outsider groups (Musolff, 2011). In this study, we combine a scenario-based analysis to metaphoric mapping to capture the attitudinal preferences and discursive trends that characterize the discourse of cross-strait conflicts from two sides of the straits. Currently, 20 pieces of news are collected online, 20 from China (China Central Television), and 20 from the Republic of China news (multiple sources). The news articles collected all include metaphoric expressions about the cross-strait relationship, and we are expanding the study to include more articles.

Preliminary analysis shows that a conceptual metaphor is prevalent in the Taiwanese news report: NATIONS ARE PEOPLE, on the basis that two nations/parties are standing on equal ground. This metaphor emphasizes the presumption that the mutual relationship could be developed on the basis of power equivalence. On the other hand, the Chinese metaphoric usage focuses on UNION AS FAMILIES, and the inseparability of “bone and flesh”. These metaphorical expressions revolve around the agenda that Taiwan is an inseparable part of Mainland sovereignty, and seeking union is the current focal point of China. Metaphors with matching source domain could be found across two sides of the straits, FAMILY, specifically brotherhood; nevertheless, the target domains are extremely different. News from Taiwan uses the brother metaphor without identifying a specific elder-younger relationship and readdresses the equal status between Taiwan and China. In the Chinese news report, the metaphor is found in phrases such as “for our Taiwanese brothers” or “for the sake/ happiness of our Taiwanese brother” (SD: brother, TD: Taiwanese); which implies the presumed role of a ruler and suggests the status inequality. Further studies are needed to ascertain the ideology embedded in these metaphoric expressions as well as the role of the US in these mappings.

We agree with Musolff (2006) that metaphor analysis should go beyond the domain-level and focus on specific scenarios and their argumentative uses (Musolff, 2006). By detailing the contexts and the implications of the same source domain, a similar metaphor could draw different pictures and deliver contrasting ideas.

# Self- and other-reference in opening sequences of vlogs by Finnish, Hungarian and French YouTubers

Panel contribution

***Dr. Johanna Isosävi<sup>1</sup>, Ms. Ildikó Vecsernyés<sup>1</sup>***

***1. University of Helsinki***

## Self- and other-reference in opening sequences of vlogs by Finnish, Hungarian and French YouTubers

YouTube is the second most popular social media platform with 1.9 billion users, and 8 of 10 18–49-year-olds watch YouTube in 80 different languages[1]. Yet, opening sequences of YouTube vlogs have been only little examined (English: Frobenius 2011; French: Combe Celik 2014), and especially cross-cultural comparison remains understudied. Opening sequences of vlogs present an interesting set of data to the study of self- and other reference: first, YouTubers build their own brand and market their channel, and second, they interact with their followers.

Our aim is to examine self- and other reference in opening sequences of vlogs of Finnish, Hungarian and French YouTubers. We hypothesise that although Finnish and Hungarian both belong to Finno-Ugric languages, due to geographical reasons, Hungarian may be closer to French than Finnish lingua-culture. Our data consist of opening sequences of 23 YouTubers per language. We study opening sequences of two videos from each YouTuber. Altogether, our data contain 46 videos per language, that is 138 videos in three languages. Our analysis is based on multimodal discourse analysis: in addition to verbal forms, we examine gestures (e.g. waiving of hands, pointing of fingers) and postures.

Our results show that there both shared features and cross-cultural references exist in self- and other-reference. It may be surprising that verbal self-introductions (e.g. *mä oon Elina*, I'm Elina'; *c'est Mafias-tunting*, 'it's Mafias-tutting' (e.g. *én Csongi vagyok*, I'm Csongi) present a minority in all languages. Yet, many YouTubers use other tools for self-introduction and building their brand: Instagram username, their own name, or logo on the screen. A greeting was a common, but not an exclusive, way to open a video and address viewers in all the languages. Greetings were often accompanied by hand movements, which can be considered an other-reference.

As to cross-cultural differences, our hypothesis was not correct: Finnish and Hungarian were closer to each other than to French. Hungarian YouTubers greeted the most systematically, and used the most frequently T forms in other-reference. In Finnish, direct other-reference with pronouns of address (collective V or T) was the least common of all the languages. In French, V was favoured in other-reference, often accompanied by a nominal address form (e.g. *tous*'everyone'). It may come as a surprise that in Hungarian and Finnish, nominal address forms were used equally often in other-reference, since they are generally favoured in Hungarian, but avoided in Finnish. French YouTubers were the only ones to include an inquiry about the health of the viewers in other-reference (e.g. *j'espère que vous allez bien*, 'I hope you're doing well') — this was not related to corona pandemic.

# Self-reference as an argumentative tool: discourse by politicians and experts during the covid-19 crisis

Panel contribution

**Dr. Jan van Laar**<sup>1</sup>, **Prof. Barbara De Cock**<sup>2</sup>

*1. University of Groningen, 2. Université catholique de Louvain*

In this talk, we look into how politicians and experts involved in the covid-19 crisis construct self-reference on Twitter and on how this self-reference ties in with the ways they explain or justify the positions they adopt. We rely on linguistic approaches to person reference and on argumentation theory. Our study will be based on Belgian, Dutch and Spanish data of leading politicians and experts active in the covid-19 crisis.

In the first place, we analyze how these persons construct their self-reference on Twitter, taking into account the different affordances of Twitter, such as the content of tweets, the content of the biography, and visuals as photos and clips. In this part of the analysis, we also focus on whether these persons construct an explicit self-reference through 1<sup>st</sup> person forms or whether they rather avoid such explicit self-reference. In the latter case, we look into whether they rely on more indirect constructions of self-reference, such as stance-taking or retweeting in such a way that it becomes clear how others construct them, for example as someone whose insights or standpoints merit support.

In the second place, we analyze how the communicative functions of this self-reference connect to the argumentation developed, or prepared, in the tweets. Indeed, self-reference contributes to self-introduction, and to the creation of a public persona. One would expect that politicians try to frame themselves as motivated and capable of making choices in the public interest, and that experts frame themselves as presenting reliable information, thus adding “ethotic” weight to their arguments. We will show whether self-reference actually used in such argumentative ways

Through a comparison of politicians and scientific experts, we will show the specific roles that self-reference hold in the discourse of each group. We expect self-reference to be more important in politicians’ discourse, for the reason that when arguing, politicians face more problems when polishing their public persona, or when trying to keep it intact, than experts do.

# Self-Representation of People with Invisible Disabilities on Social Media

Panel contribution

***Dr. Stefanie Ullmann***<sup>1</sup>

**1.** University of Cambridge

The majority of disabilities today are invisible. According to the Invisible Disabilities Association, for instance, 74% of Americans living with a disability do not use any visible aid [1]. Invisible or hidden disabilities are physical and mental health conditions and illnesses that are not instantly (or at all) visible to an observer. The umbrella term covers a great range of serious health issues from anxiety and depression to arthritis and diabetes. While perception and representation of visible disabilities are already complex and often lack adequate and empathic engagement, people with invisible conditions are also frequently faced with a variety of negative experiences from lack of understanding to microaggressions and even explicit ableism. Moreover, people with invisible disabilities often have a hard time identifying and revealing themselves as disabled, albeit this being a necessity to get access to essential services and care. People with invisible disabilities often find themselves between needing and receiving rightful support and not being perceived or viewed as disabled. Experiences are likely to diverge from those with more apparent conditions in regard to both how they perceive themselves and how they are seen by others. Research has shown that people with invisible disabilities are often incorrectly and somewhat unfairly represented and treated by non-disabled people (see, e.g., Kattari et al. 2018). The fact that the disability is not visible can cause a lack of understanding by others and may trigger hurtful remarks such as ‘but you look fine’ or ‘it can’t be that bad’. Using social media, however, many people with invisible disabilities have taken the opportunity to use the platforms to make their disabilities visible. With the help of images and text, people can share their experiences, daily lives and struggles.

This research project looks at the self-representation of people with invisible disabilities on social media. The data consists of public Instagram posts, searched for by using the hashtags #invisibleillness, #invisibledisability, #invisibleillnessawareness and #invisibledisabilityawareness and #makinginvisibledisabilityvisible. I will provide an insight into the use of multimodal (image, short video and text) features deployed by users to (self-)represent as people living with invisible disabilities, following multimodal discourse analysis methodology (see, e.g., Kress & van Leeuwen 2001; Jewitt 2014).

# Self-talk as a situated interactive practice to explore technology

Panel contribution

***Mr. Ingmar Rothe<sup>1</sup>***

**1.** Universität Leipzig

In my paper, I will show that self-talk (Goffman, 1978) does not only imply talking to oneself. Self-talk, and this may seem paradoxical at first sight, is an interactive practice that can frequently be observed in situations where participants jointly use technologies. So, talking to the self seems to have specific interactive functions in situations where others are within sight and hearing range.

Tabletops in museums either display exhibition related content such as texts or images or they engage visitors in social interaction (Heath et al., 2005; Heath & vom Lehn, 2008; Storz et al., 2015). This latter kind commonly works with multi-party games that, for example, address the museum's exhibits or related content.

The data for the present study have been collected in the Chemnitz Museum of Industry during four opening days. The corpus consists of video recordings of round about 28 hours of group interaction at a tabletop, gathered by three cameras. It is analyzed within the framework of Ethnomethodological Interaction Analysis (vom Lehn, 2018) with a focus on multimodality (Mondada, 2014) as well as on the spatial environment (Hausendorf et al., 2012).

The study investigates how participants play a digital card game. In order to be able to play that game, users have to accomplish a number of tasks: (1) They have to understand the rules and the goal of the game. (2) They have to work out how to operate the interface to achieve the goal of the game. Detailed sequence analyses reveal that these object-focused interactions "fluctuate" in many ways: The players establish an open state of talk (Goffman, 1979) in which they alternate between (1) conversational, thematically focused phases, (2) self-talk, and (3) multifocal phases. The paper thus contributes to the panel by exploring technology use and participation as well as specific tasks and activities occasioned by a tabletop in a museum.

# Semantic Spaces and Demarcation within Swiss COVID-19 Discourses. Using NLP-methods for Corpus Pragmatic Studies

Panel contribution

***Prof. Noah Bubenofer<sup>1</sup>, Mr. Daniel Knuchel<sup>1</sup>***

***1. University of Zurich***

At the end of January 2020 coronavirus has not been seen as a swiss topic and it was only part of news media discussion surrounding its outbreak in Wuhan. This changed in February when the first cases have been reported close to the Swiss borders. From then on, news media have been reporting extensively the number of new cases and broadcasted the daily media conference of the Federal Office of Public Health and the Swiss Federal Council. The articles have been commented intensively by readers. With regard to this discursive web of significances, we ask about the formation of semantic spaces, what words and concepts might be infectious, how they might travel between different spaces and change over time.

COVID-19 started as a communicatively constructed and through (digital) media disseminated topic, which most people face as a linguistic issue before they experience the virus as a biomedical phenomenon. The media coverage and the comments of laypeople have been highly productive; we collected comments from five different Swiss German news platforms (834.000 texts) for twelve months between February 2020 and January 2021. Our corpus pragmatic approach (Bubenofer/Scharloth 2015) is grounded in discourse and cultural analysis and integrates natural language processing methods such as topic modelling and distributional semantics (Mikolov et al. 2013; Lenci 2018) in a critical and innovative way besides digital methods such as keyness, collocations and concordances (Bubenofer et al. 2020, Bubenofer in print).

In this paper we use Word Embeddings to compare the semantic spaces in comments by readers. Preliminary results indicate that the virus is generally conceptualized as an enemy, but there are differences in the details between media texts and comments. Furthermore, demarcation is as an important issue, both geographically (e.g. who is allowed to travel where) and socially (e.g. who is part of which group and should behave how), although the semantics of demarcation are different between media texts and comments.

# Semiotic contagion: civic magic and democracy protests in the time of COVID-19

Panel contribution

***Dr. Judith Pine<sup>1</sup>***

*1. Western Washington University*

Although political protests against the current regime in Thailand came into being very shortly after the 2014 military coup, the global impact of the COVID-19 pandemic has shaped a complex representational economy of which these protests are a significant part. Metacognitive awareness of these links is evidenced in the formation of the Milk Tea Alliance, a social media centered alliance of mostly young pro-democracy activists in Thailand, Taiwan, Hong Kong and more recently Myanmar. The three-finger hunger games salute has emerged within the representational economy of Thai pro-democracy protests, sliding from its fictional origins into firm connection with democracy movements going back to 1932, while the umbrella as response to “non-lethal” police violence has gone viral from its origins in the 2014 Hong Kong Umbrella Movement, each complex bundle of signs deployed in protests throughout the region. Objects have slipped free of their imperial origins and become elements of emblems, iconized indexical semiotic material, energized by form of magical thinking deployed as protection against well-armed defenders of violent authoritarian anti-democratic states.

Herzfeld's (2002) intentionally unstable category the “crypto-colony”, of which Thailand is a central example, forms the context within which the signs – masks, umbrellas, three-finger salutes – are deployed while the magical process through which indexical sliders become iconized emblems interferes with the deployment of an aggressively Thai nationalist response. Protestors line up against armed forces in spaces which know well the history of state violence against pro-democracy protest. The Democracy Monument (*Anusawari Prachathipatai*) which commemorates the 1932 coup overthrowing absolute monarchy. The nearby Sanam Luang, a commons where the King performs Brahminic rituals evoking a pre-colonial past, serves as a staging area for protests which seem to be invigorated by government efforts to prevent them. The social media spaces within which signs circulate, such that (now Thai) three-finger salutes are seen in protests in Hong Kong and Burma/Myanmar, are arguably less simple to suppress in the context of COVID-19 and a growing mainstream dependence on digital spheres.

Drawing on specific examples from protests, I interrogate the potential of crypto-colonial spaces as a locations in which particular forms of magical thinking coalesce into emblems, aligned in an online space which, with COVID, has become central to economies and polities worldwide. While umbrellas and masks have pragmatic protective capacities whether in Bangkok or Portland, I argue that the conjunction of masks, umbrellas, and three-finger salutes in Milk Tea spaces operates differently, if only because the spectre of state violence is \*not\* a flimsy ghost but rather a well-understood reality. While the use of umbrellas and barriers of women have introduced tactics from colonial spaces into the discourses of the colonizers in the protests in the US, sustained, intentional, deadly state response remains “unthinkable” for mostly white protestors. The deployment of umbrellas, salutes, and masks in the face of states known to be deadly requires the reinforcement of powerful magic.

Herzfeld, M. 2002. “The Absent Presence: Discourses of Crypto-Colonialism.” *South Atlantic Quarterly*, vol. 101, no. 4, pp. 899–926., doi:10.1215/00382876-101-4-899.

# Sensing food: The accountability of food selection processes in dumpsters and markets

Panel contribution

***Mr. Guillaume Gauthier<sup>1</sup>, Mr. Sofian A. Bouaouina<sup>1</sup>***

***1. University of Basel***

Within the framework of ethnomethodology and conversation analysis, this paper discusses interactional practices between participants involved in food selection activities. Across different settings (selecting food in dumpsters, selecting food at the market), characterized by direct access to the edible items, participants are confronted with the tasks of choosing food and having to make their selection accountable for others. In this context, we will focus on how participants accountably mobilize sensorial resources in food selection processes.

Interactions with food have been studied in a variety of contexts. Discursive psychology demonstrates how participants engaged in interactions involving food accountably mobilize, through verbal and embodied means, different qualities of taste (Wiggins & Potter, 2003; Wiggins 2002, 2004) to accomplish a wide range of tasks. Using a more praxeological approach, Mondada (2014) looks at how, in instructed cooking activities, “material features” of ingredients are relevant for subsequent actions. From a multisensorial perspective (Mondada, *in press*) food has been studied as a *sensorial* object in service encounters, showing how participants make accountably relevant different sensorial qualities of those objects (Mondada 2018, 2019; Mondada et al., *accepted*). Here, we examine how food-objects are co-operatively (Goodwin 2018) selected, for example when participants successively touch and manipulate fruits to decide on their ripeness. Hence, market stalls and “dumpster-diving” are perspicuous settings for showing *how* the selection of products is made accountable in interaction with the help of sensorial resources.

This study is based on video recordings of two different settings. The first corpus originates from a local food-market in France; the second one features a group of German-speaking friends and ecological activists engaged in the salvation of discarded food from large dumpsters. This activity is characterized by *ad hoc* discoveries of the waste containers’ content and a subsequent selection of still-edible products. These data have in common that the sensorial resources and practices mobilized by the participants rely on direct or mediated access to the object under scrutiny.

The paper will focus on food-selection activities, and more particularly on how participants mobilize sensorial resources, making them accountable for others in order to emergently negotiate the appropriateness of a certain edible item over another. In other words, the paper draws attention to how the intersubjectivity of the senses is achieved *in situ* during food selection, and on how a selection-process is made accountable for others.

# Sensing one's own body via another person's voice: Mother's grunts as displays of infants' agentivity

Panel contribution

***Dr. Iris Nomikou***<sup>1</sup>

**1.** University of Portsmouth

Recent work positions the origins of the self in infants' early social interactions. These approaches (e.g. Reddy et al., 2013) propose that by being engaged in recurrent interactions, infants as young as two months construct intersubjective experiences, by being aware of other people's behaviour towards them. It is within these interactions in which they are treated as participants (De Leon, 1998; Raczašek et al., 2013) that infants learn about the effectiveness of their bodies and experience themselves as an agent from early on.

In this paper I focus on mothers' use of vocalisations—in particular grunts—and how these are designed and structure interactions. The analysis is carried out on a longitudinal video corpus of 17 German mother-infant dyads, who were filmed during nappy changing when the infants were between three and eight months of age. In the analysis I focus on the temporal coordination of grunts with non-verbal resources, such as facial expressions, torso movements and touch both within and across participants.

First analyses show that grunts are primarily used when performing actions on the infant's body, such as pulling an arm through the sleeve or lifting the infant from the changing table. When accompanying actions initiated by the mother, they are designed so that they are synchronous with the ongoing action and they are prolonged to match the entire duration of the action, or mark a specific part of a movement trajectory. Grunts display the mothers' effort in this manual activity which is a result of the properties of the infant's body (e.g., its weight) and its effectivities (e.g., the infant's resistance to getting dressed).

Furthermore, these vocalisations can be found in second position, in response to infants' own actions, such as stretching their legs or rubbing their eyes. Grunts thus display a reaction to actions produced by the infant for the infant (Keevallik & Ogden, 2020). The infant thus experiences their body as being capable of affecting others and as acting a part in a dialogical system.

Finally, in using grunts the mothers are directors and actors in scenes in which the infant's body and its effects are enacted and dramatised, capitalising on the directness of depiction (Clark, 2016) and creating enjoyable moments.

# Sequence-initiating actions in EFL text-in-interaction

---

Panel contribution

---

**Dr. Taiane Malabarba**<sup>1</sup>

1. University of Potsdam

Student initiations carry the potential a) to create and expand learning opportunities in the classroom and b) to position students as agents with rights to tailor the classroom talk they are engaged in for their specific and emergent purposes (Emanuelsson & Sahlström, 2008; Waring, 2011; Garton, 2012).

However, initiating actions in the classroom can be particularly challenging due to the nature of teacher-led encounters, which call for “somebody to ensure that the discussion proceeds in an orderly manner” (Nassaji & Wells, 2000, p. 378). Specifically with regards to English-as-a-foreign-language (EFL) contexts, where students have fewer opportunities to use their additional language to engage in social interaction outside the classroom, this may also represent a major constraint for students’ interactional competence (Pekarek Doehler, 2018).

Against this background, this paper investigates action initiation in a ubiquitous yet under-investigated interactional setting, i.e., smartphone-mediated text chat. The analysis is based on a corpus of over 800 messages exchanged among a group of adult intermediate-level EFL learners and their teacher in WhatsApp over the course of 9 months. It draws on conversation analysis (CA) and recent developments within Digital CA (Giles et al, 2015) to unpack how new courses of action are implemented. The excerpts, extracted from the collection of sequence-initiating actions produced by one student, show how participants can and do exploit the WhatsApp group to propose courses of action of their own and achieve a range of “interactional effects” (Sidnell & Enfield, 2014, p. 425). Such effects range from topic launching and the sharing of personal experiences to the incorporation of (and engagement with) a suggested activity into the classroom lesson.

The findings indicate that by producing sequence-initiating actions in the text-chat group and aligning with the proposed actions, participants jointly construct a less asymmetrical, and thus more inclusive, learning environment. The paper thus advances current understandings of the sequential organization of *text-in-interaction* and supports discussions on how student participation may be fostered through the connection of the language classroom with less controlled ‘in the wild’ settings.

# Setting up a training for deaf translators and mediators in French-speaking Switzerland: an action-research approach

Panel contribution

***Ms. Irene Strasly<sup>1</sup>***

**1.** University of Geneva

In recent years, Deaf signing people have started working as translators, interpreters and mediators all over the world. In Switzerland, this has been increasing in the last year both with the covid19 pandemic, where health information had to be made accessible in sign language, and with new legislation at a national and cantonal level that has favored accessibility projects.

From September 2017 until August 2020 we followed a team of Deaf translators who were translating medical sentences for a project led by the Geneva University Hospital and the Faculty of Translation and Interpreting in Geneva, the BabelDr project. We used an ethnographic approach (Cronin 2002; Wolf 2002; Inghilleri 2006; Koskinen 2006; Stone 2006; Buzelin 2007; Wurm 2010) to document the translation process and filmed twenty three-hour translation sessions. The filmed material was then analyzed using thematic analysis. We found that our translators faced two main issues during the translation process: 1) how to translate medical sentences properly and at the same time how to make sure that their translation would be accessible to a varied public and 2) how to translate medical terminology.

Following these findings, we decided to apply an action-research approach (Kember 2002; Napier and Hale 2013) and innovate the curriculum of our Faculty by introducing a new training for deaf people who work as translators or mediators in different contexts but do not have a diploma yet. In order to set up this program, we consulted with the local association of sign language interpreters who collaborated with us to look for fundings. We also jointly planned the content of the training. The goal we set was to give Deaf practitioners up-to-date tools that they could use in their profession and to reflect on their practice.

Our program was the first 10-day training for deaf translators/mediators in Switzerland. We delivered three modules that focused on the basics of interpreting, mediation in hospital contexts and translation to twelve Deaf people who had varying experiences in the translation and mediation fields. The trainers we selected all had extensive experience as translators, interpreters or mediators and developed both theoretical and practical contents to meet the purposes of our training.

Our participants gained knowledge on how to deal with different clients and varied work settings. They did practical exercises where they had to deal with difficult clients and had to make decisions on the spot. They then discussed about their decision-making process and how to improve it with the trainers and the other participants. They also gained practical understanding on how to work in teams with hearing interpreters as well as with their Deaf peers through practical role plays. At the end of the training, they could clearly understand the difference between translation, interpreting and mediation.

An evaluation of the modules we delivered will be organized in February 2021: we will ask our participants to tell us the positive points as well as the improvements that should be made in the future.

# Shaping prototypical images of criminals and crimes in a multilingual context: Spanish and Zapotec witness and suspect questioning protocols from New Spain (17th / 18th century)

Panel contribution

***Mr. Malte Kneifel***<sup>1</sup>

1. Johannes Gutenberg University Mainz

This contribution focuses on written protocols of witness and suspect questionings from the Spanish colonial period, aiming to link the questions of narrative strategies and textualization processes, which are central in this regard, to the role of multilingualism and translation processes.

The protocols in question originate from the historical court district of Villa Alta, situated in a peripheral region of what is now the Mexican state of Oaxaca, and date back to the 17th and 18th century. During that time, this region was populated mostly by indigenous people who spoke various different languages, Zapotec being the most dominant. While the Spanish colonial legal system allowed the indigenous people a considerable degree of jurisdictional autonomy within their own communities, including the use of their own languages in local jurisprudence, administration and documentation, certain criminal and civil law cases were brought before the *alcalde mayor*, the Spanish judge and highest judicial authority of the district. In those cases, all evidence submitted to the court had to be translated into Spanish. In questionings of non-Spanish-speaking witnesses and suspects, an official court interpreter, the *intérprete de juzgado*, acted as a mediator between the judge and the interrogated person, interpreting the questions into the indigenous language and the answers into Spanish while a court scribe documented the Spanish version of each turn.

This contribution follows a text-linguistic and juridical-linguistic approach. It aims to show how textual elements in the court scribes' protocols influence the representation of culture-specific key scenarios and argumentations that were used in the testimonies and served to construe notions of credibility of witnesses, suspects and culprits, but also specific notions of crime, such as the crime of idolatry. Utilizing the concept of *narrative typifications* as a framework, defined by Greta Olson (2014: para. 6) as "evaluative judgments based on their perceived likeness to collective, prototypical images of criminals [...] as well as other narratively organized forms of social knowledge", linguistic shifts and consistencies in the depiction of the testimonies and their contents are examined with respect to the effect they evoked. Aspects of particular interests are both repetitive and formal as well as spontaneous, abrupt textual elements, in conjunction with the legal context that defines and constrains the processes of text production (i.e., the re-shaping of the protocols by the court scribes and interpreters according to legal and institutional guidelines). Said elements include strategies such as the use of parallelisms and formulaic language, as well as perspectivization and the use of lexical and syntactical entities. Furthermore, a crucial role comes not only to the court scribes but also to the court interpreters, who functioned as facilitators of communication in the multilingual and polyphous situation in which the questionings were conducted. The translations of the interrogated individuals' utterances by the court interpreter are considered to be already re-shaped orally in order to fit into the textual requirements according to which the court scribes made their protocols.

# Shocking exposures: hypocrisy, authenticity, and the rhetorical dynamics of populism

Panel contribution

***Dr. Martin Gill<sup>1</sup>***

**1. Åbo Akademi University**

Surveys regularly show that public trust in mainstream politicians – indeed in almost any person or institution with an authoritative public voice – is at an all-time low (e.g. Pew Research Center 2019). This is equally clear from the outcome of the Brexit referendum, and the electoral successes of vocal mavericks claiming to represent the ‘will of the people’ and promising, in Donald Trump’s familiar phrase, to “drain the swamp”. It is also constantly reinforced in parts of the mainstream media.

Almost by definition, assuming a public role, especially in a democracy, involves balancing expectations of honesty with the need for pragmatic, sometimes problematic compromise (cf. Runciman 2008). Not, though, for Britain’s popular press, where anything less than ideological purity is likely to be denounced as hypocrisy. For headline writers and commenters, mainstream establishment figures (‘the elite’) tell lies, betray their ideals or their nation, and behave (individually or collectively) in ways that belie the public virtue they profess, with the sole aim of keeping their “snouts in the trough”, or promoting their own interests. By contrast, ‘the will of the people’ is honest and unambiguous. Freed from the hypocritical constraints of virtue signalling, its leaders dare to “tell it like it is” – a discursive frame in which their unpolished, vernacular lack of civility and norm-breaking willingness to give offence become signs of authenticity, integrity and courage.

Through analysis of a range of examples from press coverage of recent events in Britain concerning Brexit, a possible second Scottish independence referendum, climate activism and the coronavirus, this paper will show how the authenticity / hypocrisy contrast is established and made use of in tabloid news discourse to expose and delegitimize the motives and opinions of ‘elite’ individuals. More specifically, it will examine its role in shaping the rhetorical dynamics of populist argument. Results suggest that this polarized rhetoric constructs a discursive space in which non-rational forms of argument, particularly extreme personal criticism and moral outrage, are foregrounded. Its moral terms override the conventional norms of debate in the public sphere, where competing arguments over matters of policy should be weighed in relation to evidence.

While ‘post-truth’ populist discourse is generally held to be characterized by contempt for facts and emphasis on emotive rather than rational appeals, this study suggests that a further source of strength lies in the certainty of its moral stance towards the presumed hypocrisy of its opponents. In this it more closely resembles religious than political forms of discourse. At the same time, by purporting to unmask corruption in high places, it both aligns itself with, and tends to undermine, the democratic function of serious investigative journalism.

# **Shots at Stake. Facilitating interactions between professionals and parents on childhood vaccination**

Panel contribution

**Mr. Robert Prettner<sup>1</sup>, Prof. Hedwig te Molder<sup>1</sup>**

***1. Vrije Universiteit Amsterdam***

The COVID-19 pandemic highlighted the reason why vaccine hesitancy is considered a major threat to global health (WHO, 2019). In the case of childhood vaccinations, there are few empirical studies that investigate how vaccination consultations can be improved to address hesitant parents best. Existing conversation-analytic studies in this domain focus exclusively on the United States and conclude that presuming parental acceptance of vaccines (e.g. “Well, we have to do some shots”) is an easy and effective strategy to increase immunization rates (Opel et al., 2018). On the other hand, a participatory initiation format (e.g. “What do you want to do about shots?”) has been found potentially beneficial for a trusting doctor – patient relationship (Opel et al., 2015). To understand if and how this dilemma plays out in a country without mandatory vaccination legislation such as the Netherlands, we develop a large corpus of video-taped real-life vaccination consultations between Dutch healthcare providers (HCPs) and parents. In a pilot study of 20 recordings (Prettner, 2017), we found that Dutch HCPs frequently introduce the topic with “Have you already thought about vaccination?”. This initiation format gives parents the freedom to respond to the literal query (e.g. “We haven’t heard we need to think about this”) or the inferred purpose (Pomerantz et al., 2017) of the query (e.g. “Yes, I believe we should vaccinate”). In our paper, we will demonstrate that both parties exploit this ambiguity to follow one of two opposing trajectories: (1) They engage in deliberation and orient to the norm of responsible parenthood in the decision-making process. This practice sheds light on how parents achieve ‘not trusting blindly’ (cf. Hobson-West, 2007) in interaction. (2) They show that no deliberation is needed to respond to the question because the answer should self-evidently be ‘yes’. The implications of our findings will be discussed in light of maintaining high immunization rates as well as fostering a trusting relationship between HCPs and parents.

# Silence and Silencing in First Speeches in Israel's Parliament

Panel contribution

**Dr. Ayelet Kohn**<sup>1</sup>, **Prof. Zohar Livnat**<sup>2</sup>

**1.** David Yellin College of Education, **2.** Bar Ilan University

A First Speech, a speech delivered by a Member of Parliament following their first election to the house, aims to set the foundation for the speakers' positioning as they take their first steps as politicians. This practice is prevalent in parliaments that follow the British parliamentary style, and was first introduced in Israel in 2013, and has continued since (in 2015 and 2019).

Drawing on Goffman's concept of self-presentation that emphasizes the significant role of first impressions, we argue that First Speeches might be seen as a representative case of a speech event in which a working consensus (*modus vivendi*) is crucial. It is accepted that First Speeches are not interrupted, and that in deference to this rule such speeches should not be too controversial or provocative. (Power & Berardone 1998). Due to the ceremonial circumstances, the speakers are expected to refrain from raising certain topics that might have the potential to stir up controversy.

Our paper will focus on two kinds of silence and silencing (Kurzon 2007) that we find dominant in this ceremonial situation: **situational silence** is expected from the audience, and in return, **thematic silence** is expected from the speakers.

These two modes of silence are mutually dependent, and when one side violates it, an attempt to silence may be activated. Of special interest are speeches by Israeli-Arab representatives. The political atmosphere targeting the Israeli-Arab population seems to have affected the legitimacy of its representation in the Israeli parliament. While some of the speakers deliberately raise controversial topics, their right to be heard without interruption is sometimes violated, provoking various modes of silencing.

# Silence and silencing in psychotherapeutic interactions

Panel contribution

***Prof. Silvia Bonacchi<sup>1</sup>***

*1. University of Warsaw*

Every filled moment in a dialogue requires “unfilled” frames, i.e. “silent phases”, which turn out to be essential for the succeeding of a communicative exchange. Linguists do not use a single binding definition of silence. Silence is understood generally as an absence of sound (as in the phrase: “the silence of the night”), but in linguistics particularly as an absence of talk (as in the sentence: “She looked out the front window in silence”). This “absence” of talkativeness can be motivated by many reasons: linguistic taboos (“it is not allowed to speak about it”), inexpressibility (“no words can express it”), incapability of verbalizing (“we are not able to speak about it”), fear (“we fear sanctions if we speak about it”), disinterest (“it’s not worth talking about”) and rejection of interaction (“I do not want to speak with you [about it]”). In all these cases, the various dimensions of silence become tangible in linguistics in relation to speech, from a “logocentric perspective” (Schmitz 1990, p. 12) that contrasts the *absence* of silence with the *presence* of speech. Although the need to integrate a theory of interaction with a broader assessment of the communicative functions of silence was highlighted as early as the mid-1980s (see Tannen/Saville-Troike 1985), only in the last two decades silence has turned out to be an important research field not only for linguistic investigation (Kurzon 1998, Ephratt 2008), particularly for multimodal analysis (Kwiatkowska 1997, Acheson 2008), but also for all research fields in which communicative exchange is essential, including the analysis of psychotherapeutic interactions between patients and psychotherapists (Buchholz ed. 2020). In my lecture I will give a linguistically informed overview (see Bonacchi 2020) of the forms and functions of silence and silencing (as a form of communicative violence) on the basis of their communicative valence in order to understand how silence and silencing can be used in full awareness by psychotherapists in their work with patients, also for allocating and negotiating interactional power.

# Silence and Silencing – as an end and as a means – and the question of identity in Asaf Hanuka's comics column The Arab-Jew

Panel contribution

**Prof. Silvia Adler**<sup>1</sup>, **Dr. Ayelet Kohn**<sup>2</sup>

*1. Bar-Ilan University, 2. David Yellin College of Education*

*The Arab-Jew*, an on-going Israeli comics column created by Asaf Hanuka, is published in the supplement of the *Calcalist* business newspaper's digital edition. It narrates, in parallel, the history of Hanuka's ancestors, beginning with his great-grandfather in 1929, and Hanuka's present in 2001, right after he returns to Israel from studies in France. This juxtaposition between past and present generates various intersections and allows for analogies and contrasts.

The title alludes to Hanuka's origins as a descendant of a Jewish Iraqi family. Referring to Jewish communities living in Arab countries in the context of Zionist nationalism, the term "Arab-Jew" (rather than *Mizrahim* -"Orientals") challenges the binary opposition between, on the one hand, Arabs and Jews (in Zionist discourse) and, on the other hand, Mizrahi Jews and Ashkenazi Jews (Jews who settled in Europe, also considered Zionist emissaries), against the background of early colonialism prior to the establishment of the state of Israel (Shenhav & Hever, 2012). This hyphenated term remains controversial in the post-Zionist era for several reasons. Most Arab-Jews do not consider themselves as such; in addition, it brings forth questions of ethnicity and social (in)justice following Zionists' moves to remove any sign of Orientalness of the Jews from the Arab world upon their arrival to the land of Israel. The question of identity is dealt with on a bigger scale in this comics, since it is also relevant to the Arabs living in Palestine and to their encounters with the new immigrants, but also to Hanuka's own identity as he tries to define his place in the world.

Following Saville-Troike (1985), Kurzon (1998, 2007) and Ephratt (2014), among others, we intend to examine the way in which silence and silencing – both as an end and as a means – are involved in various aspects related to identity, both in 1929 and 2001. Hanuka's artistic language proves that silence is indeed a meaningful signifier, because it serves an end, or – in our case, because it is the end in itself. Comics being a medium where "words and pictures are like partners in a dance and each one takes turns leading" (McCloud, 1994: 156), this study is naturally carried out within the framework of multimodal theories as well (Kress & van Leeuwen, 2001).

# Silencing Facebook Election Propaganda - Objects and Strategies

Panel contribution

***Dr. Pnina Shukrun-Nagar***<sup>1</sup>

1. Ben-Gurion University of the Negev

The lecture will deal with cases where ordinary citizens silence the two candidates for prime minister in Israel in the 2019 and 2020 elections – Benjamin Netanyahu and Benny Gantz. Silencing is regarded here as “a way of using language to limit, remove or undermine the legitimacy of another use of language” (Thiesmeyer, 2003: 12). It will be demonstrated and analyzed in on-line comments to Netanyahu’s and Gantz’s Facebook posts during the election campaigns – a turbulent arena in which the two most senior Israeli politicians become the victims of criticism by ordinary citizens.

In an earlier study on Netanyahu’s Facebook page (Shukrun-Nagar, 2020), it was found that four main types of silencing were used in the comments: general silencing, aimed at preventing his writing on Facebook; thematic silencing, intended to prevent him from speaking on certain issues; metalinguistic silencing, aimed at preventing him from speaking in certain ways, and metapragmatic silencing, intended to prevent him from fulfilling certain communicational functions. It was also found that in order to silence Netanyahu, diverse discursive strategies were used, resulting in diversity in the positioning (Davies & Harré, 1990) of the commenters vis-à-vis Netanyahu in terms of closeness and power relations.

In the present lecture, I will focus on one of the most interesting and effective strategies of silencing found in my corpus – ironic echoes (Sperber & Wilson, 1981; Wilson, 2006; Wilson & Sperber, 1992) of the candidates whom the commenters oppose. I will show that ironic echoes are used in all four categories of silencing described, in regard to both politicians, and that not only former statements of the politicians are echoed, but also thoughts, motives, goals and plans that the commenters themselves attributed to them. I will stress that the strategy of ironic echoes plays a key role in portraying the echoed politicians as naïve, blind, manipulative or extreme. I will argue that this may not only position the candidates as unsuitable to serve as prime minister, but may also silence them – prevent them (fully or partially) from expressing themselves in a way that was ironically criticized as extreme, immoral or otherwise inappropriate.

# Simultaneous and sequential response building in Chinese rap battles

Panel contribution

***Mr. Mian Jia***<sup>1</sup>

*1. The University of Texas at Austin*

This paper aims to explore the simultaneous and sequential response building in Chinese rap battles. Against a preselected beat or in a cappella, freestyle rappers take turns to outdiss, outflow, and outwit their opponent with rhythmic lyrics (Mavima, 2016). Different from everyday conversations where interlocutors can interrupt or overlap with the speaker, the rules in rap battles stipulate that rappers should not verbally interrupt their opponent's performance. As a result, in addition to responding to their opponent in a subsequent turn, rappers often simultaneously co-produce their responses with nonverbal behaviors. While scholars have examined the co-production of rap battles in English contexts (Alim, Lee, & Carris, 2011), little is known about Chinese freestyle rap battles.

In this paper, Co-Operative Action (Goodwin, 2013, 2018) is used as a viable multimodal explanation to rappers' organization of responses. Goodwin (2018) observed that interlocutors often reuse conversational materials provided by others to achieve their objectives. In rap battles, rappers can transformatively reuse the lyrics and bodily actions their opponent produced and simultaneously laminate their evaluation onto their opponents' actions, showing their ability to outdiss, outflow, and outwit their opponent in time.

Data were collected from the national finals of Iron Mic, the most famous rap battle competition in China. The data were analyzed using microethnography that seeks to understand the human organization of interaction by examining the moment-by-moment development of interlocutors' verbal, visual, and physical cues in a designated environment (Streeck & Mehus, 2005).

The data show that sequentially, rappers accumulatively take others' pre-existing end rhymes, reorganize them into their own patterns, and situate these patterns in different rounds of rap battles, outflowing their opponent. The advanced rapper also tends to transformatively adapt more lyrics from their opponent, demonstrating their ability to improvise and their superior lyricism over their opponent (Bacon, 2018). In addition to the sequential exchange of ritual insults, battle emcees simultaneously rebut their opponents' accusations by using hand gestures to signal disagreement. In addition, silent rappers could also inhabit their respect for the rap community when their opponent verbally expressed their respect, which is a core component of street-consciousness upheld by the hip-hop community (Spady, Alim, & Lee, 1999). The simultaneous rebuttals and agreements further demonstrate their skillful rap techniques.

Overall, this paper supports Goodwin's (2018) argument that interactions can progress both sequentially and simultaneously by offering evidence from the unique context of Chinese rap battles. The co-operative actions accomplished in these battles are highlighted moments of outdissing, outflowing, and outwitting their opponent.

# Situated practices for rendering food (in)edible

Panel contribution

**Dr. Hanna Svensson<sup>1</sup>, Dr. Burak Tekin<sup>1</sup>**

***1. University of Basel***

Research in ethnomethodology and conversation analysis (Garfinkel, 1967; Sacks, 1992) has established the relevance of linguistic and embodied resources for establishing a mutual understanding of the nature of objects and their relevant features for situated activities (Garfinkel, Lynch & Livingston, 1981; Goodwin, 1994), including the transformation of ingredients in the process of making food in the kitchen (Mondada, 2014), and the evaluation of certain characteristics of food relevant for its ongoing production (Mondada, et al., in press).

This paper takes an interest in the interactional practices people employ to establish substances as primarily being categorized as food – or something else, such as a religious object when buying an animal to sacrifice or when participating in the eucharist. Edible substances are routinely glossed as “food”, which becomes apparent in situations where the participants accountably engage in neutralizing the nutritional and/or savory aspects of consumables when they are invoked as relevant for other activities than “eating”. To establish edibles as “food” (or not) is thus a practical problem for participants in interaction. This study elucidates the situated practices through which people engage in the transformation of “waste” into “food”, “food” into “merchandise” and “food” into “religious symbols”. By recognizably choosing to assess specific features and qualities of substances, social actors establish and invoke their relevance with reference to important societal institutions, including religious rituals, economic systems and issues of environmental sustainability.

This paper draws on a diverse set of video recordings of naturally occurring social interactions in which participants engage in and deal with consumable materials and substances, including foraging food, designing food in a hackathon, composting waste and buying animals for religious ceremonies. Through a multimodal sequential analysis of how social actors manipulate, talk about and orient to objects and their details, we demonstrate how particular features of an “edible” or “testable” are locally construed as (ir)relevant for the unfolding activity. In this way, we show how embodied resources and natural language-in-use about food, constitutes a *loci* for understanding how various social structures plays out in the details of everyday activities.

# Small stories with ordinary and not-so-ordinary participants in political discourse: How private moments are exploited to account for the presentation of political selves

Panel contribution

***Prof. Anita Fetzer<sup>1</sup>***

***1. University of Augsburg***

This paper examines the contribution of small stories to the discursive construction of (non)-ordinariness in mediated political discourse in the context of online news reports from *The Guardian* and *The Daily Telegraph*, parliamentary debates (*Prime Minister's Questions*) and political speeches from British politicians, and from their web-based comment's sections. Small stories do not only fulfil an important interpersonal function with respect to the construction of discourse common ground. They are also used strategically to support the discursive construction of ordinariness, and to assign accountability of communicative action and accountability for communicative action the status of an object of talk. From a sequentiality perspective, small stories contextualise prior and upcoming discourse.

The analysis focuses on interfacing ordinary-life experience anchored in private domains and not-so-ordinary political action anchored in public and institutional domains. It differentiates between (1) the production format: not-so-ordinary and ordinary story tellers; (2) stories with (a) not-so-ordinary, (b) ordinary, and (c) ordinary and not-so-ordinary characters and voices; (3) ordinary setting and institutional setting; and (4) explicit and implicit evaluations by characters and teller. In the data analysed, small stories are told by ordinary and not-so-ordinary tellers about ordinary characters and voices, and about a mixed set of characters and voices, generally taking place in an ordinary setting. References to the tellers' intended perlocutionary effects, and how these are taken up by commenters, and metadiscursive comments are also considered in the analysis.

The following two excerpts are illustrations from *The Guardian* and indicate the genres they represent. The first is by Hillary Clinton telling two small stories about ordinary and not-so-ordinary characters: “*On a cold winter night in 1995, Bill and I joined thousands of people at Belfast city hall for the lighting of the Christmas tree (...). It was on that same trip that I first met some of the women whose names are too often forgotten, despite their vital role in the agreement. One of those women was ...*” (09 April 2018). The second is from J. Galley from Milton Keynes telling a story about the corona virus and quarantine. The small story follows a similar pattern, but its evaluation is more explicit: “*I wonder what made it so different for Dominic Cummings and his family?*” (24 May 2020).

In the data, ordinary tellers and their ordinary characters distance themselves from the not-so-ordinary political agents demanding accountability for their actions. Not-so-ordinary tellers account for their actions through life-world-experience-based accounts which are, however, not unanimously taken up as intended by the not-so-ordinary participants.

# Social accountability at work: Topicalizing and accounting for the absence of colleagues from the staff breakroom

Panel contribution

***Dr. Marika Helisten***<sup>1</sup>

*1. University of Oulu*

In many workplaces, the staff breakroom represents an important site for social inclusion and participation, as it offers a venue for daily, informal encounters and activities between colleagues and for building and maintaining social relationships within the community. This study examines social interaction in breakrooms of Finnish work communities in which colleagues regularly convene for common breaks together. Drawing on ca. 50 hours of video-recorded data, examined using the method of conversation analysis, this study focuses on specific kinds of interactional episodes in which *the absence of colleagues from the common break* becomes a topic of conversation between those present in the breakroom. In these episodes, participants uniformly treat the absence of (a) colleague(s) as a noticeable, unexpected event in need of some explanation.

The study examines how these episodes come to be initiated and how they unfold in subsequent talk. Recurrently, they are initiated by one participant's interrogatively formulated turn which addresses the absence of colleagues in general (e.g. *how come it's so quiet in here?*) or the absence of a specific colleague (e.g. *where is Laura?*). This initial turn communicates a stance that the absence is socially "problematic" (Bolden & Robinson 2011) and engenders a sequence in which participants collaboratively seek to account for it in some way. As such, these episodes resemble complaint sequences (e.g. Drew 1998), but rather than treating the absence as a moral transgression or an offense, participants produce accounts which seek to excuse or justify it, often by attributing the absence to reasons having to do with institutional obligations (e.g. that the colleagues were too busy with work). Such "moral reasoning" (Turowetz & Maynard 2010) ascribes the breach of normative expectations caused by the absence to objective, external circumstances beyond the control of those absent – that is, their *inability* to do the thing expected rather than their *unwillingness* to do it (Drew 1998: 136).

In discussing and accounting for the absence of colleagues from the common break, participants make salient their orientations to some of the underlying social norms related to break-taking in their community, such as the socially constructed time frame of the breaks (i.e. *when* people are expected be there), or participants' shared understanding of *who* is (or is not) expected to be there. More broadly, these episodes also bring to light some of the moral and normative expectations related to participants' different roles at the workplace as professionals but also as members of a social group who hold themselves and others accountable for (non-)participation in the everyday activities of their community.

# Social and pragmatic change in the 20th century: from ‘cioè’ to ‘tipo’ in Italian phone-ins to a radio station

Panel contribution

***Dr. Chiara Ghezzi<sup>1</sup>***

**1. Università di Bergamo**

This paper focuses on the development from 1976 to 2010 of the Italian pragmatic markers *cioè* ‘that is’ and *tipolit.* ‘type’.

*Cioè* is originally a reformulation marker, but during the late 20<sup>th</sup> century its pragmatic domain of use expanded especially in younger generations. From the Eighties, it also developed a social indexicality as it was associated with a young-speech style to the point that those years in Italy are known as ‘the years of *cioè*’ (Silverstein 2003). Similarly, today the functional domain of *tipo*, an exemplification marker, is expanding in young speakers as its frequency increases, and new functions and structural contexts of use are added to the exemplifying function (Ghezzi 2013).

Through a corpus-based analysis of listeners’ phone-ins to a radio station, this study examines the pragmatic evolution of both markers in apparent and real time by comparing the variation in their frequencies, functions and structural contexts of use in different age-cohorts of speakers in 1976 and in 2010 (Britz *et alii* 2003).

Young speakers in 1976 employed *cioè* as a versatile filler word which also indexed in-group identity. This translated into an expansion of its pragmatic domain to the point that it began to be socially stigmatized within the community as a ‘verbal tic’. In 2010, when young speakers grew into adults, they partially maintained their use of *cioè*, especially in more prototypical contexts, while ‘new’ young speakers introduced *tipo* as another overextended variant.

If the social meaning of *cioè* as in-group identity marker had initially a role in accelerating its spread among young speakers, later its stigmatization promoted its progressive abandonment in new generations. Nevertheless, young speakers in 1976 and 2010 share a characterizing discourse style, as they select and overextend one form in different structural contexts (*cioè* in 1976-1980 and the incipient *tipo* in 2010).

On one hand, this can be associated with the status of pragmatic variables of which speakers are more linguistically and socially aware, and over which they have a high degree of control (Terkourafi 2011). On the other hand, this type of change, precisely for the high degree of control of speakers, may be explained in terms of modifications in linguistic norms that accompanied the profound political and socio-economic transformations that were taking place during those years (Eckert 2008, Coupland 2014). In this case cohort membership becomes relevant in explaining the connection between linguistic variation and the speakers experience of major historical events.

# Social Distancing and the Digital Relay: Slow Museums and Inclusiveness during Covid19

Panel contribution

***Prof. Marina Bondi<sup>1</sup>, Ms. Jessica Jane Nocella<sup>1</sup>***

*<sup>1</sup>. Dipartimento di Studi Linguistici e Culturali - Università di Modena e Reggio Emilia*

The crisis triggered by the recent Covid-19 pandemic has led to a variety of significant social consequences ranging from a huge number of job losses to pervasive mental health issues. One sector that has been severely affected by the pandemic is that of the arts, a sector that includes museums, which, over the lockdown, were closed to the public and, even when the lockdown was lifted, had to come up with solutions for those who could no longer visit for different reasons. The Coronavirus outbreak has led museums to cope with this unprecedented situation by exploiting the internet and creating digital content in order to include all audiences and all visitors.

This paper explores how *slow museums* have tackled inclusion through websites and online art exhibitions over the pandemic. By means of a small corpus of the website pages that promote digital events during Covid-19 we will examine features of the language of inclusion that has been adopted. Moreover, we will also examine the multimodal characteristics adopted on these the websites, especially video formats, and highlight how these modes of communication include and affect visitors and tourists.

We will provide an analysis of two *slow museum* websites that have approached slowness and inclusiveness over the pandemic in different ways, namely the websites linked to the Laing Art Gallery in Newcastle and the National Gallery in London. The Laing Art Gallery has recently taken part in Art4dementia (A4D), whose objective is to empower people with communicative or literacy difficulties, dementia, anxiety and stroke survivors, through art, while the National Gallery has supported slowness and wellbeing through 5-minute “slow looking” exercises, available on their official YouTube channel.

These two case studies will shed light on the new paths that slow museums are exploring in terms of communication and inclusiveness of people with different needs.

# Social Image and Self-identity of Chinese Elders in Aging Society: from Frailty to Vitality

Panel contribution

***Prof. Lihe Huang<sup>1</sup>***

**1.** Tongji University

With the continual deepening of the ageing problem, more and more attention has been paid to issues of aging in public communication and social cognition in today's China. The construction of image for the elderly is closely related to social development, public opinion, self-cognition and cultural tradition. All these will lead to the important influence on elders' mental health and life quality. China has witnessed a tremendous economic and social change, in which the living condition of and social cognition towards the elders also underwent some interesting change. In this sense, this paper aims to sketch a development roadmap of such difference. Based on a tailored multimodal corpus of Chinese media, including newspaper, online platform and television programs, this paper explores the elderly image and its construction mechanisms in Chinese society, self-cognition and identity construction, and the relationship with the young. The research takes the methods of both qualitative and quantitative analysis, including corpus analysis and multimodal analysis with the help of NVivo. After the pilot study, we find that the image and identity of Chinese elders experience a change from frailty to vitality. Different newspapers present a different image inclination of Chinese elders through the report of different actions and news of them. Meanwhile, Taking the elderly images in the short acts of CCTV Spring Festival Gala over the last 30 years as examples, it provides a multidimensional analysis of the changes and social cognition of the elderly image in the process of ageing in China and it calls for the perspective from elderly image and Chinese traditional culture.

Panel contribution

***Ms. Dominika Kováčová<sup>1</sup>***

**1.** *Masaryk University, Brno*

Although social media activity has been shown to significantly impact the mental and physical health of vulnerable groups of users such as adolescents (Charmaraman et al., 2020; Sheldon et al., 2019), the positive effect of social media in raising mental health awareness should not be overlooked. A particularly important role in this respect is assumed by social media influencers, who frequently break the silence about issues such as depression, anxiety, even social media addiction, and participate in online movements and campaigns dedicated to these causes. In this paper, attention is paid to a specific case study: an anti-stigma mental health campaign, which encouraged people not to use social media for one whole day. By sharing an Instagram post with a photo of the campaign symbol – a circle with the word ‘OFF’ written inside it – painted on one’s palm and using the #DigitalDetoxDay hashtag, a large number of social media influencers showed their support for the initiative and commitment to participating in the cause. Since the participation in the campaign is marked both visually and textually, this study adopts a multimodal discourse analysis approach to investigate how in these posts the influencers, whose income is contingent on their active online presence, represent the effect social media have on their wellbeing. To achieve this, the dataset consisting of 100 #DigitalDetoxDay posts shared on Instagram is used. The preliminary findings of the analysis show that the influencers who joined the campaign portray their online experience as having both beneficial and detrimental effects on their wellbeing. Moreover, in the majority of the collected posts, the influencers construct anxiety and social media addiction as a shared experience and thus encourage their followers to join them in the initiative. In effect, the #DigitalDetoxDay posts afford the influencers’ self-presentation a level of authenticity and relatability.

# Social or physical distancing: Australian COVID-19 keywords

---

Panel contribution

---

***Ms. Ida Diget<sup>1</sup>***

***1. Griffith University***

The COVID-19 pandemic has posed communicative challenges for health authorities everywhere. In Australia, state and federal governments have scrambled to provide appropriate communication about the dangers of COVID-19, what symptoms to look out for, and how to protect oneself and others from the disease. These challenges came during a time of crisis, where time is of the essence and where the facts surrounding COVID-19 are changing rapidly. The novelty of COVID-19 and its impact has meant a rapid influx of new vocabulary. Concepts such as “flatten the curve” and “community transmission” that were previously virtually unknown have become central in communication and media surrounding COVID-19. Although novel, they quickly become familiar to the public. For example, early communication efforts urged Australians to “socially distance” from each other. As people grew lonelier during lockdown measures, efforts were made to officially change this to “physical distancing” to encourage people to stay social while keeping physical distance. Some public health posters were adapted to reflect this change, substituting “social” for “physical”. However, “social distancing” had already become entrenched and “physical distancing” never became as widespread as its predecessor. This example reflects how important it is to choose words carefully, even in an emergency. Novel concepts can quickly become entrenched and changing the rhetoric later may be difficult. Communication efforts are further complicated by the fact that the Australian public is highly multilingual and providing health communication in English alone is not enough. Minority linguistic communities are reliant on access to clear and explicit COVID-19 information in their language. This study investigates some English words and phrases that have been central in Australian discourse about COVID-19 and evaluates their translatability. The study suggests that in times of crisis, authoring public health communication in a way that is translatable from the beginning can help assist potential translations and foster more effective outcomes for community-wide health communication.

# Social Values and Perception of Face in Chinese and Japanese: A Comparative Study

---

Panel contribution

---

***Dr. QI XIAO<sup>1</sup>, Prof. Ling Zhou<sup>1</sup>***

***1. School of Foreign Languages, Northeast Normal University***

This present paper aims to investigate sensitive face values at individual, group and cultural levels in Chinese and Japanese. Among the handful studies available, face attracts large attention from different perspectives. However, the in-depth comparative study of face among eastern cultures are still not enough. Therefore, we design two experiments to examine the relationship of face and values in approval and rejecting acts in Chinese and Japanese. Altogether, 132 Chinese and 120 Japanese are invited to evaluate the degree of face-sensitivity of each situation designed. In addition, T-test and ANOVA are applied to analyze the data. The results show: first, Chinese self-face is sensitive to more social values than that of Japanese self-face. Second, Chinese participants show higher other-face and group-face concerns than Japanese.

This study confirms the findings of resemblance between Chinese and Japanese face. Additionally, Chinese face has a larger scale of sensitive values, and a higher degree of sensitivity than Japanese face.

# Socialization to book-reading in French and English family life: a longitudinal and comparative interactive study of specialized language practices

Panel contribution

***Mrs. Pauline Beauvoil-Hourdel<sup>1</sup>, Mrs. Marie Collombel<sup>2</sup>, Prof. Aliyah Morgenstern<sup>3</sup>***

**1.** Sorbonne University, Celiso, **2.** Université Paris Descartes, EDA, **3.** Sorbonne Nouvelle University

At the heart of understanding the relationship between child language development and everyday experience is the linguistic anthropological perspective that views language as a form of social action and speaking as organizing social life (Duranti, 2011). This view puts interaction at the center of the organization of everyday life. It builds on the premise that language is a crucial medium for instilling and transforming socio-cultural competence across the life span (Schieffelin & Ochs, 1986). Language socialization research analyzes how and why young children are apprenticed through language into particular activities and how they learn the communicative skills necessary for inhabiting cultural identities.

In this study, social interactions during book-reading in mother-child longitudinal data were mined for culturally rooted ways in which adults and children coordinate modes of communication, actions, bodies, and objects, in the environment to enhance their knowledge and skills.

Two French children and two English children were filmed once a month in their family environment from 1 to 7 years old. We focused on book-reading situations as they naturally occurred during our video-recordings and on the unfurling of multidimensional ritualized scripts that associate an object (the book), manipulative actions, and specific language practices performed with a range of semiotic resources (gaze, facial expressions, gestures, speech). We identified two types of activities initiated by adults in book-reading situations based on their multimodality: 1) the visual medium provided by the pictures is used to make descriptions and ask questions complemented by pointing to guide the children to build their lexicon through labeling and to help them connect characters and events; 2) the vocal modality is used to tell stories and build the children's narrative skills. But book-reading also affords wonderful opportunities for adults to navigate between reality (the children's everyday life experience) and fiction (the events and characters portrayed through the pictures and the text). Those constant shifts elicit both displaced speech and affective comments. We hypothesize that early book reading routines between a child who cannot read and a parent are relevant situations for children's socialization to book reading. Book reading situations may also enhance children's capacity to identify and understand others' viewpoints and learn to subjectively position themselves using all the semiotic means they have at their disposal.

Our in-depth analyses of the longitudinal interactive data highlight the hybridity of the language productions in book reading situations that combine text that is read with spontaneous discourse, fictive and experiential narratives. Those hybrid productions enable adults to transmit and elicit specialized lexicon, morphology, syntax, co-verbal gestures and facial expressions. Children not only develop specific language practices, linguistic constructions and genres, but are also progressively socialized to a large variety of culturally relevant displays of stance as they build parallels between the characters and events being depicted and themselves as heroes of their own everyday lives.

# Society in Danger: Danish *samfundssind* 'society-mind' and the metapragmatics of pandemic discourse

Panel contribution

***Dr. Carsten Levisen***<sup>1</sup>

1. x

*Samfundssind* 'society-mind' is a Danish keyword of the moment – associated with pandemic discourse. Prior to the outbreak of the coronavirus in Denmark, the word had led a marginal life in Danish public discourse, but right from the beginning of the corona crisis management, the word achieved keyness. The rise of *samfundssind* as keyword for both understanding and navigating through the corona crisis was established through a series of press conferences where both political and medical Danish leadership jointly invoked the concept. As a compound composed of *samfund*'society' a metasocial construct, and *sind* 'mind', a personhood construct (Levisen 2017), *samfundssind* allowed for new ways of thinking and talking about the individual in society.

The aim of the paper is to provide a new metapragmatic account on the rise of *samfundssind*. Studying both the emerging meaning of the word, and the underlying cultural and situational scripts associated with the concept. The paper focuses on Danish public discourses in the beginning of the pandemic era in Denmark (i.e. from early March 2020 and onwards). The analytical frame of the paper is the NSM approach to pragmatics (Goddard & Ye 2017; Levisen & Waters 2017). The empirical frames for the investigation include single-case analyses of important press meetings, and social media responses to these meetings.

Studying *samfundssind* as a token of a medical, political, communicative, and linguistic crisis, the paper investigates the explanatory and guiding powers of this new keyword and the discourses it affords. The metapragmatic study on Danish *samfundssind* shows that the word has acquired new meanings, and in turn, new discursive affordances. One of the central new affordances is the "keying of messages", and the iconic invocation of a big, serious-sounding word for unusual, dangerous times. Another central affordance of *samfundssind* is that it allows leaders to speak with a cultural voice, rather than one of party politics.

# Socio-pragmatic meanings of the use of kinship terms in Japanese

Panel contribution

***Dr. Yoko Yonezawa<sup>1</sup>***

**1.** Victoria University of Wellington

This study aims to investigate the use of kin terms as address terms in Japanese, both inside and outside kinship relations. The study is part of a bigger cross-linguistic project investigating address practices in Chinese, Korean, and Japanese which share common socio-cultural values in acknowledging respect towards seniors in communication.

The honorific character of the use of kin terms towards seniors is observed cross-linguistically (Fleming & Slotta 2018). It is generally applicable to Japanese, along with Chinese and Korean when addressing senior kin (Suzuki 1973). However, the use of certain Japanese kin terms such as *obasan* ‘auntie’, *ojisan* ‘uncle’, *obaasan* ‘grandmother’ and *ojiisan* ‘grandfather’ towards non-kin seniors is said to have offensive connotations (Endo 1992). A recent online column reported that an increasing number of women have never experienced being called *obasan* ‘auntie’ (Tanaka 2020).

This study focuses specifically on the tendency described above that is distinctly Japanese compared to Chinese and Korean, and its influence on address practices in actual kin relations. The data consists of survey results (native speakers’ reported address practices inside and outside kin relations) and spoken corpora.

The survey results show that while almost all respondents reported that they would use kin terms to address their senior kin, when it comes to addressing non-kin seniors, the use of kin terms was rarely reported. Instead, the use of a name with a suffix *-san* ‘Mr/Ms’ was most commonly reported as a decent or respectful way to address senior acquaintances. A preliminary analysis of the spoken corpus also reveals that the fictive use of kin terms towards senior addressees is not easily found in daily conversations among acquaintances, but the use of name+*san* is again dominant. Interestingly, an impolite pragmatic value entailed by the fictive use of kin terms seems to influence address practices inside extended families. Nearly half of the respondents answered that it would be acceptable to use an aunt or uncle’s name to address them. One-third of respondents in their 20’s reported that they usually use names and nicknames to address their aunt and uncle. This tendency appears recent, being observed only in the responses of younger generations.

These findings may imply that the honorific character of the use of kin terms inside actual kin relations have universal relevance, yet the expansion of a kinship model of address practices to broader social relationships may have more culturally specific variations.

# Sociology of emotions in Iranian moral literature: Emotion experiences and expressions in Rose Garden

Panel contribution

***Ms. Afroz Rafiee<sup>1</sup>, Dr. Ad Foolen<sup>2</sup>***

***1. Radboud University Nijmegen, 2. Radboud University***

Moral literature provides researchers with a rich source which both shape and (re)present cultural understanding and interpretation of emotions in the broader socio-cultural context of a nation. This way, it contributes to track and trace the history of cultural experiences and expressions of emotion within society. Among Iranian moral literature, Saádi's *Gulistan* (*Rose Garden*) has gained high international impact (Durant, 1950) and remained popular in present time Iran. The book consists of eight chapters, each containing brief pieces of prose and poetry which deal with human issues. In this presentation, we aim at investigating emotion ideologies in *Gulistan*.

Following a dramaturgical perspective toward the sociological analysis of emotions (see, Turner, 2009) and particularly focusing on Hochschild's (1979) notions of emotion ideologies and feeling rules, we aim at answering questions such as: Which emotions are/should be experienced in which social settings? To what extent and how should emotions be expressed? In order to answer these questions, we do a content analysis of a selection of narratives in *Gulistan*. Where applicable, we will discuss how emotion experience and expressions as provided in *Gulistan* are embedded in the wider cultural context.

# Some uses of lexical repetitions in boxing instructions

Panel contribution

***Prof. Misao Yanagimachi<sup>1</sup>***

*1. Hokusei Gakuen University*

Boxing is an activity constituted through kinesthesia, where temporal (Deppermann and Günthner 2015) and spatial organization between a boxer and the opponent is crucial. This paper analyzes how participants ‘share’ (Mondada 2019) what is perceived as ‘pressing’ (Okada 2018) moments in boxing by examining a coach’s uses of some phonological features of self-repetition of lexical forms, e.g. NPs, in her instruction toward the boxer. ‘Pressing’ moments are boxing circumstances toward which the coach orients as requiring the instructed boxer’s immediate ‘bodily effort’ (Hofstetter and Keevallik, this panel). Co-experiencing the perception of these moments with recipients is accomplished (Hofstetter and Keevallik 2021) by the coach, often through deployment of particular phonological characteristics during her repetitions, e.g. latching, pitch or creaky voice. The current paper examines: 1) how these self-repetitions are produced within a coach’s instruction, focusing on their phonological features, 2) how these features relate to specificities and particularities of the moving bodies of the boxers, and 3) what actions these features display together with other multimodal resources in each local boxing circumstance.

Conversation analytic and ethnomethodological literatures have examined ‘self-repetitions’ for turn-management in everyday conversations (Schegloff 1987, Wong, 2000), but also for ‘corrective interventions’, ‘insisting on a prior instruction’ (Deppermann 2018), and responding ‘increasing urgency’ ‘with accelerated prosody’ (Mondada 2018) during driving lessons. In contrast, the current paper focuses on self-repetitions embedded within instruction in sports (c.f. Keevalik 2015), where the referential field primarily includes ongoing body movements (Okada 2018). For instance, in a sparring session, the coach sometimes tells the boxer to attack the opponent immediately by utilizing self-repetition, e.g. (after ‘hai (particle) let’s go with right double uppercuts’) ‘double (0.3) double=double=double’. These repetitions insist upon the prior instruction (Deppermann 2018), but also embody diverse meanings, matching the boxer’s progressing body movements; her first ‘double’ is produced before his compliance. This is when the boxer’s body pushes and nullifies the opponent’s right hand, and the coach tells the boxer to produce two consecutive uppercuts. In contrast, each word in the ‘second, third, and forth sayings’, i.e. double=double=double’, is pronounced with latching and overlaps the boxer’s progressing first uppercut (in the double uppercuts) and the opponent’s punch right after the first uppercut; directing him to immediately land ‘one more uppercut’. The latching between the repeated words shows that the coach treats the boxing circumstance as pressing (Mondada 2018), requiring the boxer’s immediate bodily effort, i.e. executing the second uppercut (in the double uppercuts) immediately after the first. This is evidenced by the coach’s subsequent assessment ‘right, double, good’, i.e. a ‘sequence-closing third’ (Schegloff 2017:118), regarding the boxer’s near-successful completion of the second punch. In sum, during self-repetitions, each repeated word can convey different actions, designed for the specific sequential and simultaneous contexts (Mondada 2018) of boxing circumstances.

Responding to Mondada’s call for more analyses regarding how participants ‘perceive, sense, and experience the world’ and how they ‘share’ ‘sensory’ experiences ‘intersubjectively’ (Mondada 2019), the present analysis analyzes relationships between lexical repetitions with particular phonological features and moving bodies in sport.

# Spanish pragmatic markers arising in the mid-century: a methodological challenge

Panel contribution

***Prof. Wiltrud Mihatsch***<sup>1</sup>

*1. University of Tübingen*

Unlike studies of linguistic changes of colloquial language before the 20<sup>th</sup> century, those dedicated to the (micro-)diachrony of the second half of the 20<sup>th</sup> century seem privileged for several reasons: we have recorded oral data, we may use apparent-time data based on judgements of speakers belonging to different generations and we even might have an intuition as speakers ourselves about ongoing or recent changes – and the quantity and accessibility of written data are overwhelming. However, there are some serious limitations when it comes to colloquial phenomena arising before the last third of the century, above all due to lacking oral data.

The present analysis (with a strong methodological focus) is devoted to a series of highly colloquial mitigation markers of Spanish which are translation equivalents of English *like*, for which D'Arcy (2017) offers a very detailed picture. I will focus on *tipo* and the diatopically more restricted markers *rollo*, *onda* and *corte* (cf. Mihatsch 2020b). These markers went through recent proceduralization processes with first traces in mid century and in the case of *rollo* and *onda* clear links to the counter cultures of that time. The aim of this contribution is to find out how to take advantage of corpus data from the 20th century for data before the emergence of oral data. On the basis of corpora (CDH, CORPES and COLA), complemented by metalinguistic testimonies, judgement data and semantic maps based on crosslinguistic comparisons (Mihatsch 2020a) I will analyze the constructions at the basis of the pragmatic markers and their roots in particular registers. By comparing and critically evaluating the data types I will try and shed light on the micro-diachrony of these pragmatic markers and I furthermore intend to contribute to an elaborated methodology for the study of microdiachronic processes of pragmatic markers in the 20<sup>th</sup> century.

# Speaking of probabilities, negative outcomes and intervention. A conceptual framework for analysing risk and crisis discourses

Panel contribution

***Prof. Georg Marko<sup>1</sup>***

*1. University of Graz*

According to Šubrt (2014), risk and crisis are related concepts that just represent different stages in a trajectory of a deteriorating situation. While risks are normally understood to be the potential of a negative development, crises are seen as the onset of the latter. High cholesterol levels in the blood and high blood pressure thus pose a risk, experiencing symptoms of angina pectoris is a (health) crisis. Relying on fossil fuels for mobility and transport poses a risk, droughts, major storms and hurricanes point to a (climate) crisis. The fact that risk and crisis both are often adduced to explain phenomena in the (late) modern world (cf. Beck 1986, Giddens 1991, Holton 1987, Gilbert 2019) underlines their conceptual proximity. However, there are also major differences between the two, especially the fact that risks and crises have their own sets of interventions – for risks this is prevention, for crises this is containment and mitigation.

This paper takes a social constructionist approach to the study of risks and crises, seeing them not primarily as objective scenarios in a material reality, but rather as interpretatory templates that we impose on the world to make sense of it, templates which we create and maintain through the ways we are using language. To understand risks and crises, how they relate to each other, and how and where they differ and what the sociocultural implications of all of this are we thus have to examine discourses concerned with these concepts.

The main objective of this paper is to develop a conceptual framework for discourse analytical research into risks and crises. This means postulating different essential and optional components defining and characterising, but also distinguishing and differentiating risks and crises and listing linguistic elements representing these components. In its constructionist orientation, the framework accounts for how the use of different linguistic elements can foreground and intensify or background and mitigate components, thus representing situations as more or less risky or crisis-prone and resulting in more or less alarmist communication.

To demonstrate the applicability of the framework, the paper will also include a corpus-based sample analysis comparing a discourse in which the notion of risk features prominently, namely self-help books on cardiovascular diseases (represented by a 3.5-million-word corpus) with a discourse associated with a crisis perspective, namely news and feature articles on the opioid crisis in the United States (represented by a 1-million-word corpus).

# Speech act uptake and accountability

---

Panel contribution

---

***Prof. Marina Sbisà<sup>1</sup>***

**1. University of Trieste**

While the securing of uptake is recognized as a necessary condition of illocutionary success, there are different views about how it works. I shall focus on a recently proposed distinction that singles out a ratification view, a strong constitution view and a weak constitution view. The ratification view claims that the illocutionary act that the speaker intends to perform fails, if the audience does not recognize it. The strong constitution view claims that the audience's uptake determines what illocutionary act the speaker has performed. The weak constitution view claims that the audience's uptake determines whether the speaker has performed an illocutionary act within a reasonably limited range, or has failed to perform an illocutionary act altogether. The three views have implications for the accountability of agents for what is done with words in their linguistic exchange, since they imply specific forms and degrees of co-responsibility of speaker and audience. I shall discuss these implications, making reference, as to "accountability", to the distinction between an agent's bare (that is, non-moral) responsibility for whatever she brought about and her ability to account for what she has done as well as for other features of the linguistic exchange's interactional dynamics. I shall argue for a version of the weak constitution view and for a view of the agents' accountability for speech acts compatible with it. I shall keep in the background, but not forget about, the problems raised by differences in degree of formality of illocutionary acts, which often, albeit not always, correlate with the public vs private dimension of the speech situation.

# Stance-taking and the role of laughter in the context of negotiations of cultural identities connected to food in ELF Skype conversations

Panel contribution

**Ms. Marie-Louise Brunner**<sup>1</sup>

1. Trier University of Applied Sciences

This paper analyzes identity negotiations which are connected to discussions of food, a favorite topic in conversations between strangers in data taken from international Skype conversations between unacquainted interlocutors who communicate using English as a Lingua Franca (ELF) (ViMELF 2018). ELF refers to the English used as a common means of communication between non-native speakers of English who do not share the same first language. Previous research has shown that food can be used to create identities (Brunner & Diemer 2018, Brunner et al. 2018), compare cultures (Brunner et al. 2014), and demonstrate expert knowledge (Lakoff 2006, Diemer and Brunner 2020). Speakers frequently position themselves within these complex cultural and expert identities (Benwell and Stokoe 2006, Davies and Harré 1990, Bucholtz and Hall 2005) and showcase their stance towards and alignment with particular topics in the interaction (DuBois 2007, Goffman 1981, Stokes and Hewitt 1976, Brunner 2020). Findings from the present study show that ELF speakers frequently take a stance and position themselves in a particular cultural tradition by illustrating their expertise and knowledge of the topic under discussion, specifically food. The interlocutor then reacts to this by taking their own stance with regard to what was said, either conceding or challenging a prior speaker's expert status, creating a co-expert status, or creating an alternative expert identity in opposition. These negotiated stance-taking practices are frequently accompanied by laughter which functions to mitigate problematic issues and opposing opinions, lessen the imposition and potential face-threat involved in positioning oneself as expert, and, in the context of reciprocal laughter, create rapport and common ground. In some cases, interlocutors also oppose their own joint position to that of an external Other, which may be emphasized by laughter as well (i.e. laughing about the Other). In sum, intercultural conversations about food incorporate a variety of cultural (expert) identities which are negotiated through various stance-taking practices. These practices are highlighted and supported by laughter as one central means of positioning oneself within such complex negotiations of cultural identities. Findings of this paper contribute to identity research and underline the role of laughter in food discourse.

# Stay alert, control the virus, make memes: A multimodal social semiotic analysis of UK internet memes during the Covid-19 pandemic

Panel contribution

***Ms. Avery Anapol<sup>1</sup>***

**1. UCL**

As work, leisure, and social activities moved online during the coronavirus pandemic, internet memes in the form of images, videos, and songs became more popular than ever as tools of communication. During the pandemic, memes were used to shared information about public health practices like hand-washing and mask-wearing, to spread disinformation and conspiracy theories about the virus, to make jokes about new shared experiences within communities, among many other functions. These memes can be viewed through a social semiotic lens, as culturally-shaped, motivated signs representing a variety of discourses about the many unique experiences of the coronavirus.

I argue that in the UK context specifically, memes were an important resource for the public to express dissatisfaction and confusion about the government's guidance to "Stay Alert, Control the Virus, Save Lives", trending on Twitter and earning media coverage. The social conditions of the coronavirus lockdowns (more consumption of and participation in online content; a global desire for entertainment and humour) means that memes were more accessible and spreadable than ever – many online communities were organised on Facebook based on the creation and sharing of memes.

The "Stay Alert" slogan, introduced as the first wave of COVID-19 passed, was a popular target of political memes created and shared in the UK. The designs of the memes are representative of discourses related to public health and politics within the UK coronavirus context. One possible interpretation of the "Stay Alert" memes is as sites of *delegitimising discourse*, used to undermine and reject the authority of the UK government and Prime Minister Boris Johnson's efforts at regulating public behaviour.

This study uses a theoretical approach rooted in multimodal social semiotics and discourse analysis to examine a selection of humorous memes created in response to the "Stay Alert" messaging. The analysis will focus specifically on examples of these memes, to examine how public discourses about the coronavirus and the UK government's response are represented through selection and combination of specific semiotic resources. The analytical categories draw from Kress and Van Leeuwen's framework of visual social semiotics, as well as Bezemer and Kress' theories of recontextualisation in multimodality.

# Straight man cancer and little fresh meat: Neological gender labels challenge the existing gender order in the Chinese digital world

Panel contribution

***Ms. Jun Lang<sup>1</sup>***

**1.** University of Oregon

This study examines two neological terms in Chinese cyberspace: *zhínnán-ái* ‘straight man cancer’ and *xiǎofresh meat* used as gender labels on men. The former refers to outspoken misogyny, while the latter describes men whose traits include a youthful appearance, a fair complexion, and physical attractiveness (Li 2020, Shi & Jing-Schmidt 2020).

This study integrates naturally occurring data from social media and subjective data from a survey. To retrieve social media data, I first conducted advanced searches on Weibo, the Chinese counterpart of Twitter, for the keywords ‘straight man cancer’ and ‘little fresh meat’ to collect blogposts between February 10th and February 17th, 2020. I then performed an attitude analysis and examined the top100 high-frequency collocates in both datasets. To collect perception data, I designed an online survey and distributed it only to female native speakers of Mandarin Chinese in Mainland China to elicit their perceptions of men labeled ‘straight man cancer’ and ‘little fresh meat’. A total of 204 Chinese women voluntarily participated in this anonymous survey and 193 responses were valid.

My findings show that ‘straight man cancer’ commonly co-occurs with words containing emotional negativity while the collocates of ‘little fresh meat’ are relatively positive. Female language user perceptions from the survey confirmed that ‘straight man cancer’ is perceived as significantly more negative than ‘little fresh meat’ ( $X^2 = 168.62, p <.001$ ). Additionally, perceptions of ‘straight man cancer’ are more related to men’s internal personal traits such as personalities and their viewpoints of gender roles in relationships and family lives, whereas perceptions of ‘little fresh meat’ are more associated with men’s occupations, appearances, and clothing styles. This study explores how neologisms reveal social changes and how pragmatic practices index gender identity in gender discourse (Jing-Schmidt & Hsieh 2019, Silverstein 1992). I argue that these gender labels evoke contemporary Chinese women’s collective socio-emotions, conveying their joint revulsion against misogyny and expressing an anti-macho aesthetic through linguistically sexualizing men, which seems to overturn the traditional gender order that women are sexualized, objectified, and commodified (Jing-Schmidt & Peng 2018, Lakoff 1973). This study has implications for both gender research and social actions toward gender equality.

# Strategies of memory work in a lifespan pragmatics perspective

Panel contribution

***Prof. Annette Gerstenberg<sup>1</sup>***

***1. University of Potsdam***

Not only memory changes in old age; its very meaning changes too. This is addressed in the proposed paper as memory work, based on case studies of a longitudinal project in which several life history interviews were conducted over a period of ten years. Due to its largely stable nature, the “same” content appears across different variants, recorded in the development from so called “normal” age to the manifestation of cognitive impairment and Alzheimer’s dementia.

Kitwood emphasizes how important life history knowledge is as a resource, and defines one of the goals of dementia care is “to maintain personhood in the face of failing of mental powers” (Kitwood 1997: 84). This perspective on losing such cognitive abilities as memory was enhanced when viewed in combination with the perspective on speaker strategies in actively dealing with one’s own vulnerability. For example, Matsumoto (2009) reads the interactive embedding of painful self disclosure as a way of dealing with weaknesses: “a chance to relate a compelling story at a social occasion, and a vehicle by which to regain normal life” (Matsumoto 2009: 948). Hamilton (2019, chapter 5) examines the challenges in identifying and facing issues when telling personal experience narratives under the conditions of dementia; understanding these stories as meaningful becomes possible when they are reinterpreted as snapshots. In this way, interest in analysis can move on from the deficit aspects of storytelling.

In this contribution, we show how elements of memory work can be integrated in such an approach: they indicate an active handling of one’s own memory and the knowledge stocks available. Means of memory work will be identified and examined in a longitudinal and multidimensional approach, we include interactions with family members, the spouses, residents of the retirement home and an interviewer. The various introductions, comments or gap fillers of the stories’ variants allow an approach to the question what significance remembrance itself has for the speaker, beyond the remembered content. For example, when the speaker uses “this has marked us” to emphasize the narrative variant as having been experienced by the speaker him or herself, details in the narrative are available, and the role of the contemporary witness in the intergenerational dialogue is fulfilled. By contrast, when dealing with fragmentary memories, repeated comments such as “that was long ago” attract attention, normalizing the omission of details which cannot be remembered at that particular moment. The formula “this has marked us” and “that was long time ago” could be read as elements of positioning (van Langenhove & Harré 1993) and by their formulaic use (Wray 2000). With the proposed new reading as memory work, applying a lifespan pragmatics perspective, we would like to highlight their special function and varying use over the years. We propose to read the formula as instances of memory work that indicate an adaptation to the current life situation. Paying attention to these strategies, the paper argues, can be a resource for inclusion that takes the speakers’ perspective into account.

# Studies on Chinese Apology: A Meta-Analysis

---

Panel contribution

---

**Ms. Puyu Ning<sup>1</sup>, Prof. Jarko Fidrmuc<sup>2</sup>**

***1.*** Research Institute for Linguistics, Hungarian Academy of Sciences, ***2.*** Zeppelin University

Ever since late 20<sup>th</sup> century, following the Cross-Cultural Speech Act Realization Patterns project (CCSARP), speech acts research on the realisation strategies of apology across lingua-cultures has boomed. Among these works, research involving Chinese apology stands out especially in the abundant comparative studies among different lingua-cultures. The strong concept of face and the highly ritualised linguistic tradition of Chinese apology intrigue researchers and make it appealing to contrast the Chinese linguistic behaviours to other lingua-cultures. The Chinese apology study also poses challenge to the traditional Anglo-Centric speech act theories. Since there has been no unanimously agreed framework of Chinese apology strategies so far, and different comparative studies have highlighted various linguistic features of Chinese apologies, the present study aims to conduct a meta-analysis of research on Chinese apology with a focus on the realisation strategies in order to discover the essential linguistic formulae of Chinese apologies and detect factors that could affect the apology strategies in Chinese.

We collect 370 apology studies involving Chinese lingua-culture published in English (Scopus) and Chinese (CNKI) in the past 30 years, which discuss the usage and frequency of the essential apology strategies/components. Diverse types of data are investigated in the research, including naturally occurring datasets, experimental datasets and corpora studies. These studies also cover the apology research in Chinese, comparative studies between Chinese and other lingua-cultures, such as English, Japanese, Korean, etc., Chinese interlanguage apology research and dialectological variation studies. We convert and synchronise the statistical data to depict the contour of the Chinese apology by finding the aggregated statistical results in the employed strategies. By using various statistical methods, we analyse whether different data sources, empirical methodologies, sub-types of apology, Chinese language proficiency, gender and regional differences could exert significant influence over the Chinese apology strategies. Our findings also underline the importance of more systematic research on this subject and a better documentation of research details in apology speech act studies. More importantly, the statistical results pose challenges to the existing comparative framework in cross-cultural apology studies involving Chinese and provide important theoretical implications for future comparative research in the speech act of apology among different lingua-cultures.

# Sub-discussions as a means to reach “argumentative synchronicity” on material starting points in adult-children talk

Panel contribution

**Prof. Sara Greco<sup>1</sup>, Prof. Anne-Nelly Perret-Clermont<sup>2</sup>**

*1. Università della Svizzera italiana, Lugano, 2. University of Neuchâtel*

In this paper, we interpret synchronicity in talk between children and adults from the perspective of argumentation. As synchronicity “can be observed and is directed at working on different levels of the constitution of interaction” (Hannken-Illjes & Bose, 2019), we consider argumentative sub-discussions that redefine *material starting points*, which constitute the shared *common ground* of participants, as a means to reach synchronicity. On the face of it, synchronicity and argumentation may be seen as opposite phenomena: argumentation is often understood to include some form of dissent or disagreement (Lewiński & Mohammed, 2016). Research in developmental sociocultural psychology has shown that such disagreement, in the form of *socio-cognitive conflict*, is important for cognitive development and learning (cf. Carugati & Perret-Clermont, 2001). Is there a place for synchronicity in argumentation? We advance the hypothesis that synchronicity is necessary as a preliminary agreement on “material” starting points (van Eemeren & Grootendorst, 2004; Rigotti & Greco, 2019) that constitute the participants’ common ground. In the absence of shared starting points, argumentation is futile (van Eemeren, 2018, p. 37). Therefore, when they discover discrepancies in starting points, participants have the choice to open argumentative sub-discussions to redefine them, as a repair mechanism that allow synchronization of shared material premises on which the argumentative discussion is based.

We illustrate this hypothesis analyzing sub-discussions on material starting points in informal family interactions between adults and young children (2-6 years), relying on a multilingual corpus recently collected in Switzerland. Our analysis considers argumentation as an interaction, following the pragma-dialectical model of argumentation (van Eemeren & Grootendorst, 2004). Moreover, in order to reconstruct material starting points and the sub-discussions opened to re-negotiate and synchronize them, we rely on the Argumentum Model of Topics (Rigotti & Greco, 2019), which enables a reconstruction of implicit premises of argumentation in connection to the participants’ interaction.

Our work contributes to a recent stream of studies that concentrate on young children’s contributions to argumentation by looking at their natural talk in interaction. In particular, this work introduces an argumentative interpretation of synchronicity.

# Supporting students with communicative disabilities in school - The roles of companions in whole class interaction

Panel contribution

**Dr. Maja Sigurd Pilesjö<sup>1</sup>, Dr. Helena Tegler<sup>2</sup>, Dr. Niklas Norén<sup>3</sup>**

**1.** Department of Language and Communication, University of Southern Denmark, **2.** Department of Sociology, Centre for Social Work (CESAR), Uppsala University, **3.** Department of Education, Uppsala University

In classrooms, students with severe speech and physical impairment rely on explicit support by a person in their surround and various tools that augments and complements their interaction with others (Tegler et al., 2020). In Sweden, students with severe speech and physical impairment can be included in smaller education units within the regular curriculum. They have daily individual support from personal assistants that follow them through the school day and at home. Research on these smaller education units, however, is yet limited. Despite these students' dependence on support persons in their immediate surround, there is still little known of the roles such companions play for the students' inclusion in social and pedagogical activities at school.

In this Conversation Analysis study, data were recorded in special education classes for students with motor impairment (Rörelsehinderklass, RH-klass) in 6th grade. The classes had 6-8 students with severe speech and physical impairment due to Cerebral Palsy or acquired brain damage. During whole class interaction, led by the teacher, each individual student was accompanied by one personal assistant. The recordings are part of a larger video material, where four children (12 yrs) were followed and video recorded during one day each, beginning at school and ending at home in the evening. During the day, the four children interacted with their usual everyday communication partners (mainly personal assistants, teachers, and parents, but also siblings and class mates). They all used Blissymbolics communication boards during whole class sessions.

The analysis focused on sequences of interaction where the students' companions intervened to facilitate and support the students' participation during classroom talk. The analysis looked closer at how and by whom the companion's interventions were initiated - the student, the companion or the teacher? When did such interventions occur? What did they achieve? In what ways did companions' interventions affect the students' opportunities to display individual knowledge and competencies within the pedagogical activities?

Findings indicate that companions mainly intervened when the student was requested to answer exam questions from the teacher. Help was mainly offered without explicit recruitment actions, but was sometimes requested by the teacher when the assistant was out of place. The companion's role was first to co-produce the student's answer via the board by using scanning techniques, and then to take the footing (Antaki 2018) of the student when saying the answer aloud. Such voicings were sometimes responded to as the child's voice and sometimes as the assistants' voice. These roles and how they were responded to are interesting in terms of the way they affected these student's possibilities to display knowledge within the classroom and participate as competent members of the pedagogical activity.

# Suspects' opportunities to claim their legal rights in police investigative interviews

Panel contribution

***Ms. Aafke Diepeveen<sup>1</sup>, Prof. Jan Svennevig<sup>1</sup>, Dr. Paweł Urbanik<sup>1</sup>***

*<sup>1</sup>. University of Oslo*

When interviewed by the police, suspects are to be informed that they have the right to remain silent and the right to obtain the assistance of a defense counsel. They should also get the opportunity to take a stance on whether or not they want to exercise these rights. In this paper, we investigate how it is established in interaction whether a suspect wants to carry through with the interview, or end it by invoking his rights. The study uses Conversation Analysis (CA) as a method and the data is a corpus of audio recordings of authentic police interviews conducted in Norway. First, we present an overview of the data set showing whether suspects are asked explicit questions that give them the opportunity to make a decision about their right to silence and their right to legal counsel. Second, we investigate variation in the design of such questions, concentrating specifically on expressions involving a preference for one response option over the other. Third, we discuss other formulations that may encourage or discourage suspects to make a free and independent decision. While informing the suspects about their rights, police investigators may promote active stance-taking by underlining the suspect's right to make a decision. In contrast, they may discourage such stance taking by referring to the forthcoming interview as an unconditional fact, thereby presupposing that the suspect will make a statement, or by presenting the different options in a way that is biased in favor of waiving one's rights. These findings have important implications for the safeguarding of suspects' rights and may form the basis for recommendations to the police about how to give suspects the opportunity to take a stance on exercising their rights.

# Suspects' reliability through the eyes of written report's recipients

Panel contribution

***Mr. Ryan Reynaert<sup>1</sup>, Mrs. Sofie Verliefde<sup>1</sup>, Prof. Bart Defrancq<sup>1</sup>***

***1. Ghent University***

The written record of a suspect's statement, along with the material evidence, plays a crucial role in the Belgian judicial system. It is produced as an authoritative document which serves as a basis for decision-making by judicial authorities at every step in the criminal law process (Komter 2006, Smets & Ponsaers 2011, van Charldorp 2011). As the written record is constructed through a complex process transforming the suspect's oral narrative into a formal and institutional piece of writing, linguistic studies have hitherto predominantly examined the ways in which the written record is discursively constructed during the police interview. Despite the importance of the written record, considerably less attention has been paid to its perception during the further stages of the judicial process. Whereas the written record is expected to affect judicial authorities' evaluation of a suspects' credibility, among others (De Keijser, Marsh et al. 2012), the present study aims to identify which factors, discursive or other, determine the way a suspect's image is construed in the mind of the recipient of the written record. Reception studies are a necessary complement to discourse-analytic studies to find out whether the discursive potential of the written record triggers the expected effect. To find out how a written record is approached, we organised interviews with 6 investigative judges (*onderzoeksrechters*) in the Bruges Area in Flanders. A Belgian investigative judge leads a criminal investigation and reports to the Prosecutor's Office. Written records of suspect statements are submitted by the police to the investigative judge. We proceeded according to a PEACE interviewing technique (Böser 2013; Mulayim, Lai & Norma 2015; Howes 2019; Bull & Baker 2020), submitting a written record drawn from our corpus to the judges while giving them first the opportunity to speak freely about the elements that draw their attention and about the suspect's credibility. Following that, we questioned the judges about their impressions, while focusing on particular discursive elements in written records. Results show that most judges underline the importance of other pieces of evidence in the case file and of the extent to which a suspect's statements and the other evidence concords. In particular, instances of minimizing the seriousness of particular events by the suspect, as well as inconsistencies, draw attention. Most judges in fact agree that written records containing such minimized version of events undermine the suspect's credibility to some extent. Finally, investigative judges also insist on the coherence of the timeline of events, while this is known to be an area where police officers drafting the written record take considerable liberty with the statements as they are volunteered by suspects (van Charldorp 2011).

# Sustainable periods “and not voting for the Tories”: multi-authored stance-taking in YouTube period product reviews

Panel contribution

***Dr. Susan Reichelt<sup>1</sup>, Ms. Luisa Grabiger<sup>2</sup>***

***1. University of Konstanz, 2. Universität Greifswald***

Alternative period product review videos show potential for aligning with multiple calls for social change: from sustainable waste-free living, to inclusion of all gender identities when talking about menstruation, to basic education about stigmatized topics.

## Theoretical settings and research focus

The theoretical base of this presentation is the sociolinguistic concept of stance, i.e. “taking up a position” (Jaffee 2009: 1), both in terms of constructing subject positions (social roles), and maintaining social relationships within digitally-driven Communities of Practice (CoP, after Eckert 2006). YouTube, as a “complex discourse environment” (Androutsopoulos & Terreick 2015: 354), allows for a two-pronged approach in investigating possible calls for action. Firstly, we analyse stance-taking multimodally, including platform-specific spoken discourse, meta-textual deictic elements, and body language. Secondly, we explore the dynamic interactions in the comment sections, following the framework of participatory culture (Burgess & Green 2018: 10).

As such, this paper addresses the following research questions:

1. What social roles are reproduced through multimodal stance-taking in period product review videos?
2. How are stance strategies negotiated in the CoP?

## Analysis

To answer these questions, we have compiled a specialized corpus of alternative period product reviews and their corresponding comments. The data presented here reflects findings from a case study that includes a total of ten videos from UK YouTubers. An initial multimodal analysis focuses on the YouTubers’ strategies when i) framing the topic of their video, and ii) engaging with their audience. A secondary analysis focuses on the commenters’ engagement with the videos’ content and the communities’ performed stance aligning with the call for social change.

Our findings suggest that the strategic stance-taking indexes a variety of social roles. Multimodal acknowledgements of existing stigma and the sharing of intimate experiences are contributing to the CoP by inspiring audiences to share their own preferences (ex.1). Meta-textual links in the video itself, as well as in the comments section, help define the existing CoP (ex.2). Further, previous stigmatized stances and limited inclusivity surrounding menstruation are meta-discursively negotiated (ex.3-4).

1. Where's my menstrual cup squad at?
2. that moment when Hannah mentions weak pelvic florr muscles and you start doing kegels thanks to her other video. Lol
3. i love that you've done this! i swear by reusable products and really like that there is more awareness being drawn to them [...]
4. as a trans boy who uses cloth pads, fricking thank you for using gender neutral language [...] it means a lot!!

This paper highlights the performed interdependency between social actors and activism. Such dynamic interactions, shown here through videos on sustainable period products, have the potential to increase awareness and foster critical engagement with social movements.

# Synchronised activities in improvisation: Focusing on a high point of co-producing interactions

Panel contribution

***Dr. Ayako Namba<sup>1</sup>***

***1. Kwansei Gakuin University***

The role of a listener in interaction has gradually been drawn attention from scholars conducting communication research (e.g. Goffman 1981; Gumperz 1982; Gardner 2001; etc.). Such studies in Japanese interaction include ‘listener talk’ (Yamada 1997), ‘listener responsibility’ (Hinds 1987), and ‘kyo-wa (collaborative talk)’ (Mizutani 1993). The majority of the behaviours conducted in such existing studies have investigated *aizuchi*, nodding, and verbal responses. Although the focus of such studies is likely to examine interactional or discourse functions in a single behaviour, there is still room to reveal a systemic process of communication dynamics based on simultaneity and co-occurrence of multi-behaviours in co-producing ongoing interactions. Synchronised activities between participants based on listenership behaviours likely play a significant role in reaching a high point of such interactions.

By illuminating such a high point, this paper aims to explore how synchronised activities between co-participants could contribute to making an improvisation and then reaching the co-producing interactions. In particular, the simultaneity and co-occurrence of multi-verbal and nonverbal behaviours are conducted in style-shifting analysis. In addition, the simultaneity and co-occurrence in synchronised activities are argued by drawing on the notion of ‘multivoicedness’ (Bakhtin 1981) and the Theory of *Ba*(Shimizu 2004). In particular, synchronised activities at a high point of the ongoing interaction are analysed drawing on the ‘improvised model’ from the theory.

The data for the above analyses consist of 6.1 hours of video-recorded multi-party conversations in Japanese. Four participants joined in each session and eight total sets were conducted. Data collection was conducted in August 2014 at a Japanese university. All of the participants were college students aged 18–21, and their relationships were based on close classmates taking the same course and close friends in the same club activities. The analyses reveal the following three key findings. First, three nonverbal and verbal behaviours (repetitions, simultaneous and shared laughter, and collaborating gestures) were significant for shaping synchronised activities in improvising a high point of the ongoing interaction. Second, under such improvisations, quoting and mimicking someone’s voice and action played a role in creating and further spreading continuous synchronised activities. Sharing and joining such ‘multivoices’ have brought about a great deal of the ongoing co-creating interaction. Third, diverse style-shifting in fulfilling multiple roles embedded in the ongoing improvisation reflected a flexible and creative communication process through the synchronised activities.

# Syntactic elaboration: the case of auxiliation in the communicative distance

Panel contribution

***Prof. Bert Cornillie<sup>1</sup>, Dr. Malte Rosemeyer<sup>2</sup>***

***1. KU Leuven, 2. Albert-Ludwigs-Universität Freiburg***

Over the last decades the continuum between communicative immediacy and communicative distance has been a much-debated topic in Romance linguistics (Koch & Oesterreicher 1990; Kabatek 2005; López Serena 2020). Research on the various discourse traditions along this continuum has led to a more refined description of the anchoring of linguistic subsystems in certain communicative and sociolinguistic contexts. On the side of the communicative distance, more complex (elaborate) clause combining has been accounted for in terms of more complex junction patterns (Raible 1992). Yet, syntactic elaboration on the sentence level has received less attention. Syntactic elaboration can be defined as the creation and use of new and more specific expressions replacing others, which were often polysemic or ambiguous.

In this paper, we will argue that additional evidence is needed to account for syntactic elaboration processes beyond “junction” expressions. In particular, we hypothesize that syntactic elaboration on the sentence level can be attested in the elaboration of the verbal group through auxiliation. Old Spanish saw the rise of a number of new verbal periphrases based on auxiliaries such as *amenazar* ‘to threaten’, *prometer* ‘to promise’, *parecer* ‘to seem’, *resultar* ‘to result’, *deber/deber de* ‘have to’ in the modal domain, and *haber* ‘have’, *estar* ‘be’, *andar* ‘go’, *venir* ‘come’ in the temporal domain. Our hypothesis makes the prediction that these innovation processes were bound to discourse traditions belonging to the communicative distance.

In order to test this claim, we analyze the development of these auxiliaries in quantitative longitudinal studies (4626 examples) in two historical corpora of Spanish: the *Corpus de documentos Españoles Anteriores a 1800* (GITHE 2018) and the *Corpus diacrónico del español* (Real Academia Española 2018). Our analysis shows that, in all cases, syntactic elaboration takes place in discourse traditions belonging to the communicative distance and that differences in frequency point to an unequal spread over these discourse traditions. Thus, we will show how dimensions of the grammar of distance emerge from specific processes of selection and innovation. The paper illustrates that the prestige of linguistic forms consists in a certain degree of complexity fitting in the domain of scripturalness. By adding auxiliaries to clause combining and discourse markers, we disentangle the mechanisms behind advanced written language elaboration.

# Taking Part in Peer Argumentation: Multimodal Repetitions in Children's Collaborative Co-Constructs

Panel contribution

***Ms. Nora Schönfelder***<sup>1</sup>

**1.** University of Wuppertal

Starting from a conceptualization of the term “synchronization” as the intrapersonal and interpersonal coordination of multimodal resources (Deppermann & Schmitt 2007), the paper examines how children establish and display collaborativity when co-constructing arguments together. It shows that collaborativity is not only achieved on the verbal level; children also contextualize collaborativity through *multimodal synchronization*, e.g. by repeating or ‘mimicking’ each other’s gestures.

While co-constructions can be used to establish both dissent and consensus in conversational argumentations, we will focus on collaborative co-constructions within which second speakers either complete or expand an argument made by the previous speaker (Kreuz in press). Previous research mainly focused on the use of lexical and syntactical resources, but we know little about the role of multimodal resources for accomplishing co-constructed arguments (but see Heller 2018 and Yasui 2013 for argumentative talk in general and Yasui 2013 for joint brainstorming). Addressing this gap, the paper examines how participants use (different forms of) multimodal synchronization to contextualize collaborativity when co-constructing arguments.

The data comes from a corpus of ten videotaped group discussions of children aged between 6;1 and 13;6. Drawing on multimodal conversation analysis, the paper focusses on “repetitions” of gestures. In argumentative co-constructions, the second speaker may repeat parts of the first turn (Arendt & Zadunaisky Ehrlich 2020), e.g. to demonstrate collaboration. The analysis shows that repetitions are not only a verbal but also a multimodal phenomenon: often, the second speaker also mimics (or repeats) the first speaker’s gesture within collaborative co-constructions by indicating a strong coherence between his turn and the turn of the first speaker. Furthermore, the multimodal synchronization between the first and the second speaker makes the collaboration publicly visible for all participants of the interaction.

The talk concludes with discussing the relation between argumentative co-constructions and “doing participation”.

# Talk in the Dorm: A corpus-based study of the utterance-final pragmatic marker BA in Mandarin by L1 and L2 speakers

Panel contribution

**Ms. Chen Chen<sup>1</sup>, Dr. Wenhao Diao<sup>1</sup>**

***1. Department of East Asian Studies, The University of Arizona***

This study uses a corpus of peer talk between Mandarin L1 and L2 speakers to examine the inter- and intra-group variations in their use of the utterance-final pragmatic particle BA. Mandarin Chinese has language specific ways of expressing stance, and with the growing number of Mandarin L2 learners, there is a pressing need to investigate L2 learners' use of Mandarin pragmatic markers in discourse. However, existing Mandarin learner corpora are typically based on responses to prompted tasks, rendering them not ideal for pragmatic research (Culpeper et al., 2018).

A corpus-based approach can reveal how L2 learners use pragmatic markers in discourse and how it may differ from L1 speakers (Staples & Fernández, 2019). This study uses a newly constructed corpus, DormTalk, that consists of natural conversations between L2 learners of Mandarin and their native-speaking peers in a study abroad setting. Study abroad provides opportunities for L2 learners to engage in situated use of target pragmatic forms, though variations in L2 pragmatics often exist (Taguchi, 2016). Utterance-final particles are important pragmatic markers in oral communication (Cook, 1999); in Chinese they can accomplish epistemic and affective work (Wu, 2004; Xiang, 2011). In the specific case of BA, while recent research based in L1 contexts has highlighted its potential to mark stance and convey subtle pragmatic meanings (e.g., tag questions, Ljungqvist, 2010), its role as pragmatic marker has not been explored among L2 learners.

The DormTalk corpus contains 334,899 tokens of Chinese characters or English words that were transcriptions of dyadic conversations between 17 Mandarin L2 speakers and their 17 Chinese roommates. Interviews and surveys were also conducted with each speaker. We began with frequency and keyword comparisons to capture quantitative differences in the use of BA between the L1 and L2 groups. Collocation analyses were then conducted to identify and compare BA's pragmatic functions in the immediate context by L1 and L2 speakers. Then, qualitative analysis was performed to reveal the functions of BA as a pragmatic marker in discourse (Andersen, 2001), and inter- and intra- group variations were further investigated qualitatively by incorporating the qualitative data. Finally, a post hoc analysis was conducted by comparing the findings from the corpus with the presentation of BA in popular Chinese language textbooks in North America.

Our results highlight that in L1 speakers' discourse, BA allowed speakers to form tag questions, reduce level of certainty, and convey compromises and gentle disagreements. In comparison, the L2 learners used BA significantly less frequently and for limited functions. Intra-group variations were also found in both L1 and L2 groups. Among the L2 learners, those who had exposure to Mandarin during childhood produced more BA and used it for more pragmatic functions. Furthermore, the post hoc analysis shows that the use of BA among L2 speakers corresponds to its presentation in the textbooks. We conclude with implications for future research and teaching of L2 pragmatic markers.

# Talking about corona in different languages – Native/non-native online conversations in English and Spanish

Panel contribution

**Dr. Susana Fernández**<sup>1</sup>, **Dr. Marie Christine Appel**<sup>2</sup>

**1.** Aarhus University, **2.** Universitat Oberta de Catalunya

In this presentation we intend to discuss how Spanish and English speakers who participated in a Tandem MOOC in the spring of 2020 (<http://mooc.speakapps.org/>) to practice English and Spanish as a foreign language, respectively, talk about corona and the impact the pandemic has in their lives. Participants in the Tandem MOOC met via a videoconference tool integrated into the course platform that launched a conversation activity that consisted of one task in English and one in Spanish. The tasks for the first week were designed around the topic of the COVID pandemic and lockdown. The data collected for the purposes of this study are video recordings of participant conversations during the first week of the Tandem MOOC. We will analyze how each of these language groups talks about the issue in their native language as well as in their foreign language. We will identify topics and focus points for each language group and we will explore whether changing the language of conversation implies a change in discourse or in the kind or strength of emotions conveyed.

# Talking about racism in cross-ethnic narrative therapy – use of detail, constructed dialogue, and internal evaluation

Panel contribution

***Dr. Shoko Yohena<sup>1</sup>***

***1. Ferris University***

This study examines a video-recorded narrative therapy session between a white Canadian therapist and African-American clients (11-year-old youth and his mother) in the U.S. (Madigan 2011). The study explores how the topic of “racism” was handled in cross-ethnic therapy, focusing on the use of detail, dialogue, and internal evaluation (Labov 1972) in the story-telling of the African-American mother.

Tannen (1989; 2007) pointed out that internal evaluation (i.e., the points of the stories are embedded in the ways stories are told rather than explicitly stated from outside) contributes to the creation of involvement by inviting listeners into the process of sense-making. She further argued that detail, dialogue, and repetition play essential roles in creating intertextuality and guiding listeners to appreciate and seek the correct interpretations of the stories.

In the current study, the mother frequently used internal evaluation in response to the therapist’s questions regarding racism. Yohena (2017) indicated that the mother’s hesitant tone and avoidance of the word “racism” were in contrast to the therapist’s overt use of “race” and “racism.” In the present study, it is further argued that details and constructed dialogue in the mother’s story serve as signals of important turning points and suggest justification of her story line (i.e., even though her son was accused of assault against his white classmate, the real issue was racial discrimination at school).

For example, the details of the skin colors of the students in trouble were not mentioned until later in the therapy, but once it was mentioned, it foregrounded the presence of racial conflicts at school. The story took an important turn.

When internal evaluation was used, there were a couple of occasions wherein the points were unclear, but the therapist used them to create narrative space for the mother to develop her stories. In so doing, the therapist also took the positioning of “a learner” of what it was like to be an African American and “a co-struggler” (Kaba 2020, Heath 2020) against racism.

The study argues for the importance of recognizing cues such as the use of detail, constructed dialogue, and internal evaluation in clients’ different communicative styles. It also suggests that the positioning taken by therapists could have a significant influence on the ways stories are heard and told, especially in handling such a sensitive issue as racism in cross-ethnic therapy.

# Talking through the tears: Eliciting and disclosing asylum narratives during legal consultations

Panel contribution

***Ms. Marie Jacobs<sup>1</sup>***

**1.** Ghent University

Legal consultations are often characterised by difficulties to reconcile the neutral, institutional preoccupations of the lawyer and the emotional “lifeworld concerns” of the client (Bogoch 1994). This issue is especially prominent within the legal sphere of asylum law, as applicants for international protection often deal with highly sensitive problems. This presentation investigates a) how immigration lawyers discursively negotiate their function as an emphatic counsellor and their traditional role of the professional who only pursues “legally relevant” matters and b) how clients react to this delicate balancing act. The linguistic ethnographic data were gathered in two immigration law firms in Belgium and comprise participant observation, audio-recordings, interviews with legal professionals and field notes.

My sociolinguistic analysis reveals how the lawyers do not impose an “ideological separation of the legal from the social” (Felstiner & Sarat 1995: 95). Contrary to what socio-legal literature often argues, the interactional data demonstrate how the clients’ lifeworld concerns are not regarded as a priori legally invalid, nor as a simple matter of polite chitchatting. Recognising the emotional dimension of the institutional encounter is considered to be crucial to the rapport between lawyer and client and the experiential story of the client is acknowledged as a building block of the legal case. The lawyers’ local attempts at navigating between institutional concerns and emotional demands are, however, highly affected by the fact that the asylum authorities do consider experiential narrations to be a hindrance with regard to their refugee status determination practices (Maryns 2006; Bohmer & Shuman 2007). Accordingly, lawyers who intend to prepare their clients for the hearing with the authorities, have to anticipate this translocal, institutional perspective, a practice that often threatens the rapport between lawyer and client (Jacobs & Maryns 2020).

This investigation of the way in which these local and trans-local perspectives influence the lawyer-client relationship, highlights the complex, yet productive role of emotion within institutional encounters. Additionally, the research also contributes to a body of knowledge that questions the institutional choice (or even the possibility in se) to disregard emotion, especially in a context that is as emotionally charged as asylum encounters. # Teachers' Inclusive Third-turn Composition by Gaze-shifting and the Use of the Japanese final particle “ne”

Panel contribution

***Dr. Mika Ishino***<sup>1</sup>

**1.** Doshisha University

Multiparty conversation is structurally challenging in managing the interactional inclusion of every party (e.g., Stivers, 2015). However, in every classroom, teachers organize multi-party conversations as part of their institutional tasks. In addition to using conversational grammar in the classroom setting (i.e., Initiation-Response-Evaluation: IRE sequence (e.g., McHoul, 1978)), teachers deploy various interactional resources (e.g., prosody, body positioning, gestures, gaze, etc.) to organize the multi-party conversation (e.g., Hall & Looney, 2019). This study examines one such practice of teachers observed at their third-turn of the IRE sequence. Multimodal conversation analysis was conducted on 60 hours of video recordings of English classrooms in Japanese secondary schools, focusing especially on teachers' shifting their gaze and the use of the Japanese final particle “ne” during their production of the third turn in IRE sequence. In ordinary Japanese conversation, the final particle “ne” is often used reciprocally in assessments when the referent is accessible to both parties and in inviting a reassessment of the recipient's response (e.g., Hayano, 2017). In the current study context, by using “ne” and shifting their gaze from the students who responded to the rest of the students, the teacher indicates that the response was also accessible to the students who did not respond to the teacher's question in the prior turn. For example, when a teacher pauses to ask a question to the class (i.e., “*what country is it?*”) and a student replies to the question (i.e., “*Switzerland*”), the teacher repeats the response adding the Japanese final particle “ne” to it (i.e., “*Switzerland-ne*”), and shifts their gaze from the student who responded to the rest of the students in the classroom. In doing so, the teacher explicitly includes the rest of the students to be a party to the prior IRE sequence. By illustrating the variation of this teachers' inclusive practice, the study will provide additional insights to previous findings on the use of gaze by teachers in the classroom setting (e.g., Waring & Carpenter, 2019).

# Teachers' pragmatic awareness in English as a third language: a multilingual analysis of regulative discourse for very young learners

---

Panel contribution

---

***Ms. Otilia Martí<sup>1</sup>, Dr. Laura Portolés<sup>1</sup>***

***1. Universitat Jaume I***

The focus of the present observational study is teachers' pragmatic awareness in the English as a third language (L3) classroom. This is an instructional setting under investigated when exposure to the target language is low and learners are very young. Participants are two preschool practitioners and two intact groups of 4-5 year olds. 1,942 regulative directives in all the languages employed in the classroom (English, Catalan and Spanish) are analysed. Data from audio/video-recorded lessons are collected at three different points of an academic year. From a multilingual discourse-pragmatic perspective, the linguistic realizations of procedural and disciplinary directives seem to respond to the teachers' pragmatic skilfulness or sensitivity before students' cognitive and affective needs at this early age. In showing the influence of a monolingual habitus still pervasive among preschool language educators, results could serve as a raising-awareness material for training teachers of English as an L3 in multilingual learning environments.

# Team interaction in cardiac arrest resuscitation

Panel contribution

***Dr. Chris Cummins<sup>1</sup>, Dr. Ernisa Marzuki<sup>2</sup>, Dr. Hannah Rohde<sup>3</sup>, Prof. Holly Branigan<sup>3</sup>***

*<sup>1</sup> The University of Edinburgh, <sup>2</sup> Universiti Malaysia Sarawak, <sup>3</sup> University of Edinburgh*

The resuscitation of patients undergoing out-of-hospital cardiac arrest (OHCA) represents a major challenge to first responders. The procedure is acutely time-critical, with delays contributing strongly to mortality; it is physically challenging, for instance because of the need to manipulate the patient in a confined space; and it requires excellent coordination between a team of paramedics. Successful team leadership has been identified as a key determinant of success (Cooper & Wakelam, 1999; Marsch et al., 2004; Yeung, Ong, Davies, Gao, & Perkins, 2012). Yet communication in this critical context remains understudied, due both to the challenges of accessing relevant data and of establishing what forms of knowledge would be relevant to enhancing practical outcomes.

In this presentation, we discuss the interaction between paramedics performing OHCA resuscitation based on a corpus of interactions recorded via body-mounted cameras during real-life emergencies. These resuscitations involved the deployment of a specialised paramedic with specific training in OHCA, whose role is to coordinate the other paramedics at the scene. We focus in particular on two aspects of the teams' interactional behaviour: their use (or non-use) of closed-loop communication, which guarantees fidelity of communication but at a potential time cost, and the parallel trade-off between considerations of pro-social behaviours and brevity. We also examine how situational awareness is managed and communicated between team members.

Our work also addresses the question of how to train paramedics to deal most effectively with these scenarios. Paramedic training incorporates simulations of OHCA, which are highly realistic in respect of the physiological behaviour of the simulated patient, but less so in respect of the social context, emotional engagement and so on. We compare a corpus of these simulations with real-life interactions, with a view to exploring how these simulations could be made more realistic. In particular, we look at how the interactants deal with challenges that are not prefigured by the training.

This project is novel among studies of medical communication in that it considers interaction between medical professionals in the context of critical care, which is generally difficult to access for analysis. We conclude by discussing the relevance of this work within a larger ongoing and interdisciplinary project that examines the entire life-cycle of emergency medical interventions – including emergency call handling, triage, and hospital admission – from a broad social science perspective, in close collaboration with medical colleagues.

# Teasing and Shared Knowledge in a Newbies Football Fan Forum

---

Panel contribution

---

***Dr. Jonathan White<sup>1</sup>***

***1. Högskolan Dalarna***

In the Chelsea FC fan site, The Shed End, there is a forum for new users at the site (newbies) to introduce themselves. The forum site itself started in 2006 and the newbie forum began in 2008. This forum was chosen as a good case study for how users do identity work and present themselves to other users. According to research, online communities are characterized by banter, conflict and an impoliteness that is considered by many to be normalised behavior (Beers Fägersten, 2017). This is clearly reflected in the Shed End forum. Users tease each other and can generally be explicitly face-threatening, even though it is warned against in the community guidelines. This teasing behavior is marked and is sometimes explained metapragmatically as joking. Secondly, there is much presupposed knowledge surrounding Chelsea FC used in the football discussions, such as the nicknames of players (*Lampo*, *Wisey*). Users do ask if they do not understand particular terms, specifically users from outside the UK. Thus, it seems to be expected that users share knowledge of certain nicknames or initialisms. Finally, the textchat speech style is mentioned in the guidelines as “horrible”, but this is clearly not filtered out by moderators, despite explicit references to this happening. Non-native speakers are often apologetic about their language skills, but this leads to teasing about the proficiency of non-standard native speaker users, and so this seems to be a linguistically open community. To conclude, we see that users are explicitly part of a teasing, non-standard linguistic culture in this fan forum.

# Technical supported competence. The construction and resemiotization of competence during the development of a reminder robot.

Panel contribution

***Dr. Antonia Krummheuer<sup>1</sup>, Dr. Matthias Rehm<sup>1</sup>, Dr. Kasper Rodil<sup>1</sup>***

***1. Aalborg University***

Assistive technologies aim to support people's autonomy in everyday activities. For example, a scheduling and reminder robot aims to support a person who has problems in remembering. As such, these technologies aim to assist people in (re)gaining agency and competences in the performance of certain activities that pose challenges.

This talk approaches the construction of competence across different contexts by following the construction of human and technical agency during the development of a reminder robot for and in collaboration with a person living with severe memory loss. Therefore, I will combine Actor-Network Theory's concept of human and non-human agency (Latour, 2005; Winance, 2006) and Iedemas (2001) concept of resemiotization with an ethnomethodological and conversation analytical approach to the situated construction of competence in interaction (Clarke & Wilkinson, 2013; Garfinkel, 1967; Goodwin, 2004).

My insights are based on a multimodal interaction analysis (Heath, 2011) of three video sequences that derive from a co-creation process in which researchers build a reminder robot for and together with a person living with severe memory problems. The project was undertaken in collaboration with a Danish residential home for people living with acquired brain injury and was build up as an iterative workshop series with residents and staff.

As central aim for the project was to find out how the robot could support the resident's autonomy by promoting his/her agency to participate more competently in activities that posed difficulties for him/her. We aimed to understand what are relevant activities for the resident, how does the resident participate in this activities, and how can these activities be supported by a robot?

The analyses of this talk follows the resemiotization process (Iedema 2000) in which the agency of the human-robot interaction was developed from talking about the design features the robot should have, to testing cardboard prototypes and finally implementing the high-fidelity prototypes at the resident's apartment. My interest is directed to understanding the concept of communicative competence by looking at how the participants understand resident's and robot's competences in the different sequences of the development of the robot. This will be done by analyzing sequences in which the participants assess the resident's and robot's competence to support each other's agency.

# Technologies of Recognition

---

Panel contribution

---

***Dr. Stuart Reeves<sup>1</sup>, Dr. Martin Porcheron<sup>2</sup>, Dr. Burak Tekin<sup>3</sup>***

***1. University of Nottingham, 2. Swansea University, 3. University of Basel***

A signature concern of ethnomethodology and conversation analysis is examining how and in what ways participants in social interaction achieve intersubjective understanding (Garfinkel, 1967; Garfinkel, 2002). Recognition in / as one another's actions—i.e., reflexively 'doing' recognisability whilst also 'showing' recognition—is central to social activity and a methodological bedrock to the curation of intersubjectivity (Dourish & Button, 1998; Schegloff, 1992; Suchman, 2007).

But technologies of *machine recognition*—including but not limited to voice recognition, facial recognition, bodily recognition, or behaviour recognition—complexify this picture. To start with they are beginning to pose serious challenges as engines for significant social problems (e.g., bias, unfairness, etc). Concomitantly, there are major conceptual problems encountered with the spread of 'recognition'. In this paper we tackle such conceptual difficulties by treating machine 'recognition' as a distinct, *different* sense to the reflexive recognisability of social action. In other words we turn the tables on machine recognition by looking at it *as a members' problem*. Technologies of recognition are therefore technologies that require members to manage their own distinct kind of recognisability *to* the machine to trigger intended human-machine interactions, i.e., to fit within orders of *machinic* recognition. Such 'users' therefore must juggle machine recognition alongside and embedded amidst the ordinary organisation of social activities. Moreover, this work may require responding to designed output from these technologies to aid recognisability.

To investigate this phenomenon empirically, we examine two cases of machine recognition—voice recognition and bodily recognition—as exemplars of a broader class of technologies. Analogous with recipient design (Sacks, Schegloff & Jefferson, 1974), participants work to design input in machine-recognisable ways whilst simultaneously attending to how human-machine interactions are embedded into the wider ongoing production of social order (Porcheron et al., 2018). As part of this we must also examine how co-present 'spectators' intervene in and orient to the 'capacities' of technologies of recognition by engaging in some moral work of distributing responsibility and ascribing agency for situatedly emerging troubles (Tekin & Reeves, 2017). We compare both verbal and bodily ways of 'disciplining' action as well as the repair and resolution of troubles that arise as a socially and sequentially organised, collaborative accomplishment.

# Temporary norms as building blocks in emergent common ground

Panel contribution

*Prof. Istvan Kecske<sup>1</sup>*

1. STATE UNIVERSITY OF NEW YORK, ALBANY, USA

The paper revisits the notion of “language norm” from the perspective of intercultural interactions. It also attempts to demonstrate and discuss how temporarily co-constructed normative elements create emergent common ground in intercultural interactions.

In the traditional sense language norms are usually considered essential properties of language that ensure its functioning and historical continuity due to their relatively inherent stability. However, this relative stability goes together with historical variability. Norms, on the one hand serve to preserve speech traditions, and on the other, to meet current and changing social needs. It is argued that the traditional approach to the notion of “norm” is untenable because it is mainly prescriptive and considered a diachronic phenomenon (see Havránek 1964; Labov 1972; Bartsch 1987; Milroy and Gordon 2003). Analyzing intercultural interactions Kecske (2019) argued that norm development is not necessarily just a diachronic process, but it can also be synchronic and temporary. Even if interlocutors spend only a short time together, they attempt to co-construct some temporary norms that become a part of their emergent common ground.

In order to collect supporting data for the claim and demonstrate how this process works in language production, data will be gathered from two 30-minute discussion sessions by a group of seven university students representing five different L1s. The two sessions will be on different topics, and the participants are going to be encouraged to have a spontaneous, uncoached interactions on the two topics. The recorded data will be analyzed for occurrences of temporary norm development. What is sought in data is collectively used language elements (words, expressions) that are co-constructed by participants and made part of temporary common ground during interaction to assure mutual understanding. Temporary norms emerge through a self-organized process in which group-level consensus is the unintended consequence of individual efforts to coordinate locally with one another.

# Ten years on, what do we say? Examining the Facebook threads of a crisis-ridden bank

Panel contribution

***Dr. Lise-Lotte Holmgreen<sup>1</sup>***

***1. Aalborg University***

The omnipresence of social media has created unprecedented possibilities for consumers to publicly criticize organizational behaviour. For corporations, this represents a formidable challenge to image and earnings, requiring vigilance in online communication (Gretry et al. 2017; Van Noort and Willemsen 2012).

One of the sectors to have felt consumers' discontentment most acutely is the financial sector. Since the 2008 financial crisis, which ushered in a period of severe economic instability worldwide, financial institutions have fought to retain legitimacy. However, this has been no easy task when stories of questionable conduct continue to surface, resulting in disgruntled publics which seek to hold the institutions accountable by sharing criticism online (Holmgreen 2020).

This situation forms the background of the presentation, which discusses the case of a bank that used to be among the top three of Danish finance. In the ten years that have passed since the crisis, the bank has been under continuous attack in the media (social and news) because of its poor moral judgement in many cases, and most recently in a historic case of money laundering.

Drawing on Khosravinik's (2017) social media critical discourse analysis (SM-CDS) and discursive legitimacy (Van Leeuwen 2008), I will analyse how the bank negotiates its position and makes legitimacy claims on Facebook. The data for the analysis consist of seven Facebook 'threads' from early September to early November 2019, one year after the results of the investigations into money laundering were presented. The threads are initiated with the bank posting events that are unrelated to the case, and which present the bank as a good corporate citizen. However, this is met with relentless criticism by several Facebook users, who condemn the bank of immoral behaviour. Thus, the strategy of proactive webcare, inherent in the posts opening the threads, appears only to have partial effect (cf. Van Noort and Willemsen 2012).

This suggests that despite decades of respected business conduct, corporations may suffer the long-term consequences of bad business decisions if they imply underlying values of greed and immorality. Furthermore, the opportunities that social media offer for voicing criticism are instrumental in maintaining the pressure to change corporate behaviour.

# Textual construction and discourse characterization: The case of letters of the 15th century

Panel contribution

***Dr. Blanca Garrido-Martin<sup>1</sup>***

**1.** University of Seville

Letters have proven to be an important source of data for the history of the Spanish language since it offers the possibility of observing the gaps in the most spontaneous variety of speakers from past stages. In this sense, letters, especially private ones, are understood as a mixed discourse tradition in which features of communicative immediacy are revealed (Koch / Oesterreicher 2007: 34), along with others from distance (Kabatek 2007). However, studies that deal with linguistic aspects have focussed on either canonical literature of the Golden Age or, most recently, 19<sup>th</sup>-century private letters.

Regarding the chronological framework that concerns us, we find few editions of letters from the 15<sup>th</sup> century written by literary figures (cf. De Ochoa 1850-1870 for a collection of several authors, Gómez Moreno 1985 for Íñigo López de Mendoza and Alfonso de Cartagena, Cátedra and Carr 2001 for Enrique de Villena, and Zaharescu 2017 for Fernando de Pulgar). Nevertheless, there are no linguistic studies, to the best of our knowledge, that address the textual construction of these texts in contrast to private letters.

Therefore, in this talk we will analyse a corpus of private correspondence collected within the project DOLEO-Historia15, composed of private letters from the noble and courtesan class dated between the 15th and 17th centuries, to observe their configuration in the textualization process that involves the writing of the private letter in Spanish from the underlying models and textual conventions of Humanism and the Castilian Renaissance. In this sense, we will study what elaboration processes these letters present in terms of their (para)textual structure compared to other similar and highly developed ones, such as the epistle, and in what way it is determined by discursive traditionality in which the text is inserted, as well as its subsequent evolution beyond the 15th century.

# Textual Histrionics: Stance, Community, and the Construction of an Ideal Witness in the Witness Depositions of the Salem Witch Trials (1692–1693)

Panel contribution

***Dr. Peter Grund<sup>1</sup>***

**1.** University of Kansas

The witch trials in Salem, Massachusetts, in 1692–1693 have left us with rich documentation of the trial proceedings, including over 400 witness depositions (Rosenthal et al. 2009). These depositions attest to a range of linguistic strategies that the witnesses and the recorders of their statements adopted to present and frame the evidence, the accused, and the deponent. Focusing on a subset of these depositions (ca. 150) filed by or on behalf of witnesses who claim personal affliction by witches, this paper explores these linguistic strategies through the lens of “stance,” or expression of “personal feelings, attitudes, value judgments, or assessments” (Biber et al. 1999: 966; see also Englebretson 2007; Jaffe 2009). I will consider, for example, the use of degree modifiers, such as *grievously*, *dreadfully*, and *greatly*, words of affliction, such as *torture* and *torment*, as well as markers of the source of information, including *see* and *believe*. I argue that these resources are deployed variably and strategically by witnesses and/or recorders to perform a range of stance functions. In some depositions, the use helps underscore claims to privileged knowledge, victim status, and a bid for a central role within the community of practice that developed during the trials (Wenger 1998; Kopaczyk and Jucker 2013). The linguistic strategies in the depositions also complement and overlap with how some of the witnesses behaved during hearings; indeed their often over-the-top performances in court are mimicked by the textual histrionics in their depositions. I also consider the complex and intersecting roles of the witnesses and recorders in accomplishing this discursive fashioning. I pay special attention to the role of Thomas Putnam, a militia sergeant and former parish clerk, who acted as the main recorder of testimony for what has been called the core group of accusers during the Salem trials (including his daughter, Ann Putnam Jr.).

Overall, this approach allows us to see the complex dynamics of how recorders and witnesses tried to (co-)construct the “ideal” witness linguistically, and how this linguistic construction in text is part of a broader semiotic system of behaviors, acts, and discursive strategies in a community of practice.

# Thai narrative discourses of internal thoughts with SELF expressions

Panel contribution

***Dr. Kiyoko Takahashi<sup>1</sup>***

**1.** Kanda University of International Studies

This paper aims to investigate a language-particular characteristic of Thai narrative discourses expressing internal thoughts. Specifically, it examines 'logophoric' (Clements 1975) uses of Thai morphemes referring to the 'SELF' (Sells 1987) whose internal thoughts are being narrated (SELF expressions) and clarifies semantic and pragmatic factors that influence the choice of those SELF expressions.

The holder of internal thoughts being narrated may or may not be identical to the narrator. The style of narratives in which the narrator's own thoughts are conveyed is called 'reportive' (Kuno 1972). Different styles of English examples include: (a) the reportive, direct one, e.g., ' $I_i$  thought, " $I_i$  am pushy."'; (b) the reportive, indirect one, e.g., ' $I_i$  thought that  $I_i$  was pushy.'; (c) the non-reportive, direct one, e.g., 'Mary<sub>-i</sub> thought, " $I_i$  am pushy."'; and, (d) the non-reportive, indirect one, e.g., 'Mary<sub>-i</sub> thought that  $she_i$  was pushy.' In the logophoric context, English narrators use first- or third-person pronouns and normally do not use other nominal expressions such as reflexive pronouns and kinship terms, e.g., ' $I_i$  thought that \*myself<sub>-i</sub> was pushy.'; 'Mary<sub>-i</sub> thought that \*Mommy<sub>-i</sub> was pushy.'

The data for this research are from Thai novels. The research findings show the following. First, reportive narratives in Thai do not clearly distinguish between direct and indirect speech. Second, besides ellipsis (zero anaphora), a variety of SELF expressions are utilized by considering the referent's specificity, viewpoint, and social status. In the reportive style, first-person pronouns are used to refer to the narrator herself/himself as the SELF. In the non-reportive style, third-person pronouns are used to refer to a specific discourse-character (except the narrator) as the SELF, while morphemes encoding the self (Self terms) are used to refer to a non-specific discourse-character as the SELF. Self terms may also be used to refer to a specific discourse-character as the SELF, provided that the specific discourse-character is the 'PIVOT' (Sells 1987) from whose point of view the internal thoughts in question are narrated.

Thai narrators must select a socially appropriate item of the pronouns or Self terms according to the narrative-discourse situation. In addition, they may use other nominal expressions (such as kinship terms and proper names) logophorically as well, thereby specifying a particular interpersonal relationship between the discourse-characters.

Narrative discourses of internal thoughts are by no means addressee-oriented; they are simply a private, monological assertion. Yet, such narrative discourses in Thai require consideration of interpersonal relationships among different discourse-characters. This is reflected in the fact that they largely indicate, by means of various SELF expressions, specific links between a discourse-character as the SELF and the other discourse-characters.

# The ‘emotional turn’ in science dissemination: Towards a promoevolutionary science?

---

Panel contribution

---

***Dr. Carmen Guinda<sup>1</sup>***

***1. Universidad Politécnica de Madrid***

Due to the current technological affordances, the commodification of science, and the implementation of more democratic models of science dissemination, we are witnessing an ‘emotional turn’ in scholarly discourse, especially in multimodal online genres, such as the graphical abstract, increasingly demanded by high-impact journals. Starting out from the traditional expectations of formality and objectivity in academic discourse, and with the aid of a blended theoretical framework that combines Multimodality, Systemic Functional Theory, Positioning Theory, and Bednarek’s taxonomy of affect, I examine published scholarly samples of graphical abstracts criticized by science bloggers and academic network fora. Findings suggest that emotion is frequently caused by visual stylization, may co-occur with emotional talk, and sometimes takes for granted encyclopedic and experiential backgrounds that the intended audience not always has and may go against the democratisation of science or constitute face-threatening acts. A reflection on the challenges and dangers posed by graphical abstracts is finally offered, and emphasis is laid on the need for visual literacy training and more explicit and controlled guidelines for authors in scientific journals.

# The acquisition of spoken French: a study of pragmatic markers - *donc*, *alors* and *du coup* - in a contrastive native/non-native corpus of spoken French

Panel contribution

***Ms. Grace Mercy Dornukuor Kitcher<sup>1</sup>, Prof. Juliette Delahaie<sup>1</sup>***

**1.** Université de Lille, CNRS-STL-UMR 8163

This research presents a contrastive study of the use of the pragmatic markers *donc*, *alors* and *du coup* in spoken French by native and non-native speakers.

Numerous studies have been conducted on the pragmatic markers *donc* and *alors* (Mosegaard Hansen, 1997; Pellet, 2009). Some of them propose a contrastive study between two languages, like French and English (Beeching, 2016), or between native and non-native speakers of the English language (Muller, 2005). Our analysis will give new insights on the use and the pragmatic meaning of *donc*, *alors* and *du coup* by the contrastive study of two types of data : spoken French by native speakers of French, and French spoken by Ghanaian students of French after a one year immersion programme in a French University.

This study has two main objectives. The first is to find out the impact of a year abroad programme in a homoglot environment (France) on the acquisition of pragmatic markers by non-native (Ghanaian) learners of the French language. Secondly, this study aims to contribute to the description of the meaning and functions of pragmatic markers *donc*, *alors* and *du coup*.

We analyse the language development of pragmatic marker use in non-native speech over two periods of time (T1 and T2 : 5 months), in an interactional and semi-directive conversational context, where two speakers have to debate around two topics. Furthermore, we examine the similarities and differences in the use of pragmatic markers between Ghanaian students and French native speakers recorded in the same situation.

Our study focuses on the use of two pragmatic markers, *donc* and *alors*, by native and non-native speakers, and *du coup*, only used by native speakers. Although there was a quantitative and functional change in the use of *alors* and *donc* by non-native speakers over the period T1 and T2, pragmatic markers are not used in the same way and for the same functions by native and non-native speakers. Even after a one-year immersion, non-native speakers tend to use *donc* and *alors* in spoken French, just like they are used in written French. We noticed for example that in certain instances *donc* was used by non-native speakers in a more formalised and structured way as one is likely to use it in written French. In our native corpora, we identified cases where *donc* was used in manner that is mostly associated with spoken French. Finally, we observe that in contexts where non-native learners use *alors*, native speakers tend to use *du coup*, whose meaning will be explored.

# The Apparent-Time Construct as a proxy to spoken data in the 20th century: a Spanish case study

Panel contribution

**Mrs. Renata Enghels<sup>1</sup>, Ms. Linde Roels<sup>1</sup>**

**1. Ghent University**

The 20<sup>th</sup> century is characterized by important changes in the sociohistorical context of Spain which have led to the steady process of ‘colloquialization’ of Spanish, in spoken and written language. So this era should not be overlooked as a site of linguistic change (Pons Bordería 2014). Still, these major developments contrast sharply with the scarcity of oral data, mostly available from the 90s decade. As a way out, linguists have turned to the analysis of particular forms of written data as a proxy to the analysis of spontaneous informal discourse (Taavitsainen 1995), but several studies concluded that written data have to be handled with care (Enghels & Azofra 2018).

This contribution investigates whether the Apparent-Time analysis offers a solution to the data-problem. According to this method, a linguistic phenomenon is analyzed across the speech of different generations during one time period (Bailey et al. 1991). The basic assumption is that differences between generations mirror developments in language, and that the language of older generations can be treated as a proxy for language use at an earlier stage. However, the method has been subject to critical assessments. The hypothesis that adult vernaculars remain stable has been debated and few studies have empirically monitored if the method is able to detect previous uses of a particular phenomenon.

This study investigates whether the generational use of the Spanish discourse marker *sabes* ‘you know’ corresponds to the pragmaticalization cline previously observed (Azofra & Enghels 2017). It looks into the data of three generations in the present-day CORMA corpus and plots the patterns on a timeline, after which real time data are compared to the apparent-time profiles. It is shown that the prototypical functions of *sabes* as used by speakers of the third and fourth generations largely coincide with the predominant functions observed in the (scarce) oral data available for the 20th century. However, some additional functions are observed (e.g. filler use), although less frequently than in the speech of the second generation, suggesting that some speech community related influence has taken place. It is concluded that the method constitutes an added value to the analysis of spoken data in the mid till late 20th century, but that it should be handled with care.

# The Application of Standard Melody Patterns to Instruction in Shamisen Lessons: Findings of a Multimodal Analysis of Shamisen Practice through Simultaneous Imitation

Panel contribution

***Dr. Seiji Nashio***<sup>1</sup>

*1. Hiroshima University*

The purpose of this study is to apply multimodal analysis to examine the instructions that the *shisho*, a shamisen instructor, conducts with a combination of bodily and verbal behaviors so as to determine the contribution of standard melody patterns unique to shamisen music as instructive tools to the extremely complicated practice. The shamisen is a traditional Japanese stringed instrument with a variety of historical types (Tanaka et al., 2009). The data analyzed in this study are videotaped segments of lessons in *nagauta* shamisen, which is played while singing songs narrating Noh or Kyogen plays, Japanese traditional performing arts. During a lesson, two adult women, the *shisho* and her student, are seated on the floor facing each other across a small table. The student is a novice player.

The most remarkable feature of the lesson is its practice style. The *shisho* and her student basically engage in a simultaneous imitation in which the student watches and imitates the *shisho*'s playing (especially her fingering) and without a score (Nashio, 2020). In this style, the *shisho*'s evaluations and corrections of the student's play proceed as follows: 1) When the student plays well, the *shisho* continues playing. In contrast, when the student makes a mistake, the *shisho* stops playing and, making some bodily or verbal sign, indicates that the student replay the part that she played wrong. 2) The student cannot stop playing until the *shisho* so orders: the *shisho* sometimes plays alone to present an example, although the student does not. In order to maintain this practice style, the *shisho* must conduct very brief and concise instructions, such as dropping words into narrow gaps syllable by syllable or melody by melody.

This study focuses on the instructions with which the *shisho* verbally refers to some melody patterns just before playing them. These patterns are standardized for *nagauta* shamisen music and are preferred by classic composers. They are essential forms of fingerings that players must master to play *nagauta* shamisen, because the melodies regulate their fingerings. They have a variety of names, some of them *kuchi-jamisen*, words imitative of shamisen sounds. When the *shisho* calls them, they may evoke in the student's mind the fingerings to be practiced at that time and recall related caution, advice, and experiences from previous lessons.

This study presents examples of the application of the standard melody patterns and investigates their role in organizing practice and their effective in instructing and learning shamisen techniques.

## The artisan bread market in action

---

Panel contribution

---

***Dr. Emma Tennent<sup>1</sup>, Prof. Ann Weatherall<sup>2</sup>***

***1. Vict, 2. Victoria University of Wellington***

Mundane marketplace interactions are an everyday location where positive sociality is practiced and people support and learn about local food initiatives. Artisan bread offers high quality and speciality versions of an otherwise staple food item. Market stalls where artisan breads are bought and sold provide an ideal setting for examining how people engage with what members refer to as “real bread” in mundane and meaningful ways. Drawing on a corpus of interactions between customers and a stallholder, we examine the kind of affective and sensorial engagements that constitute a local sociality produced by the boutique bakery. An analytic focus is on how customers identify and choose breads through looking, naming, and pointing. We show that descriptions of characteristics of the bread, including ingredients and taste, have a sequential organisation.

The data are around three hours of audio-visual recordings at a university campus market-day. Data were collected in March 2020 and include more than 50 service encounters at the artisan bread stall that were transcribed and analysed drawing on discursive psychology and using multimodal conversation analysis.

We begin by showing the shortest cases of sales encounters where customers know what they want, request bread by name, and have their requests granted. The local sociality around artisan bread is tacit in these cases because they appear as straightforward economic exchanges. However, we show that socialisation does underpin knowing about the bread and being able to identify and name it. The more visible sociality occurs in particular sequential positions. Customers can identify themselves as appreciating the bread in the openings of the interactions. Positive sociality also happens in positions where decision-making occurs in the here and now of the interaction. Furthermore, when a requested product is unavailable parties display knowledge about relevant substitutions and affective engagements such as regret and disappointment.

The following extract is an example where a customer learns about the bread. It begins with the customer asking about the name of the bread while looking and pointing at it. In response, the seller names the bread and shows it.

HM-22

01 CUST: and what are th#e:se?

#fig1

02 (0.6)

03 SELL: these are our focaccia? er- fougasse sorry? (0.4)

04 they look like that?#

#fig2

In sum, our analysis shows how parties engage with a local artisan bread business. We conclude that the market stall is an important site where people learn about food and specialist knowledge is displayed through labelling and describing ingredients, texture, and taste. It is a setting where affective and sensorial engagements with the bread for sale are core to the sociality of a local food community.

# The body as prison, machine, or battleground: metaphors of the body in chronic pain consultations

Panel contribution

**Dr. Jana Declercq<sup>1</sup>, Dr. Lotte van Poppel<sup>1</sup>**

*<sup>1</sup> University of Groningen*

This paper analyzes metaphors of the body in consultations between doctors and chronic pain patients in a pain clinic, and how they shape and get shaped by ideologies of what constitutes good health, good patients, and good health care. In Western societies, health and illness are predominantly seen from the perspective of mind-body dualism: the mind and body are constructed as functioning independently, and as requiring separate, different forms of health care (Scheper-hughes & Lock, 1987; Slatman, 2014). In the literature, this dualism is associated with the metaphors of the body as prison (in which the mind is imprisoned by the body, specifically because of reduced functionality when ill); the body as machine or vessel (in which the body is a technical carrier of the mind), and the body as battleground (in which there is competition between an individual/the mind and their body/bodily functions) (Coveney, Nerlich, & Martin, 2009; Malson & Ussher, 1996; Scheper-hughes & Lock, 1987; Slatman, 2014). However, this dualism is increasingly found untenable. A more integrated perspective in health care, which takes the physical, mental but also social into account, is now increasingly implemented in treatment (Gatchel, Peng, Peters, Fuchs, & Turk, 2007; Loftus, 2011).

Despite this tension being identified, little empirical research is done on which and how metaphors on the body are employed in health care interactions. However, metaphors used in illness discourses, e.g. war and journey metaphors (Flusberg, Matlock, & Thibodeau, 2018; Semino, 2010), come with specific assumptions and evaluations about illness- or, in other words, ideologies (Goatly, 2006). As these ideologies can come with stigma and have an impact on how patients feel and experience treatment, it is key to understand the metaphors of the body used in health care interactions.

This paper therefore takes a qualitative empirical approach to study the metaphors used to talk about the mind and the body by health practitioners and patients in a Belgian pain clinic. It is determined what source domains are employed (e.g. PRISON, MACHINE, WAR), how these are used to talk about the body/mind, pain, treatment and medicine, and which ideologies these metaphors are embedded in.

# The challenges of lingua-franca communication and its translation in multilingual institutions: a case study on ELF at the European Central Bank

Panel contribution

***Dr. Elena Magistro<sup>1</sup>***

*1. University of Bologna*

Lingua-franca texts produced in multilingual institutions pose major challenges in terms of public communication and translation, even more so when they have significant repercussions on society. This study expands on preliminary research investigating the intriguing case of a market-sensitive press conference held in 2018 at the European Central Bank (ECB) (Magistro 2019, Ceccarini 2019). On that occasion, an “unconventional” use of English – albeit legitimate – led to multilingual translations by the ECB language service that, according to external recipients, generated conflicting messages. This prompted a wave of media queries urging for disambiguation, followed by remedial responses by high-level ECB officials, ultimately resulting in changes to the institution’s official translations – in an emblematic clash between expectations of a “standard” (native) use of English and “divergent” meanings found in lingua-franca discourse (Seidlhofer 2017).

From the perspective of ELF studies (Jenkins 2015; Seidlhofer 2011; House 2003, 2013), English was in this case legitimately appropriated by ELF speakers and adapted to their communicative goals. However, the chosen locution triggered inferences in the recipients that did not match the actual communicative intention, giving rise to an extensive process of meaning negotiation. In this respect, Ceccarini (2019) designed a survey polling over 500 respondents – mostly advanced users of English and with a translation background – which aimed to assess their perception of a set of English clauses that were co-textually comparable to the one uttered at the ECB. The results showed that, as with the press conference, a rule-abiding interpretation of the clauses was largely given by both NSs and NNSs of English.

The events that followed the press conference and this communicative mismatch – as well as the evident resistance to accommodating deviations from a prescriptive reading of English – highlight two practical yet critical issues that seem largely unexplored. First, the effects of lingua-franca variability in institutional contexts, where highly influential information is conveyed to a vast audience including advanced/native users of English. Second, the repercussions on the practice of translation and, primarily, the challenges faced by institutional translators in making decisions and taking risks when it comes to “unconventional” usage in impactful lingua-franca discourse (Pym 2015, Albl-Mikasa 2017, Albl-Mikasa et al. 2017).

# The Change from the Come/Go-and-V Sequence to the Come/Go-V Sequence over the Last 80 Years

Panel contribution

**Dr. Noriko Matsumoto**<sup>1</sup>

1. Kobe University

This paper shows the change from the *come/go-and-V* sequence to the *come/go-V* sequence over the last 80 years, relying on the *COHA*, *Collins Wordbanks Online (CWO)*, *Movie Corpus*, and *TV Corpus*. The historical development of the *come/go-and-V* sequence is discussed in comparison with the uses of the *come/go-V* sequence, which are in many ways semantically similar to the *come/go-and-V* sequence. From a semantic standpoint, there is no satisfactory differentiation between the *come/go-and-V* and *come/go-V* sequences. This paper supports one hypothesis: The differences in meaning that different forms exhibit include differences in historical development based on functional differences in meaning. Based on our corpus data, this paper also shows how the differences between the *come/go-V* and *come/go-and-V* sequences are closely related to genres of language use, inflectional categories of V1, V2 selection, and historical development in a complicated way.

This paper divides both the *come-V* and *come-and-V* sequences into two semantic types, the motion type, as in (1), and the hortative type, as in (2).

(1) Come (and) see us.

(2) Come (and) join us.

Both the *go-V* and *go-and-V* sequences are divided into two semantic types, the motion type, as in (3), and the modality type which expresses counter-normative stance, as in (4).

(3) You can go (and) buy food somewhere else.

(4) Did you have to go (and) wreck my ideas?

In terms of morphological marking, one restriction is imposed on the *come/go-V* sequence: Both V1 and V2 are always in a bare form. No restrictions are imposed on the *come/go-and-V* sequence.

There are four main findings from our corpus data. First, concerning genres of language use, the CWO shows that both the *come/go-V* and *come/go-and-V* sequences generally occurs in spoken English. This validates the outcome of previous studies, where both sequences are regarded as colloquial. Second, concerning inflectional categories of V1, the CWO shows that whereas imperative forms are predominant in the *come/go-V* sequence, non-imperative forms are predominant in the *come/go-and-V* sequence. Third, all four corpora employed in this paper show that the *come/go-and-V* and *come/go-V* sequences indicates the roughly similar distribution of the top ten V2s used most frequently. Fourth, all the four corpora show that the *come/go-V* sequences have been recently gaining in currency in that they are replacing the *come/go-and-V* sequences. Note that the V2s where the replacement happen are limited.

From these findings, it is fair to state that both the *come-V* and *go-V* sequences are undergoing historical development not based on grammaticalization or auxiliarization, and that the motivations behind their historical developments are different. It can be concluded that the historical development of the *come-V* sequence is related to what this paper calls hortative device functioning at the discourse level, whereas the historical development of the *go-V* sequence is related to two kinds of devices functioning at the discourse level, what this paper calls the full motion and modality devices. Both the *come-V* and *go-V* sequences are undergoing different historical development from each other, though both sequences are currently undergoing change.

# The changing landscape of academic publishing: Wiggle room for elusive hypocrisy of inclusion?

Panel contribution

***Prof. Tuija Virtanen<sup>1</sup>***

***1. Åbo Akademi University***

The changing landscape of academic publishing: Wiggle room for elusive hypocrisy of inclusion?

Recent years have seen the birth of a plethora of new academic journals across disciplines in tandem with the shift to Open Access (OA) publishing. Online journals occasionally issue calls for academics to submit papers and to join their editorial boards as reviewers or editors. In addition to their web sites, such invitations may appear on professional mailing lists and in the email inboxes of targeted candidates. Some OA-sites urge you to start a journal of your own and thus become its editor-in-chief. Voluntary work as a peer reviewer or an editor of some kind is a great opportunity for scholars to advance their careers and contribute to high quality OA-publishing in their field. The rapid increase of ‘predatory’ journals, however, warrants due attention to the interactional activities of recruiting editors and reviewers (see e.g. Sorokowski et al. 2017).

Leaving aside the blatantly deceptive practices of blacklisted journals, this paper investigates the extent to which personalized email invitations to join editorial teams might constitute subtle instances of verbal hypocrisy. Some degree of hypocrisy appears to be expected for the smooth running of everyday life, in the sense of the politic behaviour of ritualised politeness (Feinberg 2002; Mills 2003; Watts 2003). Further, moral hypocrisy serving mutual gain also seems to be generally accepted as benign in complex social environments such as business, politics and governance (see e.g. Batson et al. 2006; Grant 1997; Mörkenstam 2019). Less attention has, however, been paid to the possible hypocritical nature of the kinds of recruitment practices under study, which profess to contribute to increased inclusion of individual academics in a global research community and to forward the laudable goals of openness and scholarly debate in international scholarship. Yet, there may arguably be wiggle room for hypocrisy as journal owners appearing to be committed to a high scholarly standard may in reality choose to avoid honouring their commitment in pursuit of ulterior gain.

Using concepts and methods from pragmatics and discourse analysis, I examine traces of the elusive notion of hypocrisy at the micropragmatic level of personalized email offers of honorary positions as an editor/reviewer as well as the macropragmatics of possible organised hypocrisy in OA-publishing. The postulated wiggle room is approached from the perspectives of adjacent phenomena such as politeness and deception, in order to identify interdependencies as well as boundaries and central characteristics of hypocrisy. Findings raise the issue whether the scale from outright deception to honest and trustworthy OA-publishing features a fuzzy zone of hypocrisy in this professional sphere. The study opens new vistas on the changing landscape of academic publishing and provides theoretical insights into verbal hypocrisy as a multifaceted pragmatic phenomenon in its own right.

# The choreography of multimedial procedures in family dinners

Panel contribution

***Prof. Aliyah Morgenstern<sup>1</sup>***

**1.** Sorbonne Nouvelle University

When we analyze human interactions, not only is the large variety of semiotic resources often disregarded, but environments, objects or activities whose affordances have a multitude of impacts on communication are rarely taken into account. In order to capture the full complexity of language use, approaches are needed in which all semiotic resources can be analyzed as they are deployed in their natural habitat.

We share with Cienki (2012) an integrative view of language, and use what he calls the “dynamic scope of relevant behaviors” to capture the complexity of interactive practices. Following Boutet (2018), we analyze the bodies of our participants as both the support (the instrument) and the substrate (that which constitutes and structures) for “languaging” (Linell, 2009). In this paper we present a multimodal multimedial approach to multiparty interactions through the analysis of French family dinners in which child and adult participants are engaged in the activities of eating and interacting. We will use multimodality to refer to the variety of semiotic resources (gesture, speech, facial expressions, gaze) used in “languaging”, and multimediality to refer to the various media used in context to construct meaning (such as manipulative actions/languaging”).

Through family dinners, language practices can be analyzed in the framework of multiactivity (Haddington et al. 2014). We focus on the finely-tuned coordination and in situ organization of the joint activities of conversing and dining that fully engage the same body components (eyes, head, mouth, hands, arms). Our aim is to capture the multiple deployments of the embodied behaviors of dinner participants, and children’s progressive socialization to multiactivity. We show how family members collaboratively manage the accomplishments of multiple streams of activity and coordinate their temporal organizations through the embodied performances of dining and interacting (Goodwin, 1984). The families consist of two adults and two to three children. For this study, we recorded sixteen dinners in eight middle-class families living in Paris with children between 3 and 16 years old.

The range of behaviors are usually categorized as being either verbal, gestural or actional. Manipulative actions are separated from communicative gestures. Our detailed coding demonstrates that when we use an integrative approach and include the artifacts that are present and handled, we need to question the categories we have constructed. Food and utensils are fully integrated in the situated script that is deployed. Manipulative gestures can be communicative as are the offering of food and wine, but also use of napkins, cutlery, glasses, or the actions of getting up from the table, sitting down in a chair, moving towards a participant or the kitchen. They are constraints - using the mouth to eat and speak is problematic; but there also are possible multiactivities one learns to combine - chewing can be synchronous with actively listening and gazing at the speaker. We also show that children are progressively socialized to the art of dining and interacting. They learn to deploy multimedial procedures in a multitude of skillful variations in the collective coordination of bodies, activities and artifacts.

# The collaborative accomplishment of communicative competence in interaction between a teacher and a child with autism spectrum disorder

Panel contribution

***Ms. Orlagh O'Leary<sup>1</sup>, Dr. Mike Clarke<sup>1</sup>***

***1. University College London***

This paper explores interaction between Emma, a child who has a clinical description of autism spectrum disorder (ASD) and has been proved with a speech generating device (SGD), and her teacher John, in the context of language intervention. The provision of SGDs to children with ASD is intended to support and enhance possibilities for communication by fostering in the child new skills and new learning to promote more general communicative competence.

The intervention examined in this paper is based largely on John coaxing Emma to use the SGD to make more socially recognisable turns (e.g. requests for food items or toys) than she might normally do through less conventional methods such as vocalisations or physical actions (e.g. reaching out and taking a toy). By using the SGD to take a relevant turn, Emma is judged by John to display a form of communicative competence through behavioural compliance and appropriate language use. One method that John uses to encourage Emma's use of the SGD is to use it himself in his own turns. John's SGD use is intended to be a noticeable and recognisable model of the desired form and content for Emma's next turn (see Sigurd Pilesjö & Norén, *in press* for analysis of modelling practices).

In this analysis we examine how John's intervention goals and his intervention practices may diverge, and how Emma's contributions may be relevantly aligned with John's actions despite not being desired in relation to the intervention goal (Sterponi & Kirby 2016; Maynard & Turowetz 2017). We discuss also how transitions within and between intervention activities can enhance and mask John's expectations for Emma's next turn (the intervention goal), and the recognisability of Emma's actions as relevant.

Through the analysis we highlight how communicative competence is realised as a shared accomplishment that is the outcome of interactive practices between both teacher and child in interaction, and how communicative competence is generated incrementally on a moment-by-moment basis through the participants' realisation of recognisably shared actions.

# The communication between the aged people and the foreign carers in Japanese nursing homes

Panel contribution

***Ms. Liansi Gao<sup>1</sup>***

***1. Japan Women's University***

The aim of this study is to clarify the communication gaps between the aged people and their foreign carers in Japanese nursing homes. This research illustrates what the aged people expect to the carers in relation to the communication and is designed for foreign careers in order to understand the psychology of the Japanese aged people and communicate smoothly with them. The smooth and considerate interaction will bring about the harmonious inclusion beyond the different cultural backgrounds.

The Japanese government has begun to promote the immigration policy and invite foreign workers from 2019. About 340 thousand workers are expected to come to Japan and work over 14 categories of business. The demand of the labor force in the category of carers is urgently high and the government has provided the new internship system especially for the caregivers. The situation like this motivates this study.

As the research design of this study, the mixed method is adopted. The quality and quantity approaches are employed in order to observe the situation accurately. In this study, the quality and the quantity surveys are carried out chronologically. At the first step, the author had the experience of working in the nursing homes as a volunteer and realized the importance of the addressing in conversation. As the second step, the survey by questionnaire has implemented and asked the aged people in which form they want to be addressed and whether they will expect the change of the addressing as the familiar relation is strengthened. It can be noticed that a certain ratio of the aged people prefer to the change of the addressing from the family name to the first name, 'papa (father)' or 'mommy (mother)'. As the last step, the interviews of the aged people has been done. It shows that the aged people are generally intend to accept the foreign carers under the condition that they have deep consideration for the aged people rather than the Japanese language ability or the technical knowledge about caring.

In conclusion, the relation between the aged people and their foreign carers is not exceptional in terms of cross-culture communication. The adjustment of the distance between the speakers and the listeners usually reflects the forms of the address.

# The construction of a polite professional identity through telephone role-plays in a Japanese company

Panel contribution

***Prof. Haruko Cook<sup>1</sup>***

*1. University of Hawaii at Manoa*

This paper examines how new employees in a Japanese company are socialized into a polite, trustworthy professional through role-plays of a telephone call from the perspective of language socialization (Schieffelin & Ochs 1986).

To date, the research on linguistic politeness in Japanese has focused on honorifics (see Haugh 2018). The centrality of honorifics in the Japanese linguistic politeness literature gives an impression that the use of honorifics alone is sufficient to act politely in Japanese society. On the contrary, business manners training in Japan places a great importance not only on honorifics but also on manners of communication such as speaking cheerfully and clearly (Cook 2018; Dunn 2011). In fact, Dunn (2011) reports that business manners course instructors consider that a cheerful and kind attitude can make up for small mistakes in honorifics. Studies on business manners training indicate that ultimately, the polite professional self to which new employees aspire is the co-ordinated enactment of honorific use and co-occurring appropriate manners of delivery. Dunn's study (2011) is based on the reports of instructors of business manners classes, but does not include actual socialization practices. This paper fills the gap left by Dunn by examining role-plays of a telephone call in a new employee orientation of a Japanese company and asks the following questions: i) What kinds of non-honorific features are considered as resources that constitute a polite professional identity? and ii) Through telephone role-plays, what are new employees socialized into?

The data consists of twelve role-plays of a phone call conducted during a new employee orientation of a Japanese company. The video-recorded data are transcribed and qualitatively analyzed.

The qualitative analysis shows that although new employees' utterances all contain honorifics, ten out of twelve trainees are not judged polite because their utterances lack non-honorific features such as a cheerful tone of voice, proper intonation, and/or quality of voice, among others. The analysis demonstrates that honorifics alone do not index politeness and proposes that both honorifics and co-occurring multimodal features are part of *kata* 'prescribed form', which indexes a good image of a trustworthy company. In the larger context of Japanese cultural tradition and business practice, the role-play of answering a call is a way of socializing new employees into the *kata* of answering a call, which requires the mastering of all the details as discussed in the paper.

# The construction of ‘otherness’: a way towards a kind of inclusion? The case of refugee victims of torture

Panel contribution

***Dr. Iphigenia Moulinou<sup>1</sup>***

***1. independent scholar***

The presentation explores issues of social representation of a particular group of refugees, those being victims of torture (hence VoT, recognized or waiting to have their cases examined and be recognized as such), from the theoretical standpoint of linguistic anthropological research and discourse analysis.

The data to be analyzed draw from representations shaped in two kinds of sources: policies’ and implementation institutional texts (e.g. international protocols, official guidelines) concerning refugee-VoT, and narratives of the latter.

In addition to the analysis of the duality of labelling this refugee group both as victims and survivors, another recurrent representation is also examined, that of VoT as dehumanized, disintegrated, with broken will and loss of control. The dehumanizing portrayal of migrants in social and formal media and political discourses leads to discriminatory otherness and discourses of exclusion (Musolff 2019, Nikunen 2020). Interestingly, however, in this context, the ‘dehumanized other’ which, still, portrays VoT as intrinsically different and alien, not only ethnically and culturally but also ontologically, as human beings, rather than producing discourses of exclusion and rejection, it serves the legitimization of their inclusion (asylum), be it at a first level. Through my analysis based mainly on agency linguistic devices, I show how agentive positionings play a major role in constituting discursive trajectories towards exclusion and different kinds of inclusion.

What emerges is the complexity of the identity work and integration work for this social group and also the complexity between othering and discourses of rejection. In effect, social representation of refugee VoT provides a yielding field of further elucidation of nuances between the notions and the discourses of discrimination and rejection, inclusion and division, among others.

# The COVID-19 pandemic in Japan: The meaning ascribed to the cultural keywords *jishuku* and *dōchō-atsuryoku*

Panel contribution

***Dr. Yuko Asano-Cavanagh<sup>1</sup>, Prof. Robert Frederick Cavanagh<sup>1</sup>***

***1. Curtin University***

This study investigates the semantics and pragmatics of two keywords which have recently emerged in Japanese discourse as a result of the COVID-19 crisis. These are: *jishuku* ‘self-restraint’, and *dōchō-atsuryoku* ‘pressure to conform’.

A distinguishing feature of the COVID-19 is its epidemiological designation as a pandemic. The virus has spread throughout the world irrespective of geographical, political and cultural boundaries. Given the multiplicity of locations and contexts in which the virus exists, it is not surprising there is a wide variation in how countries have responded to the presence of the virus. Since initial identification of the contagion, governments and public health organisations have implemented a range of strategies aimed at controlling the spread of the virus. These include restricting local and international travel, isolating infected persons, and the wearing of face masks. However, community acceptance of such measures is inconsistent within countries and between countries. Totalitarian regimes require compliance whereas more liberal regimes can be less dogmatic in their expectations. In the latter case, a crucial issue is the how the public perceive policy intentions including levels of compliance. These perceptions or interpretations derive from the semantics of the terminology used. The thesis of this paper is that resolution of the misunderstandings and inconsistencies that occurs in Japan when making sense of the COVID-19 pandemic requires semantic and pragmatic analyses.

Although the Japanese keywords *jishuku* ('self-restraint'), and *dōchō-atsuryoku* ('pressure to conform') can be roughly translated into English, the literal translations do not convey the cultural nuances and complexities embedded in the expressions. The study identifies the exact meaning of *jishuku* and *dōchō-atsuryoku* using the framework of the Natural Semantic Metalanguage approach. The corpus was obtained from newspapers, news reports, and social media. The semantic analysis reveals that the two keywords mirror the tension between freedom of choice and a sense of social obligation. The study illustrates how complementary semantic and pragmatic analyses can be applied to a contemporary socio-cultural phenomenon.

# The deployment of inter-(dis)fluencies in the course of multimodal communication: a French case study in two interactional settings

Panel contribution

***Ms. Loulou Kosmala<sup>1</sup>, Dr. Maria Candea<sup>1</sup>, Prof. Aliyah Morgenstern<sup>1</sup>***

*<sup>1</sup>. Sorbonne Nouvelle University*

So-called disfluency markers (*uh*and *um*, pauses, repetitions, self-repairs), also known as “repair phenomena” (Schegloff et al., 1977) have often been associated to speech production difficulties by a number of linguists and psycholinguists (see Bortfeld et al., 2001 ; Smith & Clark, 1993) as their main formal feature is to interrupt or suspend the flow of speech (Fox Tree, 1995). However, they can also be analyzed from an interactional perspective (hence *inter*-(dis)fluency) which views them as multimodal and dynamic processes contributing to the interactional flow.

The different roles served by inter-(dis)fluency markers in talk-in-interaction is highly contextual: while some of them occur in contexts of speech production trouble (e.g. self-directed, solitary searches), others can also be used to facilitate the coordination of the co-speakers’ actions (Goodwin, 1981), maintain a hearer-speaker relationship (Fischer, 2000) or manage turn-taking (Kjellmer, 2003). Therefore, the use of “dis” in brackets is adopted (following Crible et al., 2019; Götz, 2003) in order to stress their interactional ambivalence. This ambivalence also relies on the use of the visual-gestural resources embodying inter-(dis)fluencies, mainly gaze behavior, facial expressions, body orientation, and manual gestures. The combination of verbal, vocal, and visual-gestural modalities can be used as multimodal strategies by speakers to make the delay of an utterance visible to the hearers: the display of a thinking face (Goodwin & Goodwin 1986) during a multimodal word search (Hayashi 2003, Dressel 2020) can indicate a speaker’s preference for self-repair (Schegloff et al. 1977). A delay in discourse can also be embodied in the coordination of a vocal marker (e.g. a filled pause) and a held hand gesture (Graziano & Gullberg, 2018) making the process of delaying talk visible.

Therefore, inter-(dis)fluencies can constitute relevant bodily actions deployed by speakers in the course of their multimodal production. Given their contextual and dynamic nature, the use of inter-(dis)fluencies is strongly determined by the type of discourse produced. The present contribution aims to investigate the impact of the conversational context on the multimodal deployment of inter-(dis)fluencies. The data under study, (the *DisRegCorpus*) comprises video recordings of French students in two different communication settings (individual class presentations vs face-to-face interactions). Three research issues will be addressed: (1) the preference for certain inter-(dis)fluency markers in particular conversational settings, (2) whether this preference is determined by the type of communication setting, or if it predominantly displays speakers’ need to delay discourse; and (3) the speaker’s preference to rely on different multimodal resources to embody delays in the interactional flow.

An overview of the distribution of inter-(dis)fluency markers in the data shows that speakers produce different types of inter-(dis)fluencies in the two situations recorded. Furthermore, a close examination of the use of inter-(dis)fluency markers in specific conversational sequences highlights the different speakers’ multimodal strategies for delaying discourse in various turn positions (turn beginning, mid-turn, and turn-final). These strategies further allow the speakers to visibly display their degree of (dis)engagement in the unfolding conversation.

# The development of participants' orientation to the chat function in video-mediated L2 interaction

Panel contribution

***Ms. Jenny Gudmundsen<sup>1</sup>***

*1. The Center for Multilingualism in Society across the Lifespan, University of Oslo*

Because of distancing during the Covid-19 pandemic, many language cafés moved to video-mediated settings to continue informal language training. This paper zooms in on video recordings of naturally occurring interactions between second language (L2) and first language (L1) Norwegian speakers at a digital language café. The study uses multimodal Conversation Analysis (CA) as a method to investigate vocabulary-oriented sequences in which the participants orient to the chat function as a textual screen-based resource to identify linguistic items. Applying the concept of recruitment (Kendrick and Drew, 2016), I analyze both how the participants seek assistance from each other by requesting the other to write the trouble-source in the chat as well as how they offer or volunteer assistance by writing the trouble-source in the chat, and show how these methods change over time.

The analysis explores prolonged vocabulary-oriented sequences between an L2 user in different dyads in video-mediated interactions over time. Examples show how the participants orient to the chat function as a relevant resource after they – unsuccessfully – have attempted to solve the interactional trouble verbally (e.g. by repeating the trouble-source and providing reformulations to identify the linguistic item).

First, the analysis shows how the L2 user develops a practice of explicitly requesting the L1 user to write the trouble-source in the chat. Thereafter, I investigate how the L1 user develops a practice of offering or volunteering to write the problematic item in the chat after the L2 user has encountered an unknown word. By showing different interactions between each of the dyads chronologically ordered in time, I find that the L2 user's requests lead to the L1 users offering or volunteering assistance at later points in their interaction history. I argue that the two methods of recruitment develop systematically in and through interaction and intertwine with the larger processes of learning and socialization in a complex video-mediated environment.

This study exemplifies how the chat function is oriented to as a relevant resource in the co-constructed work of identifying linguistic items in video-mediated L2 interaction. The observed changes in methods of recruitment show the participants' evolving social relationships and processes of learning in this particular setting.

# The diachrony of politeness in British and American movies (1930-2019)

Panel contribution

**Dr. Daniela Landert<sup>1</sup>, Prof. Andreas Jucker<sup>2</sup>**

***1. University of Basel, 2. UZH Zürich***

There appears to be a widespread consensus among cultural commentators, self-appointed etiquette authorities and public opinion that politeness standards have continuously fallen in living memory and that they have never been quite as bad as at the present moment. However, irrespective of how much credence we want to give such claims, they are notoriously difficult to assess empirically. In this contribution, we explore a relatively new source of data, the Movie Corpus compiled by Mark Davies, which contains transcripts of movies from 1930 to 2019. In this data, we trace a range of elements that have relatively clear default politeness values (see Culpeper and Gillings 2018). The results suggest that there are some expressions that show a declining pattern (*Sir, Madam, pardon, would you mind*), some that remain more or less stable (*please, thank you/thanks*) and one that becomes somewhat more frequent over the period up to the 2000s before it starts to decline (*could you*). We carefully discuss the reliability of these results, which fully depend on the composition of the corpus and its consistency over time as well as on the reliability of the chosen elements as politeness indicators. We also discuss the extent to which movies can be taken as indicators of language change in general and compare the results with those of a similar investigation based on written data taken from the fiction component of the Corpus of Historical American English (COHA) (see Jucker 2020: Chapter 9).

# The diachrony of Spanish “como” between communicative distance and immediacy

Panel contribution

***Ms. Nicole Feifel<sup>1</sup>, Prof. Wiltrud Mihatsch<sup>1</sup>***

***1. University of Tübingen***

Today, Spanish *como* is a colloquial mitigator and imprecision marker in many Spanish varieties. *Como* tends to be considered a recent phenomenon and as such also subject to metalinguistic criticism. Miguel Ángel Mendo's comment is typical in this respect:

Como muletilla puede llegar a ser enfermiza, puesto que puede colocarse delante de cualquier adjetivo, sustantivo o frase adverbial. Se puso de moda en los noventa entre la juventud pija, hasta tal punto que bastaba con utilizarla dos o tres veces para caricaturizarlos.

(<https://www.fundacionlengua.com/es/como-muy/art/2488/>, page last consulted 20/01/2020)

However, *como* was used as an imprecision marker as early as in the Middle Ages and, perhaps surprisingly for us today, was already employed in scientific treatises such as the *Lapidario* by Alfonso X around 1250, and throughout the centuries also appears in religious texts, poetry and other domains (see Cano Aguilar 1995 and Velando Casanova 2005) rather belonging to the communicative distance. The variant *como que* is also attested in these contexts early on, which now seems diatopically marked and rather belonging to the communicative immediacy. Another intriguing variant is the position of *como* after the article as in *una como sonrisilla de hombre de mundo* (Galdós (1887): *Fortunata y Jacinta*, 485, in Cano Aguilar 1995: 67), which again seems rather marginal and diatopically marked today (for a summary of these tendencies also documented in other Romance languages see Mihatsch 2010).

Generally, the approximative uses seem to become more restricted after the Siglo de Oro (Montes 1980/1981: 672), Wielemans (2005) observes a similar phenomenon for French *comme*.

Based on extensive corpus analyses we will trace the usage patterns of the imprecision marker *como* with a particular focus on the question of communicative distance and immediacy, we will try and explain the increasing restrictions in the communicative distance in the light of normative tendencies and we will close with an outlook to the contemporary more pragmaticalized uses of the communicative immediacy and the missing links between the earlier uses in the communicative distance and the current uses in colloquial language.

# The dialogicity of ironic meta-representation: Demanding accountability from political leaders through ironic positioning

Panel contribution

***Dr. Hilla Atkin<sup>1</sup>, Prof. Elda Weizman<sup>2</sup>***

*1. Oranim Academic College of Education, 2. Bar-Ilan University*

In April 2020, a nation-wide lockdown was imposed on the Israeli population in an attempt to slow down the spreading of the COVID-19 pandemic. This included the requirement that people should not join the traditional Passover Eve (*erev pesach*) dinner, *leil haseder*, with family members who lived in another household. As a result, the elderly were separated from their children and grandchildren and most of them spent this traditionally, emotion-loaded family evening all alone. On the other hand, Israel President Reuven Rivlin and Israel Prime Minister Binyamin Netanyahu were reported to have invited their children to spend *leil haseder* with them. This was a severe breach of the health regulations.

Heated backstage and frontstage discussions evolved around these events. Public figures, politicians, journalists and commenters demanded from both leaders accountability for the breach of requirements to ordinary people (Weizman & Fetzer 2019). Whereas President Rivlin apologised publicly, PM Netanyahu did not.

In this presentation we discuss demands for accountability made by commenters in two online journals: the internet version of the liberal, highbrow, subscription-based *Ha'aretz* (17 articles, 2311 comments) and the free-of-charge Israel's most-widely read, pro-Netanyahu *Israel Hayom* (11 articles, 862 comments) in two separate online outlets: their news websites and Facebook page. The data was retrieved through key-word based queries between April 8th-29th, 2020[i]. A sharp decline of public trust has been observed in both journals, but Rivlin is more often defended, whereas Netanyahu and his followers are extensively blamed. The loss of confidence is conveyed mostly through ad-hominem commenting, i.e. comments addressing directly and indirectly the personality and positioning of the politicians and their families. (Weizman & Dori-Hacohen 2017).

The discursive analysis focuses on ironic comments, with special emphasis on comments which have ironic signatures, which represent the commenter's self-positioning. Irony is conceived of as meta-representation of beliefs and stances (Wilson 2012). It is argued that through the ironic utterance the commenter conveys a demand for accountability, while the meta-represented belief or stance implies its rejection. Ironic demands for accountability are thus inherently dialogic, as they convey both stances while prioritizing the implied commenter's position.

# The discourse-interactional uses of interjection “hai” in responsive turns in Mandarin Conversation

Panel contribution

*Mr. Ruixiang Zhang<sup>1</sup>*

*1. Innter*

Interjections are prevalent in spoken interaction. In general, they are seen as spontaneous or instantaneous verbal expressions in response to some prior actions in interaction. However, with little semantic meaning, their actual functions are often interpretable only in context, which makes understanding of their uses a less straightforward matter. In recent years, conversation-analytic methods have been employed in examining interjections in Chinese, such as “ei”, “ou” and “aiyou” for their functions in interaction (Tsai 2008; Wu 2014; 2016; 2018; Wu & Heritage 2017). This study, as part of a large project, focuses on another token of interjection “hai” in Mandarin conversation. Chao (1968) points out that “hai” is an interjection expressing disapproval, which could be used in situations such as when seeing someone put salt in the tea. Yet there is little systematic study of this interjection based on authentic interactional data. The present study aims to fill the gap by examining “hai” as it is found in spontaneous spoken interaction. As an initial step, the use of “hai” in responsive turns is examined in a number of sequence types for its possible interactional functions. The data for analysis are drawn from telephone calls and videotaped face-to-face interaction in Mandarin Chinese. The research method in the present study is guided by conversation analysis and interactional linguistics.

It is found that “hai” is used in response to questions, suggestions and assessments. In question-answer sequences, “hai” is found to preface non-type-conforming responses (Raymond 2003). Specifically, “hai” can serve to point out the inappropriateness of the terms of the question, take issue with the questioner’s understanding. In assessment sequences, especially in competitive contexts, turn-initial “hai” is used to preface counter argument, treat the prior assessment as divergent from his/her own. In suggestion sequences, turn-initial “hai” serves as a resource for displaying disagreement or incongruent epistemic stance. In these sequences, “hai” in the responsive turn is often followed by accounts or explanations. Such characteristics of “hai” indicates that the interjection could be seen as a preface to a disaligning response. The findings from the study can provide us insights into the function of interjections in Mandarin talk-in-interaction, and in particular the different sequences of action in which they are situated.

# The effect of the rubric at Japanese junior college during a Covid-19 affected school term

Panel contribution

***Dr. Ritsuko Izutani<sup>1</sup>***

*1. self-employed*

The purpose of the study is to clarify the effect of the rubric in English lessons at a Japanese junior college through a comparison of the school term affected by the Covid-19 crisis and the school term not affected by Covid-19. In Japanese universities, there are cases that a cognitive gap is observed in the understanding of the concept “presentation” between teachers and students. Shiobara (2020) reports that many Japanese university students when they are to give presentations, don’t use presentation notes but read aloud the essays they wrote without eye contact with the audience.

To fill the gaps of understandings between teachers and students, Stevens and Levi (2014) suggest rubrics. They say detailed explanations of teachers are not sufficient to solve the problem and argue that having students discuss lesson themes and rubrics usage is practical for clarifying teachers’ expectations. This study shows how far rubrics fill such gaps about “presentation” between a teacher and students employing discourse analysis of transcription of video data.

The data consist of video records of English Communication lessons of 2019 and 2020 of some junior college in Japan. The change of students from mid-term presentation to the final presentation in 2019 and 2020 compared respectively. Thus how the rubric affects the changes is discussed.

In 2019, after the mid-term presentation, the teacher intervened orally. In 2020, after the mid-term presentation, the teacher intervened with a rubric and a checklist. The study notes that in 2020, the beginning of the spring term was delayed for two weeks due to the Covid-19 crisis, and even after the spring term started, face-to-face communication between the teacher and students was not possible until six weeks had passed. From the first to the sixth week, students had to learn through paper documents, pdf files, or lesson movies provided by the teacher through Universal Passport, a designated school internet system, which both the teacher and the students are not familiar with at all. The last three lessons of the autumn term were conducted hybrid.

In the 2019 mid-term presentation, 11 students (three groups) chose role play, and no students chose PowerPoint presentation, and in the final presentation, 12 students (4 groups) chose role play, 16 students (seven groups) chose PowerPoint presentation, and two students (one pair) chose presentation by cardboards.

In the spring term of the 2020 mid-term presentation, 24 students read out their essays and two students chose PowerPoint presentations, and in the final presentation, seven students read out their essays, and 19 students chose PowerPoint presentations.

In the autumn term of the 2020 mid-term presentation, all 32 students read out their essays, and in the final presentation 14 students chose PowerPoint presentation , and 18 students chose presentation by cardboards.

A change between mid-term presentation and final presentation of one group from 2019 and a change between mid-term presentation and final presentation of an individual from 2020 spring term and autumn term will be analyzed in detail by the methodology of discourse analysis and discussed.

# The Embodied Enactment of Politeness Metapragmatics

Panel contribution

***Dr. Lucien Brown<sup>1</sup>, Dr. Soung-U Kim<sup>2</sup>, Dr. Hyunji Kim<sup>3</sup>***

*1. Monash University, 2. SOAS, 3. University of Oregon*

Along with the multimodal turn in politeness research, recent years have also witnessed increased acknowledgement of the importance of metapragmatics within the field. The interest in metapragmatics marks a shift towards recognizing politeness as residing in the recursive evaluations of social behaviour, and the discursive negotiation of societal norms and ideologies (see Watts 2003, Mills 2003, Locher 2006). From this perspective, if we are to understand the workings of politeness, then we need to understand the ways in which people talk about politeness in their everyday lives.

In this paper, we attempt to connect these two emerging themes of politeness research (multimodality and metapragmatics) by exploring the embodied properties of the ways in which speakers talk about politeness. The research is motivated by the observation that research on politeness metapragmatics to date has tended to look only at *WHAT* people say about politeness or the meaning of politeness metalexemes, but has not addressed the question of *HOW* people talk about politeness using various verbal and nonverbal resources.

To explore the way that metapragmatic discourse emerges as an embodied achievement, we conducted a multimodal analysis of sociolinguistic interview data collected from two speakers of Korean. Despite commonalities between the two participants' backgrounds (same dialect, same gender, similar social standing, etc.), they enacted contrasting understandings of politeness during the interviews. Whereas one participant equated politeness with following prescribed rules, the other identified it with the promotion of mutual attentiveness and interaction. Through analysis of embodied movements that the two participants performed during the interviews, we see how these different views on politeness were multimodally manifested in the ways that they talked about politeness. The participants employed bodily movements when evoking specific embodied practices related to politeness, and used gestures and other multimodal resources for enacting politeness-related concepts, and for mapping them onto imaginary and physical spaces. The results speak to the importance of researching inter-cultural variation in understandings of politeness. Moreover, the research works towards locating the study of politeness metapragmatics firmly within the multimodal turn in politeness research.

## The essence of face

---

Panel contribution

---

**Dr. Jim O'Driscoll<sup>1</sup>**

**1.** University of Huddersfield

Face has become an established concept, almost a buzzword, in scholarship on the interpersonal aspects of interaction. But what exactly is its role in this enterprise? To answer this question, we need to find its essence, so that we can answer another question which follows from the first: what can it offer us as a tool for explanation which related concepts (e.g. identity, self-esteem) cannot? This talk will begin with a five-minute ‘performance’ in which I introduce myself (at absurd and, indeed, tedious length) as a way of demonstrating the essence of what I suggest face is - a phenomenon not merely (as has been recognised) both constituted *in* and constitutive of interaction but actually a *sine qua non* *for* interaction.

It will be followed by brief examinations of two scenes from (non-academic) autobiographies which likewise exemplify one or more crucial characteristics of face. These are its omnipresence, its relational reflexivity, its emotional impact and its sheer preciousness for the interactant. While most of these qualities are arguably also involved in concepts such as identity and self-esteem, it can be shown that there are situations in which the consequences for these aspects of a person are in conflict with those for their face, thus supporting the claim that face can explain some interactive behaviour which these related concepts cannot.

Having re-affirmed (I hope) that face is a heuristic tool in its own right, I will proceed (if there is time) to argue the need for a distinction between face itself and notions such as face concerns and face wants.

# The evidentiality-pragmatics interface in argumentative settings: Implicit communication as a modulator of information source and commitment degrees in political debates

Panel contribution

**Dr. Viviana Masia**<sup>1</sup>

1. University of Roma Tre/University of La Sapienza

Argumentative and dialogical settings offer a valuable testing ground to investigate the use of implicit communication (IC) (Lombardi Vallauri & Masia 2014) and its implications in the reconstruction of speakers' information sources and commitment degrees. IC thus works as an evidential strategy (Faller 2002, Murray 2010) through which speakers can modulate their source of information or committal attitude to truth, so as to dodge recipients' potential challenging reactions (Masia 2017a, 2020). In political speech, whether in dialogical or monological contexts, the use of IC as an evidential strategy becomes particularly noticeable with respect to certain types of contents (CTs) and, notably, those with a stronger challenging or face-threatening nature, such as attacks or self-praises (Lee & Xu 2017, Masia 2020). Building on the analysis of two political debates, one held in 2016 between Donald Trump and Hillary Clinton in Hampstead before the Presidential elections, the other aired on TV in 2019 between Matteo Salvini (League party) and Matteo Renzi ("Italia Viva") after the resignation of the former, data are shown that highlight how IC, mainly in the form of implicatures, presuppositions, and other implicit communicative devices, are preferred to more explicit strategies when it comes to more challengeable CTs. Conversely, less challengeable CTs (either involving neutral or stance-taking information, cf. Garassino et al. 2019, Masia 2020) often find encoding in more explicit and/or assertive communicative strategies. In the former case, IC discourse devices encode a less direct type of evidentiality, as they reduce the speaker's commitment to truth, while with assertions the speaker strengthens her degree of sourceness and commitment to the exchanged content. The trends observed hint at an inverse relation between evidential strategy (implicit/non-implicit) and CT, and trace quite interesting profiles of the four politicians' communicative behaviors with respect to either attacking, praising, stance-staking or simply neutral conversational moves.

# The Expression of Sympathy in African Contexts: A Case Study of Iraqw

Panel contribution

***Dr. Chrispina Alphonse<sup>1</sup>***

*1. The university of Dodoma*

This study examines linguistic and nonlinguistic resources that are used to communicate sympathy in Iraqw, a Cushitic language spoken in Tanzania. This research area has scarcely been addressed in East African contexts as evidenced by very limited literature on the topic. This study thus aims to add to our knowledge of African ways of communicating compassion. The investigation considers situations where sympathy is appropriate or inappropriate and analyses the forms used to express sympathy, taking into account the interdependence of verbal and non-verbal resources (Goodwin 2000). Methodologically, data were collected through metapragmatic introspection and elicitation from Iraqw native speakers residing in Mbulu (Irqwar Da/aaw) and Babati Rural District (Masabeda). These areas were purposely selected due to minimal interaction or contact with other indigenous populations. My goal was to identify specifically Iraqw cultural heritage and practices.

In Iraqw, sympathy expressions serve to show pity for someone who is experiencing a bad situation, and to give courage or comfort. The analysis reveals that sympathy expressions are used in tragic or traumatic situations such as death, disaster (e.g. war, flood, famine), accidents, loss or destruction of property (crops, farms, livestock, houses), sickness or emotional distress. Additionally, they are employed when a person is hurt or injured, or if someone has stumbled, fallen over, broken or dropped an object, or was insulted or beaten for no reason. We also find sympathy expressions used to comfort children. In some contexts, sympathy may be accompanied by congratulations, for instance, when a woman gives birth to a new baby, or when people are injured during fights with enemies or wild animals. In contrast, sympathy is not appropriate in the context of circumcision, during which boys and girls are also not allowed to cry. Sympathy is also withheld from people who are aggressive or who are perceived to be suffering as a result of their own misbehaviour.

To express sympathy, Iraqw use the conventional phrase *orok lowa ale* for singular and *orokee lowa ale* ‘very sorry’ for more than one person. Other expressions include *muuna gawdese* or *guraa gawdese*, *tla/angw tseege*, *naas qitl*. These expressions are accompanied with non-verbal cues involving facial expressions, bodily contact, pauses, silence and interjections such as *oooyee*, *uuuuu*, *uuuuu aree*, *ah ah ah ah*, as well as clicks and prosodic features include low volume and talking slowly. Following a discussion of these different resources, I consider how people comfort children, an activity called *halaahao na/ayin* Iraqw. Songs are a notable part of *halaahao na/ay*(cf Milligan et al 2003). While I try to identify an indigenous Iraqw model of expressing sympathy, no communities live in isolation, and in the final part of my talk I comment on possible contact effects in this domain.

# The freestanding adverbs in responsive turns: A case study of queshi ‘indeed’ and zhende ‘really’

Panel contribution

**Ms. Ting Tian<sup>1</sup>, Prof. Mei Fang<sup>1</sup>**

***1. Chinese Academy of Social Sciences***

This study investigates the aligning function of independent confirming adverb *queshi* ‘indeed’ and *zhende* ‘really’, particularly when they appear as responses in spontaneous conversation. Previous studies have described their semantic properties and their uses in sentences extensively. However, it is observed that the two adverbs are often used in spoken Chinese conversation as independent units occupying the whole turn, yet few studies have focused on this use of these adverbs.

Mainly using the conversation analysis method, and drawing on over 20 hours spontaneous Chinese conversation, this research examines the independent use of *queshi* and *zhende*, especially concerning the features of the responsive turn they locate in, as well as their function. As it can be observed in our data that there is linkage between the two uses, independent and dependent use, we compare the two uses of the same adverb in similar sequential context, to explore the function change of their independent use, as well as the functional distribution of the two freestanding adverbs used in responsive turns.

Based on all the analysis and findings, this article argues that the syntactic change and independence as realized in freestanding *queshi* and *zhende* should be treated here as an instance of Emergent Grammar. Some earlier research pointed out that the independent use of an adverb can be seen as a result of omission, we hold the view that subjectivity of language plays a significant role in the freestanding use of an adverb. Either *queshi* or *zhende* can be used at the beginning of a responsive turn as an affirmative response, however, there are still some clear distinctions between the two adverbs when they are spoken independently: speakers use *queshi* to show their affiliation to the preceding utterance, while *zhende* often appears in a sequence with epistemic incongruence, which means more of a subtle contradiction.

# The grammar-body interface: A cross-linguistic analysis of pseudo-cleft-like constructions in Hebrew, French, Swedish and Estonian interaction

Panel contribution

**Prof. Yael Maschler<sup>1</sup>, Prof. Simona Pekarek Doepler<sup>2</sup>, Prof. Jan Lindström<sup>3</sup>, Prof. Leelo Keevallik<sup>4</sup>**

*1. University of Haifa, 2. University of Neuchâtel, 3. University of Helsinki, 4. Linköping university*

We present a multimodal, interactional linguistic analysis based on recordings of casual spoken interactions in four languages, focusing on complex clausal structures that have traditionally been regarded as pseudo-clefts, opening with Hebrew *ma she-* ‘what that’, French *ce que/qui* ‘this that’, Swedish *det som/vad* ‘that which/what’, and Estonian (*see*) *mis/mida* ‘(that) what (nom/part)’ clauses (‘Part A’).

In line with existing research (Hopper 2001, Pekarek Doepler 2011, Maschler & Fishman 2020), we argue that, rather than constituting the first part of a bi-clausal structure, the A- parts pertain to a continuum of pseudo-cleft-like constructions, ranging from canonical A+B variants to free-standing A-parts. In the latter case, Part A is a projecting construction: it occurs without any syntactic link to subsequent talk, serving to frame the following talk as an action/event/rephrasal or to display the speaker’s stance towards his/her upcoming talk. We show that this projecting construction has become grammatically and lexically sedimented for specific interactional purposes in a similar fashion across the four languages, although ‘full’ grammaticalization has been realized to differing extents.

We further show that speakers’ co-occurring embodied conduct manifests some consistencies across the four languages as a function of the sequential contexts in which the construction appears. When Part A occurs at a major frame shift (Goffman 1981), it tends to be accompanied by a prominent shift in bodily-visual conduct. In the following Hebrew example, Dotan has just completed a narrative about a situation evaluated as *drives one nuts* (line 1) and *difficult*(3-4):

- 1 Dotan: ...meshagea.  
drives one nuts.
- 2 Alex: tsk
- 3 ...kashe.  
difficult.  
gazing towards his lower right
- 4 ...ka%she.  
{-pp-}  
difficult.  
%—turns head in Dotan’s direction, looking down——>
- 5 ...%tsk  
—%
- 6 (inhale)
- 7 ...%&'az ma she-'asiti%&,  
{——f——}  
%straightens up, pulls head up and backwards, gaze at Dotan%  
so what that I did  
so what I did,  
dot: &turns head and gaze towards Alex&
- 8 ...be-zman she-nasata-,  
when you drove,

- 9 ...lehabi 'et 'e-h  
to bring u-h

10 Dotan: Nikolaus.

11 Alex: Nikolaus.

12 ..(inhale)

13 ...'e-m,  
uh-m,

14 .yom xamishi ha-'axaron?  
last Thursday?,

15 ...halaxnu- la-gan ha-botani?,  
we went to the botanical garden?.

After closure of the previous topic, Alex turns his head towards Dotan, still looking down (4). Following a click, inhale, and the DM so, he produces what looks like a potential Part A of a pseudo-cleft – *ma she'asiti* ‘what I did’—in continuing intonation and higher volume, projecting further talk depicting actions. Following an inserted co-constructed adverbial clause, an inhale and hesitation marker (8-13), he frame-shifts to a new narrative (14-15). No syntactic link connects Part A with what follows. Part A is produced with a noticeable shift in bodily-visual behavior (line 7). In response, Dotan returns his gaze back to Alex, showing reciprocity.

Systematic analysis of such occurrences across the four languages sheds new light on cross-linguistic consistencies in the grammaticalization of projecting constructions and on the interface of embodied conduct and emergent grammar.

# The Hawaiian language in the Hawai'i state educational system

Panel contribution

***Dr. Yumiko Ohara<sup>1</sup>***

**1. University of Hawaii at Hilo**

The negative social, psychological, and physical effects of language endangerment are well documented (e.g., Fishman 1997, Fitzgerald 2017, Haliniak 2017, Hallett et al. 2007, Harrison 2008, Taff et al. 2018) and we now know that there are numerous factors involved in language endangerment. However, the educational system arguably has the most influence in determining if a previously dominant language might be on its way to endangerment. For instance, Wilson and Kamanā (2006) claimed that the English-only law of 1896, which was enacted three years after the overthrow of the Hawaiian monarchy, had a tremendous effect on its current endangered status by making Hawaiian-medium education in both private and public schools illegal. Largely due to these forced assimilation policies in education, the devaluation of the community's language resulted in an interruption of intergenerational transmission of language.

- However, as a result of a Hawaiian cultural renaissance in the 1960s as well as grassroots work carried out by families in 1970's and 80's, the Hawaiian language was reintroduced into the educational system in the state of Hawai'i. In 1978, at the same time the Hawaiian language gained official language status of the state, the state mandated the teaching of Hawaiian language, culture, and history from kindergarten to the sixth grade in public schools. In 1980, a Hawaiian studies program from kindergarten to the 12th grade was established by the Hawaii State Department of Education making it a requirement for all schools to provide a Hawaiian studies component in their curriculum. In 1984, the first Hawaiian-medium preschool was established.
- In this presentation, I will focus on the current status of the Hawaiian language within the educational system in the state of Hawai'i. I will provide an overview of how well and to what extent the language is incorporated from the preschool to the university level 125 years after the banning on Hawaiian-medium instruction, and by doing so I will examine how some of the negative consequences caused by endangerment have been reversed.

# The impact of new technologies on language services in healthcare

Panel contribution

***Dr. Doris Anita Hoehmann<sup>1</sup>***

**1.** University of Bologna

Language barriers can have a negative effect on both the quality and efficiency of face-to-face interactions, especially in situations involving large numbers of individuals who are not speakers of the local languages (refugees, migrants, but also tourists), and where appropriate professional language mediation services are often not available. Furthermore, in today's multilingual societies language services can hardly cover all the language combinations required.

In order to overcome, at least partially, the communicative problems which can arise in such settings, both patients and healthcare providers more and more often are using translation and interpreting applications which are increasingly sophisticated and efficient.

The paper tries to outline some key issues related to the use of language tools in healthcare communication:

- types of communicative practices for which they are (not) appropriate
- to what extent they can be considered reliable
- how and to what extent their use contributes to standardization processes

The paper will discuss the results of empirical studies concerning, on the one hand, the evaluation of currently used apps, and on the other, the creation and optimization of model dialogues in plain language.

# The impact of silence(s) on politeness in Russian

Panel contribution

**Prof. Wolfgang Stadler<sup>1</sup>, Ms. Priska Wahrstätter<sup>2</sup>**

**1. IPrA, 2. Innsbruck University**

Silence (*молчание*) has been a topic in pragmatics since the 1980s but to many linguists it remains a marginal phenomenon, and at best a “non-verbal peculiarity”. At first, only few publications appeared, which were mainly concerned with pauses in conversation. Further research was prompted by the publication of Tannen & Saville-Troike’s volume (1985) and by the works of Jaworski (1993, 1997). More recent publications on silence from a pragmatic point of view are Kurzon (1998, 2007) or, for example, Ephratt (2008, 2014). Most of these papers focus on English. One of the first and more detailed studies of Russian silence(s) outside Russia is Stadler’s monograph (2010). Silence as a component of Russian speech culture has been studied only in a fragmented, incomplete, and unsystematic manner (Muchametov 2012). Important Russian contributions treating silence from the perspective of culture theory and philosophy are Ěpštejn’s (2005) essay and Kopylova & Marynenko’s (2015) expositions.

The extant gap in the investigation of silence in Russian in connection with (im)politeness, as well as the under-researched inability to deal with silence in conversation, makes our study a valuable contribution to this conference. In our talk, we will zero in on the following research question:

Which types of silence(s) are relevant to face-work: acts of silence, phases of silence (e.g. pauses, gaps) or “silence(s) during activities”?

We assume that acts and phases of silence are directly related to language etiquette and constitute a significant part of linguistic politeness, whereas to silence someone explicitly would be considered impolite.

# The Implicit Negative Meaning of *Shenme* Rhetorical Questions in Chinese from the Perspective of Pragmatics-Grammar Interaction

Panel contribution

***Prof. Shaojie Zhang<sup>1</sup>, Ms. Hongjuan Wang<sup>1</sup>***

***1. Northeast Normal University***

The implicit negative meaning of *shenme* rhetorical questions in Chinese remains an open discussion in the linguistic circle. For example, A says, “Her dress is so nice.” B responds, “Is it nice for what?” (In Chinese, “Nice what?”) Such a question with a negative meaning has attracted a great deal of attention from scholars in the literature. This paper aims to analyze this type of rhetorical question from the interactive perspective of pragmatics and grammar. It addresses three research questions:

(1) How is the negative meaning of *shenme* rhetorical questions derived? (2) Whether or not is the negative meaning grammatical or pragmatic in nature? (3) How is it possible to explain the speech acts that rhetorical questions perform with negative and emotional meanings from the interactive perspective of grammar and pragmatics?

Drawing on insights from the studies on grammar-pragmatics interaction, the present study reconstructs a theoretical framework within which *shenme* rhetorical questions are analyzed on the basis of the Chinese corpus data. For the derivation of negative meaning expressed by *shenme* rhetorical questions, we argue that driven by a specific communicative purpose, the speaker’s intention to express negative meaning with certain additional subjective emotion occurs more than often in interpersonal communication, and due to the deficiency of conventionalized grammar resources, the speaker is forced to employ *shenme* interrogative sentences to express negative meaning in the process of pragmatic function compensatory selection, in which the form/meaning of *shenme* interrogative sentences is extended in order to better fulfill the communicative effect. In response to this pragmatic selection, the grammar’s regulative adaptation impels *shenme* interrogative questions with rhetorical mood to emerge as a grammatical innovation so that the negative meaning compensated with emotion is derived. Furthermore, in such an interaction between pragmatic selections and grammatical adaptations, the negative meaning of *shenme* rhetorical questions has been gradually conventionalized. Thus such negative meaning is both grammatical and pragmatic in nature, with the conventionalized grammatical meaning and the pragmatic implicit meaning encoded together. The two aspects of meaning encoded by such rhetorical questions interact with each other to achieve its pragmatic functions: speech act function and emotional function. The former is dynamic but modulated by the latter which is driven by the speaker’s communicative purpose in the interaction of the pragmatic functional selection and grammatical functional adaptation.

To conclude, through analyzing the origin, nature and pragmatic function of the negative meaning expressed by *shenme* rhetorical questions in Chinese from the interactive perspective of pragmatics and grammar, this paper reveals that pragmatic selection and grammatical adaptation interact with each other in meaning construction.

**Key words:** *shenme* rhetorical questions, implicit negative meaning, pragmatic function, pragmatics-grammar interaction

# The intelligibility and accountability of speaking and crying

---

Panel contribution

---

***Prof. Ann Weatherall<sup>1</sup>***

*1. Victoria University of Wellington*

There are common sense ideas about when, where and for whom it is OK to cry. Studies of children and crying have begun to document the socialisation processes involved with making emotional displays. Other work has identified the patterned ways crying episodes are built and understood in sequences of turns. In this paper I focus on documenting the different ways talking and crying can be organised within a turn of talk. I ask how that organisation produces the crying as a display of upset and also shows an orientation to ‘feeling rules’ or the accountability of emotional expression in different institutional settings. Cases of crying were collected from three different corpora of naturalistic interaction: courtroom cross examination in rape cases, a telephone mediated victim support service and therapeutic interviews. In all three settings talking and crying regularly occurred together, with evidence of efforts to keep talking and suppress crying. When talking was suspended by crying, the resumption of talk was routinely linked back to where it had been left off. Both practices point to a normative orientation to not crying and to progressing talk. However, the settings differed in how the displays of upset were managed. In the victim support service and the courtroom cross examination next speaker turns did not explicitly respond to the crying either continuing an ongoing action or launching a new action. In contrast, the clinician in the therapeutic encounters examined instructed the client to stay with feelings and sensations and interrupting their claims to the conversational floor. The findings underscore the importance of studying emotional displays *in situ* in order to understand their meaning and accountability.

# The interactional function of a turn-final particle in service encounters: An analysis of *nuntey* ‘but’ in Korean

Panel contribution

***Dr. Sung-Ock Sohn***<sup>1</sup>, ***Dr. Mee-Jeong Park***<sup>2</sup>

*1. UCLA, 2. University of Hawaii at Manoa*

Cross-linguistic studies in naturally occurring talk demonstrate that clause connectives are often used in utterance/turn-final positions. The use of clause connectives without main clauses is pervasive in Japanese and Korean. For instance, the Korean clause connective *nuntey* ‘but’ is commonly used without main clauses in conversational discourse. This has been traditionally considered as a syntactic ellipsis derived from a main clause omission.

However, conversation-analytic approaches to turn-final elements reveal that these final connectives are used in particular contexts as a vehicle for implementing particular social interactions (Park 1999, Kim&Kim 2015). Specifically, Park (1999) illustrates that *nuntey* in a final position (without a main clause) indexes interactionally delicate actions such as requests, disagreements and denials. Based on authentic conversational discourse, Park’s study demonstrates that the speaker invites the interlocutor to infer the speaker’s intention by employing *nuntey* at a turn-final position. Furthermore, Park’s study confirms that the interlocutor can understand the invited inference without any trouble.

While the previous studies focused on usage of the final *nuntey* in everyday conversations among friends and/or family members, very little research have examined its interactional function in institutional discourse such as commercial service encounters. Institutional discourse is different from everyday, informal conversation in terms of communicative goals and agendas, whereby the interaction and the speakers’ goals are partially determined by the institution.

This study attempts to explore the interactional use of *nuntey* in the context of commercial service. Specifically, we examine how the invited inference associated with the final *nuntey* is employed in dealing with delicate interactional contexts such as unexpected requests during service encounters taking place between a flight attendant and a passenger for South Korean airline meal service. In such contexts, it is crucial to satisfy the customers. Non-granting of customers’ requests may bring about negative consequences. As such, agents design their conduct to maximize preferred responses when dealing with dispreferred requests. A preliminary analysis of airline service encounters in Korean indicates that both a service agent and a passenger tend to employ the final *nuntey* in dealing with delicate situations. Through the invited inference associated with *nuntey*, both the agent and the passenger achieve mutual understanding and agreement for the given service.

The use of *nuntey* in this context exhibits unique features in terms of interactional functions, turn designs, and prosody. First, the use of *nuntey* by the agent is accompanied by multiple components (offering substitutes) and multimodal features (body gestures). Second, the service agent designs her turn as enabling the customer’s request to the maximum extent. Thus, the agent facilitates the process of granting a request in a very efficient manner. Finally, the turn-final *nuntey* tends to be realized as HL(rising-falling) boundary tones. The ‘H’ tone is

used as a resource to claim the speaker's epistemic primacy regarding the conveyed information, whereas the 'L' tone indexes the speaker's assertive stance (cf. Park 2012). By using the HL tone in a response position, the speaker signals new information and invites the interlocutor to infer the implied message in socially delicate situations.

# The interdependence of common ground and context

---

Panel contribution

---

**Prof. Keith Allan**<sup>1</sup>

**1.** Monash University

The aim of this essay is to argue that common ground is context shared between S (speaker, writer, signer) and H (audience) where S presents  $v$ , uttered by S in context C1 (the ‘world and time spoken of’), so as to bring about in C3 (the ‘situation of interpretation’ from H’s point of view) H’s understanding  $v$  in terms of the relevant beliefs that S holds or purports to hold in respect of uttering  $v$  (speaking of C1) in C2 (the ‘world and time spoken in’, the situation of utterance from S’s point of view). If C3 is very different from C2 (such that H does not share some of S’s system of beliefs and assumptions), H may be well able to understand what S intended to mean; nevertheless,  $v$  can have reduced comprehensibility and its psycho-social appropriateness may be differently evaluated from the way S expected to be understood: examples would be when a 21<sup>st</sup> century H reads a sonnet by William Shakespeare or, for another instance, reacts to Jeannie Gunn referring in 1908 to Indigenous Australians as *niggers*, despite her showing greater respect for their culture and landrights than most of her white contemporaries.

# The Ironies of Ainu Language Education in Public Schooling

Panel contribution

***Prof. Jeff Gayman<sup>1</sup>***

**1.** Hokkaido University

Beginning in the mid-Meiji Era (1890s~) Ainu people underwent assimilatory education at Native Schools (until 1937) as well as at mixed schools, where they were taught in the medium of the Japanese language and inculcated in value and knowledge systems which denied their unique culture, history, language, and Indigenous knowledge. Discrimination and prejudice accompanying the colonization of their lands and a huge influx of settlers from the south moved many Ainu individuals not to transmit the language to their children and grandchildren, with the result that today the Ainu language is designated critically endangered by UNESCO.

On the other hand, efforts by impassioned Ainu activists and cultural bearers combined with changing human rights standards have brought about cultural promotion legislation for the Ainu in 1997 and again in 2019, with the latter law culminating in creation of a new National Museum of the Ainu. However, neither of these Acts sanctioned the teaching of the Ainu language in public schooling, and indeed instruction in the Ainu language medium in a proposed nursery school in Nibutani in 1982 was given as reason for the Ministry of Welfare to threaten pulling funding. As a result, Ainu language instruction currently occurs through the medium of adult and community education community language classrooms, at student clubs housed in local universities, and through privately arranged self-study groups, with the exception in public institutions of limited instruction at the schools of the Biratori municipality. Meanwhile, however, the language is still very much alive in the songs, dances and prayer ceremonies of the Ainu people conducted by local cultural promotion societies, and has been gaining increasing visibility in public spaces and the media recently as a result of the 2019 legislation.

This presentation delivers the results of analysis of data gathered through two large-scale surveys, the first sanctioned by the Japan Agency for Cultural Affairs (2012-13) to overview the current status and conditions of transmission of the Ainu language, and the second (2014~present) to examine the articulations of Ainu Indigenous knowledge, including the Ainu language, within the complex social and educational structures described above. The former study was based on in-depth questionnaires combined with interviews, and the latter has centered around focus groups with Ainu elders/community activist/culture bearers.

The findings indicate an increased usage of the Ainu language in the younger generation, as well as an increase in domains of usage, especially in the performing arts and tourism realms, and additionally, a gap between the calls of activists for increased official recognition of the Ainu language in public services and schooling, and the ideology of the government which ‘promotes’ revitalization of Ainu culture but not as a linguistic human right. These disparities in actual usage/aspiration indicate that the efforts at inclusion of the Ainu people through education in the medium of the Ainu language are ironically too piecemeal and sporadic to contribute to concrete revitalization of the Ainu language.

# The language of the Spanish journalism on Political Economy in the 18th Century

Panel contribution

**Mrs. Maria Mendez Orense<sup>1</sup>, Mrs. Elena Carmona Yanes<sup>1</sup>**

**1. Universidad de Sevilla**

During the second half of the 18th century, the consolidation of journalism in Spain created a new type of discourse based on the specific treatment of economic matters (Astigarraga 2018). The Spanish journalism on Political Economy combines two different *textual traditions* (López Serena *et al.* 2020). On the one hand, its specialized content is related to the economic essays that were published by *arbitristas* and *proyectistas* in the 17th and 18th centuries. On the other hand, its textual organization is associated to the macrostructure of the 18th century periodical press. This new way of communication is closely connected to communicative distance and to the processes of linguistic elaboration that took place in the pre-modern Spanish language.

The aim of this contribution is to obtain new data on the grammatical characterization of the Spanish language during the 18th century (Octavio de Toledo 2016, 2020), as well as to establish the linguistic patters that specifically characterize this type of discourse. Additionally, the linguistic influence of the foreign sources (Urzainqui 1991) that could be observed will be analyzed.

# The life cycle of the COVID-19 mask meme cycle

---

Panel contribution

---

***Prof. Marta Dynel<sup>1</sup>***

*1. University of Lodz*

This presentation contributes to the research on humorous memes as carriers of non-humorous meanings. In my talk, I will report the findings of a diachronic study of evolving trends among a heterogeneous meme cycle about COVID-19 mask memes, which has been evolving in the wake of the pandemic and the changing socio-political situation.

The study takes as its point of departure metapragmatic evaluations of memes as being humorous and addressing the topic of COVID-19 masks, which guarantees the relevance and representativeness of the data, as judged by individuals other than the researcher. The automatic, diachronic corpus was compiled to cover the time from January 2020 to January 2021. In the light of these data, I examine the dominant memetic trends gradually emerging in the various stages of the pandemic relative to the changing situation. The memes are discussed through a multimodal discourse analytic lens in order to extract the main memetic trends, which are shown to reflect the changing offline reality, ranging from humorous recontextualisation of peculiar masks worn by desperate citizens, lockdown spoofs and parodies of masks (Dynel 2020) to memes critical of some people's refusal to wear COVID-19 masks or unwise decisions on how to wear them.

As the different memetic trends and topics are elucidated, a distinction is drawn between (1) memes that are inspired by, and thus allude to, socio-political facts reported in the background but are essentially specimens of *autotelic humour* (Dynel 2017, 2019), and (2) those that serve the meme authors to express their true beliefs about the contemporary world in a humorous fashion. The topics of the memes prevalent at different points in time in 2020 give insights into users' perceptions and evaluations of the surrounding reality (notably, political decisions and citizens' reactions, as well as other socio-cultural facts).

# The Linguistic Code as Basis for Common Ground Building in English as a Foreign Language

Panel contribution

***Prof. Olga Obdalova<sup>1</sup>, Dr. Ludmila Minakova<sup>1</sup>, Dr. Aleksandra Soboleva<sup>1</sup>***

***1. Tomsk State University***

This study was designed to check the validity of two intertwined hypotheses according to which linguistic code plays the role of common ground in L2 use (see Kecske 2007, 2013) and formulaic language use is an indicator of shared core common ground (Holtgrave 2002). When common ground among participants is high and figurative language is more likely to be understood, and probably more likely to be used, while literal interpretations (linguistic code-based use) tend to be preferred when common ground is low.

In order to check the validity of the hypotheses we organized conversation groups on two levels: intermediate and advanced. On each level there were two groups created. The participating groups received two topics to discuss for 20 minutes on different days. The result was four batches of datasets, each of which was transcribed. The data analysis was based on two measurements: number of formulaic units (idioms, SBUs, speech formulas) and metaphorical density (the number of words used in metaphorical sense divided by the number of words used).

It will be claimed and demonstrated through the measurements and examples that common ground construction in L2 EFL users is highly predetermined by the interplay between the interlocutors' discourse design and salience as a perception quality. It will be argued that speaker's and listener's perspectives are attributable to the linguistic coding by the non-native communicants.

We provide evidence on the role of the linguistic code as a tool of communication in common ground construction and we establish the link between shared core common ground and the nature of communicative means used. The study can deepen our understanding of cognitive processes in interactions between speakers of English as a foreign language at different levels of common ground construction.

# The Linguistic Landscape of Covid-19 Mask-Wearing Responsibility in New York City

Panel contribution

**Prof. Maureen Matarese<sup>1</sup>, Mr. Brandon Coombs<sup>2</sup>, Ms. Lorancy Denis<sup>2</sup>, Ms. Cristina Diaz<sup>2</sup>,**  
**Ms. Chloe Friedman<sup>2</sup>, Ms. Kylie Lance<sup>3</sup>**

**1.** BMCC, City University of New York, **2.** BMCC, CUNY, **3.** Hunter College, CUNY

## The Linguistic Landscape of Covid-19 Mask-Wearing Responsibility in New York City

There is growing research on how responsibility is constructed in social interaction (Östman & Solin, 2016). Matarese (2020) has argued that constructions of responsibility can occur in constellations, combinations of deontic formulations (Coates, 1984), references to neoliberal ideologies, and negative cultural mythologies (Ehrlich, 2010). She argues that responsibility needs to be viewed as it relates to time and space (“responsibility-as-chronotope”) and as a gestalt that evidences itself through the co-presence of a variety of features (“responsibility-as-gestalt”). However, constructions of responsibility such as these often involve orientation to goals, tasks, identities, and constraints specific to the institution (Drew & Heritage, 1992) and, therefore, likely depart from everyday encounters of a similar type. Using a linguistic landscape approach, this paper explores how responsibility is constructed in COVID-19 storefront signage.

In March and April of 2020, New York City’s cases of COVID-19 skyrocketed. By late October 2020, 494,874 total Covid-19 cases have been reported in NYC, and 33,022 people have died (NY Times, 22/10/2020). As the city began reopening in early summer, shopkeepers placed signs on doors and windows to enforce mask-wearing to protect themselves and others. This study uses a linguistic landscape approach (Landry & Bourhis, 1997; Shohamy & Gorter, 2009) to examine the complex interplay between constructions of responsibility and risk in storefront signage across New York City. Data in the form of over 500 photographs of COVID-19 signage were gathered from Brooklyn, Manhattan, Queens, and the Bronx. Machin and Mayr’s (2012) Multimodal Critical Discourse Analysis and a modified SPEAKING model (Huebner, 2009) are used to analyze the data.

Findings suggest a wide variety of linguistic and multimodal approaches to constructing responsibility regarding mask wearing, creating different constellations of responsibility. Drawing on Curl and Drew (2008), Potter, (2010), and Antaki and Kent (2012), this analysis reveals an intersection between responsibility, contingency, and entitlement. Data further reveal a radically different responsibility-as-gestalt. Mask wearing signage presents a responsibility that gatekeeps institutional membership and (albeit often inadvertently) indexes political membership. Certain graphics and colors become weighty cultural symbols in context, and signs range from educational to prohibitive to combinations of the two. COVID signs index class, linguistic code, authority, group membership, and stances vis-à-vis coronavirus. In concluding, we present implications for institutional interaction theory, as COVID-19 signs exist in a hybrid space between institutional interaction and the everyday, presenting pre-requisites for institutional engagement.

# The local formulation of norms in situated activities during the pandemic

Panel contribution

***Mr. Philipp Hänggi<sup>1</sup>, Mr. Guillaume Gauthier<sup>1</sup>, Ms. Yeji Lee<sup>1</sup>***

***1. University of Basel***

Everyday life under Covid-19 has been massively shaped by prevention campaigns, the imposition of safety measures as well as normative discourses about how to prevent risk and promote safety. Much has been said about prevention discourse; less is known about how prevention is actually implemented moment by moment in situated actions (but see Mondada et al. 2020a, b). This paper explores how people treat preventive and normative injunctions when they engage in formulating norms within situated courses of action. In particular, it addresses i) how safety measures are instructed *in situ*, formulated in so many words and how, consequently, participants locally understand and respond to these instructions, complying with them; ii) how norms and measures—like the obligation to ensure distance or to queue in a specific way in certain institutional settings—are made relevant and enforced when correcting the conduct of people, disciplining them; iii) how norms and normative expectations relative to safety are not only formulated, but also discussed and negotiated endogenously in relation to specific circumstances and contingencies. Within the framework of Ethnomethodology and Conversation Analysis, the analyses are based on video recordings of instructions issued the first day of school, of injunctions produced while people queue in order to access goods, and of negotiations of norms and normative expectations on public transport. The analyses show how the formulation of norms is a situated accomplishment, how they are uttered for all practical purposes, how they orient to the specific circumstances and contingencies of ongoing actions, and thereby shape these very courses of action.

# The Mainlandization of Political Discourse in Hong Kong

---

Panel contribution

---

***Dr. Jennifer Eagleton<sup>1</sup>***

*1. Open University of Hong Kong*

Hong Kong officials increasingly struggle to transpose and adapt the language of an authoritarian governing system for use in Hong Kong where the rights and freedoms of it as a Special Administrative Region of China (SAR) with a high degree of autonomy are supposed to remain undisturbed.

Following the large-scale protests of 2019 and by 2020's National Security Law imposed by Beijing, the Hong Kong government's language have even more so echoed the vocabulary and phrasing of that of the central people's government while still emphasizing that Hong Kong's past norms remain intact. In 2021, Beijing plans to radically overhaul Hong Kong's electoral system so that "patriots rule Hong Kong", it being a "necessary condition" for implementing the governance framework of One Country, Two Systems. This presentation, though a critical discourse analysis of Hong Kong Government's press releases and statements, will look at how the Hong Kong Government sees "patriotism" vis-à-vis this future political reform, democracy, the pro-democracy camp, and the promise of the "ultimate aim" of universal suffrage for the election of Hong Kong's leader contained in Article 45 of the Basic Law.

# The Meaning of Pittsburgh: Deixis in Mac Miller’s “Frick Park Market”

Panel contribution

**Ms. Alexus Brown<sup>1</sup>**

1. University of Pittsburgh

The interpretation of deictic forms, like *I*, *here*, or *now* in English, is context-dependent and linked pragmatically to the identity of interlocutors, their locations, and the time of the utterance (Hanks 1992; Yang, 2011). Drawing on Hanks's (1992) deixis model, my analysis demonstrates poetic usage of deixis (Jakobson, 1960) by rapper Mac Miller to achieve meaning-making in his song lyrics, and specifically, how these elements situate the rapper's place ideologies. Early in his career, Miller would often speak highly of Pittsburgh in interviews and songs. Miller's song “Frick Park Market,” propagates his self-characterization as a “Local *Pittsburgh* boy,” while delineating his audience through deictic reference in two figure-ground relationships: space deixis invocations of Frick Park Market in “Mac’s Pittsburgh”, and the person deixis invocations of the speaker-addressee continuum. The lyrics are a commodification of Miller’s experience, a social construction wherein the social meaning of place and identity are composed, space and person deixis are key semiotic means underlying the commodification process (Heller, 2010).

Therefore, I argue that poetic parallelism develops the deictic figure-ground relationships mentioned previously through semantic linkage with rhyming and repetition conventions (Jakobson, 1960; Tannen, 1987). The poetic function of language (message factor) is evident in Mac Miller’s lyrical use of different forms of parallelism. Deictic usage such as *I*, *you*, and *here* in the examples [1] and [2] can be considered poetic because such forms determine how the metalinguistic code is to be understood between speaker and addressee. Example [1] defines space deixis, meaning Miller’s use of the deictic *here* in reference to Frick Park Market defines “Mac’s Pittsburgh.”

[1] Fool you better get prepared/ Don’t know ‘bout you but all my rhymes are deadly  
HERE / FRICK PARK MARKET where we kicking out the garbage (Miller & Dan, 2011).

In example [2] demonstrating person deixis, *I* and *you* define the speaker-addressee continuum, where *I* is deictically anchored to the referent Miller, while *you* refers either inclusively to the audience within “Mac’s Pittsburgh” in line 1, or exclusively to those outside of “Mac’s Pittsburgh”, as within the conditional statement in line 2.

[2] Anything YOU need YOU can find it at the market  
If YOU don’t hold me down for all I care YOU can starve bitch  
(Miller & Dan, 2011)

There is value in studying popular music lyrics for semiotic commodification. This paper attempts to link two types of commodification: material commodification (buying and selling an image while gaining prestige) and a kind of “semiotic” commodification (through repetition/poetic function of deictic forms to make stable comparisons within the lyrical content). Embedded within the song “Frick Park Market,” is Mac Miller’s personal social construction of the meaning of Pittsburgh, insofar as Mac’s lyrical choice is part of the process of language ideology creation and dissemination of his affinity to place.

# The metapragmatic discourse around the argumentative strategies associated with trolling on British and Hungarian political blogs

Panel contribution

***Dr. Marton Petyko<sup>1</sup>***

*1. Aston University*

This paper investigates the metapragmatic discourse around trolling, a negatively marked online behaviour (Hardaker, 2013), on British and Hungarian political blogs. It aims to identify the argumentative strategies that users attribute to those they call trolls in 1,713 British and 519 comment threads from 2015. These threads include 740,841 British and 107,719 Hungarian comments. The paper is also concerned with how the argumentative strategies associated with trolling affect the ways in which trolling is depicted and trolls are portrayed in the users' comments.

The analysis focuses on 2,542 action-related metapragmatic comments taken from the comment threads. In these comments, participants call other users trolls or identify comments as trolling and also discuss the specific communicative actions in which the alleged trolls engage. Consequently, the paper approaches 'trolling' and 'troll' as metapragmatic labels that participants use to describe, conceptualise, and evaluate others' communicative behaviour (Haugh, 2018). Using the concordance lines of the search term \*troll\*, the study presents a fine-grained taxonomy of the argumentative strategies mentioned in these comments.

The paper points out that both British and Hungarian users contrast 'trolling' with 'engaging in reasoned and intelligent political debate', which they see as the normative behaviour in online political discussions. This suggests that participants utilise 'trolling' as an umbrella term for perceived non-normative behaviour. The paper also identifies a set of argumentative fallacies that both British and Hungarian users regularly associate with trolling, including *argument by repetition* (Walton et al., 2008), *argumentum ad hominem* (Walton, 1989), *hasty generalisation* (Walton, 1999), *false dichotomy* (Tomic, 2013), *undistributed middle* (Tindale, 2005), *false analogy* (Walton, 1989), *straw man argument* (Macagno & Walton, 2017), and *appeal to common practice* (Walton et al., 2008).

Finally, the paper concludes that users generally depict trolling as a non-normative and manipulative behaviour while trolls are portrayed as bad debaters and uncooperative troublemakers. This also suggests that users accuse perceived trolls of committing argumentative fallacies not only to conceptualise their behaviour but also to belittle and discredit them.

# The Metapragmatic Negotiation of Critical Comments on YouTube Electronic Word-of-Mouth

Panel contribution

***Mr. Michael Wentker<sup>1</sup>***

**1.** University of Duisburg-Essen

Electronic word-of-mouth (eWOM) in the form of product reviews on YouTube is a fairly recent and rapidly evolving genre (cf. Vásquez 2014, Pollach 2008). The socio-technical affordances of the online video-sharing platform allow for highly creative displays of both products and selves. Spurred by incentivization or altruistic motives, reviewers draw from a broad repertoire of linguistic styles, visuals as well as production and editing techniques to multimodally construct reviewer identities which are accessible to an international audience. These reviewer identities are frequently the target of metapragmatic evaluation in the discursive spaces below the review, where audience members negotiate how authentic and credible the review(er)s are (cf. Mackiewicz 2010). Naturally, these evaluative processes prompt a substantial amount of critical, i.e. potentially face-threatening, comments, originating from a perceived lack of relatability, i.e. disidentification, between audiences and the reviewer, or a potential mismatch between audience members' genre expectations (Pollach 2008) and the product review itself.

Drawing on material from a corpus of 160 beauty and technology reviews, this study investigates the metapragmatic discourse (Bublitz & Hübner 2007) revolving around such critical evaluations. Adopting a first-order, social-constructivist perspective (Bucholtz/Hall 2005), the qualitative analysis investigates users' critical comments targeting the review(er) and focuses particularly on the ensuing metapragmatic discussions (Kleinke/Bös 2015) about these potentially impolite and face-threatening discursive moves. In more detail, the analysis sets out to identify second-order impoliteness tokens directed at the reviewer, viewing them as triggers for first-order negotiations among users in the comment section (cf. Culpeper 2011). The analysis thus aims to disentangle the complex relationship between multimodal identity construction in the review video and perceived impoliteness in the comments (Blitvich/Sifianou 2017). The cumulative subjective criticism of both reviews and reviewers and their negotiation shape and (re-)define the social norms (cf. Locher & Watts 2008) governing the genre as well as the norms of this emerging multimodal genre itself.

# The metapragmatics and discourse of hypocrisy: how do people talk about ‘word-deed misalignment’?

Panel contribution

**Dr. Mathew Gillings<sup>1</sup>**

1. Vienna University of Economics and Business

Generally speaking, deception is considered to be a negative act, with Grice (1975) identifying truthfulness (through the quality maxim) as part of what it takes to be a cooperative speaker. However, Vrij (2008: 12) argues that lying is ‘a social lubricant’, going as far as to suggest that we ‘often like the company of people who lie frequently’. One potential reason for this perceptual disparity is because so many different types of deception exist; they are governed by the individual speaker, receiver, and context around the communicative event. This, too, is what makes hypocrisy (also referred to as *word-deed misalignment*) so tricky to model.

Researchers from a range of disciplines have explored various forms of deception - white lies, falsifications, distortions, concealments, etc. However, the study of hypocrisy is still in its infancy: there have been efforts to study its cognitive realisation (Fried and Aronson, 1995) and to theorise it (Wieting, 2015; albeit from a non-pragmatic perspective), and scholars within organisational studies have made a first step towards an interactional model (Effron et al., 2018), which helps to understand its subjective nature.

This paper aims to achieve two main objectives: (1) consider how hypocrisy fits into other theories of deception; and (2) consider how hypocrisy is discussed in natural language. The rationale, here, being that if speakers are *discussing* hypocrisy, this can provide clues as to what is considered prototypical. To do this, I will take a corpus-led approach and search for instances of the lemma *hypocrite* within the *Times Online 2000s* corpus. By reviewing how people characterise hypocrisy metapragmatically, we can begin to explore how it fits into wider theoretical frameworks. For example, preliminary collocation and concordance analysis of the data suggests not only a negative semantic prosody and an emphasis on politics and religion, but also a frequent usage of *who*, *whilst*, and *when* to represent that misalignment. It is also clear that hypocrisy is seen as an affront to one’s morals, or even a direct attack on society, and this may explain why hypocrisy is frequently featured in literature. Not only do some of these findings fit Effron et al.’s (2018) model of word-deed misalignment, but they also fit work from deception detection, suggesting that liars undergo a form of attempted behavioural control to moderate the information being passed to the hearer.

# The Ministry of Health, Labour and Welfare's stance on the press conference -An Attempt at critical discourse studies of PCR Testing-on the Response to the Novel Coronavirus Disease

Panel contribution

***Ms. Zhang Shuo<sup>1</sup>***

***1. Osaka University***

The Novel Coronavirus disease (COVID-19) which was identified firstly in Wuhan, China in December 2019 has globally triggered an unprecedented health and social emergency. So far (Oct.20th.2020) the number of confirmed cases in Japan has been reported about 93,000, while the death toll has reached 1,674. Although the death rate in Japan is lower than that in Europe and the U.S, the Japanese government has been criticized for ambiguous testing guidelines and low Coronavirus test rate using PCR (Polymerase Chain Reaction). This study has been conducted to investigate how the policy of PCR testing was narrated and to clarify the representations and attitudes of the Ministry of Health, Labour and Welfare (MHLW) that determine the policy of PCR testing. Analysis is mainly based on the theory of "Order of Discourse" (Fairclough, 2003). The perspective of critical discourse studies will be taken to micro-analyze the speeches which are related to PCR test in press conferences by MHLW from Jan.7th ,2020 (the first press conferences on the COVID-19) to July.31th of the same year. The results show that (1) MHLW is represented as a government institution which has the sense of responsibility and values the health of its citizens while presenting the justification and advantages of its policies.(2)When MHLW had been criticized by media reporters, the spokesperson of MHLW (former Minister of MHLW, Katsunobu Kato) would be obscure about the criticisms or divert them towards the medical profession and the public in order to rid the government of responsibility.

# The Moral Call for Hopeful Action and the Pragmatics of Precarity in the Village of Tewa

Panel contribution

***Prof. Paul Kroskrity***<sup>1</sup>

**1.** University of California at Los Angeles

At a time when there are multiple threats to the language, culture, and the very existence of the Village of Tewa (Kroskrity 1993), its members are deploying cultural and linguistic resources to generate an appeal to hope “as a moral call” (Mattingly 2010). The Village of Tewa consists of about 700 people who are heritage speakers of a Kiowa-Tanoan language their ancestors brought to Hopi lands 320 years ago from their former Rio Grande pueblos in the wake of the Second Pueblo Revolt of 1696.. Their distinctive language has become emblematic of their persistence as a people but now that enduring emblem is threatened by a sweeping language shift to English.

Adding to language shift, are other dangers including climate change, environmental degradation through domestic colonialism, and now the COVID-19 pandemic. According to many Tewa, all these patterns result from their own past failures to maintain cultural values. Changing things for the better, in the Tewa view, requires a moral reaffirmation and reconnection with traditional linguistic practices. Some Tewa work toward a dictionary of their language and the possibility of language instruction in their community. They also turn to such cultural resources as social dance song performances, *yaaniwiwae*, as an appropriate venue for the kind of explicit intergenerational language instruction that has been lacking in their community. As in Miyazaki’s (2004) analysis of Fijian gift giving, “hope lies in the reorientation of knowledge” taken from the past with the interest of reshaping thinking about the future (Miyazaki 2004). I will describe this “hopeful nostalgia” (Debenport 2015) and how it is regimented by Indigenous beliefs and practices emerging from their *language ideological assemblage* (Kroskrity 2018). Language ideologies and cultural norms guide this hopeful action. As Narotzky and Besnier (2014:11) describe: “The habitus here is the expression of the limits that frame future expectations and therefore condition the modes of mobilization in the present for a future.” Using ethnographic, ethnopoetic, and metalinguistic data collected in decades of field research, I will examine how local resources inform a particular cultural form of hope and how that hope appears to shape the future of Tewa language and identity.

# The multimodal ritual practices used for organizing transitions between activities in a Budo class: an analysis of a Taido lesson

Panel contribution

***Dr. Ikuyo Morimoto<sup>1</sup>***

*1. Kwansei Gakuin University*

This study aims to investigate the multimodal resources through which a Taido lesson is organized, and, more broadly, to discuss where traces of Geido's philosophy can be identified in the way participants organize the transitions between steps.

Taido is one type of Japanese mixed martial art. It originated from various kinds of martial arts, such as Judo and Karate. The lessons are normally structured following several steps. First, the teacher demonstrates in front of all trainees the correct movements of '*kata*', which are 'forms' of specific patterns of movement. Second, the trainees each practice the movements on their own. And third, the teacher gives a command and all trainees practice the movement in chorus following this. This third step can be further categorized into two types: individual practice sessions and paired practice sessions. Using the methodology of Conversation Analysis, I illustrate the embodied and linguistic ways in which the transitions between the steps are organized.

The analysis shows that the transition from the first step to the second is made gradually, and that they sometimes merge into each other. In contrast, the third step is launched more recognizably. A transition to an individual practice session is organized through the teacher's saying "hai [ok]" and announcing the command "kamaete [en garde]", followed by the students' response "sei [yes]", along with crossing their arms in front of themselves, then quickly pulling their arms down to their sides, and taking a ready position. The students then start practicing the *kata* in chorus. For a transition to a paired session, the teacher first announces the end of the second step by saying "OK", then launches the third step with "jya ikima::s [so, we'll start]" followed by the same practice used for individual practice sessions.

There are three points to note. First, the multimodal practices used to organize the transition to the third step are recognizably ritual. For example, the students' response "sei" and their arm movements are symbolic acts in Taido. These practices show that they are oriented to the third step as more real than the first two. Second, while the transition is initiated by the teacher, it is achieved in a collaborative way. For example, the teacher's announcement is usually prolonged, such as "ikima::s", "kamaete:::", which provides the students time to perform the command before the prolonged sound ends and enables them to start the next action in chorus. Råman (2018) found that teachers' management of the transitions in judo and Brazilian jiu-jitsu lessons is largely dependent on the students and their embodied conduct. His observation also aligns with the findings of this study[AA15]. Third, as mentioned above, participants are oriented to practicing '*kata*' in chorus.

In the presentation, I will discuss how all three of these points are relevant to the organization of Taido lessons, and how some aspects of Geido's philosophy may manifest in the lessons.

# The not-so-obvious nature of (pragmatic) inferences

---

Panel contribution

---

***Prof. Marco Mazzone<sup>1</sup>***

**1.** University of Catania

(1) has listed six challenges raised against Gricean pragmatics. Half of them converge towards a coherent view, according to which comprehension is not inferential: it is instead a unitary perception-like process, a pattern-recognition ability based on the retrieval of stored patterns and conventions in memory (2, 3, 4). I personally find much to agree with in this picture, *except* for the claim that it is non-inferential.

My aim in this talk is to outline a view of pragmatic processing as an inferential process, which is nevertheless compatible with the above picture – at least under a certain interpretation. In practice, I try to use a couple of intuitions that are normally marshalled against inferential pragmatics in order to shed light on what pragmatic inferences really are.

The first intuition can be phrased as follows: perception and comprehension are part of the same flow of associative activation. This view is considered with interest even by major supporters of the inferential approach (5), and in fact there are two reasons why it is not grist to the mill of anti-inferentialism. First, perception can be considered inferential, too, in the following sense: it involves rule-based transitions between mental contents. Specifically, perception makes use of domain-specific rules taking as input representations of proximal stimuli and then projecting hypotheses about distal objects. And second, comprehension is inferential (also) in a stronger sense than this: the rules (concepts, frames, schemas, scripts and so on) on which its transitions are based are intentionally (consciously) accessible.

With regard to the second intuition, I propose to phrase it as follows: comprehension is based on social conventions and patterns of regularity more than is often appreciated. However, this is a problem for inferentialism only under a couple of assumptions. One is that the conventions at issue are to be conceived in terms of linguistic conventionalization of inferential transitions: once such conventionalization occurs, there are no more inferences to be drawn. Another is that in comprehension conventions have no other function than to provide coherence: we retrieve patterns that confer meaning on inputs which would remain otherwise unrelated and unintelligible. In contrast, I will discuss a couple of crucial examples in order to show that i) an important role in comprehension is played by conventional knowledge which is not a case of conventionalization in the above sense (it does not dispense with inferential transitions) and ii) providing coherence is not the only function of the retrieved patterns, since these almost always warrant hypotheses formation.

# The organization of closing sequences in Periscope-like live video streams

Panel contribution

*Mr. Le Song<sup>1</sup>, Prof. Christian Licoppe<sup>2</sup>*

*1. Department of Social Sciences, Telecom-Paristech, and I3 (UMR CNRS 9217), 2. Department of Social Sciences, Telecom Paristech, and I3 (UMR CNRS 9217)*

Research on institutional organizations for talk-in-conversation (Drew & Heritage, 1992) have argued that ‘ordinary conversation’ and its organization were foundational, and that institutional forms of talk could be characterized as constraints on such a sequential organization. Such an argument can be extended to technology-mediated interaction, in which participants may orient jointly to ‘standard’ conversational sequences and the technology’s interactional ‘affordances’ to achieve interactional ends (Arminen, Licoppe, & Spagnolli, 2016). We discuss here the way such an interactional goal (closing a technology-mediated encounter), may be achieved in a highly asymmetric form of interaction, that is live video streaming (as on Periscope), in which a streamer appear live on video, with an active audience being able to respond to him/her through publicly available messages (See Licoppe & Morel, 2017 for an EM/CA perspective on live streaming sequences). We argue that while participants can be seen to do that in a way which orients to, and is made intelligible by, the organization of closings in ordinary conversation (Sacks & Schegloff, 1974), they do so in a way which is sensitive to the affordances of live video streaming, and especially : a) The preference for ‘talking heads’ (Licoppe & Morel, 2012); b) The existence of a flux incoming messages which are controlled by the technology, and timed in different ways with respect to the streamer’s talk in progress, especially regarding the potential placement of pre-closing sequences FPPs, the way in which topic completion or elicitation may be relevant after pre-closings, and finally the way closings per se appear sensitive to the agency of an online audience.

# The pediatrician's normalizing practice in well-child visits: reassuring parents and ratifying medical knowledge in infants' growth assessment sequences

Panel contribution

***Dr. Federica Ranzani***<sup>1</sup>

*1. Department of Education, University of Bologna*

One of the most common sources of anxiety among parents is the growth of their children, mostly indexed by length and weight. For this reason, well-child visits may constitute a stressful event for parents, given the potentially “atypical” outcome of their infant’s length and weight assessment. However, very little is known about the interactional accomplishments of these visits and particularly on how pediatricians and parents manage the evaluation of infants’ growth.

This paper presents data from the growth *assessment activity* (Goodwin & Goodwin, 1987) as it unfolds during the physical examination phase of the visit. In particular, it illustrates how pediatricians engage in normalizing the infant’s growth to reassure parents, while, at the same time, ratifying the “voice of medicine” over lay knowledge.

Given the growing parental health literacy and the widespread availability of pediatric information, parents often have expectations about their infant growth curve. However, if these expectations do not match the pediatrician’s assessment, parents may express concern and dissatisfaction. In these cases, pediatricians are expected to reassure and give explanations to parents (see APA guidelines, 2008). As we illustrate, they do so mostly by mobilizing medical and statistical knowledge, therefore patrolling their domain of expertise and institutional role.

Adopting a Conversation Analysis nurtured approach to a data set of 23 well-child visits, we analyze the normalizing growth assessment sequence which is structured as follows: 1. the pediatrician provides a numerical report-formatted online comment of length and weight; 2. parents display concern; 3. the pediatrician engages in the *normalizing practice*, i.e. comparing the infant’s growth values to the locally “talked into being” statistical norm.

We suggest that in this sequence the definition of what characterizes the infant’s “typical growth” is mutually accomplished and locally negotiated. On the one hand, by making explicit their concerns, parents orient the pediatrician to provide an assessment of the numerical values and to take into account the specific situation of their own child. On the other, through “normality talk” (Bredmar & Linell 1999, p. 257), pediatricians reassure parents by categorizing the case as “typical”, and ratify the medical knowledge as authoritative and accountable by making statistics “actionable through talk”.

In conclusion, we advance that parents and pediatricians engage in constructing a shared understanding of what an unproblematic infant growth is by cooperatively constituting statistics as the ultimate trustworthy representation of “normality”.

# The perceived effects of machine translation on communication in a high-stakes setting

Panel contribution

***Dr. Tomas Lehecka<sup>1</sup>***

***1. Åbo Akademi University***

The quality of machine translation is becoming comparable to that of professional translators (Wu et al. 2016, Hassan et al. 2018, Popel et al. 2020), which opens new opportunities for inter-cultural communication. However, the efficiency and appeal of translated communication is not only dependent on translation quality, but also on opinions, attitudes and beliefs of the interlocutors regarding the act of (machine) translation itself. Such opinions may be especially consequential in settings where the stakes are high, i.e. setting where there is a substantial pressure to achieve a given communicative goal, such as in risk communication.

In my presentation, I explore the effects of machine translation on the relationship between two interacting agents, where one ("the local") is providing the other ("the visitor") with directions to reach a hospital in a foreign country. In an online-experiment with a between-participant design, participants were asked to follow route instructions presented in a video by a researcher. Crucially, while all participants received instructions from the same person, some received them directly in their native language, while others received identical instructions that were translated through a mobile device. Afterwards, participants filled in a questionnaire about how they perceived the task, the quality of the instructions, and the person in the video. The study investigates both task performance as well as the participants' responses to a series of follow-up questions.

Examining how people perceive real-time translated communication in relation to unmediated intra-language communication in a high-stakes setting helps us to understand the pragmatic value and the potential handicaps of (machine) translation. In risk communication, all communicative handicaps may have serious consequences. Given that machine translation is becoming a more and more prevalent means for inter-cultural communication, we need to be aware of any handicaps that the method brings.

# The Phonetic Approach towards Alzheimer's Disease : Language Tasks and Phonetic Parameters

Panel contribution

***Mr. Xin Cui<sup>1</sup>, Prof. Hongwei Ding<sup>2</sup>***

***1. shanghai jiao tong university, 2. Shanghai Jiao Tong University***

***Background:*** The combination of language tasks and parameter evaluations has been broadly adopted in AD language impairment studies. Language tasks can elicit language production from AD patients, which can be evaluated via linguistic parameters. As speech is the most direct form of language output, the current article particularly focuses on language tasks that are suitable to elicit AD patients' speech and the phonetic parameters to evaluate the impaired speech.

***Aims:*** To introduce language tasks commonly adopted to elicit AD speech and relevant phonetic parameters for the language impairment evaluation.

***Method:*** This article firstly explains the type of language impairment each language task aims to reveal and how each task is performed, including necessary materials and the procedure. Then, relevant phonetic parameters adopted in the subsequent evaluation process are provided. According to their phonetic and phonological characteristics, phonetic parameters are classified as segmental, prosodic, and sequential parameters. After a discussion of state-of-the-art research on the phonetic approach towards AD language impairment, we point out some directions for future investigations.

***Main contributions:*** This article provides a systemic review of language tasks and phonetic parameters commonly used in AD language impairment studies, which brings manifold practical assistance for the understanding of AD language deficits.

***Conclusion:*** The combination of language tasks and phonetic parameters serve as an effective way to examine the language impairment of AD patients. Each task has its pros and cons and focuses on different aspects of language functioning. Readers interested in this field are suggested to select language tasks and phonetic parameters appropriate to their research goal, to ensure the validity and the efficiency of their research.

# The policing of emotion by institutional participants in the courtroom

Panel contribution

***Dr. Isolda Carranza<sup>1</sup>***

**1.** Conicet and Universidad Nacional de Córdoba

Within a research program centered on discursive practices in institutions, this presentation builds on an interest in the emergence of public emotion displays and talk about emotion in power-charged speech events. In addition to incorporating insights about the interactional management of emotion (Peräkylä & Sorjonen 2012) and about the relevance of participation frameworks in structuring it (Goodwin 2007), this study also draws from linguistic anthropological research on how the expression of emotion may be subjected to the workings of power and legitimation (McElhinny 2010; Wilce 2014; Lutz 2019). A prolonged multi-site ethnography of judicial settings provides a substantial corpus of audio-recorded and video-recorded criminal trials. This allows for the observation of a variety of situational roles and all the stages of the courtroom procedures. On the basis of comparative analysis of instances of participants' orientation to the absence and the presence of a certain emotion, this study shows that judges and attorneys evaluate witnesses' behavior either implicitly or through explicit metacommunicative commentary. This contextualized exploration of how emotion and emotion displays are interpreted reveals aspects of institutional culture, a concern with the connection between emotion and cultural values, and the existence of specific expectations related to categories of social actors. The findings also show that the emotional life of the individual is the object of regimentation beyond the face to face institutional encounter. It is concluded that research on participants' orientation to interactively regulate emotions and through them, interpersonal relations has the potential to complement established views of the role of institutions in social control.

# The practice of poetics: Metapragmatic perspectives from professional wordsmiths

Panel contribution

***Dr. Gwynne Mapes<sup>1</sup>, Prof. Crispin Thurlow<sup>1</sup>***

*<sup>1</sup>. University of Bern, Switzerland*

In this paper, we offer a metapragmatic perspective on the poetics of language, drawing from our ongoing discourse ethnography of professional language workers – or wordsmiths. Seeking to contribute to this IPrA panel's collective interests, we consider issues of indexicality, stance, and enregisterment from the perspective of what we might call *high poetics* (cf Coupland, 2007): spectacular, institutionalized expressions of the aesthetic, artistic or creative dimensions of language. Where John Shotter (1996), after Wittgenstein, spoke of a “poetics of practices”, therefore, we are effectively concerned with the *practice of poetics*. Specifically, we examine how political speechwriters and advertising copywriters, as wordsmiths, talk about – and defend – their own work as poetic. These are two applied settings where the poetic is also expressly understood and deployed for its defining *rhetorical* capacity (see Herzfeld, 1997); in other words, with persuasive intention.

Our empirical evidence comes from a combination of primary and secondary data, all of which is focused on the ways wordsmiths themselves talk about their work and, especially in the light of Jakobson's (1960) famous formulation, the tension between verbal function (aka “the message” or pitch) and verbal form (aka visual or aural style). In descriptive terms, our paper documents how these relatively influential “creatives” (or mercantile poets) understand the aesthetic or artistic dimensions of their work vis-à-vis its core representational and instrumental objectives. More than this, and in critical terms, these insights may help language scholars in two ways: (a) with maintaining a clear sense of the poetic as a matter of political economy and semiotic ideology; and, (b) by complicating the self-invested but specious distinction we tend to draw between “everyday” poetics and “exceptional” poetics (or creativity; cf Swann & Deumert, 2018). To call language poetic – or creative – is not simply to make a technical, linguistic assessment; it is also to make social, moral and indeed economic judgments. In other words, “poetic” functions also as a claim-to-truth rhetoric in much the same way as does “authentic” (Thurlow, 2019). We thereby demonstrate how claims to the poetic are a key status-making tactic by which wordsmiths position themselves as experts and, in turn, how they shore up their privilege vis-à-vis peers and other language workers.

# The pragmatics of diagnostic uncertainty – a closer look at hedges and shared understanding in diagnostic statements

Panel contribution

***Dr. Maria Dahm<sup>1</sup>, Dr. Carmel Crock<sup>2</sup>***

***1. the Australian National University, 2. Royal Victorian Eye and Ear Hospital***

Diagnosis is a complex clinical and communicative task. The diagnostic errors rate including missed, delayed, and mis-diagnosis, has remained prevalent at 10-15% over the last few decades (Graber, 2013). The patient-centred definition of diagnostic error encompasses failures to establish an accurate and timely explanation for a patient's health problem *and* failure to communicate that explanation to the patient (National Academies, 2015). Clinicians use "diagnostic statements" to name, describe or explain the health problem to patients. If uncertain, clinicians are encouraged to share their working diagnosis and indicate their level of uncertainty. Research on the communication of diagnostic uncertainty is sparse. Most studies on the communication of diagnostic uncertainty are based on elicited data from surveys or interviews. Strategies for communicating diagnostic uncertainty in interactions with patients have not yet been systematically investigated using interactional data.

In order to assess how clinicians communicate diagnostic uncertainty, we must first establish what exactly clinicians say when providing diagnoses to patients. Which explicit and implicit discourse features can we observe in diagnostic statements? More importantly, how are these features distributed in diagnostic statements; are there differences between those which are linked to correct diagnosis vs those linked to diagnostic errors and which might be linked to diagnostic uncertainty?

This study takes an interdisciplinary approach combining insights from medicine and applied linguistics to investigate the language of diagnostic statements. We focus, in particular, on the pragmatic functions of explicit and implicit expressions of epistemic modality – especially hedges (Fraser, 2010) – as linguistic realisations of diagnostic uncertainty within health care contexts. We aim to make inferences about potential divergent understanding of expression of uncertainty between patients and clinicians and draw connections to diagnostic errors and shared decision making.

We analysed a corpus of 32 transcribed, video-recordings across 2 role-play scenarios conducted as part of a practice high-stakes exam for international medical graduates (n=32) to gain accreditation to practice in Australia. Applying discourse analytical methodology (Harvey & Adolphs, 2012) and informed by literature (Heritage & McArthur 2019), we identified all diagnostic statements in the corpus. We analysed diagnostic statements deductively for type, ranging from plain assertions, to providing indexed or explicit evidence to generalisations (Peräkylä, 1998).

Results showed that evidentialised diagnostic statements were the most frequently used type of diagnostic statements. In role-play interactions linked to diagnostic error, clinicians drew more heavily on evidence in their diagnostic statements than in interactions with correct diagnoses. This suggests that clinicians might seek to support uncertain diagnosis with evidence, for example to build trust with patients.

In evidentialised statements, both clinician groups used evidentialised verbs but clinicians providing incorrect diagnosis also expressed uncertainty indirectly through hesitations, false starts and lengthy evidence-heavy introductory phrases. Such indirect features were less common for interactions with the correct diagnosis. This suggests that clinicians might use evidence in form of introductory phrases as 'shields' to signal their lack of commitment to the diagnosis conveyed. If patients do not recognise these shields as such, shared understanding of the diagnosis might be at risk.

# The Pragmatics of Expressions and Ritual: A contrastive pragmatic case study

Panel contribution

**Prof. Juliane House<sup>1</sup>, Prof. Daniel Kadar<sup>2</sup>**

***1. University of Hamburg, 2. Dalian University of Foreign Languages***

In the study described in this presentation we propose a new bottom-up and corpus-data driven methodological procedure for capturing the meaning and function of pragmatically salient conventionalised expressions serving as *tertia comparationis* for cross-cultural pragmatic analysis (for details see House and Kadar 2021). This procedure is also centered on the concept of ritual frame, and we define salient conventionalised expressions as *ritual frame indicating expressions* (RFIE). In the current study we engage in an examination of the English expressions *Sorry, thank you and hello*, their multi-word extensions and their translation equivalents in English, German and Chinese corpora. While these expressions are conventionally associated with the speech acts Apologize, Thanks and Greet respectively, our analysis shows that we need to differentiate between what we call ‘speech act-heavy’ uses and ancillary uses of these expressions. The latter typically take on meanings that differ drastically from their conventionalized speech act-based meaning, and we will show how these meanings unfold in different interpersonal as well as power and familiarity-related scenarios across the linguacultures involved in our study.

# The pragmatics of requests: Naturalized Interactions as an innovative means of collecting cross-cultural data

Panel contribution

***Mrs. Aurélie Marsily***<sup>1</sup>

**1.** Université catholique de Louvain

Numerous studies in pragmatics have focused on finding the best way to collect data in order to reflect the way learners and native speakers express themselves in authentic situations (House, 2018), since different types of data are retrieved depending on the collecting method. For instance, in our study, the triangulation of methods allows for multiple perspectives on request production and perception, and how these requests are conventionalized and internalized in each culture and across these cultures. The COPINE corpus (*Corpus Oral de Peticiones en Interacciones Naturalizadas en Español*) comprises naturalized interactions, which is an innovative means of collecting spontaneous speech, where the aim is to distract the informant's attention in order to collect spontaneous speech. Indeed, the term 'naturalized' indicates the degree to which "data approaches natural data" (Tran 2006). The COPINE corpus also comprises written DCT, an online cross-cultural questionnaire and retrospective interviews on politeness issues, in academic settings.

Our hypothesis, based on the literature (Blum-Kulka & House, 1989; Bataller, 2013), is that the students perform their requests in a more formal way in the DCT than in the naturalized interactions, and that they perceive the formulation of this speech act differently than what they actually produce. The research questions of this presentation are: (1) How do native and non-native speakers use requests in academic interactions? (2) Which factors influence the way Spanish native and non-native speakers produce requests in naturalized interactions? (3) How do the cultural differences influence the way Spanish native and non-native speakers perceive requests in Spanish?

The contrastive analysis of the data shows that indirect strategies are among the preferred requests in the DCT, both from the native and non-native students. Yet in the naturalized interactions, a much wider variety of requests are produced. The questionnaires reveal that native speakers judge requests formulated by native and non-native speakers in different ways.

The different methodologies offer promising insights for cross-cultural studies on request pragmatics, and by extension, on translation studies and teaching pragmatics.

# The pragmatics of transdisciplinary football research: Aligning linguistic and other perspectives to explore and transform gender (in-)equality in (female) football.

Panel contribution

***Prof. Eva-Maria Graf<sup>1</sup>, Ms. Melanie Fleischhacker<sup>1</sup>***

*<sup>1</sup>. University of Klagenfurt*

This paper presents the scope and goals of a transdisciplinary research project on gender (in-)equality in (female) football in the local context of the First Vienna Football Club in Austria. We will focus particularly on what applied linguistics contributes to the overall endeavor and critically discuss the added value of a transdisciplinary approach in comparison to intra-disciplinary linguistic research on the topic (e.g. Lavric et al. 2008; Caldwell et al. 2017).

In the envisioned project, linguistic insights together with ethnographic observations first help explore current (gendered) discourses in and through which (female) football is locally and socio-culturally co-constructed (Sunderland 2004; M  an 2001; M  an and Kassing 2008; Adams et al. 2010; Woodward 2019); secondly, sport pedagogical and (social) economic perspectives help develop and test transformative actions based on the qualitatively gained insights into causes and characteristics of gender (in-)equality. Both, the exploratory and the explanatory research foci, set off from – and are embedded in – a synergistic science-practice knowledge base. This base results from an assemblage of various epistemes within and outside of academia (Leavy 2011; Krohn et al. 2017). The transdisciplinary project is based on the following hypotheses: 1) Sustainable solutions for complex, socially relevant problems such as gender inequality can only be generated via dovetailing scientific and practical epistemologies. 2) The complexity of gender (in-)equality requires multi-perspectival insights into its individual, organizational and institutional manifestations and into its local embeddedness in communities of practice to generate sustainable transformation beyond the research site. As regards its methods, the project synergizes different disciplinary and methodological approaches in accordance with the different perspectives. The collaborative analysis builds on diverse data sets from multiple settings (e.g. focus group interviews, participant observation, surveys etc.) and applies qualitative, quantitative, multi- and mixed-methods approaches. As part of the exploratory research focus, the applied linguistic perspective examines *how* and *which* (gendered) discourses surrounding (female) football in Austria are (co-)constructed and (re-)produced or challenged and deconstructed by participants and stakeholders on the individual, organizational and social level. According to previous research the cultural field ‘football’ (Schirato 2013) entails and predisposes core discourses and practices deeply molded by hegemonic masculinity, masculine entitlement, as well as gender stereotypes and ideologies. For (female) footballers, this often results in perceived tensions between e.g. a female/feminine and an athletic identity (Scranton et al. 1999; Harris 2007; McDowell and Schaffner 2011; Jeanes 2012; Fielding-Lloyd and M  an 2016). Qualitative methods such as Critical Discursive Psychology (Edley and Wetherell 2008; Wiggins 2017) and Critical Discourse Studies (Wodak and Meyer 2015; Flowerdew and Richardson 2018) serve to investigate how individuals (e.g. players, family members, coaches) position themselves and construct their identities based on prevailing discourses; how gender (in-)equality is discursively manifested on the organizational level (e.g. by the club and management); and how it materializes on a societal macro level (e.g. in school curricula or media representations).

# The pragmatics of translanguaging in Indian social media

Panel contribution

***Dr. Usha Kanoongo<sup>1</sup>***

*1. The LNM Institute of Information Technology, Jaipur*

The linguistic diversity of the fast digitizing multicultural and multilingual Indians is manifested in their social media texts in the form of phonetic typing, Romanized transliteration, flexible use of named languages and language varieties and other semiotic resources. Viewing this playfulness and fluidity as a translanguaging ritual, this paper proposes that this kind of practice is a conscious pragmatic feat of multilingual users which they exploit to maximize their socio-communicative potential. Grounding on this idea, the paper aims to address the following questions:

1. What pragmatic motivations drive the multilingual social media users to capitalize translanguaging in their online communication?
2. How does translanguaging become an agent of group socialization online?
3. Is social media translanguaging a conscious work of the designing mind (Jørgensen 2008) or a random and unintentional practice as it is generally perceived?

Positioned at the interface of text and social practice, the paper conducts a linguistic ethnography (Rampton et al. 2014) of interactional data from a WhatsApp group of twenty-nine extended family members, collected over a period of time. Methodologically, it combines the discourse analysis of text with blended-ethnography involving thick description of the setting and participant observation through questionnaire responses. Findings reveal that the multilingual social media users draw on their repertoire of linguistic structures, multimodal resources and multi-semiotic strategies in order to maximize their communicative capacity as well as to negotiate social relationships and facets of group behaviour. Tranlanguaging frequently serves as a conscious resource for performing pragmatic functions, mainly of the five kinds viz. constructing identity, indexing individual stance, performing culture, creating humour and building solidarity. Fulfilling a variety of functions thusly, its usage is contingent upon the event and topic of communication, while also occasionally emerging as an unmarked behaviour within the group. These translanguaging practices of multilingual users reflect how they not only manage diversity but also use it as a resource of social capital. This fluid languaging online can also be viewed as indexing the fluid nature of the WhatsApp instant-messaging medium. The present paper also tries to shed light on how the affordances of social media translanguaging help in sustaining multilingualism and linguistic adaptability of online dwellers within multicultural societies.

Keywords: translanguaging, pragmatics, WhatsApp social media, linguistic ethnography

# The pragmatics of *wei* ('danger') in Chinese government discourse

Panel contribution

***Dr. Zhengdao Ye<sup>1</sup>***

*1. Australian National University*

In Chinese government discourse, fostering an awareness of the consideration of danger in untroubled times, as reflected in the historically-established set phrase *ju an si wei* (lit. ‘dwell security think of danger’) occupies an important place. Systematically expounded by successive Chinese top leaders, the concept forms part of a party-state theory which defines ‘socialism with Chinese characteristics’ and guides the government’s strategy and planning. Given the critical role of China in the new global order, understanding the key ideas underlying Chinese elite politics serves to illuminate how China’s leaders and government perceive the world. Understanding the idea of *ju an si wei* is fundamental to this, especially since it has drawn on early Chinese ideas of global governance. In this paper, I aim to achieve three objectives. First, I look closely at the contexts in which the expression is used in the government discourse, including those during the COVID time. Second, I undertake a detailed meaning analysis of *wei* ('danger') in conjunction with its opposite *an* ('settled state /security'), and discuss the key differences in conceptions of 'danger' between Chinese and English. Third, I unravel and elucidate a web of embedded cultural scripts which underlie how 'danger' should be thought of as they are reflected in a cluster of idioms and set phrases. These scripts will illuminate ways of talking and thinking about danger distinctive to the Chinese linguacultural sphere.

# The Relationship Between Laughter and ‘Proper’ Behavior in Restaurant Conversations over Food

Panel contribution

***Ms. Vipasha Bansal<sup>1</sup>, Dr. Polly Szatrowski<sup>1</sup>***

*<sup>1</sup>. University of Minnesota*

This paper focuses on how participants use laughter to show what they consider ‘proper’ or appropriate behavior in a conversation between three women in an upscale urban restaurant. Laughter is used when behavior that is interpreted as inconvenient, impolite, or otherwise inappropriate is mentioned. Subsequently other participants laugh (or withhold laughter) to agree (or disagree) with the initiator of the laughter, showing their stance on the behavior under question. This research addresses three questions: When do the participants laugh? What functions does the laughter serve? How is laughter used in an utterance sequence in the interaction?

Previous research by Chafe (2007) argues that laughter can be triggered by the combination of pseudo-plausibility and absurdity, and creates a sense of non-seriousness. He also outlines other factors that trigger laughter, such as awkwardness or rudeness. Ervin-Tripp and Lampert (2009) argue that laughter can accompany self-criticism, lighten the tone, and build shared perspectives. Additionally, Jefferson, Sacks and Schegloff’s (1987) research on conversational responses to impropriety, ranging from disaffiliation to escalation, plays an important role, as does Glenn and Holt’s (2013) work on laughter and alignment.

My research shows that the three women tended to laugh in non-humorous contexts. In (1) the participants discuss their enjoyment of butter:

(1)

- k Seriously: (.) that butter,
- j I’m gunna start licking it off the, {huh huh huh huh} #it=BUTTER #off the=off the dish  
 {ha //ha ha ha ha ha} ||  
 h //{ha ha ha ha ha || ha}  
 k //{ha ha ha ha ha || ha}

Applying Chafe’s (2007) research, here we see the combination of plausibility and absurdity – it is possible for j to lick butter off the dish, but given existing norms, it seems unlikely. Throughout the data, we see other examples where factors such as embarrassment or surprise serve as causes for laughter. (1) is also an example of escalation (Jefferson et al 1987). K’s utterance (implying the butter is good) begins the sequence; j then escalates the sentiment while using laughter to show her non-seriousness. H and k then show their agreement and appreciation by adding their laughter. In this way, all three participants create a shared perspective (Ervin-Tripp and Lampert 2009) in their positive assessment of the butter, and reaffirm a norm against licking butter off the dish. The shared imagination of violating this norm creates a stronger sense of friendship within the group (Glenn and Holt 2013).

This paper demonstrates how existing research on laughter can be applied to new data on conversations about food, and how the link between laughter and ideas about ‘proper behavior’ can be analyzed through these frameworks. Laughter can serve as a mechanism for speakers to show agreement or disagreement, and their perspective on the acceptability of any given behavior. This paper contributes to the growing body of research on laughter in interaction, and language and food, suggesting ways that behavioral norms are created and reaffirmed in conversational interaction.

# The relationship between stereotypical meaning and contextual meaning: A study of Korean self-address form *ce*

Panel contribution

***Dr. Xi Chen<sup>1</sup>, Ms. Jungmin Lee<sup>1</sup>***

***1. University of Central Lancashire***

Address terms have attracted a number of pragmatics studies for ideologies underpinning people's choice of them and context-specific meanings that people's choice creates (e.g. Fetzer and Bull 2008; Kim 2018; Miyazaki 2004; Morford 1997). Particularly the choice between honorific and non-honorific address forms is often laden with one's self-values in relation to his/her reticulation of social relationships (Agha 2004). The mechanism of how the value-laden and ideology-saturated address terms are translated into context-specific meanings has, however, rarely been investigated.

In this study, we address this question by exploring the specific ways that Korean native speakers connect their knowledge of a self-address form *ce* to their understanding of its contextual meanings. Specifically, *ce* is an honorific form that Korean language speakers typically use to address themselves in relationships with status-higher or socially distant interlocutors (lit: a humble 'I' in English). The conventional belief about how *ce* should be used is regarded as its 'stereotypical meaning' (Okamoto 2011). Contextual meaning, on the other hand, emerges when an honorific is used by a speaker's active choice in a specific context (Okamoto 2011). For example, in the context of inter-Korea summit, *ce* used by the North Korea leader, Kim Jong Un, delivered a variety of contextual meanings, including politeness, image change, his political intent and appeal to public sympathy, as reported by South Korean media outlets.

Drawn on 30 one-to-one interviews, we analysed Korean native speakers' metapragmatic discourses in which they explicitly denoted the connection between contextual meanings and stereotypical meanings of *ce*. We find that contextual meanings of *ce* are metapragmatically related to different subsets of stereotypical meanings. The varied relationships between the two meanings follow the mechanism that people make cognitive relevance between their language choice and pragmatic interpretations. Participants' contextual awareness and language ideologies mediate the functionality of the mechanism, and hence explaining how and why one stereotypical meaning instead of another was activated in creating a contextual meaning.

The findings revealed the nexus between metapragmatics, language ideologies and pragmatics through the lens of a Korean address term. The mechanism we found in Korean can be re-tested in other languages, particularly Asian ones which have honorific and non-honorific address forms. Cross-cultural comparisons of the mechanism will help us to understand why the seemingly equivalent translations of address terms in different languages are construed differently. In addition, we also expect this study to navigate second language research to explore how contextual meanings are interpreted by language learners, which is an essential part of their pragmatic competence.

## The renaming of football stadiums

---

Panel contribution

---

**Dr. Cornelia Gerhardt**<sup>1</sup>, **Dr. Ben Clarke**<sup>2</sup>

**1.** Saarland University, **2.** University of Gothenburg

In FIFA men's football, two discourses about league clubs may clash: the practices of the fans often represent a celebration of local identification with their city or region with the stadiums usually constituting the homestead of a tradition. On the other hand, big business takes precedence in decision making within the clubs (and associations and leagues), decisions about fixtures, media coverage, kick-off times, kits, player transfers, but also the naming of leagues, clubs and stadiums. In this paper, we will consider the (re-)naming of stadium at the intersection of these competing discourses.

Stadiums have traditionally been named after local sites (e.g. *Betzenberg*(1. FC Kaiserslautern) or *Anfield* (FC Liverpool) or regions (*Ruhrstadion* (VfL Bochum) or *Somerset Park* (Ayr United F.C.)). Such toponyms are increasingly being replaced by company or product names (e.g. *Playmobil-Stadion* (SpVgg Greuther Fürth 1997-2010) or *bet365 Stadium* (Stoke City)) (cf. Boyd 2000 for the US). We will mainly consider (re-)namings within the German Bundesliga (Bering 2007, Stellmacher 2010).

Starting from an onomastic enquiry (origin and history of the names), we will analyse the clubs' official stance, the media reception, the reaction of the general public as well as the fans coming to terms with such changes. Topics include stadiums as sites for identity construction, commemoration (Boyd 2000), as public memory (Browne 1995), as homestead and symbol of a tradition, as enduring, detached from time, and the positioning of the fans within a radical critique of capitalism (Bering 2007). Based on an array of documents such as the clubs' websites, fan sites, as well as media coverage, we will discuss in pragmatic perspective why some renamings were hotly disputed while others represented viable options for all parties concerned, most notably also the fans.

# The role of ambiguity and vagueness in language change: quantity or quality of knowledge?

Panel contribution

***Prof. Elisabetta Magni<sup>1</sup>***

**1. University of Bologna**

Questions concerning the relevance of ambiguity and vagueness, as well as their interactions in language change, have been addressed in some recent works (e.g. Magni 2020a, 2020b; Denison 2017). According to Denison, both phenomena imply ‘incomplete knowledge’ on the part of the interlocutors and choices that can lead to the ‘wrong’ interpretation with ambiguous expressions but are in general less ‘risky’ with vague terms. Nevertheless, in his opinion, “greater weight should be given to vagueness than ambiguity as a driver of change” and as “an enabler of change ‘from below’ (in the sense of unconscious change)” (Denison 2017: 294 and 318). In this communication, after discussing the definition of the two concepts, several examples will be presented in support of the view that ambiguity, also due to its pervasiveness (Wasow 2015), plays a greater role in language change than vagueness. Besides, the following points will be explored to corroborate this assumption:

- vagueness is in itself limited to lexical semantics, while virtual ambiguity is found at all linguistic levels and becomes effective whenever the prosodic or contextual clues do not allow disambiguation;
- semantic underdetermination is an intrinsic feature of vague terms and can be modulated through context, while multiple interpretations of ambiguous expressions are not given *a priori* but arise contingently from the uncertainty associated with their use in a particular context;
- hermeneutic impasses can become a source of instability and trigger various mechanisms of change which, in most cases, do not depend on the quantity (incompleteness) of knowledge but on its quality, that is, on the uncertainty or opacity perceived in linguistic forms and contextual data;
- diachronic processes occurring at the interface between semantics and pragmatics can be better investigated by making reference to pragmatic ambiguity rather than to the notion of ‘pragmatic vagueness’.

Lastly, it will be shown how ambiguity can be both a source and a result of language change.

# The role of communication in building social and emotional reserve for people with dementia

Panel contribution

***Prof. Alison Wray<sup>1</sup>***

***1. Cardiff University***

This talk contributes to answering the question *How can inclusivity be enhanced for people with dementia?* It proposes that inclusivity is part of *social reserve*, that it impacts on *emotional reserve*, and that it is fundamentally dependent on how effective communicative events are judged to be.

*Brain reserve* and *cognitive reserve* are recognised ways of understanding the variation in the extent to which people are protected against dementia-causing diseases and their symptoms. In my recent book (Wray, 2020), I introduce two more types of reserve. *Social reserve* is ‘the currency of resilience located in a person’s cultural and social context, both local and global’ (p.76). People with dementia (and their families) who have high social reserve have access to strong infrastructure and practical support, positive social attitudes, opportunities for socialising and adequate social credibility. *Emotional reserve* is the internal resilience that individuals bring to the many frustrations and indignities of living with dementia or caring for someone who does. People with high emotional reserve are less likely to be lonely and depressed.

This talk explores the relationship between communication and the building and sustaining of social and emotional reserve. Both types of reserve pivot on *inclusion*, and inclusion in turn is heavily determined by the quality and effectiveness of communicative events. People considered uncommunicative, unfriendly, incomprehensible or difficult to interact with are likely to experience social exclusion with onward impact on their emotional resilience. Dementia has many effects, direct and indirect, on people’s ability to communicate optimally, including impairments of language, memory, concentration and processing. The determinant of whether social and emotional reserve are diminished, however, is how interlocutors respond to these effects. To understand that, we need to examine the impact on interlocutors of communication not working as they expected. Only when interlocutors conceptualise their communicative acts in a manner that renders them successes rather than failures will they be able to create the socially and emotionally inclusive environments that people with dementia need.

# The role of cultural ideologies in indexing socio-pragmatic meanings through dialogs in Japanese translations of English novels

Panel contribution

***Dr. Shigeko Okamoto<sup>1</sup>***

**1.** University of California, Santa Cruz

The repertoires of indexical signs to convey socio-pragmatic meanings differ from language to language. This difference becomes salient when we translate one language into another. In this study, I analyze dialogs in English novels and their Japanese translations as “mediatized language” (Agha 2011) to see how the two languages differ in the availability of indexical signs, how the translator deals with this difference—i.e. what socio-pragmatic meanings, are added or lost in translation, and how ideologies are involved in this indexical process. Two English mystery novels by Michael Connelly, a best-seller writer, and their Japanese translations by Furusawa Yoshimichi were chosen for analysis: *The Burning Room* (2014; translation 2018) and *The Late Show* (2017; translation 2020). The former’s protagonist is a male police officer and the latter’s a female police officer. I examined dialogs in each novel and their translations with regard to a variety of indexical signs used in the speech acts of statements, information-seeking questions, and directives uttered by the two protagonists and several secondary characters.

Findings and their interpretations:

- The comparison of English originals and Japanese translations show that among the wide variety of indexical signs, personal reference and address terms, honorifics, and utterance-final forms in Japanese convey far more detailed socio-pragmatic meanings than in the corresponding (original) expressions in English. As a result, the translated utterances usually offer much more information about the relevant characters’ social identities (in terms of gender, social class, social position, age, etc.) and relationships to the reader than the English originals. In contrast, although not many, there are some information lost in translations (e.g. meanings indexed by standard and non-standard forms in English).
- A close analysis of the use of indexical signs in the data indicates that the translator uses, or recycles, highly stereotypical mediatized, or commodified, speech styles related to social identities, which may be quite divergent from actual speech practices that have been reported in many recent studies. I argue that the process of constructing such speech styles in translations (as well as in the originals) is highly ideological, illustrating a complex version of “double-voiced discourse” (Bucholtz 1999; Meek 2006) that involves: (a) the voice of the original author of the novel; (b) the voice of the character in the novel; and (c) the voice of the translator. The analysis suggests that the choice of styles is “culturally filtered” (House 2019) in that the translator’s voice is highly informed by cultural ideologies about certain social groups—both in Japan and US—and their speech styles.

# The role of emotions and context in the reception of news; brain-imaging experiment

Panel contribution

**Dr. Mareike Bacha-Trams<sup>1</sup>, Dr. Lauri Haapanen<sup>2</sup>**

**1.** University of Helsinki, **2.** University of Jyväskylä

This is how the news is made: real-life circumstances and events are, first, elevated to newsworthy status, then constructed in a semiotic form and, finally, mediated as written or audio-visual news stories. The reception of news – as perceived by the reader, viewer or listener – is affected by the way, in which these real-life circumstances and events are represented as news. However, this way is not one and certain. Therefore, what is interesting - and crucial to the success of the journalistic industry - is the relationship between the way the semiotic resources have been recycled into the news and the effect it produces.

On this basis, we present three research questions:

**RQ1:** What is the effect of newswriting style on the reader's experience of the news story?

**RQ2:** What is the effect of the publishing context on the credibility of the news story?

**RQ3:** What is the influence of different forms of feedback on the reader's initial, individual evaluation of the veracity of the news story?

Our interdisciplinary study answers these questions through a laboratory experiment that combines neurosciences, linguistics and journalism studies.

For the experiment, we have selected three news topics (containing elements of *disgust, fear* and *surprise*), prepared two different news stories of each topic (*unemotional, emotional*), and embedded them in four different contexts (*a high-quality newspaper in print, newspaper in print, newspaper online, personal blog online*). In this way, we have 24 different news stories that we use as stimuli material in the experiment. In addition, we prepared various (written) feedback texts that are either *supportive* or *opposing* and either (said to be) written by *a friend* or *an expert on the issue discussed in the news*. All the material is in Finnish.

In the experiment (that will be conducted in spring 2021 in Espoo, Finland), we will ask Finnish-speaking adolescents ( $n = 40$ ) to read three stories (one of each topic), each followed by the feedback texts, in a magnetic imaging scanner. The scanner records the reader's brain activity by using functional magnetic resonance imaging (fMRI), thus allowing us to compare intersubject correlation (ISC) of brain hemodynamic activity across the 120 stimuli news stories. We also ask the readers to verbalize their reading experience both at the scanner right after reading each stimuli story and then afterwards. These retrospective verbalizations allow us to compare the readers' brain hemodynamic activity (e.g. in regions of emotional processing, reasoning, cognitive control, emotion regulation, etc.) to their conscious reading experience.

The results of the experiment, which will be discussed in our presentation, will contribute the knowledge of the use of language by explaining in a new way how different co- and contextual aspects of a news story affect its conscious and cognitive reception. This also relates to the topical discussions in journalism studies on, e.g. the role of emotion in the audience engagement (*an emotional turn*, Wahl-Jorgensen 2020); media literacy, especially among young people; and the supportive means for the penetration of fake news and disinformation.

# The role of lexical ambiguity in vagueness

---

Panel contribution

---

***Prof. Miriam Voghera***<sup>1</sup>

1. University of Salerno

*Systemic vagueness* is a property of human languages that consists in the possibility to broaden or narrow meanings and form of the linguistic signs without compromising communication. There is abundant evidence that natural speech cannot be represented as a linear chain of sequences of well-formed units and communicative efficiency cannot be calculated as a function of adherence to a canonical form of the verbal output. On both sides, meaning and signifier, speech can vary in every respect, according to the speakers' characteristics, context, rhythm and speed of turn-taking, interactive setting and so on. Whereas canonical shape displays the relevant features in the most redundant way, speakers can use signs with a different number and quality of relevant features. There is a continuum from vagueness to precision, from hypospeech to hyperspeech, depending on the exigencies of the speaker-addressee pair. Speakers do not identify the signs on the basis of specific inherent properties, but because they are distinguishable from each other. The degree of discriminability depends on communicative conditions, but a number of studies have shown that speakers tend to be vague at both meaning and form level.

A semantic manifestation of systemic vagueness is ambiguity, i.e. morphems, words and constructions that have multiple meanings. There is abundant evidence that ambiguity is not a feature of a restricted class of words: the most frequent words we use in any language are polysemous. Many ambiguous items, such as general nouns, placeholders, dummy words etc., occur in Vagueness Expressions to convey *intentional vagueness*, i.e. in linguistic choices with low discriminating power in relation to the situation. Intentional vagueness responds to different communicative needs:

- a) lack of information (informational vagueness);
- b) reluctance to establish a clear relation with the utterance or the addressee (relational vagueness);
- c) exigencies due to online programming and production processes (discourse vagueness).

We investigate to what extent ambiguous lexemes contribute to intentional vagueness. Our prediction, resulting from previous studies, is that an ambiguous lexeme are not so relevant in producing vagueness, which rather derives from specific constructions.

# The role of pragmatic markers in an emerging mixed code: the case of Gibraltar

Panel contribution

***Ms. Marta Rodríguez García<sup>1</sup>, Dr. Eugenio Goria<sup>2</sup>***

*1. University of Basel, 2. University of Torino*

In this paper, we give a description of the bilingual patterns involving discourse and pragmatic markers in three corpora of English-Spanish bilingual speech from Gibraltar, UK.

While English is the sole official language of Gibraltar, Spanish is also spoken by most of the community at a familiar level. In this scenario, code-mixing is a widespread phenomenon (see Moyer 1998). As demonstrated in previous studies (Weston 2013; Goria 2018, 2020), code-mixing varies across different age groups, reflecting different stages of language shift in the community. Therefore, we find in the corpora both Spanish- and English-dominant speakers. Thanks to a sociolinguistic analysis grounded on the comparison between different generations, we will show that a new mixed code is being developed by younger speakers. This is based on the systematic use of Spanish discourse markers and pragmatic markers in an otherwise English discourse; see the following examples:

- PERO MIRA, once you learn to accept those things, and you find you way things around... PUES MIRA, it's fine. (Canessa 2019, *Bordering on Britishness corpus*)
- PERO I think QUE EL influence VIENE DEL english NO. and the consciousness of the lisp. PERO SI the elements are that I think. (Goria 2018)

Our methodology is corpus-based, as we will resort to both self-collected corpora (Goria 2018, Rodríguez García 2021) of bilingual speech, as well as to the corpus of biographic interviews *Bordering on Britishnesscorpus* (2019), where code-mixing is also frequent in the recordings.

While previous studies focus on the whole class of pragmatic markers, which are treated as *utterance modifiers* (Matras 1998), we will analyse from a quantitative perspective the distribution of specific Spanish markers in bilingual discourse (namely *y*, *pero*, *sabes*, *bueno* and *mira*), in order to show the emergence of regular patterns that characterise mixed codes (Auer 2014). On the one hand we will classify different types of bilingual patterns, identifying cases where the use of a Spanish discourse/pragmatic marker prompts a change in the language of interaction and cases where it does not. On the other hand, we will analyse the pragmatic functions of the switch by asking the question whether there are differences in bilingual usage between items with a discourse-oriented function and items with a participant- or interaction-oriented function (see Fraser 1990, 2006; Aijmer and Simon Vandenberg 2011).

To conclude, this study will significantly improve our understanding of the behaviour of discourse and pragmatic markers in bilingual speech in Gibraltar; furthermore, it will highlight the benefits of a multidisciplinary approach to DMs and PMs in order to analyse pragmatic functions in the light of more global sociolinguistic aspects.

# The role of speaker goals in children's use of evidence and reasons for joint decisions

Panel contribution

***Dr. Andreas Domberg<sup>1</sup>***

***1. Max Planck Institute for Human Development, Berlin***

Reasoning together and making joint decisions are a ubiquitous aspect and clear benefit of social life. While individual decision-making entails setting goals, understanding the present situation and taking appropriate action to reach these goals, deciding together means putting together relevant individual knowledge and aligning goals to find the best course of action given the situation and joint goals. Commonly, however, cooperating individuals disagree either about their goal, or about how to attain it. To resolve disagreements and prevent gridlock, speakers often direct each other's attention to mutually accessible evidence around them or shared beliefs. A used car buyer may for instance point out a scratch to justify a lower price, instead of just insisting on paying less. However, how we go about searching for evidence and using it in argumentation is itself influenced by individual goals, and this competence for goal-sensitive reasoning emerges early in ontogeny.

The experimental research reported here shows that children's reasoning is attuned early to their goals, and their use of evidence is flexible. Given a joint goal, 5- and 7-year-old children can be unbiased and unrestrained in finding reasons that best inform their shared endeavour. However, when children also have individual competitive goals within a cooperative task, this can lead to relatively impoverished reasoning, with joint decisions informed by less reasoning. Our results suggest that children produce this outcome via omission: They withhold evidence or reasons that, even if informative to the cooperative goal, are misaligned with their individual goals.

Additional experimental evidence suggests that collaborative and competitive goals also do not work as drivers of reasoning per se, but that the configuration of these goals matters: Motivating cooperative reasoning dyads of children additionally by exposing them to outgroup competition does not improve their reasoning. This contrasts with results from cooperative trust games with adults, but is in line with the hypothesis that goal configuration is key in how reasoning performance varies.

# The Sequential Organizations of the Speech Event of Offer-acceptance in Chinese: A Framing Approach

Panel contribution

***Ms. Junli Liu<sup>1</sup>***

***1. School of Foreign Languages Beijing Institute of Technology***

This research proposes a framing approach to the sequential organizations of the speech event of offer-acceptance in Chinese. It is mainly inspired by the frame theory adopted in previous studies on offers. They are the frame theory by van Dijk (1977) to justify imperatives in the initiation of offers in certain situations; the frames of speech events by Aijmer (1996) to justify the speech act sequence; the frame-based approach to politeness by Terkourafi (2001, 2005, 2009, 2011a, 2011b, 2015, 2019) to illustrate that both indirect and direct speech acts are natural defaults; and the ritual frame theory by Kadar and House (2020a, 2020b, 2021) to justify a pragmalinguistic approach in their study. Moreover inspired by Hymes (1986) and Rabinowitz (1993), this study deems the physical realization of the offer as the obligatory step. Thus the speech event of offering sometimes may extend to two or more than two interactions (from the initiative offer to the final realization of the offer).

In general, the sequential organization of the speech event of offer-acceptance can be classified into four categories according to the interactive structures exhibited either in one interaction or in two or more interactions: the direct acceptance (single structure in one interaction); the indirect acceptance (the multturn structure with embedded ritual refusals and reoffers in one interaction); the indirect unwilling/forced acceptance (the multturn structure with forced offers in one interaction); and the ritual refusal in the first interaction but later acceptance when the offer is reissued in the ensuing interaction (the multturn structure realized in two interactions). Although the fourth type is quite similar to the second type in structure, yet the second is realized in one interaction while the fourth is extended to two or more than two interactions.

**Key words:** the framing approach, speech events, offers, acceptance, Chinese

# The Simplification of the Honorific Language in Japanese of the Globalized age

Panel contribution

***Dr. Kazuko Tanabe<sup>1</sup>***

***1. Japan Women's University***

This study attempts to understand simplification of the Japanese language in the globalized age from the inter-cultural communication's point of view. In modern Japanese

language, "desu" and "masu" are auxiliary verbs which can make two types of polite forms. During the past 20 years, the use of "desu" expanded as emergence of the colloquial style "ssu" expression, which seems to be in trend taking the place of the role

"masu". The purpose of this study is to illustrate the influence of the frequent multicultural communication on the honorific language.

According to Trudgill (2011), the reason why Japanese has a developed system of honorific registers lies in cultural values. He claims that Japanese society has traditionally been highly stratified, with "strict conventions of politeness" and the relative social status of the speaker and hearer determines in the speech register employed. However, after the world war II, the society of Japan has been democratized under the new constitution. The business conventions such as the life-long employment and the seniority based on the traditional ideas have been gradually de-constructed in a few of decades in order to increase the productivity. These social and personal changes of value can give influence to the language use in the honorific language.

This study is to analyze the expanding of "desu" in place of "masu" by utilizing Yahoo's real-time search engine and the survey with questionnaires. The data which has been collocated by lexis by Yahoo's real-time engine provide us the frequency of use of both of "desu" and "masu" in twitters. On the other hand, the questionnaire's answers show us the people's consciousness related to the honorific language use. The combination of these two kinds of data clarifies the process of the transition of polite forms in Japanese honorific language.

# The social actions of parenting: managing multi-layered situations at home

Panel contribution

***Dr. Anna Vatanen<sup>1</sup>***

*1. University of Oulu*

This conversation analytic study looks at situations in the family home where parents and their children conduct various everyday activities. The data are video-recorded naturally occurring everyday interactions in Finnish family homes. These families have several children, and at times, rather hectic moments occur where the parents need to attend to several children and several ongoing activity trajectories at once – i.e., the situations involve multiactivity (Haddington et al. 2014). The analytical focus of this study is on the social actions that the parents accomplish to manage these busy situations. Preliminary findings indicate that at least accounts (Sterponi 2009), suspensions (Keisanen et al. 2014) and requests/recruitments (Drew & Couper-Kuhlen 2014, Zinken 2016) are used, as well as norm-policing turns that aim at modifying or changing a child's behavior. These actions are mostly accomplished by verbal means, but also various embodied actions occur, such as shepherding a child (Cekaite 2010) or manually granting a child's request (Rauniomaa & Keisanen 2012).

This study examines the situational and interactional contingencies that have an effect on which of the social actions is/are used in each case. The studied social actions – accounts, suspensions, requests, norm-policing turns, and the various embodied actions – in various ways and to different degrees highlight the rights the parents exert when interacting with their children and guiding their behavior (what they are allowed to do and when), but also the parents' responsibilities for (taking care of) their children. The aim of the study is to sketch the array of resources and practices the parents use in the busy everyday situations, and to provide an insight into what doing being a parent looks like in actual interaction.

# The Sound of Urgency: Listener Perceptions of Synthetic and Natural Speech Warnings for Hazards and Disasters

Panel contribution

***Ms. Marikris de Leon<sup>1</sup>, Dr. Marc Pell<sup>1</sup>***

***1. McGill University***

Human listeners are able to recognize emotions, such as panic fear, communicated through the prosody of speech. As they process emotional prosody, they automatically make an approximation of urgency, which is the personal relevance and time pressure implied by speech. This approximation may be based on vocal acoustic properties, and is expected to moderate arousal and generate perceptual judgements. The present study investigates listener perceptions of voices used in speech warnings for environmental, safety and health risk communication. These warnings employ either a natural voice (e.g. biohazard warning relayed by a TV news anchor) or a synthetic voice (e.g. automated building fire warning that uses a computer-generated text-to-speech message). Depending on the type of prosody used, it is expected that listener evaluations of the speech warnings would vary.

The present study examines how listeners subjectively perceive 3 different prosody types (synthetic, non-urgent and urgent) used in speech warnings. Through acoustic-perceptual testing, it describes how listeners evaluate the different prosody types in terms of perceptual ratings (negative emotional valence, risk, urgency, believability and appropriateness) and in relation to their acoustic properties. Seventy Canadian Anglophone speakers rated warning message stimuli that each consisted of a hazard description and safety instructions (e.g. "A tsunami is coming. Move to higher ground now."). Ten types of hazards and disasters were used. Preliminary results reveal that listeners were able to perceptually differentiate each of the three prosody types. They gave urgent speech the highest perceptual ratings. This could be attributed to the acoustic characteristics of urgent speech as it has significantly different values of fundamental frequency, jitter, harmonics-to-noise ratio standard deviation, Hammarberg Index and total duration of voice breaks in comparison with synthetic and non-urgent speech. Synthetic speech resulted in perceptual ratings higher than those given to non-urgent speech but lower than urgent speech. This may be due to the widespread use of synthetic speech in automated safety systems, which generated conditioned associations with risk contexts.

It is critical for listeners to make accurate judgements of urgency in dangerous situations for them to respond to hazards or disasters in a timely and appropriate manner. It is thus useful to determine what prosody types are optimal for listeners to recognize and accurately estimate urgency in speech warnings. The results of the study show that urgently intoned speech may be the most effective in communicating urgency. This information may be used towards the improvement of risk communication systems. It may provide insight into more appropriate voice types for applications in automated warning systems, news broadcasts and public service announcements.

# The Taiwanese child in families with dementia: learning through their inclusion

Panel contribution

***Dr. Boyd Davis<sup>1</sup>, Ms. Ching-Yi Kuo<sup>2</sup>, Dr. Margaret MacLagan<sup>3</sup>***

***1. UNCCharlotte Emerita, 2. Independent researche, 3. UCantebury Retired***

In Taiwan, young children often help older family members care for older persons with dementia who are home-bound. The children may be more empathetic if they know more about the condition affecting their relative. Studies of the impact of disseminating knowledge about dementia typically focus on adults or on adolescents. Little is known regarding the effects of increasing dementia knowledge in pre-adolescent children in Asia or its impact on combating the stigma of dementia still prevalent in Asian societies.

We report on our initial study of Taiwanese youth and their understanding of dementia. The study first surveyed 350-plus children, grades 3-6, in seven middle-income elementary schools in southern Taiwan, to elicit what Taiwanese children might know about Alzheimer's disease and related dementias (ADRD), and their self-disclosed empathy towards home-bound old adults in their families. We then delivered a short multimedia presentation at the same schools about key features of dementia. We conducted interviews on a subset of the participants (5%) designed to gently probe potential attitudes about dementia from the children and their teachers that suggested filial piety and/or stigma. A pair of post-interview surveys, staggered two weeks apart in delivery, was designed to elicit what information children and school personnel retained from the initial presentation. Conventional quantitative analysis was used to compile survey findings; discourse analysis was used to investigate the conversational interviews and identify critical pragmatic issues. We contextualize our findings with responses from a subset of 5 community adults and compare responses from children who live in 2- and 3-generational families.

Our study explores whether the application of dementia education in the child population could reduce the impact of dementia stigma on inclusion and can help pre-adolescent children to accept potential problem behaviors of dementia elders at home, especially as the children assist in home care work.

# The Three Oranges: Political influencers as flashpoints for manufacturing online aggression

Panel contribution

***Dr. Philip Sargeant<sup>1</sup>, Dr. Korina Giakoglou<sup>2</sup>***

*1. The Open University, UK, 2. The Open U*

This paper examines political influencers' social media feeds as sites of antagonistic political debate. We focus, in particular, on how the persona and activity of an influencer becomes a lightning-rod for audience outrage as part of an affect-based rhetorical strategy.

We take as a case study a media event centring around the British journalist and activist Ash Sarkar's tweet of a selfie accompanied by three orange emojis as a caption, which was posted on 20 June 2020, the same date on which three people were killed in a terrorist incident in a park in Reading, UK (Sarkar, 2020). The tweet unleashed a storm of abuse from people erroneously relating it to the killings in Reading. This response was manufactured by an element of her audience mixing conspiracy theories, political partisanship, racism and misogyny and projecting intentions and meanings to her post, specially targeting her use of the orange emoji as a symbol of the three people killed in the Reading stabbing.

The data for this study consist of the original tweet and the cascade of hostile responses it received during the five-day period of this social media storm between 20 and 25 June 2020 (126 tweets and 32 retweets). The tweets are drawn from a bigger corpus of posts extracted and compiled via NCapture from Sarkar's feed and covering four months from April to July 2020 (No=3,187). We also draw selectively on selected media coverage of the event.

Our analysis reconstructs how an undistinguished selfie was recontextualised by part of Sarkar's audience into a coded message of race hate to become part of a broader antagonistic and reactionary online discourse and its associated conflicting affective positions. Drawing on insights from the metasemiotics of emoji communication (Sargeant, 2019) and social media storying (Georgakopoulou, 2016; Giakoglou, 2021), the paper outlines a hermeneutics of audience outrage as a response to influencer posts. In this case, audience outrage was based on assigning meaning on the basis of coincidence, far-fetched cultural allusion, nationalist narratives, all of which was being conducted within the broader context of circulating affective positions on Black Lives Matter debates and Sarkar's earlier comments about structural racism and white hegemony.

The paper illustrates how the storying, image and influence of this type of political influencer are predicated on the crafting of a polarising persona which generates conflict, and thus attention, in the media environment, thus becoming a key component in today's outrage politics.

# The Use of Memes in Communication about COVID-19 in Chinese Online Community

Panel contribution

***Ms. Songyan Du<sup>1</sup>, Mr. Adrian Yip<sup>1</sup>***

***1. Queen Mary University of London***

Since the outbreak of COVID-19 in early 2020, there has been rich discussion in digital media about various aspects of the pandemic, such as its risks, impact and measures adopted to counter it. Online platforms see internet users employ both verbal and non-verbal resources to express their ideas and opinions, and memes are a common strategy to facilitate such communications. Often multimodally materialised through the combination of text and image, memes and their uses embody the processes of re-semiotization and re-entextualization, in that original signs are adjusted and situated in an entirely different context to realize new communicative effects (Leppänen et al., 2014; Varis & Blommaert, 2015).

In the Chinese context, netizens frequently use memes on social media or other virtual platforms to voice their perspectives. Zhihu is a socialized question-and-answer website in China which provides a space for sharing knowledge, experience and thoughts over various topics, and for creating dialogues between users who have similar interests or concerns. It is interactive as users can engage with others' responses by agreeing with them through an upvote system and commenting on them. This open forum design of Zhihu encourages debates and reasoning within loosely-bonded online communities with shared interests, offering grounds for the disruption of toxic 'magical thinking'.

This study investigates how memes are used to communicate beliefs about COVID-19 in the Zhihu community. The dataset consists of 50 memes collected from the most agreed responses in featured discussions under the topics of 'coronavirus (COVID-19)' and 'COVID-19 Pneumonia'. Both verbal and non-verbal semiotic resources in memes are analyzed. The analytical framework combines a social semiotic account of meaning construction (e.g. Kress & van Leeuwen, 1996) and a pragmatic approach to meaning transmission (e.g. Forceville, 2014; Yus, 2019).

The analysis suggests that meme is an effective tool to construct meanings and pictorial metaphors, through which attitudinal judgment about topics related to COVID-19 is formed in a multimodal (and usually humorous) way. Chinese netizens mainly use memes to communicate health risks and support/criticize/mock responses to the pandemic. The affordances of memes render them effective in demystifying widely held beliefs about COVID-19, countering toxic 'magical thinking'. The importance and complexity of understanding memes through text, image, and their interaction is also discussed.

# The use of the ‘吧ba’ particle as a politeness marker in L2 Chinese

---

Panel contribution

---

**Prof. Wei Ren**<sup>1</sup>

*1. Beihang University*

Chinese sentence final particles (SFPs hereafter) are an often-researched topic in linguistics. Previous research has examined Chinese SFPs' functions of indicating tense, aspect, evidentiality, emotion and speech acts. However, few studies have investigated the function of manipulating politeness or rapport in Chinese SFPs. This study aims to investigate the pragmatic use of the Chinese SFP ‘吧ba’ by L2 Chinese learners in both oral and written communication. Data were elicited from the Guangwai-Lancaster Chinese Learner Corpus. The corpus has both a spoken and a written part and covers a variety of tasks types and topics. The elicited uses of the ‘吧ba’ particle are calculated quantitatively with respect to frequencies in communicative mode (written vs spoken), activity types (dialogue vs narratives) among learners and are analysed qualitatively with respect to different pragmatic functions of the ‘吧ba’ particle. In addition, learners' uses across different proficiency levels will be analysed and discussed to investigate the role of L2 proficiency in L2 Chinese learners' uses of the particle.

# The Use of Utterance Completion in Delivering Cognitive Empathy in English as a Lingua Franca: A Case of Simulated Medical Consultations in Japan

Panel contribution

***Ms. Yukako Nozawa<sup>1</sup>***

**1.** Waseda University

This study investigates how student doctors (SDs) and simulated patients (SPs) co-construct empathic communication during medical consultation in English as a lingua franca (ELF) from a conversation analytic perspective. Empathy has been researched extensively in literature. In medicine, it has been widely shared that it is rather cognitive attribute than affective, that is, the common key features of empathy in medicine seem to be ‘understanding’ and ‘communication of understanding’ (e.g. Hojat, 2007). This study aims to reveal the behavioural aspect of empathy by using the model of empathic communication proposed by Suchman et al. (1997) and conversation analysis. The present study compares two cases of simulated medical consultation during a medical English classroom at a university in Japan. The participants are four SDs and two SPs from different lingua-cultural backgrounds. The SDs conduct medical interviews and specifically engage in taking history of the patient’s illness in ELF, focusing on the co-construction of empathic communication and thus achieving patient-centred care. The conversation was transcribed for subsequent analysis. Preliminary results indicate that empathic communication emerges as the medical interview proceeds, that is, the expression of empathy becomes more explicit. Another significant feature of this data is that the SDs tend to express their empathy in the form of utterance completion (e.g. Sacks, 1992). Cogo and Dewey (2012) report that the use of utterance completion is frequently observed in ELF communication in their data as well, and it is argued as ‘skilful interactional work’ of ELF speakers, as it requires close monitoring of the interactional structure. This suggests that the SDs are more attentive and highly cooperative than displaying cognitive empathy by simply verbalising the SPs’ emotions. The results cannot necessarily be generalised as the number of cases is limited, but the findings might help to develop teaching models of empathic communication for medical ELF classrooms in the future.

# The visible arrangements of embodied actions: Mobile trajectories in public space

Panel contribution

***Dr. Burak Tekin<sup>1</sup>, Prof. Lorenza Mondada<sup>1</sup>***

***1. University of Basel***

This paper studies fleeting interactions between strangers in public spaces, like squares, roads, side walks, and circulation areas. It shows how walking trajectories are intelligible for strangers and used by them for coordinating their movements, both to avoid collisions and to organize gatherings, either reciprocally or unilaterally. The starting point is an interest in co-presence in social spaces (Goffman 1971), prior to any engagement leading to focused interactions. Goffman insisted on the fact that “vehicular units” constituted by people recognizable as “withs” (1971) do mutually identify each other in public space. The recognizable visibility of categories of people populating public space was discussed by authors such as Sacks (1992), Jayyusi (1984), Pollner (1974), Lee & Watson (1993) on the basis of ethnographic observations. Queuing was also addressed as an co-present arrangement of bodies in space that is witnessably ordered and self-organized (Garfinkel, 2002 ; Garfinkel & Livingston 2003). Other studies highlighted the methodic organization of walking, making people walking alone or together recognizable (Ryave & Schenkein, 1974, Relieu 1996) and walking an interactional achievement (Mondada, 2009, 2014). Building on this literature, we are interested in how people moving in public space orient to each other, sight each other, and how they show, by aligning (or not) with others' trajectories, under which category they *see* the other person.

In this paper, we address these forms of minimal interactions. This enables us to re-visit the distinctions and connections between unfocused and focused interactions (Goffman 1963, 1971), to interrogate rather liminal, minimal, fleeting forms of interaction, and to discuss emergent forms of pre-openings, making openings possible (or not), and ultimately probing what social interaction is or isn't through the question of its emergent flexible and fleeting boundaries.

Empirically, we draw on video recorded fragments of city life collected in the project entitled ‘The first five words’, in which passers-by cross each other on the side-walk, people join other people in a queue, pedestrians are targeted by persons selling, asking for, or offering something – and in which they might exchange glances, smiles and greetings, or just notice each other without entering in any form of interaction. This study focuses on the first glances exchanged or addressed by a pedestrian with/to a passer-by, and on their orientations to projectability and intelligibility of trajectories of embodied actions in public space. It explores the publicly available and witnessable character of how people see and approach each other, as demonstrated – within their own co-present conducts – by the ways they monitor and adjust to each other.

# The war metaphor in E.Macron's speeches: a discursive construction of exclusion in times of health crisis

Panel contribution

*Prof. Caroline Facq-mellet<sup>1</sup>*

*1. MODYCO CNRS UMR 7114*

We propose to explore the use of the war metaphor in E. Macron's speeches between March 12 and October 14, 2020 from a semantic, argumentative and discursive perspective. The metaphor of war is one of the most frequent in political discourse. In the speeches of Emmanuel Macron, it is used as an argument in favor of a conclusion to buttress the rejection of any form of protest against the management of Covid public policy. The war metaphor produces a certain regime of inclusion and exclusion.

The study is in two parts. The first is a semantic analysis based on notions from the theory of conceptual metaphor. Three notional domains are called upon in the President's speeches: the nation; war; disease. The notional domain of war as a source domain projects a certain number of elements on disease and on the nation, the most salient of which are: /human agent/, /intentional action/. The projection of the "human" element also allows a certain number of inferences to be made about the representations of the human body: a body envelope that clearly delimits inside from outside, the coordination of bodily movements and functions, control of the brain, etc. The domain of disease is both a target domain (disease is an enemy) and a source domain (the nation is sick).

It is the double projection of disease and war onto the domain of the nation that contributes to merging the representation of the nation as a sick body with that of the nation as a soldier in fighting. This figuration enables the nation to be represented here as a single and compact entity, marking a separation and a clear opposition between inside and outside, between health and illness. The war metaphor thus constitutes an argumentative scheme in which the properties and scenarios of actions associated with the field of war (border defense, army unity, coordination and hierarchization of military actions) form an argument in favor of prescribing actions under a military regime in the name of collective health. This conclusion allows, in contrast, for the exclusion and the rejection of anything that opposes these measures, on the side of considered as siding with the enemy. The second part explores the referential and interdiscursive universe of the war metaphor in Macron's speeches in order to grasp the imaginary that is constructed and activated by these discourses. The figure of war appears both as a powerful matrix (marked out by discursive memory, applied to all domains, supported by numerous lexicalized metaphors) and at the same time rather blurred. The representation of war is above all a generic representation that appears, even if it can be noted that the different aspects evoked in Macron's speeches refer more specifically to the First World War or to traditional warfare in defense of territories and borders. It is noteworthy that there are no references to the Second World War and the Resistance, which reflect a more complex pattern in the distribution between enemy and friend, inside and outside.

# The words of facts: “in fact” in English L1 and L2 student writing

Panel contribution

**Ms. Sara Gesuato<sup>1</sup>, Prof. Katherine Ackerley<sup>1</sup>**

***1. University of Padua***

“In fact” is a metatextual and a stance-building marker with multiple pragmatic uses (Schwenter & Traugott 2000). It shows how an utterance relates to its co-text, signalling the speaker’s/writer’s attitude toward its content. Spoken dialogic data (Bruti 1999) show that, in its textual function, “in fact” is a forward-orienting marker, which introduces an autonomous argumentative assertion, determining the progression of discourse. As a stance marker, it either contrasts the truthfulness/accuracy of an utterance vis-à-vis the preceding text, or clarifies and expands on the content of the co-text with more focused information.

We examined “in fact” in written monologic discourse, by contrasting essays/papers written in English by L1 English and L1 Italian university students. The native English data come from the BAWE corpus (8,000,000 words). The learner English data are drawn from a corpus of 180 essays (90,000 words) produced by Italian undergraduate university students (IT-essays). The BAWE corpus contains 841 tokens of “in fact” (i.e. 145.86 per million words), while the IT-essays corpus contains 45 tokens (i.e. 500 per million words).

We each independently analysed the concordances of “in fact”, intuitively classifying its meanings. We then compared our analyses, resolving issues in our interpretation of the data. We determined three L1 uses of “in fact”: ‘contradiction’ (‘but instead’; cf. Italian *ma invece*; e.g. “less damaging insects would competitively exclude *R. conicus* from this trophic niche. The opposite, in fact, occurred”); ‘specification’ (‘more accurately’; cf. Italian *anzi*; e.g. “President Bush has taken a hard line toward North Korea, and, in fact, ‘turned a cold shoulder’ even to South Korean doves”); and ‘factfulness’ (‘indeed’; cf. Italian *effettivamente*; e.g. “I will firstly examine how lay concepts of health and illness are, in fact, lay”). This is in line with Aijmer & Simon-Vandenbergen (2004: 1787-1789). We also detected one prominent sense of L2 English “in fact”, namely ‘support (with examples/conclusions)’ (‘indeed’, ‘sure enough’; e.g. “metacognitive training can be an effective tool for teachers to use in helping learners improve their language skills. In fact, nowadays, teachers have to identify students’ learning strategies in order to help them become more independent.”)

The findings indicate that in both L1 and L2 English, “in fact” functions as a topic management indicator signalling thematic connectedness in monologic discourse. However, L2 English “in fact” is subject to interference from the Italian false friend “infatti”, which is backward-orienting (Bruti 1999), because it announces that a topic is being brought to a close, confirming what has been stated before.

We suggest that “in fact” should be the focus of corpus-based activities for Italian learners of English to become aware of its prototypical native usage.

# The ‘COVID-19 Presidential Genre’: an exploration of off-the-cuff rhetoric of fighting the pandemic

Panel contribution

***Dr. Levis Mugumya<sup>1</sup>***

*1. Makerere University*

On 18 March 2020, the President of Uganda addressed the nation on the impending Corona virus; thereby announcing thirty-five actions to fight the pandemic. Following the implementation of the measures, especially a quick lockdown to curtail community transmission, the President has so far made twenty addresses to the nation on the situation and progress (confirmed Covid-19 cases, recoveries and medical healthy preparedness) of the pandemic in Uganda. These measures were successful in containing the spread of the Corona virus among Ugandans. Unlike other global and African leaders’ addresses, President Museveni’s addresses have been extraordinarily long, often lasting more than one hour and exhibited recurring typical rhetorical actions (Miller 1984) that identified it as a genre of its own. Although the addresses were written and emanating from the briefing of multisectoral national taskforce on Covid-19, the President very often deviated from the script to illustrate a point using different modes of persuasion, including anecdotes and proverbs. He also used Runyankore, an agglutinating Bantu language, to explicate the clinical manifestations of Covid-19, arguing that English is devoid of suitable terms to explicate the clinical conditions. Therefore, this paper will invoke a critical discourse analytical approach (Wodak 2011) to examine the nature of the rhetorical moves that characterised the Presidential addresses. It will also analyse the linguistic devices that the president invoked during the addresses. Focusing on the extempore narrative episodes emanating from the 20 presidential addresses, it will also explicate the nature of utterances (rebukes, warnings and reassurances) the president made. It will demonstrate how the President not only invoked the war rhetoric, metaphors, and similes to sustain the attention of his audience but also to explicate the science of new pandemic, justify the continued lockdown and other restrictive measures, and rally support from the citizens.

# These cameras won't show the crowds: Conspiracy theories and the manipulation of truth in Trumpian discourse

Panel contribution

***Ms. Kelsey Campolong<sup>1</sup>***

***1. Ulster University***

This study uses a linguistics-based critical discourse analytic framework (cf. Fairclough 2015) to identify, isolate, and contextualise the discursive strategies involved in the construction of conspiracy theories (CTs) in US President Donald Trump's campaign-style rally speeches (2017-2020). The CTs propagated by these discursive strategies are shown to have significant discursive functions in the Trumpian construction of (un)truth. Unlike simple falsehoods, which also appear conspicuously in Trumpian discourse, CTs involve (specific or vague) accusations about certain *agents* necessarily acting *against* Trump and/or his supporters surreptitiously, contributing to the us-versus-them right-wing populist framework (Wodak 2011; Cap 2013) established throughout the discourse broadly and the rally speeches specifically. This research introduces a particular form of intertextuality found to characterize the discursive strategies of Trumpian discourse's CTs that allow for the dissemination of lies and untruths that nevertheless *feel* true, leading to the manipulation both of the rallies' immediate audience and the American public more generally.

One of the most pervasive CTs constructed within Trumpian discourse is the idea that the mainstream media and other "opponents" of Donald Trump routinely manipulate, mask, and intentionally underestimate the extent of Trump's support, and specifically the number of people who come to see him at events. Focusing on what I call Trumpian discourse's "crowd size" conspiracy, I will demonstrate how Trump's use of particular discursive strategies deploys a form of intertextuality that is markedly *intradiscursive*; i.e., it is characterized by repetition and reference both across texts within the speech genre (campaign rallies) and importantly, across the discursive context (Trumpian discourse) writ large. This empirical research utilizes a rigorous, data-driven approach to qualitative analysis informed by various CDA traditions. Drawing on detailed transcriptions of Trump's rallies, I identify several discursive strategies that invoke the "crowd size" CT: the iconization of stock phrases for intradiscursive recognition, the legitimization of untruths by appeal to an authority of numbers, and the recursivity of intertextual references (i.e. each rally provides fodder for subsequent rallies), among others. Furthermore, I identify two prominent discursive functions of the CT: to manipulate the appearance of Trump's popularity by manufacturing an "alternative truth" (in which Trump enjoys more support than he does in reality); and to bolster the larger Trumpian CT of a fake news media intent on destroying him (of which the "crowd size" CT is merely a part). In sum, I aim to demonstrate that Donald Trump uses several recurring discursive strategies in the manifestation of his "crowd size" conspiracy, which in turn has specific self-serving discursive functions involved in the manipulation of objective truth.

# This smells like cat's wee: Laughter and gaze during disagreements about hummus

Panel contribution

**Ms. Vidya Somashekharappa<sup>1</sup>, Dr. Chiara Mazzocconi<sup>2</sup>, Mr. Vladislav Maraev<sup>1</sup>, Dr. Christine Howes<sup>1</sup>**

**1.** University of Gothenburg, **2.** Aix-Marseille Universite, Laboratoire Parole et Langage (LPL)- Institute of Language, Communication and the Brain (ILCB))

In conversation, interactants generally aim at an optimal level of co-operation and equilibrium avoiding direct disaffiliation as much as possible (Pomerantz and Heritage, 2012). Nevertheless, social interactions often require the production of speech-acts that can make this equilibrium unstable or at risk (Raclaw and Ford, 2017). Such situations can be marked by non-verbal cues such as laughter and gaze (Raclaw and Ford, 2017; Hunyadi, 2019). For example, a laughter can occur to smooth a perceived disagreement with one's interactional partner (1). Following Mazzocconi et al. (2020), we refer to any situation where there is a clash between a social norm and/or comfort to the current situation as *social incongruity*.

We investigate whether different laughter functions related to social incongruity are associated with different gaze patterns, and can therefore demonstrate different interpersonal dynamics at play. Our preliminary observations are based on the analysis of video recorded dyadic spontaneous interactions in the context of hummus taste-testing, constituting as a part of the Good Housekeeping Institute corpus (GHI) previously annotated for gaze (Somashekharappa et al., 2020).

(1)

A: oh my god ((sniff)) is that cat's wee

[Gaze: A (hummus).....A (B).....

B (A).....B (questionnaire)....]

A and B: ((co-active laughter))

[Gaze: A (B)....A(questionnaire)....A (B)

B (questionnaire).....]

B: hasn't got a lot of smell

[Gaze: A&B (questionnaire).....]

A: ((laughter: [response to disagreement]))

[Gaze: A&B (questionnaire).....]

In our data, when laughter is related to social incongruity as in (1), the partner tends not to look at the laugher. The opposite pattern is observed when the laughter is related to humorous comments (i.e. the laugher tends not to look at the partner), consistently with results from (Gironzetti, 2017).

In laughs used to mark irony, we observe a similar pattern of mutual gaze avoidance, together with the avoidance of shared attention on an external target. The tendency to avoid mutual gaze in the context of disapproval or non-literal language such as irony may be a way to mark distance from the produced speech-act, either from its "harmful" intent or with respect to commitment to its literal meaning, similarly to eye-rolling (Colston, 2020).

# Toasting as an Interactional Frame for Embodied Human-Robot Interaction

Panel contribution

***Ms. Rosalyn Langedijk<sup>1</sup>, Prof. Kerstin Fischer<sup>1</sup>***

*<sup>1</sup>. University of Southern Denmark*

Fillmore (1982) introduced the notion of interactional frames to account for how we conceptualize what is going on between the speaker and the hearer. However, so far these frames have received very little attention (but see, for instance, Antonopoulou & Nikiforidou 2011; Fischer 2000, 2015; Matsumoto 2010, 2015), and the nature of these frames has hardly been described, let alone formalized. In the current talk, we study toasting, a “ritual in which a respect or esteem for the company at hand is shown” (Black 2010: 76) and which “refers to the deeply rooted tradition of raising a glass of alcoholic beverage in honor of others or to celebrate an event or an ideal, accompanied by a few words about the occasion” (Black 2010: 184). Kotthoff (2013) suggests that toasting is ‘doing culture’ in the sense of expressing national customs and standards and supports “positive face needs” (Brown and Levinson 1987), for instance, by signaling affirmation, appreciation, or sympathy.

We show that toasting in practice is guided by interactional frames that account not only for the sequencing of verbal and non-verbal actions, but also for the relationship between speaker and hearer, the role of mutual gaze and the fact that toasting is a joint action (Clark 1996). We analyze 40 toasting interactions between a large service robot and members of the general public, who were waiting to be admitted to a concert hall. The robot drove around with a tray of glasses filled with tap water on its back and verbally offered water to people in its field of view. Most people responded to the robot’s offer and subsequent toast by practicing the whole toasting ritual, consisting of repeating the toast, lifting the glass and drinking, yet significantly more often if there was mutual eye gaze between participants and the robot (cf. Fischer et al. 2020).

The results of the empirical investigation of embodied human-robot interactions show the interdependencies between situational elements and ‘what is going on between speaker and hearer’, which informs the definition of frame elements and their influence on the successful use of toasts. Our analysis reveals how the use of the toast ‘skaal’ is embedded in complex multimodal interactional sequences, comprising cultural as well as interactional knowledge. Furthermore, our study shows that human-robot interactions constitute a perfect methodological environment to identify and study interactional frames.

# Top-down meets bottom-up: Governmental stances in above-the-line Guardian online comments on Covid 19

Panel contribution

**Prof. Sonja Kleinke<sup>1</sup>**

*1. University of Heidelberg*

As a public communication space, Web 2.0 environments have brought about new patterns of participation also in political discourse (Johansson et al. 2017) and play an important role in the dissemination of governmental stances on Covid 19. Above-the-line (Atl) online comments in public online news media such as The Guardian Online are part of a dense web of interconnected on- and offline public debates (Eller 2017). Produced by professional journalists, Guardian online Atl comments convey governmental discourses and those of the opposition to the broader public and invite public discussions by Guardian Online users, which may reach up to several thousand below-the-line (Btl) comments. Thus, with their topical focus on institutionalized political discourse, Atl comments take on a mediating role at the interface of official top-down- and user-generated bottom-up discourses in the public Covid 19 debate.

The present qualitative study analyses a set of 10 randomly selected Atl-Guardian Online comments on Covid19, sampled between March and October 2020, in order to investigate how governmental stances are conveyed regarding their overall verbal strategies when addressing the broader public. The paper raises three central questions:

- What overall verbal strategies of Governmental discourses when addressing the broad public (such as demanding, boasting with own achievements, denouncing failures) do Atl comments relate to?
- How do Atl comments use quotations to position themselves vis-a-vis governmental discourses (Buchstaller&Van Alphen 2012, Fetzer 2015)?
- and how do users respond to these Governmental stances in their respective Btl-comments?

# Topicalising the choice of language – practices of inclusion in multilingual meetings

Panel contribution

***Dr. Inkeri Lehtimaja<sup>1</sup>, Prof. Salla Kurhila<sup>1</sup>, Dr. Lari Kotilainen<sup>1</sup>***

***1. University of Helsinki***

In the globalising world, an increasing number of people work in a language that is not their first or strongest language. Consequently, multilingualism and linguistic asymmetries present challenges for participation in work-related activities. The language policies – both explicit and implicit – adopted at workplaces play an important role in promoting or hindering participation and thus making possible for the personnel to exploit their full potential.

In this presentation, we discuss opportunities for participation in multilingual workplace meetings. Our data (30 meetings, about 50 hours) come from a cultural organisation where the employees have diverse linguistic backgrounds and where the work is highly verbal, consisting, for example, of planning and organising events with various collaborators. The work is performed in three languages (Finnish, Russian and English). We will focus on instances where the choice of these three working languages is explicitly topicalised in the conversation. Drawing from the video recorded data, we will offer a detailed CA analysis of the practices the participants mobilise when negotiating and verbalising the choice of the language of the meeting.

The analyses reveal that the topicalisation of the language choice is motivated by different levels of language proficiency among the participants and thus represents a potentially delicate activity. The topicalisations occur either at the beginning of the meeting, in which case they are usually initiated by the chair, or later during the meeting, initiated by any of the participants. In the former cases, the topicalisation is more institutionalised and reflects the professional positions of the employees in the workplace hierarchy. In the latter cases, the topicalisation is more locally responsive to the ongoing interaction, either as a response to emerging problems or as acknowledging a deviation from a prior decision. The cases vary from simple announcements to open and lengthy negotiations. We will analyse the different sequential environments of the topicalisations and discuss the actions that are accomplished via these topicalisations. It will be shown that plurilingual practices, such as openly negotiating the choice of the language, can be used to enhance participation in multilingual workplace meetings, thereby contributing to the professional and social inclusion of all employees.

# Touching paintings. A multimodal analysis of guided tactile explorations in a contemporary art museum

Panel contribution

***Dr. Biagio Ursi<sup>1</sup>***

**1.** Aix-Marseille Université - Laboratoire Parole et Langage

Within the ethnomethodological and conversation analytic perspective, recent multimodal studies have investigated touch in several settings (Cekaite & Mondada 2020), institutional (Routarinne et al. 2020) as well as family interactions (Goodwin 2017). So far, very little research has been conducted on touch in guided tours at museums (vom Lehn 2010, Kreplak & Mondémé 2016).

In this contribution, relying on video-recorded data, I analyze the sequential development of the tactile exploration of painting reproductions in an Italian contemporary art museum. More specifically, I show the multimodal organization of the first phases of this exploration, when the guide touches the hands and the fingers of both sighted and visually impaired visitors, drawing a reading path on the surface of the tactile reproduction through haptic configurations and verbal explanations.

First, visitors have to exert an adequate pressure (Greco et al. 2019) by touching the reproduction, so as they let their fingers run across the tactile surface without displacing the support. Then, the guide relies on touch to focus the attention of the visitor on some areas and specific properties of the support: she grasps the hand of the visitor, she recalls previously mentioned pictorial elements of the artwork and, simultaneously, she goes through the tactile surface. The focus on the pictorial elements is realized by retracing their contours while maintaining a haptic configuration.

Acting as a mediator, the guide mobilizes touch as a resource for coordinating her talk and visitors' tactile perception, in order to ensure a vicarious experience of the painting (via a tactile reproduction).

With visually impaired people, *hapticity* (i.e. the action of touching visitor's hands by the guide) is articulated with talk, while in the presence of sighted participants the guide solicits attention also through gaze. Moreover, turn suspensions as well as turn realizations with perception verbs are mobilized to establish new attention foci on the painting.

This paper studies guided tours that represent valuable initiatives in favor of social inclusion of visitors with disabilities and awareness rising towards alternative museum experiences for all.

# Towards a dynamic concept of AOIs in eye tracking studies on joint attention in interaction

Panel contribution

**Dr. Klaus Kesselheim**<sup>1</sup>

1. University of Zurich

While eye tracking data provide a reliable indicator of the gaze direction of the person who is wearing the eye tracking glasses, they do not give a direct answer to the question what this person is looking at. In order to automatically translate a particular gaze direction into something like “a gaze to object X”, researchers typically define “areas of interest” (or AOIs). AOIs also form the basis of quantitative studies on joint attention in interaction. If the gaze of two participants is simultaneously directed towards the same AOI (“gaze cross-recurrence”, Jermann/Nüssli 2012), this is taken as an indicator of joint attention. In these studies, AOIs appear as static units with fixed boundaries and fixed meanings.

I will argue that this conception of AOIs prevents us from achieving a better understanding of the construction of joint attention in interaction. What is needed is an understanding of AOIs as flexible, emic units that are constantly (re-)negotiated by the participants to an interaction according to the changing needs of the ongoing joint activity (Stukenbrock, 2020).

Based on 35 hours of video and eye tracking data from a project on visitor interaction in science centers, I will show how the participants’ attentional orientations can be empirically reconstructed. Firstly, I will demonstrate that the negotiation of the participants’ dynamic AOIs is not accomplished by gaze alone, but by a broad range of multimodal means (Mondada 2014, Kidwell & Zimmerman 2007). Secondly, I will show that depending on how the current AOI is negotiated, gaze can either be quite independent of the sequentiality of the other communicative modes or become integrated in the sequential flow of interaction.

By developing the notion of dynamic AOIs, my presentation contributes to overcoming shortcomings of current quantitative studies on joint attention in interaction. In addition, it adds the dimension of gaze (Rossano 2012) to conversation analytic research on the multimodal construction of perceptual space (e.g. De Stefani 2014; Hausendorf 2010; Stukenbrock 2020).

# Towards linguistic gender equality in open access articles?

Panel contribution

***Ms. Charlotte Stormbom<sup>1</sup>***

*1. Åbo Akademi University*

Language communities vary considerably in how and to what degree the question of linguistic gender equality is addressed. One reason is that the expression of gender can take many forms, differing from one language to another. This situation poses both challenges and opportunities for promoting gender-inclusive language in contexts where individuals from a wide variety of lingua-cultural backgrounds interact. One such context is the international research community. However, few studies have addressed the pragmatics of gender inclusion in the linguistic landscape of changing publishing practices. The aim of the present study is thus to examine use of and attitudes to gender-inclusive language in English as an academic lingua franca (EALF). The focus is on open access (OA) publishing, which is a recent initiative to increase equality in academia by making research publications freely available online. This is an important development as studies have shown that OA articles are downloaded and cited more frequently than traditional subscription-based publications (see e.g. Davis 2011). The paper explores gender equality in OA articles by addressing the following questions: To what degree and in what form do OA authors employ gender-inclusive language? What attitudes do academic readers have to gender-inclusive language in OA publishing? To answer these questions, two types of data are used: (1) corpus data on the use of personal pronouns collected from 40 OA journals, and (2) survey data on readers' attitudes to gender-inclusive language in OA publishing. The analysis of pronoun use focuses on the three most common types of personal pronouns used in gender-indefinite reference in English: generic *he*, *he or she*variants, and singular *they*(see e.g. Paterson 2014).These types of pronouns co-occur with both singular indefinite pronouns, such as *someone*and *anybody*, and singular NPs, such as *a student*and *the person*.

The findings reveal that recent demands for gender equality are reflected to some degree in the language of OA articles. For instance, the traditional generic *he*proved to be the least common pronoun type in the data, although it still accounted for 14.7% of all pronouns. In place of generic *he*, both *he or she*forms and singular *they*were common (38.5% and 46.8% respectively); of these two pronoun types, singular *they*is arguably the most gender-equal option as *he or she*forms sustain a binary view of gender. The survey data are expected to show how much readers pay attention to and appreciate gender inclusion in academic articles, as well as their preferences for binary versus non-binary pronouns.

The study has implications for the use of EALF. As the corpus study shows, gender inclusion practices do not necessarily carry over automatically. The increasing popularity of OA publications therefore warrants attention to the kinds of gender constructions with which the audience is presented. This is all the more important given that today's EALF serves as a model for future scholars.

# Toxic masculinity as a way of life: Case study of a serial relationship con artist

Panel contribution

***Dr. Sheila Estevez<sup>1</sup>, Ms. Roser Giménez García<sup>2</sup>***

***1. LABORATORIO SQ - LINGÜISTAS FORENSES, 2. Universitat de Barcelona - Laboratorio SQ-Lingüistas Forenses***

This contribution presents the notion of ‘serial relationship con artist’ (SRCA), which refers to men who specialize in deceiving people (mostly women) after they establish a romantic relationship with them, with the sole aim of obtaining financial or social benefit, such as sums of money, free housing or access to personal details they can use for illicit purposes (i.e. romance fraudsters, Carter 2021). This new concept shares some characteristics with the ‘pick-up artist’ identity (PUA; Hambling-Jones and Merrison 2012), including ideological elements like misogyny and toxic masculinity (e.g. regarding sexual promiscuity as praiseworthy in men and as reprehensible in women, portraying oneself as a stoical survivor of women’s attacks and as an independent individual). Yet, SRCAs and PUAs differ in their goals (obtaining personal gains versus ‘seducing’ women) and in their relation to other individuals with similar behaviours. While PUAs are usually active members of a Community of Practice (Hambling-Jones and Merrison 2012), SRCAs operate in isolation and avoid being identified as members of a community because of the negative connotations of the labels used by their victims and the media (e.g. ‘love swindler’, ‘Tinder swindler’). Drawing on a case-study approach, discourse analytic and pragmatic frameworks and content analysis, this research explores (a) the identity performed on WhatsApp by Albert C., one of the most infamous romance fraudsters in Spain, when he is confronted by one of his victims and (b) how such an identity is reinforced by a segment of the wider society in the shape of anonymous comments left on news platforms and social media. An instance of the hegemonic discourse that validates and promotes masculinities like those performed by SRCAs was provided by a female judge that ruled against the victim and in favour of Albert C. in 2018, during one of his first appearances in court because, she argued, there was no fraud since the complainant could have avoided the ‘error’ she incurred in ‘with minimal diligence’ (Robledo 2018). SRCAs (like PUAs) conform extreme realizations of the traditional heterosexual masculine norms that are essential to maintaining male dominance in patriarchal societies (Connell 1995, Martino 2000, Rosenberg et al. 2017).

# Tracking Audio-Visual Identities. Analyzing multimodal representations of minorities in digital media

Panel contribution

**Ms. Tamara Drummond<sup>1</sup>, Dr. Janina Wildfeuer<sup>2</sup>**

**1.** University of Bremen, **2.** University of Groningen

Tamara Drummond, University of Bremen, Germany

Janina Wildfeuer, University of Groningen, The Netherlands

This talk aims at adding a multimodal perspective to the linguistic analysis of minority issues in digital media by specifically focusing on the affordances of (audio-)visual, digital discourses and their inclusive or exclusive representation of minorities.

While disciplines such as linguistics and discourse studies have actively raised awareness for and pursued a comprehensive analysis of the inclusive treatment of various groups of minorities, the question of how these identities are represented non-verbally is in many cases only in the background of investigation. Multimodality research on the other hand has developed several approaches to the analysis and identification of social actors and characters in media artefacts with particular regard to their multimodal, intersemiotic representation (see, among others, van Leeuwen 1996, 2005; Tseng 2013, Tseng et al. 2018; Drummond/Wildfeuer 2020). These frameworks not only analyze the various semiotic resources and modes that are at play in these artefacts, but also particularly focus on their interplay in the general process of meaning construction. By analyzing linguistic principles such as cohesion, coherence and discourse structure, they demonstrate how social actors and characters are constructed both mono-modally and cross-modally and with this, potentially, also rather implicitly or less explicitly than by verbal resources.

On the background of a larger corpus study that analyzes audio-visual TV data and their character construction, we will present a theoretical and methodological overview of possibilities to analyze multimodal representations of minorities in digital media such as, for example, online advertising, webseries, social media stories, etc. We will show how a general approach to the multimodal analysis of social actors and characters is applicable to several forms of digital discourse in order to pursue corpus-based analyses with larger amounts of data.

# Trajectories of sustained student-to-student touch during peer activities in school

Panel contribution

***Prof. Liisa Tainio<sup>1</sup>, Dr. Pilvi Heinonen<sup>2</sup>, Dr. Kreetta Niemi<sup>3</sup>***

*<sup>1</sup> University of Helsinki, <sup>2</sup> University of Turku, <sup>3</sup> Jy*

The spatio-material organization of the traditional classroom with participants' close physical proximity provides a rich base for empirical analysis of embodied interaction as well as interactional order of haptic sociality and intercorporeality (see e.g. Meyer, Streeck & Jordan 2017; Goodwin & Cekaite 2018). Recent studies of classroom interaction have revealed that teacher-to-student touches are recurrently used for pedagogical purposes, e.g. managing classroom and directing students' attention (Heinonen, Karvonen & Tainio 2020; Routarinne & al. 2020; Bergnehr & Cekaite 2018), thus underlining the institutional aspects of haptic and tactile practices in classroom. Instead, this paper focuses on embodied interaction in peer interaction by analyzing the trajectories of sustained student-to-student touches that are produced during academic group tasks, and by examining how embodied interaction reflects students' multilayered roles at school.

In our classroom data, students often lean on each other's shoulders while sitting side-by-side in classroom settings, for example, when working together at the table. Students may spend quite a long time in this close position in disattending ways (Goffman, 1963) towards the on-going physical contact. Our examples are drawn from a data-set consisting of 13 videotaped group work sessions in Finnish basic education, in which two to four 15-year old students are sitting side-by-side and collaborating in solving a grammar task. As a method, we use multimodal conversation analysis (e.g. Mondada 2014), which provides tools to examine how participants draw on local ecology of spatio-material affordances and the variety of other modalities (talk, gazes, body positions etc.) in (co)-construction of the activities.

Through sequential analysis of sustained student-to-student touches, we show 1) how participants manage parallel activities and legitimize close proximity during group work, and 2) how embodied interaction reflects students' dual role in the classroom as an academic learner who works along teacher instructions, and as a young person negotiating their position in a peer group (Kyratzis & Goodwin 2017). During the embodied negotiations involving the other student's act of leaning on another student's shoulder or arm, the touched student may accept or decline the invitation to stay in a continuous physical contact, and thus orient to social bonding or its rejection. In a detailed analysis, we show the sequential construction of a simultaneous participation, enabled by the use of multiple modalities, both on the academic activity of solving a task and on the activity of social bonding, as well as the shifts between the orientation to these activities. The focus of the analysis is on the identification of the interactional steps in detaching from and entering into the leaning position as well as in the examination of the role of the (synchronized) embodied formations and other resources (e.g. manipulation of school artefacts, verbal and facial expressions, gazes, body positions) in constructing and sustaining the proximity with a peer.

# Transforming meaning and understanding: Clients' responses to therapists' interventions in psychotherapy

Panel contribution

***Prof. Anja Stukenbrock<sup>1</sup>***

*1. University of Lausanne*

In social interaction, participants continuously face the problem of attributing meaning to their interlocutors' situated talk and making sense of their utterances and actions in the local context. Notwithstanding the ubiquity of this task, the problem of meaning in interaction is considered "a provocative topic" (Maynard, 2011, p. 199), and it has been questioned whether it is a pervasive or a more limited interactional problem for participants (Maynard, 2011).

Among the social arenas in which meaning construction and mutual understanding can fruitfully be studied as phenomena that participants themselves take issue with and publicly orient to are interactions between experts and lay persons. Professionals, in particular counselors and therapists whose primary aim is to advance clients' self-understanding, often recast clients' utterances in ways that are in line with their "professional stocks of interactional knowledge" (Peräkylä and Vehviläinen, 2003). For instance, they transform clients' narratives through notionalization (Deppermann, 2011) into more generic categories, or use lexical substitutions to alter the meaning of clients' prior talk in therapeutically relevant ways (Rae, 2008).

While most studies target therapists' actions (Peräkylä, 2019), our paper, in contrast, examines meaning transformation in clients' responses to therapists' talk. The data consists of 100 hours of video-recorded psychodynamic psychotherapy with four different therapists. The analysis is based on 25 sessions between a young female therapist and an elderly male client. It focuses on the transformations that the client's responses perform on the therapist's professionally shaped use of expressions in psychological interpretations. These transformations display what the client makes of the interpretation. By recontextualizing key expressions of the therapist's previous utterance, by drawing inferences and/or providing narrative accounts, the client may significantly shift or even reverse the meaning of the therapist's utterance. The way in which the therapist subsequently treats the client's understanding of her talk documents that the client's attribution of meaning is not in line with the therapist's own understanding of her interpretation and in need of clarification.

While attesting to the indexicality of meaning as a *sine qua non* quality of verbal interaction, the sequences under investigation show that indexicality and ambiguity can also be a resource for participants to weaken, neutralize, or even reverse meanings and inferences in prior speakers' turns and delay or divert interactional, and possibly therapeutic, progression.

## Transitivization of silence: A model

---

Panel contribution

---

***Prof. Dennis Kurzon<sup>1</sup>***

*1. University of Haifa*

In this paper, the aim is to present a way of looking at the act of (non-violent) silencing. We have to distinguish four features. Firstly, process. The act of silencing occurs after an instance of noise, defined in a broad technical sense. This is followed by a speech act with the illocutionary force of command – the act of silencing. Lastly we arrive at the result – the act of silencing is either effective and the noise is no longer heard, or it is ineffective. Secondly, power. In acts of silencing the person or group of people has to have some type of authority over the person or group to be silenced. This could be political, legal, institutional authority, or it may be some permanent or temporary social power, broadly defined. If the silencer does not have any authority, then the process of silencing may not work.

The third feature is volume, that is the loudness of the act of silencing. This could range from non-verbal means such as gestures, to a person shouting, through to a mechanical means of silencing.

Finally, the fourth feature is mode. It has been assumed that we are relating to the act of silencing in spoken discourse, and here we may include digital communication, for example the power of the host on a zoom meeting to close the microphone of – to silence – the participants. But silencing may also occur in the written media, as for example, in notices outside libraries which reads “Silence”, or in a series or flood of publications – articles, headlines, social media posts – whose aim is to silence a speaker or speakers.

# Translanguaging as a communicative resource in the multilingual classroom

Panel contribution

**Mrs. Elena Becker<sup>1</sup>, Prof. Maxi Kupetz<sup>2</sup>, Ms. Helen Nikolay<sup>3</sup>**

**1.** Martin Luther University Halle-Wittenberg, **2.** Martin, **3.** Mart

For a long time it was assumed that languages should be treated separately from one another in the classroom since translanguaging was equated with linguistic deficits and unconscious linguistic behavior. Due to the *multilingual turn*, the simultaneous use of several languages has been destigmatized, at least in the academic community (Paulsrud et al. 2017; Corcoll López/González Davies 2016; Hall/Cook 2012; Hinnenkamp/Artamonova 2019). Now “language learners are increasingly seen as multiple language users, with the language classroom conceptualized as a multilingual speech community” (Hall/Cook 2012: 279).

Drawing on Conversation Analysis, Interactional Linguistics and Multimodality research (Sidnell 2010; Couper-Kuhlen/Selting 2018; Mondada 2013), we explore forms and functions of translanguaging in the classroom (Auer 1999; Paulsrud et al. 2017; Corcoll López/González Davies 2016). Our study is based on 11 hours of video data collected during a STEM project week in a German as second language classroom for refugee students. The project leader and two student teachers work with the class in a hands-on manner on biology related topics such as the role of bacteria in everyday life or sugar and acids in nourishment. Hence, a language and content integrated teaching and learning situation is created. The data set was collected during two days, using cameras from various angles in order to allow for detailed reconstruction of the learning situations.

Based on detailed sequential and multimodal analysis of more than 50 cases of translanguaging in a group work setting, we will show how translanguaging is systematically used by students and teachers as a communicative resource for pursuing the ongoing activity: Through translanguaging understandings of words, instructions, and tasks are negotiated and maintained, thereby allowing the students to participate in the goings-on of the (language) learning interaction in the multilingual classroom (Huth 2020).

# Translanguaging for interactional goals through digital media: a proposal for identifying moves

Panel contribution

***Dr. Richard Nightingale<sup>1</sup>***

*1. Universitat Jaume I*

Research into language use on digital media shows that offline practices are frequently carried over into online contexts (Cunliffe, Morris & Prys, 2013; Nightingale, 2016). Moreover, it has been conclusively demonstrated that, once we venture beyond the online Anglosphere, mixing languages is a common practice for internet users (Paolillo, 2011; Wei, 2011; Caulfeild, 2013; Androutsopoulos, 2013, 2015; Schreiber, 2015). In fact, online language mixing has been analysed in multilingual adolescents and is believed to be consciously outcome oriented (Nightingale & Safont, 2019). That is, it has been shown to be intentionally and deliberately deployed to achieve interactional goals (ie: modifying requests, marking identity, and marking humour). In this sense, the creation, interpretation, and negotiation of meaning is coded in the act of language mixing itself; that is, the differing values of the languages involved and the values that can be assigned to their situated juxtaposition. Thus, constituting a multilingual phenomenon that goes further than traditional understandings of codeswitching and can best be described as ‘pragmatic translanguaging’ (Nightingale & Safont, 2019) - a quintessentially multilingual characteristic. With this in mind, the present study takes Gesuato’s (2019) guidelines for identifying interactional moves and attempts to apply them to instances of pragmatic translanguaging in digital media contexts. Gesuato points out that an interactional move is indicative of a goal-oriented or need-driven change. This encapsulates the idea of the intentionality of the speaker/writer, who makes the move in order to achieve an effect in the larger economy of the communicative event. This intentionality is inline with the notion of the ‘designing mind’ behind translingual practices (Jorgensen, 2008). The study responds to calls for further research on multilingual online communication in different contexts (Franceschini, 2009; Gorter & Cenoz, 2011; Canagaraja & Wurr, 2011), and specifically for additional research on multilingual pragmatics (Safont, 2012; Nightingale, 2016; Nightingale & Safont, 2019).

# Translanguaging in CLIL: the pragmatics of bilingual meaning-making in Economics classrooms

Panel contribution

**Prof. Julia Huettner<sup>1</sup>, Prof. Ute Smit<sup>1</sup>**

**1. Universität Wien**

Multilingualism is a hallmark of European schools, both in terms of existing linguistic repertoire(s) of school-age learners, but increasingly also as a target of school education. Content and Language Integrated Learning (CLIL) has established itself as the most prominent way towards fostering proficiency in a further language, typically in English. Especially at higher levels of school education, the focus of CLIL lies on developing disciplinary or subject-specific language competence, i.e. the ability to use the foreign language appropriately in professional and academic contexts. This learning trajectory goes hand in hand with continued development of disciplinary literacy in the main language(s) of education, which thus remain equally important targets of education. This focus on the pragmatics of bilingual practices has, however, not yet been researched extensively.

Translanguaging, which provides promising inroads into understanding the interactional practices of multilinguals (e.g. Garcia & Wei 2014; Otheguy et al. 2015), has helped address the dynamic use of linguistic repertoires in achieving pragmatic goals, “without regard for watchful adherence to the socially and politically defined boundaries of named languages” (Otheguy et al. 2015, p. 281). This conceptualisation has proven helpful in understanding educational language uses, too, including in the CLIL context (see Nikula & Moore, 2016).

In this project, we describe the translanguaging practices of 37 CLIL students and 2 teachers in the processes of meaning-making within a specific school subject at upper secondary level, i.e. *European Economics and Politics*, taught through English. The data set of 16 hours of video-recorded classroom interactions covers classroom events with and without teacher input, assessed and non-assessed performances, as well as interactive/non-interactive exchanges. In addition, focus group interviews with students and interviews with teachers on their perceptions of language use were conducted. Both quantitative and qualitative data analyses were performed to explore the frequency and type of use of German (as main L1) vs. English.

Findings suggest that while translanguaging is present and supports the pragmatics of bilingual meaning-making in all types of classroom events, there are clearly distinct patterns to be observed depending on classroom event. Thus, translanguaging is most effectively employed in all processes involving knowledge creation (e.g. teacher – whole class input; learner preparations for presentations) whereas interactions used to display knowledge (e.g. student presentations, assessed role-plays) tend to be monolingual, showing the educational force of preparing for (future) professional communicational needs, conceptualised as international with English as shared lingua franca.

# Translating pragmatics: Dutch ‘toch’ and ‘eigenlijk’ in a parallel Dutch-English corpus

Panel contribution

***Prof. Lieven Buyssse<sup>1</sup>***

**1. KU Leuven Campus Brussels**

Dutch modal particles and adverbs display many of the characteristics and functions typically associated with pragmatic markers in English but have not necessarily received as much scholarly attention as their English counterparts. They have, for example, been shown to be highly frequent in speech, tend to be syntactically and semantically optional, do not alter the truth conditions of an utterance, but they do carry a pragmatic load and serve interactional purposes. The Dutch particle ‘*toch*’ and the adverb ‘*eigenlijk*’ both belong to the broad domain of ‘contrast’: their prototypical functions have been described as ‘concession’ and ‘counterexpectation’, respectively. They are also flexible in terms of their position within an utterance, and both have been attributed additional emphatic discourse uses (e.g. ‘*toch*’ as a reminder of common ground or ‘*eigenlijk*’ as a reinforcement marker). ‘*Toch*’ does not have an apparent equivalent form in English (as opposed to in German, which offers ‘*doch*’), whereas ‘*eigenlijk*’ does have a ready cognate (‘*actually*’). They are, therefore, a suitable pair for a contrastive study of pragmatic markers in Dutch and English. This study will investigate the use of ‘*toch*’ and ‘*eigenlijk*’ in Dutch and their translation equivalents in English through an in-depth analysis of the Dutch-English component of the Europarl corpus, a parallel corpus of proceedings from the European Parliament. Through its contrastive approach, this investigation will enable us to explore the functional scope of these markers beyond their prototypical meanings. It will also provide an insight into (i) how the functions of modal particles can be conveyed in a language that does not have such forms of its own (‘*toch*’), and (ii) the level of agreement between pragmatic items in one language and their cognates in another (‘*eigenlijk*’). It is hypothesised that in translations ‘*eigenlijk*’ will show a distinct preference for its cognate form ‘*actually*’ regardless of the specific function it expresses, whereas ‘*toch*’ will be translated by a concessive marker when expressing ‘concession’ on a textual level and will not receive an English equivalent in its more interpersonal functions.

# Translation of pragmatic markers in an interpreter-mediated police interview involving ELF

Panel contribution

***Dr. Simo Maatta***<sup>1</sup>

**1.** University of Helsinki

ELF constitutes a major challenge for interpreter-mediated encounters between public service providers and their clients (who are usually migrants). Due to a more or less important mismatch between the interpreter's and the migrant's linguistic resources, the challenge concerns mostly the balance between accurate renderings that are "faithful" to the source language and pragmatically felicitous renderings that the interlocutors understand (Määttä 2015).

Pragmatic markers form a particularly interesting case challenging the possibility of accurate translation. According to Karin Aijmer (2008: 95), perfect interlingual equivalence between different pragmatic markers is virtually impossible to achieve. However, Sandra Hale (2004: 238–239) has argued that in legal interpreting, pragmatic information has to be translated if the goal is to reach superior quality.

In this talk, I will examine the ways in which discourse markers are translated in a police interview interpreted between Finnish and English via the telephone. The topic of the interview is permanent residency. The officer conducting the interview and the interpreter are native speakers of Finnish; the interviewed person and the interpreter are both ELF users. The interview lasted for 1 hour 46 minutes and was transcribed, the transcription contains 79,063 characters with spaces.

The talk will focus on the Finnish pragmatic markers *tota* (43 occurrences), its less informal equivalent *tuota* (11 occurrences), *joo* (56 occurrences), *okei* (29 occurrences), and *no* (20 occurrences). Among the English pragmatic markers, the study will examine *okay* (97 occurrences).

First, the functions of these particles will be analyzed. Subsequently, selected examples of translation strategies will be examined in order to determine to what extent the translation of these particles is actually possible and whether the strategies adopted by the interpreter are successful in terms of the contextual meaning of the particles in the source text.

# Treating someone as if they know how to do something (when they probably don't)

Panel contribution

***Prof. Charles Antaki<sup>1</sup>, Ms. Charlotte Russell<sup>1</sup>***

*<sup>1</sup>. Loughborough University*

If you ask someone to perform a task, you assume that they are capable of doing it. Other factors will then affect the design of what you say - the costs of the task, its urgency, your right to ask for it to be done, and so on. But when the person you're asking has an intellectual impairment, a more fundamental consideration comes into play: should you assume they actually know how to do it at all?

This happens a lot to staff who support people with impaired cognition- learning disability, dementia and so on. There are risks both ways. If staff assume that the person can do the task, then there will be trouble when it turns out that they can't. If staff don't so assume, then they either (a) have to find roundabout ways of getting the task done, or (b) simply tell them what to do. Both of may be interactionally troublesome (at least), if the person turns out to be quite capable after all.

We examine examples of how these difficulties cash out in interaction, and show the conversational practices (principally optimistic questioning, candidate answers, and lower epistemic stance signalled in a number of ways) that allow staff navigate between getting tasks done while bolstering confidence in the people they support. We also consider the factors that warrant cases where staff take more direct control with simple, unilateral imperatives which assume complete incompetence.

# Troubles in talking about group practices: self-repair by members of Italian voluntary associations

Panel contribution

***Mr. Christian Geddo<sup>1</sup>***

***1. Università della Svizzera italiana, Lugano***

The progressivity of conversations is vulnerable to different troubles. As the seminal work by Schegloff et al. (1977) has shown, participants handle these troubles in highly organized ways, that is by engaging in *repair practices*. Conversation analysts have studied the repair domain in English and across many languages (cf. Kitzinger 2013 for a comprehensive overview), showing that, while repair occurs in all languages and cultures, its specific forms are influenced by language-dependent factors, such as morpho-syntactic structures (cf. Sidnell 2007). Although talk-in interaction has been abundantly studied in Italian, only a few works have focused on repair (e.g. Fele 1991; Cirillo 2010, on repair in multilingual medical interactions; Rossi 2015, on other-initiated repairs).

This contribution investigates self-initiated self-repairs in Italian oral interviews and virtual meetings. The data were collected to study situated practices within voluntary associations. We will focus on a collection of same-turn repairs marked by the frequent particle *cioè* and its reduced variant *c(io)è*. We will examine cases in which a speaker replaces/reformats a part of her turn (Schegloff 2013: 43-64) or adds an additional unit (Mandelbaum 2016: 121-122) to address troubles regarding the participants' epistemic status and stance (cf. Heritage 2012). The analysis will show that speakers repair: (i) a turn that invokes a particular *territory of expertise* (cf. Kitzinger and Mandelbaum 2013), that is expected to be inaccessible to the addressee; (ii) a turn that deploys an epistemic stance which differs from or contradicts the speaker's status in the *territory of knowledge* (cf. Heritage 2012) of the association. The notion of community of practice (Wenger 2000) will be employed to show that the possession of information and the rights to articulate it are part of the communitarian resources and play a role in the inclusion of members within the group.

# Trump and blame shifting in the era of COVID 19

---

Panel contribution

---

**Dr. Diana Boxer<sup>1</sup>, Ms. Judith Lejeck<sup>1</sup>**

***1. University of Florida***

This paper focuses on the speech behavior of what we term “blame shifting,” and specifically on former US President Donald Trump’s use of blaming during the COVID 19 pandemic. Trump’s initial discourse in January and February of 2020 had repeatedly downplayed the severity of the virus, with assurances that it would not be a problem for the U.S. since his administration would be able to halt any spread of the disease. However, as cases of COVID-19 continued to spread in the U.S., criticisms of Trump’s discourse and policies related to the worsening situation became frequent. In reaction to these criticisms, Trump’s discourse engaged in blaming others (e.g. labeling it ‘the China virus’) while continuing to present himself as performing only constructive, positive actions. In this paper we demonstrate how Trump’s blaming talk attempted to exhibit a positive public image for himself and a negative image of others. We show precisely how the blaming backfired.

The literature on blame is quite extensive; however, very little analysis of blame and blame shifting has been carried out within the fields of linguistic pragmatics. Instead, we see studies from psychology and psychiatry (e.g. Malle, et al., 2014; Aliche, 2008; Tognazzi & Coates, ed., 2013; Holmes, 1968; Tennen & Affleck, 1990); brain science (e.g. Lagnado & Cannon); ethics (e.g Hersh, 2013), and political science (e.g. Lockhart, 2018; Ott & Dickinson, 2019; Weaver, 1986). For the current research we take a CDA methodological perspective (Chilton, 2004; Wodak, 2006; G. Lakoff, 2009; Tilly, 2010; Mooney & Evans, 2019; van Dijk, 2006; Blommaert, 2019), analyzing data from six main sources: 1) two briefings/conferences; 2) a formal address to the United Nations; 3) a speech to the Republican National Committee; 5) a TV interview; and 6) 70+ of Trump’s Tweets.

Our analysis focuses on several linguistic devices identified by type and counted. The major types we found were framing, metaphor, agency/passive voice, semantically loaded word choices, contrast, representation/misrepresentation, legitimization/delegitimization, implicature, and foregrounding, especially by means of repetition. A qualitative analysis was then performed on the data by showing the connection between each of the linguistic devices and mental models and emotional effects in the hearer/reader.

Blame shifting is shown in this paper to have been a hallmark of Trump’s discourse in handling the pandemic in the US. It is a quintessential example of “mishandling” one of the most dangerous and thus important global issues that the US and the world are facing today.

# Turn-taking and grammatical change: Sentence-final triple und ‘and’ in German

Panel contribution

***Prof. Patrizia Noel<sup>1</sup>***

**1. University of Bamberg**

The sentence-final German connector *und und und* ‘and’, as a default, is an utterance-final cue, cf. (1). Sentence-final connectors have a high interactional load as possible transition relevant places (cf. Walker 2012: 152 for evidence of visible features like right-hand lowering during sentence-final English *and*). Also, designedly incomplete turns are regularly used for specific interactional ends (cf. Drake 2015 for turn-final English *or*). This paper investigates *und und und* as an example of demonstration for the role of turn-taking in grammatical change.

0039 PB\_ga er wollte die kinder sehen (.) hat\_s immer zum anlass genommen sie wieder zu sehen **undund und**  
 ‘he wanted to see the children (.) he always took it as a reason to see them again *und und und...*’

0040 KL\_g [hm\_hm]

0041 (0.74)

0042 PB\_ga ähm is (.) wie gesagt (.) mittlerweile weggezogen

‘um has (.) as I said (.) meanwhile moved away’

(DGD (Database of Spoken German), FOLK\_E00125\_SE\_01)

The form of *und und und* supports its usage as a transition relevant place. Triple *und* forms a trochaic sequence, the second foot ending in a pause (́́́)(́P). The pause is ‘inbuilt’, since neither dactylic *und und und*(\*́́́) nor double \**und und*(́́) are employed. The pause functions as an indexical sign, pointing to something omitted and thus prompting the recipient to complement it. In addition, the tripling iconically reflects the emotive and thus both subjective and intersubjective use of *und und und*, which separates it from single sentence-initial *und*. Reduplication, in addition, signifies its distinct use as sentence-final (vs. sentence-initial) connector and, at the same time, provides evidence of its advanced degree of conventionalisation as a sentence-final connector with the special interactive continuation-projecting character of a general extender.

Employing sentence-final *und und und* is a “technique routinised for turn-taking” (Detges and Waltereit 2011). In the case of German *und und und*, its emotive meaning, pragmatic usage and syntactic placement interrelate. Sentence-final connectors assume their meanings in relation to their syntactic placement, which in the case of *und und und* is not inherited. Seen in the context of final particles emerging in modern European languages (cf. Hancil, Post and Haselow 2015), the evolution of sentence-final connectors is not an isolated phenomenon but part of an ongoing linguistic change: the functionalisation of the right sentence periphery.

## Turning the tables: Conduct formulations in conflict talk

---

Panel contribution

---

***Dr. Rebecca Clift<sup>1</sup>, Dr. Marco Pino<sup>2</sup>***

*<sup>1</sup> University of Essex, <sup>2</sup> Loughborough University*

This presentation will be a conversation-analytic examination of occasions where a speaker declines to respond to a turn in a sequentially relevant way, but instead formulates what a recipient is doing as something objectionable. In so doing, they deliver an accusation, e.g. “Why you shouting” or “I don’t know why you’re being so aggressive”. We call these lexical formulations of what someone has just done *conduct formulations*. We shall show representative instances of this practice in both mundane conversation and institutional contexts in videoed English and Italian interaction, and examine its sequential origins and implications. The accusation delivered by the conduct formulation may be in declarative, interrogative or imperative form, but in whichever form, is produced in the context of hearably antagonistic, conflictual talk, and contains an embedded reference to the complainable conduct. It turns out that the conduct formulation is: 1) responsive to an ongoing imputation of misconduct or misdemeanour; and 2) produced in response to an upgrade on prior attempts by the recipient to engage the producer of the conduct formulation in aligning with their project. The speaker thereby “turns the tables” on the recipient, challenging the legitimacy of, and thus rendering accountable, their line of action. The response by the recipient involves a downgrade of their prior action, and so proposes resetting the terms of engagement on a more conciliatory basis. In the production of the conduct formulation, speakers thus show attention to the accountability it has brought to the surface of the talk: the accountability that underlies all cooperative courses of action.

## Two authoritarian responses to the corona challenge: the diverging strategies of Belarus and Russia

Panel contribution

***Prof. Daniel Weiss<sup>1</sup>***

*1. University of Zurich*

Among the different factors that impact on the crisis management during the corona pandemic, a prominent role is played by the political system and the current constellation of political forces in the given country. In this respect, authoritarian regimes have an evident advantage over democracies since they do not (or less) have to reckon with a strong opposition against their policies. Yet, a closer look at Belarus and Russia, two neighboring autocracies that share not only their historical and cultural background but also a heavily disordered system of checks and balances (to say the least), reveals that these two countries have chosen two opposite strategies. Belarus in the beginning refrained from a partial or total lockdown, did not introduce quarantines or self-isolation, never closed its borders and did not even call for elementary hygiene measures, such as social distancing or a ban on mass gatherings. Its leader also decided to celebrate national holidays notwithstanding their threat to public health. By contrast, Russia announced regional lockdowns, successively closed all its borders, introduced weeks off work, offered financial aid to social groups most affected by the crisis and postponed several other events (Victory day, constitutional referendum) on the political agenda; moreover, it decentralized the whole decision process by assigning more competences to regional authorities (governors, mayors).

The paper examines these different strategies on the basis of a sample of selected statements by the authorities (presidents, health ministers, subordinate civil servants) and their reception in the society: doctors, health care workers, voices from independent Radio stations, internet newspapers, oppositional bloggers, etc. The time span covered by the data reaches from the first infections to the end of July, thus stopping before the Belarusian presidential elections, a cesura which fundamentally changed the whole political arena. The analysis focuses on the argumentative functions of the most relevant fragments by deciphering implicit messages and reconstructing (sometimes conflicting) argument schemes and hierarchies. At the same time, it pays due attention to the rhetorical outfit including humorous and ironical notes, metaphors, quotations, and populist wording based on colloquialisms or vulgarisms. Additional questions to be addressed are: who accepts/rejects whose authority? Who shows social empathy, who adds a personal note, e.g. by reporting on their own experience with the virus? The paper closes with a global comparison of two opposite styles of communication: one seemingly oriented towards a collective exchange (Putin), the other one based on an apodictic educational monologue (Lukashenko).

## Two Levels of Accountability: Irony in Socio-Political Contexts

Panel contribution

**Prof. Zohar Livnat<sup>1</sup>**

**1.** Bar Ilan University

The concept of accountability is relevant to the use of verbal irony on two different levels. On the communicative level, verbal irony is an indirect form of language that addressees might easily misinterpret. While this may make it risky to use, it has the advantage of allowing the speaker to deny the ironic utterance's implicature. On the social level, irony is accused of being socially irresponsible because it undermines shared sociopolitical conventions (Colebrook 2012). The typical stance of the ironist is that of a detached and disengaged observer (Muecke 1969:218). Tobin & Israel (2012) explain irony as involving the act of "zooming out" to a more distant perspective from which the original perspective of the observed is reassessed.

The detachment and disengagement of the ironist can be expressed in two ways: first, by allowing their intentions to remain obscure, and second, by criticizing and ridiculing those who are active in the sociopolitical arena, without offering constructive solutions. In both cases, the ironist can be viewed as demonstrating indifference and a lack of concern towards the consequences.

These assumptions can explain the tendency of some Israeli publicists to use a combination of ironic utterances with co-textual explicitation (Weizman 2011, 2019). While one explanation is related to the desire to prevent misunderstandings, another possible explanation may be related to a desire to manifest social accountability, namely so that they will not be perceived as having this typical detached and disengaged stance.

# Two ways of requesting confirmation in Tagalog

Panel contribution

***Dr. Naonori Nagaya***<sup>1</sup>

1. The University of Tokyo

**Background:** Tagalog is an Austronesian language of the Philippines. As is often the case in Southeast Asian languages (Goddard 2005), this language has a rich inventory of discourse particles. This paper focuses on two particles *diba* and *ano*, which are used to mark an utterance as a request for confirmation, as in (1) and (2), respectively.

- (1) M: *Kasi      nga      nasa    Italy    diba?*  
       because    EMPH    be.at    Italy    NEG+Q  
       'It's because (she) is in Italy, right?'

C: *Oo.*

'Yes.'

- (2) M: *Pero    hindi    nag-announce    (a)no?*  
       but    NEG    AV:RL-announce    what  
       'But (they) didn't announce, right?'

C: *Hindi.*

'No.'

**Research question:** Despite the fact that *diba* and *ano* occur quite frequently in everyday interaction, *diba* and *ano* remain to be investigated. In this paper, I propose an analysis of *diba* and *ano* in request-for-confirmation (RfC) sequences, providing an account of similarities and differences between the two particles.

**Data:** Naturally occurring conversations produced by Tagalog native speakers are examined to determine the actual usage of the two discourse particles. In particular, a corpus of video recordings of informal everyday language usage is analyzed. It consists of approximately four hours of spontaneous face-to-face interactions in Tagalog.

**Findings:** First, from an interactional perspective, *diba* and *ano* are related to different social actions. The former is a complex word composed of the negator (*hin*) and the question particle *ba*. The latter is an interrogative word that can also be used for requests for information, as in *Ano ito?* 'What's this?'. In other words, *diba* is polar question-based, while *ano* is interrogative question-based. It is argued that these question-related particles enable the speaker to posit himself/herself in a less knowing position in interaction (Heritage 2012a; Heritage 2012b) but with different degrees.

Second, there are clear linguistic differences between RfC sequences with *diba* and *ano*. In terms of frequency, those with *diba* are more frequent than those with *ano*. The position of *diba* is relatively free, appearing turn-initially, turn-medially, or turn-finally. By contrast, *ano* only occurs turn-finally. In addition, *ano* has a "sympathy"-building effect that *diba* does not. These differences will be examined against the naturalistic data. Lastly, attention will be given to both verbal and non-verbal actions that follow RfCs. Utterances with *diba* and *ano* are often followed by verbal responses such as *oo* 'yes' and *hindi* 'no', but not always. In such cases, some kind of non-verbal action is expected to occur. In this paper, video recordings are examined to look into differences in the distributional patterns of answer possibilities.

# Type Conformity in Mandarin Polar Questions

Panel contribution

**Dr. Wei Wang<sup>1</sup>**

**1.** University of Houston

Questions have been shown to impose fundamental constraints on answers. For instance, they set agendas for responses, incorporate different kinds of preferences, and convey the epistemic stance of the questioner (Heritage, 2010). One type of constraints has received particular research attention ever since the seminal studies of Raymond (2000, 2003), that is, type-conformity. Responses that conform to the constraints of the grammatical design of the question are defined as ‘type-conforming’, whereas those departing from such constraints are considered ‘non-conforming’. In English, type-conforming responses to polar questions contain either a yes or a no (or equivalent tokens such as *uh huh*, *yep*, *nuh uh*, *nope*, etc.).

While a number of subsequent studies have shed light on type conformity across different languages (e.g. Keevallik, 2010; Kim, 2015; Stivers and Hayashi, 2010), little has been known about type-conformity in Mandarin polar questions (Wang 2020). Thus, the current study aims to fill in this gap and provide a comprehensive picture of the grammatical fittedness between Mandarin questions and answers and their interactional relevance. Using conversation analysis as the framework and Mandarin everyday conversations as data, this study asks the following questions: 1) what constitutes a type-conforming answer in Mandarin conversation, given Mandarin lacks a set of generic polar interjections like yes and no; 2) what are the grammatical formats of non-conforming answers; and 3) how do type-conforming and non-conforming answers differ in their interactional imports.

This study furthers our understanding of the connection between grammar and interaction. A respondent’s choice of a conforming or a non-conforming format is not merely a matter of grammatical choice, but a moment-to-moment decision motivated by the respondent’s calibration of his or her own agenda in relation to the questioner’s and the orientation to the relationship with the questioner. And such a choice, in turn, has an important bearing on the answering space that the respondent is sequentially afforded, the trajectory of the ongoing talk, as well as the social relationship between the questioner and the respondent.

# Uh and um as pragmatic markers in dialogues: A contrastive perspective on the functions of planners in fiction and conversation

Panel contribution

***Mrs. Ilenia Tonetti<sup>1</sup>, Dr. Daniela Landert<sup>1</sup>***

*1. University of Basel*

The planners *uh* and *um* – also called fillers or hesitation markers – fulfil a range of interpersonal and discursive functions, akin to other pragmatic markers (see Tottie 2014a). Research on spontaneous conversation has demonstrated that they can serve as sociolinguistic markers (Tottie 2011; Stenström 2012: 550-550) and that they can signal turn management (Clark and Fox Tree 2002; Tottie 2014b). In scripted fiction, planners have also been used for characterization and to signal interpersonal relationships (Jucker 2015). Although there appear to be differences between the planners' functions across those genres, the factors influencing these differences have not been analyzed comprehensively so far. In particular, the fact that spontaneous conversation and scripted fiction vary with respect to two distinct dimensions – fiction / non-fiction and spontaneous / scripted – has not been taken into account. Thus, the question remains to what extent differences in the functions of planners in fiction compared to spontaneous conversation should be attributed to the lack of spontaneity or to the fictional nature of the text.

In our study, we analyze the functions of *uh* and *um* across three different genres: spontaneous conversation, scripted dialogues in television series and dialogues in improvised theatre. To determine the planners' functions, we carry out a manual analysis of all instances in context. Our analysis is based on the Santa Barbara Corpus of Spoken American English and on two corpora of transcriptions that we compiled ourselves (television series and improvised theatre performances). Including improvised theatre as a form of spontaneously produced fiction makes it possible for us to observe variation across the dimension of fiction/non-fiction as well as across the dimension of spontaneous/scripted. Our findings show that planners can fulfil a broad array of functions, which can be related to cognitive processing, but also to discourse management and politeness, and that those functions show both similarities and differences across the three genres, suggesting that both the fictional nature of a text and its degree of composition have an influence on the planners' functions.

The paper will present some results of the project “Un-/desired Observation in Interaction: ‘Intelligent Personal Assistants’ (IPA)”, which is, since January 2020, a subproject of the 2nd phase of the Cooperative Research Cluster (SFB) 1187 “Media of Cooperation” at the University of Siegen (Germany) funded by the German Research Foundation (DFG). In accordance with the theoretical framework of the Cooperative Research Cluster, we understand co-operation as the reciprocal production of goals (actions), means (media) and processes (practices), and thus media as co-operatively developed conditions of co-operation. A prominent case of co-operation is the sequential and incremental production of language in interaction, including its respective material and technical foundations (Goodwin 2018; Schüttelz & Meyer 2018).

Against this background, the project investigates how smart speakers are integrated into verbal and multi-modal interaction and everyday practices in private households, how aspects of the social situation affected by technology use are negotiated, and to what extent and how (auditory) “observation” (“listening in”) by third parties is reflected in practice and used to draw boundaries between layered private and public spheres. In this context, it is repeatedly apparent to users that smart speakers are only the surface of media co-operation conditions, which also include infrastructures that make everyday life possible (including “machine learning” over time), platforms of operating companies and third party providers that interfuse private life (each with their own logic of utilization) and, last but not least, diversely situated ‘data’ that result partly from everyday usage practices and partly from background co-operation. Infrastructural processes are only partially recognizable for different participants and prototypically represent a type of co-operation “without consensus” (Star & Griesemer 1989).

With regard to three technical systems in two households each, the project examines on the one hand video-ethnographically observed situations of the first installation, especially with regard to the negotiation and establishment of ‘socio-technical arrangements’. On the other hand, the project investigates everyday uses of smart speakers in more-than-one-party households with the help of conditional voice recorders (Porcheron et al. 2018). Complementary to this, the project aims to gain insights into the black box behind the commercial IPA with the help of experts in the further institutional processing and shaping of data in practice.

# Uncommon ground and the dialectics of mutual understanding

Panel contribution

***Dr. Fabrizio Macagno<sup>1</sup>***

***1. Universidade Nova de Lisboa***

In pragmatics, it is a commonly accepted view that the cooperative activity of conversation is based on the “common ground” between the interlocutors, a concept that only apparently is uncontroversial. Described in cognitive theories as “knowledge of each other’s beliefs and attitudes” (Gibbs 1987) – or “shared knowledge” (Kecske and Zhang 2009) – and in logic as a set of propositions whose truth is taken for granted and not subject to further discussion (Stalnaker 1974; von Fintel 2008), common ground represents a challenge for any theory of presupposition or implicatures. Despite its importance, very few studies have proposed alternatives to the cognitive or logical approach, considering not only the relationship between an utterance and the granted information, but more importantly its dialogical and dialectical nature that emerges when the ground is in fact not completely common.

This paper intends to present an approach to common ground based on the notions of presumption and commitment: common ground is defined as a commitment that is presumed by the speaker to be held also by the interlocutor. This approach can explain the conditions under which a proposition can be reasonably treated as part of the interlocutors’ commitments, and how this presumptive attribution can go wrong and needs to be explicitly discussed. Building on a corpus of intercultural dialogues among 8-10 year-old students, it will be shown how common ground is based on and results from a dialectical process through which the status of the interlocutors’ commitments are brought to light and negotiated.

# Underspecified requests and their understandability. Orienting to the coworker's expertise in airport security screening

Panel contribution

**Dr. Chiara Bassetti<sup>1</sup>**

1. University of Trento and CNR

Based on the ethnomethodological ethnography I conducted at an international airport, the contribution focuses on security screening as a perspicuous case to analyze how participants orient to “knowing how” in the collaborative accomplishment of work tasks. My interest lies in expertise as the tacit background of action formation in interaction, particularly of requesting. I show how screeners expect professional vision (Goodwin, 1994) by coworkers and how, based on such a taken-for-granted, they recruit action from them in largely underspecified, if not completely unspecified ways. It is not a matter of implicit solicitation or “oblique” requesting (Gill et al., 2001); implicitness pertains to the requested action. This highlights design orientations to know-how in requesting, not only in terms of ability to perform an action, or “grant-ability” of what is explicitly requested (Curl and Drew, 2008), but also in terms of ability to *understand which action is to be performed*, i.e., the “understandability” of what is largely implicitly requested. Indeed, the screener’s attendants exhibit understanding – rather than claiming it (cf. Sacks, 1972) – by bringing about the requested action, i.e., by fullfilment (Rauniomaa and Keisanen, 2012). In so doing, they display their own know-how, thereby confirming the shared knowledge background on which membership in the expert group is grounded. The contribution is based on fieldnotes (13 months participant observation) and video-recordings (35.5 h.) of hand-luggage screening at airport security check lines.

# Understanding and enabling autistic sociality in digital networking environments

Panel contribution

***Dr. Nelya Koteyko<sup>1</sup>, Dr. Martine Van Driel<sup>1</sup>***

***1. Queen Mary University of London***

This project engages in research at the intersection of anthropological linguistics and human-computer interaction design, examining how autistic adults navigate the opportunities and challenges of self-presentation in social networking sites/SNS. SNS provide opportunities to plan messages for users who have difficulties reading body language and facial cues. The lack of such cues is also a challenge since posting involves ‘imagining’ of diverse addressees. We therefore need to understand how ‘autistic sociality’ (Ochs et al, 2004) is mediated in SNS characterised by ‘dilution of conversational obligations’ and emphasis on digital co-presence (Oulasvirta et al 2010). The project will develop datasets and conceptual tools to examine the multi-semiotic practices of autistic Facebook and Twitter users within their sociocultural and technological contexts. RQs:

1. What communicative practices do autistic adults perform to reach diverse social circles in SNS?
2. What social identities are constructed by autistic SNS users?
3. What are their strengths and weaknesses in signaling affiliation in SNS?
4. How is ‘autistic sociality’ shaped by the social and technological contexts, and how can this understanding inform inclusive design?

## Conceptual framework and research programme

Research on SNS and autism has focused on psychosocial outcomes and psycholinguistic content patterns. This focus, however, sidesteps the complex communicative practices and forms of agency that make such interactions meaningful for autistic users. To address this gap we combine digital ethnography and linguistic research on self-presentation and phaticity in SNS (Segeant and Tagg, 2014) within an anthropological perspective on autism. We draw on the relational conceptualization of affordances (Hutchby, 2003) which, instead of prioritising inherent platform properties, allows us to ask what properties are enacted by autistic users. From this perspective, the communication dis/ability arises from interactions between individual abilities, technological environment, and wider discourses on autism and social interaction. Adopting a participatory approach, we will collect and analyse four datasets based on the observation of online activities, linguistic analysis of posts, interviews, and workshops with users and developers.

## Outcomes

The results will provide an empirically grounded theorisation of how autistic adults engage in self-presentation and relationship management in SNS. The linguistic analysis will reveal how autistic users take up affective stances and use CMC cues in a manner that is directed at specific others, whereas the combination of observation and interviews will reveal platform properties directly implicated in promoting or constraining identity construction and social participation by autistic individuals. The emerging insights will be discussed in workshops to inform the creation of a design toolkit that supports various means of expressing autistic sociality.

# Understanding challenges in expert-lay communication: focus on term circulation

Panel contribution

***Ms. Julie Humbert-Droz<sup>1</sup>, Dr. Anne Condamines<sup>2</sup>, Prof. Aurélie Picton<sup>3</sup>***

**1.** TIM-FTI, University of Geneva; CLLE, UMR5263, University of Toulouse 2 & CNRS, **2.** CLLE, UMR5263, University of Toulouse 2 & CNRS, **3.** TIM-FTI, University of Geneva

Communication of specialised knowledge for a broader audience is often approached from the perspective of expert-lay communication, as is the case in doctor-patient communication (Ainsworth-Vaughn 2001). However, specialised knowledge can reach laypeople through various ways that are not necessarily the result of a clear will from the experts. More speakers besides experts and laypeople (i.e. semi-experts) are likely to take part in this process and specialised knowledge can be transmitted through different types of media, such as general press or science popularisation (Moirand 2007, Ledouble 2020). In this case, several phenomena that fall under the notions of conceptual variation or instability are likely to occur, interfering in the communication process. From a linguistic perspective, this phenomenon can be addressed through the issue of determinologisation, which refers to the progressive integration of terms into general language and to the use of terms by laypeople (Meyer & Mackintosh 2000). Semantic changes are likely to occur in this process, such as the appearance of a shallower meaning or metaphors (*Ibid.*). These changes are particularly interesting to better understand how terms and specialised knowledge circulate and how laypeople perceive and assimilate them.

In this context, our communication aims at presenting a corpus-driven investigation of semantic change resulting from determinologisation. Our main goal consists in identifying the diversity of the semantic phenomena at stake to better understand how the determinologisation process works through texts that are produced by speakers with different levels of expertise and that play a role in the dissemination of specialised knowledge to laypeople. To this end, we adopt a distributional approach, which relies on the assumption that the meaning of a word can be described on the basis of its collocates (Harris 1954). Semantic shifts are tracked by the observation of changes in the distribution of terms in comparable corpora (Fišer & Ljubešić 2019).

Main results point not only to the existence of semantic changes usually described in the literature, but also to subtler mechanisms that might be linked to a large range of causes (e.g. changes in the viewpoints adopted by authors, interdisciplinarity within research fields, genre characteristics). From this perspective, we believe that a better grasp of these mechanisms will lead to a better understanding of the ways in which specialised knowledge is mediated between experts and laypeople.

# Understanding Chinese Neo-Bei Construction: How Pragmatics Interacts with Grammar

Panel contribution

***Dr. Bing Xue<sup>1</sup>***

*1. Dalian University of Foreign Studies*

Neo-*bei* construction (i.e. *bei zisha*) , as a newly emerged type of non-canonical passives in Chinese stands in stark contrast with the canonical Chinese *bei*-passive. While there is no shortage of analysis of it from the perspectives of generative syntax, construction grammar and socio-pragmatics, some important linguistic facts of this construction are still left under- or un- explained, i.e. its syntactic-semantic markedness and construal mechanism.

In this paper, we provide an alternative pragmatics-grammar account of neo-*bei* construction, in the hope of better explaining its complexity in use. It is argued that both conventional pragmatic value ‘affectedness’ and pragmatic inference interact with grammatical passiveness (agent-patient reversal) in the process of neo-*bei* construction interpretation. So to speak, the choice of passive marker - *bei* automatically triggered two argument slots to be filled in: the former is automatically taken by the subject while the latter is an unarticulated constituent (Perry 1986) in neo-*beiconstruction*, which is in need of further pragmatic enrichment. In addition, the conveyed meaning via neo-*bei* construction goes beyond the propositional level and further indicates a non-propositional or attitudinal effect held by the speaker, such as being ironical.

# Understanding common ground as a cognitive object

---

Panel contribution

---

**Dr. Brian Nolan**<sup>1</sup>

1. Technological University Dublin

## Understanding common ground as a cognitive object

Brian Nolan

Technological University Dublin

### Abstract

At first glance, the idea of common ground seems a simple notion. In fact, nothing could be further from the truth. Common ground is actually very nuanced and complicated, with a dynamic connection to knowledge, context and situation. Common ground has been characterised to date as joint action, dynamic, and containing shared knowledge of various kinds. In this talk we propose a view of common ground as a type of cognitive object. We argue that common ground, the informational contents of common ground, and the operations that act on it in its construction and maintenance (grounding, verification, repair, accommodation, etc.), can be considered as contributing to the emergent common ground, while distributed across the minds of the discourse interlocutors. We argue for a view of common ground as distributed, complex, and adaptive across discourse agents.

In motivating this view, we show how knowledge, context and situation intersect to help delineate the scope boundaries of the common ground informational content, and act as cognitive framing devices. We propose a formalisation of this model of common ground that can i) resolve diverse kinds of linguistic ambiguity found in discourse, and ii) be utilised in the characterisation of, for example, speech acts such as the assertive and declarative, along with indirect requests. The formalisation exemplifies elements of the interfaces between knowledge, context, situation, and both core and emergent common ground.

The important questions we consider are therefore:

1. What is the relationship between context, situation and common ground?
2. What is the relationship between core and emergent common ground?
3. How does relevant knowledge and content get selected for inclusion into core and emergent common ground?
4. Considered as a cognitive object, what operations are used to manage the informational content of common ground?

# Understanding the relationship between English and Dutch football terms in Flemish football reporting: a mixed methods approach

Panel contribution

***Mr. Quinten Hiel<sup>1</sup>, Dr. Eline Zenner<sup>2</sup>***

***1. Thomas More, 2. KU LEUVEN, CAMPUS BRUSSEL***

**Background:** According to Bergh and Ohlander (2012), football language is the world's most widely used specialist language, in which English plays a dominant role for two reasons: (1) football has its roots in the UK; (2) football is a globalized sports played all over the world. Yet, in many languages, heritage alternatives introduced in the early days of football became well-entrenched alternatives (Preoteasa 2014). Particularly for professional discourse, we so far do not understand quite well how the resulting choice between borrowed (e.g. *keeper*) and heritage (e.g. Dutch *doelman*) variants in football terminology is made. Grasping the interaction between individual speakers' preferences and more general usage tendencies within and across professional genres could however help shape language policies in mass media context.

**Research aim:** This study aims to address this research gap by adopting a usage-based approach to the choice for English football terms or language-specific alternatives in Flemish football mass media football reporting (compare Winter-Froemel & Onysko 2011).

**Method:** A mixed methods approach is followed, complementing a quantitative variationist corpus study with qualitative interviews based on insights gained through the corpus study. For the quantitative study, a corpus was created containing data for three football reporting genres: 1900 minutes of live commentary, 900 minutes of studio analysis, 103 written articles spread over 20 matches and 38 commentators, pundits and journalists. Drawing from Geeraerts et al. (1999), the data is mined for 20 football terminology concepts showing variation in their lexicalization. The 6166 yielded observations were subject to uniformity analysis within and across genres (see Geeraerts et al. 1999, Zenner et al. 2012). For the qualitative part, in-depth interviews were held with three of the thirty-eight reporters from the corpus data. The reporters were asked to reflect on the position of English, their own use of English (confronted with figures and tables of their own use of English, derived from the corpus study) and the need for language policy on the use of English in football terminology.

**Results and implications:** Analyses of the corpus data reveal that the ratio between English concept names and language-specific variants is 28.98% in Flemish football reporting. English has a stable, yet not dominant position in the lexicalization of football terminology. In addition, our results show uniformity in Flemish football reporting with relatively stable patterns of choice across reporters and genres. Thematic analysis of the interview data shows that reporters overall feel that no uniform language policy on the use of English concepts is needed, nor should English be avoided. However, they believe commentators, pundits and journalists should become more aware of the dominant position of English in relation to other foreign languages (see Crystal 2003). Overall, this study shows the benefits of mixed methods research for uncovering tensions between language production and language regards (Preston 2013).

# Unflattening virtual break-taking: registering aspects of co-participants' person or surroundings as a means of constructing co-presence

Panel contribution

***Ms. Mari Holmström<sup>1</sup>, Dr. Mirka Rauniomaa<sup>1</sup>, Dr. Maarit Siromaa<sup>1</sup>***

*1. University of Oulu*

Taking a coffee break from work has over time developed into a widely established social activity in the Finnish culture, and it has also been observed and studied in other Nordic countries (e.g. “fika” in Sweden). In many work communities, such breaks provide opportunities for workmates to talk about both personal and professional matters. Our diverse data, which consists of video recordings from seven different communities and ethnographic interviews and fieldnotes, shows the significance of regular social break-taking and the sharing that takes place therein.

Working and break-taking conditions changed drastically in spring 2020 with a world-wide pandemic that moved large numbers of people to home offices, and away from the reach of social contacts. Break-taking in the communities that we have studied was first brought to a halt following the distance working guidelines, but then resumed virtually, via different mediums and modalities, such as Zoom and Skype. In our presentation, we examine social interaction on these virtual platforms and reflect on the findings in light of data that we have collected earlier from physical break rooms.

We adopt a conversation-analytic approach to investigate noticing or registering sequences that typically occur in the initial stages of interaction during remote breaks. More specifically, we look at sequences in which a participant brings up a sensorial aspect concerning another participant or their immediate surroundings. For instance, a participant may orient to and consequently establish joint attention to another by producing a verbal registering of their appearance or some other visually or audibly attainable aspect at hand (see Pillet-Shore 2020), thus resisting the flattening effects of video-mediated interaction and highlighting the social and sensorial, multidimensional and multi-sited aspects of the encounter. We treat such instances of other-attentiveness as practices of inclusion (see Stommel et al. 2019) and as means of constructing co-presence and maintaining a sense of community during an indeterminate period of remote work.

# Using ambiguity and vagueness to avoid problematic answers: the case of Italian ‘abbastanza’

Panel contribution

***Dr. Alessandra Barotto***<sup>1</sup>

1. University of Bologna

The aim of this paper is to examine the strategic use of ambiguity and vagueness when answering problematic or risky questions, in potentially face-threatening situations. Although ambiguity and vagueness are usually considered flaws to avoid in communication, several scholars have noted that they both can be very effective depending on the context (Cheng & Warren 2003, Piantadosi et al. 2011, among others). In this regard, Brown and Levinson (1987) suggest that being ambiguous or vague (thus violating the Maxim of Manner) can be seen as an off-record strategy, whereby the speaker can do a face-threatening act avoiding the responsibility of it and leaving the interpretation of the utterance up to the addressee.

In this paper, the strategic role of ambiguity and vagueness will be discussed through a case-study of the Italian adverb *abbastanza* ‘enough, quite’ when it is used as a part of minor clauses to reply to potentially face-threatening questions (e.g. enquiries and requests for opinions), for instance:

(1) A: *Le è piaciuta la cena?* (‘Did you like your dinner?’)

B: *Abbastanza.* (‘Not bad’)

The example in (1) is part of a questionnaire in which Italian native speakers were asked to provide a negative reply (i.e. ‘no’) to a set of face-threatening questions (in this specific example, a waiter is asking about the dinner in a restaurant). The use of *abbastanza* (here translated as ‘not bad’ in English) allows Speaker B not only to be ambiguous on whether the dinner was actually good or bad, but also to be vague on the exact degree of goodness or badness. As it will be argued in the paper, this combined effect of ambiguity and vagueness is what enables the speaker to avoid being (too) direct in expressing a negative opinion.

Using data from corpora of spoken Italian (LIP and KIParla corpus) and from questionnaires specifically created, we will analyze the patterns of usage of *abbastanza* as a way to reply to more or less problematic enquiries. Therefore, we will examine 1) whether the expression can result more ambiguous or more vague depending on the context of interaction, and 2) how contextual elements and clues (e.g. the type of question; the presence of other markers encoding mitigation, polarity or politeness; the degree of familiarity between the speakers; the formality of the situation; etc.) can be used as a key to disambiguate the actual polarity of the answer. Finally, we will discuss the relationship between the meaning of *abbastanza* and communicative effects such as politeness and irony.

# Using conversation analysis to challenge the notion of emotional tone in sentiment analysis

Panel contribution

***Ms. Sophie Parslow<sup>1</sup>, Prof. Elizabeth Stokoe<sup>1</sup>, Dr. Saul Albert<sup>1</sup>***

***1. Loughborough University***

How do contact centres gauge the ‘quality’ of their service provision? One increasingly popular approach is to use ‘sentiment analysis’; a computational method that combines natural language processing (NLP) and machine learning (ML) to ‘score’ the emotional polarity of an automatically transcribed call. To analyse telephone calls to service providers, audio-recordings are first run through speech-to-text software (Ezzat et al., 2012) and text outputs are assigned sentiment scores (i.e., positive, neutral, negative) or labelled with emotions (e.g., confusion, happiness, anger). This analysis or labelling can be applied at a range of granular levels, for example speaker turns, or to produce an overall call evaluation. With the ability to analyse thousands of calls almost immediately, sentiment analysis is enabling organisations to rate customer satisfaction in ‘real-time’ and score call-takers’ call-handling ability accordingly.

However, current automated methods do not capture and respond to the micro-analytic details of interaction (Housley et al., 2019). Pragmatic concepts based on language use such as adjacency pairs are rarely incorporated into NLP systems, and this often results in a hollowed-out notion of emotion, devoid of the social actions and sequences of action in which emotions are used and produced.

For example, “thank you” is routinely classed as a positive customer sentiment in these automated systems. Conversation analytic research, however, has shown that “thank you” does very different things depending on its sequential location - and is not always indicative of customer satisfaction (Sikveland & Stokoe, 2017). In this paper, we explore the consequences of these (mis)understandings of emotions and sentiments in calls to a range of service providers. With access to a sentiment analysis platform, we compare the outputs from the system to conversation analytic transcripts of the same calls. We analyse, from the point of view of conversation analysis, the adequacy of the system’s sentiment and emotions tags, and overall call evaluation as descriptions of the data. In so doing, we investigate which consequential details are routinely omitted when automatically classifying sentiments such as sighs and silence, and show how call-handlers orient to them as emotionally relevant.

Overall, our paper contributes to how emotion is understood in institutional encounters from both a conversation and sentiment analytic point of view and focuses on how these (do not) intersect. It also contributes to developments in NLP with research in CA on the pragmatic and tacit features of talk.

# Using requests for confirmation to register and question other's embodied actions

Panel contribution

***Ms. Oleksandra Gubina<sup>1</sup>, Prof. Arnulf Deppermann<sup>2</sup>***

***1. IDS Mannheim, 2. Institut für Deutsche Sprache***

The “embodied turn” (Nevile 2015) in EMCA has shown how its material environment is crucial for the formation of social action (Mondada 2019). One way in which it becomes relevant to interaction are situations in which participants draw attention to, or *register* something perceived in the environment (Schegloff, 2007: 82-88; Keevallik 2018; Helisten 2019; Pillet-Shore 2020). In this paper, we will concentrate on one specific practice in which participants can verbally draw attention to the interactional environment, namely through a request for confirmation (henceforth: *rfc*) that concerns something that the requester has just perceived. More specifically, we find that *rfc* can be produced in response to (i) some environmental observation of the producer of the *rfc*, who becomes aware of some object, event, or state of affairs, or (ii) in response to some embodied action of the addressee.

Our paper will focus on the latter cases, i.e. on *rfc* that refer to recipient's embodied conduct and are done by means of offering a requester's self-authored interpretation of the addressee's embodied conduct. We will show that such *rfc* are typically implemented to accomplish two interactional tasks: First, they can be used as means of an off-record account solicitation (cf. Raymond/Stivers 2016). Such *rfc* are produced in cases where (i) the other's embodied conduct deviates from the normatively expectable or preferred structure of the activity the participants are involved in, or (ii) where the other's embodied conduct is potentially unintelligible for all practical purposes. Thus, such *rfc* mark a breach in the intersubjectivity or a common ground knowledge about what should be done, when etc. and treat the Other's conduct as problematic. Second, such *rfc* can also be used for coordinating the requester's own actions with the recipient's conduct (cf. Deppermann/Kaiser in press for checking the addressee's intentions associated with their prior verbal action). As a rule, such *rfc* check pre-conditions for the requester's own actions. Third, *rfc* concerning addressee's prior embodied action can be used for topic proffering, especially when occurring after lapses or in openings.

Our study will inquire into the role of interactional and multimodal organization in the production of these *rfc*. In particular, we are interested in how such resources as gaze behaviour, turn design, and position of *rfc* within the talk-in-interaction and the ongoing activity inform these registering sequences. Thus, this paper will contribute to a better understanding of "how people grasp the subjective meanings of each others' actions" (Heritage, 1984: 57).

Our study draws on more than 20 video-recorded instances of *rfc* in various interaction types in German from the Research and Teaching Corpus of Spoken German (FOLK).

# Using Speech Act Theory in the Analysis of Chinese Data

---

Panel contribution

---

***Prof. Fengguang Liu<sup>1</sup>, Prof. Daniel Kadar<sup>2</sup>***

*1. Dalian University of Foreign Languages, 2. Dalian University of Foreign Languages & Hungarian Academy of Sciences*

In this talk, we will set the scene of the Speech Acts in Chinese Panel, first by discussing why it is important to use a theory of speech acts in a rigorous way, without unnecessarily proliferating speech act categories, and then by providing a systematic overview of previous research dedicated to speech act theory applied to the study of Chinese. We will argue that while in other areas of pragmatic research scholars often complain that Chinese (and other East Asian linguacultures) have been regarded as ‘testing ground’ for predominantly Western theories (see an overview in Kadar and Mills, 2011), when it comes to speech act theory the situation is rather that Chinese has very often been regarded as an infinite source of ‘exotic’ speech acts (typically, ‘Chinese speech acts’ instead of ‘speech act realisations in Chinese’). Paradoxically, it has very often been Chinese scholars who exoticised speech acts in the Chinese linguaculture, by proposing ‘Chinese specific’ speech act categories! A problem with this exoticising view is that it shuts the door on contrasting Chinese speech act realisations with their counterparts in other linguacultures, which is essential to make research on speech acts in Chinese replicable. As part of our talk, we will also introduce the foundations of a speech act typology, to be introduced in more detail by the Panel Discussant, Prof. Juliane House.

# Using the London–Lund Corpora to investigate recent change in advice-giving in spoken English

Panel contribution

***Dr. Nele Põldvere<sup>1</sup>***

**1.** Lund University, University of Oslo

Several new spoken corpora have seen the light of day in recent years. Few, however, are comparable to a corpus from an earlier period to facilitate diachronic investigations of spoken language. The new London–Lund Corpus 2 (LLC-2) of spoken British English, collected 2014–2019, fills this gap. The size and design of LLC-2 are comparable to those of the world's first spoken corpus, the London–Lund Corpus (LLC-1) with data mainly from the 1960s–1970s, which means that, together, the two corpora allow us to make principled diachronic comparisons of speech over the past 50 years. This paper has two aims: (i) to critically examine the methodological aspects of the London–Lund Corpora as a diachronic resource, and (ii) to demonstrate the usefulness of the resource based on a case study of the development of constructions expressing advice in spontaneous conversation.

One of the most important challenges of the compilation of LLC-2 was to capture recordings of conversations that are comparable to those in LLC-1 in terms of the situational contexts in which they occur. In order to overcome this challenge, a large number of the conversations in LLC-2 were recorded at the University College London, which was also the main site of recording for LLC-1. This gave us speech situations that revolve around similar subject matters (e.g., common-room conversations, tutorials), and it also ensured that the speakers in LLC-2 share many of the same characteristics with those in LLC-1.

The usefulness of the London–Lund Corpora as a diachronic resource is demonstrated in a case study of the development of constructions expressing advice in spontaneous conversation. Advice is a pervasive feature of human communication, but it is also a notoriously sensitive undertaking where language plays a crucial role. Advice can be expressed in a variety of ways, ranging from more deontic (e.g., imperatives; *do it!*) to less deontic constructions (e.g., various types of modals; *I would do it*). Based on a quantitative analysis of a large number of constructions expressing advice in the London–Lund Corpora, this case study aims to find out whether speakers today prefer or avoid constructions that assert power and authority compared to 50 years ago (Leech, 2003). The preliminary results suggest an increased preference for advice to be expressed in more direct ways. A closer inspection of the distribution of the advice constructions shows that there are conversations in both corpora that slightly skew the results; i.e., they occur in advice-heavy contexts that do not exist in the other corpus (e.g., study abroad sessions in LLC-2). However, the overall distribution of the constructions is relatively even, thus suggesting that the London–Lund Corpora are a suitable resource for studying recent change in spoken English.

# Vagueness and ambiguity are very different (persuasion devices)

Panel contribution

Dr. Giorgia Mannaioli<sup>1</sup>, Prof. Edoardo Lombardi Vallauri<sup>1</sup>, Dr. Claudia Coppola<sup>1</sup>

<sup>1</sup>. Roma Tre University

Without taking a stance on the definitions and the boundary of ambiguity and vagueness, we will characterize the two phenomena in order to show that, at least as persuasion devices, they are quite different and almost opposite.

We will count as ambiguous all expressions whose multiple meanings are mutually exclusive, so that if one is meant in the communicative situation, the other is not (except for linguistic jokes). Example: *I don't trust the bank* is only ambiguous in the language system, but in each actual context it must mean that I don't trust either the institution that keeps my money or the dangerous edge of the river, but not both of them [1], [2].

We will count as vague those expressions whose multiple meanings can all be meant at once also in the actual communicative situation. Example: *someone has to prepare the table* is compatible with the task to be done by any of the family members.

Given these practical definitions, we will try to show that vagueness is a powerful means of persuasion in that it can specifically *divert epistemic vigilance*[3] from the most questionable or unpleasant parts of a message (as contended by [4], [5] and [6]). In other words, it arguably protects some contents from critical challenging on the part of addressees.

Ambiguity, on the contrary, affects the message as a whole, essentially by *drawing additional attention* to it, thus increasing its generic pleasantness and global memorability.

We will support such claims by means of examples from persuasive texts from different languages and various kinds (commercial advertisements, political propaganda and political speeches). In addition, we shall present the results of a behavioural experiment aimed at detecting differences in processing time between vague and precise expressions in informative vs. non-informative contexts.

# Vagueness and ambiguity of perlocutionary effects in Prime Minister's question time sessions

Panel contribution

***Dr. Milica Radulović<sup>1</sup>***

**1.** University of Niš

The paper examines the vagueness and ambiguity of perlocutionary effects in Prime Minister's Question Time sessions (PMQs). These sessions consist of question-answer exchanges that can be defined as the argumentative frameworks with the specific question-answer dynamics inasmuch as questions are not only requests for information, and answers are not given only to provide the requested information. Namely, speakers also use this dialogic framework to exchange arguments, which means that the illocutionary act of advancing argumentation and the main intended perlocutionary act of convincing are the constitutive components of these dialogic sequences. Moreover, to argue persuasively and convincingly, speakers may rely on illocutions that are vague and ambiguous, which is why, on the other hand, diverse perlocutionary effects and responses can be expected, such as accusing, rejecting argumentation, deflecting criticism, changing the topic, posing a counter-question, criticizing the arguer, imputing intentions, misunderstanding, etc. This means that the understanding of the illocutionary act can also be vague and ambiguous, which can result in intended or unintended, expected or unexpected, preferred or dispreferred interactional effects and consequences. The paper tests the assumption that both clear/unambiguous and vague/ambiguous questions can lead to vague/ambiguous perlocutionary effects. The analysis starts with the discussion of semantic and epistemic aspects of vagueness and ambiguity and the effects of these aspects on the truth value of the proposition and the illocutionary force of any speech act, including the complex illocutionary speech act of argumentation. The discussion is also based on the difference between illocutionary and non-illocutionary perlocutionary effects and consequences, proposed by van Eemeren and Grootendorst (1983). The research is based on 70 examples of the question-answer exchanges from two sessions of Prime Minister's Question Time.

# Vagueness explored: the role of comment clauses

Panel contribution

***Dr. Maria Lo Baido***<sup>1</sup>

1. Università degli studi di Cagliari

The work explores comment clauses (verbal parentheticals) such as *diciamo* ('let's say') and *non so* ('I don't know'), which are mobilised to (meta-)comment on the host meaning to convey informative, relational, and discursive vagueness in Italian (Voghera 2017). Informative vagueness signals a semantic mismatch (Fraser 1996, 2010), as in 1):

1. non c' avevano, **diciamo**, un esempio da imitare. (KIParla, TOD1015)

'They haven't **let's say** an example to emulate'

Relational vagueness is motivated by the difficulty to establish a direct relation with the content or with the interlocutor (Voghera 2017: 180):

2. noi ne avremo **penso** per una ventina di minuti [perche' poi] l'esame e' diviso in due parti:: (KIParla, BOC1005)

'We will still have it **I think** for at least 20 mins since the exam is made up of two sections'

3. se puoi:: **diciamo** parlarmi in modo p- approfondito, di questi: [fattori interni [...]] (KIParla, BOC1005)

'If you could **let's say** talk to me about these internal factors in-depth [...]'

*Penso* and *diciamo* hedge an assessment (Nuyts 2001) in 2) and a request (Leech 2014) in 3). Moreover, the simultaneity between real-time planning and speaking calls for the production of words functioning as fillers to cover production times, i.e., markers of discursive vagueness (Voghera 2017: 181):

4. voi avrete ((0,4s)) e:h **non so** ((0,9s)) dei foglietti (KIParla, BOD1005)

'You will find eh **I don't know** some instructions'

We examine how such types of vagueness are performed in spoken Italian (KIParla Corpus, Mauri et al. 2019) studying the discourse profile (position, syntax, hosting speech act, sources) of 1131 comment clauses. Given that some markers originally expressing informative vagueness may be mobilised to express relational and discursive vagueness, we explore how such development is traceable. Comment clauses are often purposely used with a view to providing second order instructions referred both to the construction of reference and to the expression of speaker's stance. We aim at uncovering the strategic uses of an apparent phenomenon of disfluency showing that vagueness is not always synonym of ambiguity. The frequency of medial (interrupting) position and the prosodic integration of vagueness comment clauses are described as clues indicating the way such parentheticals are produced, namely, as items eventually integrated to the speech flow conveying functional and elusive meanings.

# Variation in metaphor reduces risk in conceptualization: Metaphors on the COVID-19 pandemic in Japan

Panel contribution

**Mr. Tetsuta Komatsubara**<sup>1</sup>

1. Kobe University

According to the cognitive linguistic view of metaphor (Kövecses 2010), metaphors are primarily conceptual and govern how we experience the world, how we think, and how we act. If so, our experience, thought, and activity during the COVID-19 pandemic should be, at least partially, metaphorically structured. This paper explores how metaphors build, bias, and balance our views on the situation we are faced with.

War metaphors in discourse around epidemics and diseases, such as “the *fight*against an invisible *enemy*”, are highly conventional and efficiently structures our ability to reason and communicate, but at the same time, the blind dependence on DISEASE IS WAR metaphor may be ineffective or even risky (Flusberg, Matlock, and Thibodeau 2018). People can choose another metaphorical source to gain a different perspective, such as DISEASE IS LINK (e.g., “*chains* of infections”), DISEASE IS A PHYSICAL OBJECT (e.g., “not to *bring* coronavirus home”), and DISEASE IS PERSON (e.g., “to *live together with* COVID-19”). These choices of metaphor can vary depending on contextual factors, such as surrounding discourse, physical environment, conceptual-cognitive knowledge, and sociocultural settings (Kövecses 2015). However, little is known about pragmatic implications of contextual variation in metaphor. Through the description of social and temporal variation in metaphor around the COVID-19 pandemic in Japan, this paper aims to argue that variation in metaphorical sources produces conceptual multiplicity and reduces conceptual bias.

We investigated metaphorical expressions observed in directly quoted utterances in newspaper articles, which provide information about the speaker’s social identity. Focusing on approximately 1,200 articles published during the period from March to July in 2020, in which the situation in Japan had rapidly been changing, we analyzed temporal and social variation in metaphorical sources. As a result, we observed 78 types of metaphorical mappings in total and found that political, economic, and psychological factors motivated the choices of metaphorical mappings. Among these contextual factors, political factors are closely related to the issue of the sociocultural responsibility (Solin and Östman 2016: 7) to spread a metaphorical source. Political slogans which aim at controlling public behavior, such as *wizu korona* “[live together] with coronaviruses” by Tokyo Metropolitan Government, have strongly affected how people speak and think. However, people do not always adopt such propaganda and have their own metaphorical words to construe the situation. The results of this paper will illustrate that analysis of contextual variation in metaphor can lead to deeper understanding of conceptual variation in interpretations of the difficult situation.

# Verbalizing non-human sensory perception in narratives of nature observation

Panel contribution

***Dr. Rea Peltola<sup>1</sup>***

***1. Université de Caen Normandie***

This paper addresses narrative patterns where human language users verbalize non-human perceptions by speaking the (internal) words of the other animal:

(1) *se [kettu] tuntee jo kymmenium metrium päästä sen hajun **että siel on jotakii***

's/he [the fox] can feel the smell from dozens of meters away [PTCL] **there's something there'**

(2) *muutkin siilit huomaa et ahaa täst on menty*

'the other hedgehogs also notice [PTCL] **aha [open person >] someone has passed here'**

A related type of practice has previously been investigated in family conversations where talking through co-present pet dogs was used for conveying interactional meanings to other human participants (Tannen 2004). The present study explores spoken narratives in Finnish where speakers report *a posteriori* their everyday encounters with mostly non-domestic animals. The data is collected from a call-in radio program (*Luontoilta* 'Nature night') and the Finnish Dialect Syntax Archives.

The utterances framed as non-humans' (inner) speech frequently co-occur with experiencer-based expressions of specific sense modalities (*tuntee haju* 'to feel the smell') as well as perception verbs unmarked for stimulus type (*huomata* 'to notice') (Viberg 2019). They typically also include referentially non-specific or indefinite markers (*jotakii* 'something'; open person reference; interrogatives), as well as deictic items (*siel* 'there', *täst* 'here').

By using these patterns, the narrator connects the origo of their own subjective orientation ('I-now-here') with an imagined spatio-temporal setting (*Deixis am Phantasma*, Bühler 2011 [1934]). This creates a layering effect: the voice and the bodily coordinates of the human narrator interact with the deictic center of the other creature (Stukenbrock 2014). In this sense, the patterns are narrative resources for making the non-human animal's perceptual experience more accessible.

From a biosemiotic perspective, these patterns serve to concretize and share awareness of the plurality of perceptual and semiotic centers in the situation described (von Uexküll 2011 [1982]). The non-human participants are presented as engaged in embodied sign processes and thus treated as *selves*, i. e. as beings to whom entities and events in the world matter (Kohn 2013).

The paper contributes to our understanding of the complex mappings between human language forms and sensory experiences (Caballero & Paradis 2015), as it raises the question of interspecies sharedness in perception and bodily coordination.

# Verbs of seeing as evidentials: Hebrew ‘ata ro’e and Estonian näed ‘YOU SEE’

Panel contribution

***Dr. Hilla Polak Yitzhaki<sup>1</sup>, Dr. Marri Amon<sup>2</sup>, Prof. Yael Maschler<sup>1</sup>, Prof. Leelo Keevallik<sup>3</sup>***

*<sup>1</sup> University of Haifa, <sup>2</sup> University of Tartu, <sup>3</sup> Linköping university*

This study compares the Hebrew SUBJ-PRED perception verb construction *'at/aro'e/a*(you.2m/f.sg see.prs.2m/f.sg) lacking any complements with the Estonian equivalent PRED+SUFFIX– *näed* (see.prs.2sg) ('YOU sg) SEE'). We argue that these constructions can be highly formulaic, do not necessarily denote visual seeing, but are rather often employed to express evidentiality. We show that their uses are closely tied to their prosodic features, to particular activities in which participants engage, and to the bodily-visual conduct of the speaker.

The two Hebrew (Semitic) and Estonian (Finno-Ugric) verbs of seeing are considered transitive verbs; the investigated constructions are therefore traditionally viewed as complement-taking-predicate (CTP)-phrases. However, employment of these constructions in spontaneous Hebrew and Estonian interactions reveals their routinization into metalingual fragments functioning as discourse markers.

Employing interactional linguistic methodology, we build on earlier studies of perception verbs (e.g., Sweetser 1990, Keevallik 2008, Whitt 2011, Miller-Shapiro 2014, San Roque et al. 2018, Kendrick 2019), which point out the relation between seeing and evidentiality.

The great majority of Hebrew YOU SEE tokens (1) point out evidence supporting a previous assertion based on visual data or (2) invite recipients to view the just prior talk as proof of a speaker's previous assertion/stance, as in the following Hebrew excerpt:

1 Dad: *mi holex la-sifriya ha-le'umit?*

who goes to the National Library?

(3 intervening IUs)

5 Mom: *tsila gam hayta ba-sifriya ha-le'umit be-london.*

Tsila too was at the National Library in London.

6 Neta: *'o!*

prt

7..'**ata**      **ro'e?**

you.m.sg see.prs.m.sg

..you see?

8 'ani lo levdad.

I'm not alone.

Dad criticizes Neta's desire to visit national libraries when going abroad (line 1). Mom points out that her friend, too, had gone to the national library while visiting London (5). In response, Neta produces the non-lexical vocalization *'o!* followed by *'ataro'e?* (6-7), instructing Dad to treat Mom's utterance as evidence supporting Neta's stance that her desire to visit the library is not odd but rather quite common. Indeed, Neta then adds 'I'm not alone' (8).

Such tokens of the YOU SEE construction, which fulfill the semantic, structural, and sequential requirements of a prototypical discourse marker (Maschler 2009), occur in their own separate intonation unit (Chafe 1994) and are articulated in sentence-final rising intonation. Their production is accompanied by the speaker's pulling the head backwards, usually while raising the eyebrows and holding one hand in a palm up gesture – embodied behavior unattested for the other functions of the YOU SEE construction.

Similarly, in the Estonian conversational data we can document a pattern of turn initial *näed* followed by the specification of what is to be understood as evidence supporting prior discourse. In this use *näed* is produced with a separate, mostly high onset intonation contour, in combination with other particles functioning as formulaic fragments.

Our study demonstrates the relation between sedimentation of discourse markers and the embodied conduct accompanying them in two languages, revealing the interlaced nature of grammar, the body, and interaction, thus widening our cross-linguistic understanding of evolvement of perception verb constructions into discourse markers.

# Very young children's information-tellings as an inclusive practice

Panel contribution

***Ms. Olga Anatoli<sup>1</sup>, Prof. Asta Cekaite<sup>1</sup>***

***1. Linköping university***

This talk offers a discussion on talk-in-interaction in a bilingual preschool in Sweden, focusing on very young children's (1-4 yo) practices for including adults (teachers) in a meaningful conversation.

The context of a preschool, where children are offered both education and care, is a productive site for observing learners' evolving linguistic and social competences beyond classroom interaction. Regarding practices for enabling and encouraging participation, the existent research has focused primarily on actions initiated by teachers, which can be explained with the great asymmetry in epistemic access between teachers and children, as well as their institutional roles (Gardner, 2019). This talk adds to research that looks at child-initiated interactions as a means of gaining agency over learning process (e.g., Blum-Kulka and Snow, 2002; Burdelski and Evaldsson, 2019); beyond children's conversational storytelling, there have not been many studies on information-giving initiated by a child toward an adult. This talk discusses such child-initiated information-tellings occurring outside of formal classroom activities. The data comes from 80 hours of video recordings collected during ethnographically informed fieldwork, analyzed with the methods of conversation analysis and multimodal interactional analysis.

While according to conversation analytical approach, Informings are distinguished from News Deliveries based on their sequential position and the preceding turn type (e.g. information-seeking question versus pre-announcement, respectively; Couper-Kuhlen and Selting, 2018: 269), in the observed interactions, children initiate information-telling without an initial information-seeking question. In so doing, children claim their agency not only as initiators of the conversation, but also establish themselves as knowledgeable ones. The latter appears to be particularly relevant in the institutional context of a preschool where teachers by default occupy the position of information holders. The analysis of turn-taking in these information-telling exchanges suggests that children seek a response validating them in this agentive role.

By aligning with the child's course of action, teachers support an inclusive learning environment where they confirm children's initiatives in gaining control over their learning processes.

# Video-mediated Sociality during the COVID-19 crisis – potential for inclusion and exclusion

Panel contribution

***Dr. Katharina Miko-Schefzig<sup>1</sup>, Ms. Cornelia Reiter<sup>1</sup>***

***1. Vienna University of Economics and Business***

Katharina Miko-Schefzig and Cornelia Reiter

Vienna University of Economics and Business

The ongoing restriction of social contacts during the COVID-19 pandemic in order to limit the spread of the coronavirus has enormous implications for private, professional and public situations. The sudden and radical suspension of most activities and face-to-face interactions during the COVID-19 crisis has changed participation in society radically (Ammar et al., 2020). Many aspects of social life have shifted to video-based interactions and have led to an accelerated use of digital communication channels during and after the lock-down in private (family talk), professional (work at home) and public (school lectures) situations.

In our research we analyzed the various ways in which video-mediated interaction helped maintaining sociality during and after the COVID-19 crisis and identify the including and excluding effects this had and still has on society.

On the one hand we describe how video-usage includes people in private, professional and public situations, by (i) allowing people to communicate and interact without physical contact (e.g. Skype-Parties); (ii) by enabling the maintenance of services over distance (e.g. health care service; therapy); (iii) by connecting groups to collaborate over distance (e.g. team meetings, distance learning); and (iv) by enabling private contacts, maintaining relationships and offering a kind of community (e.g. religious groups, game rounds).

On the other hand, we show how video-mediated sociality excludes those with limited access to those technologies. Accelerated video usage carries the risk of socially excluding and isolating those who are not able to use the necessary technologies (Xie et al., 2020) This development is bound to deepen existing ‘digital inequalities’ (Beaunoyer et al., 2020). The extensive use of digital communication has shifted virtual, digital interactions from a possibility to a ‘necessity’ (Beaunoyer et al., 2020; Xie et al., 2020). (Macedo, 2020) for example points out that video-mediated interaction in the health sector demands a lot from the people who use it. He sees signs of fatigue in himself and his colleagues and emphasises the value of face-to-face encounters, sensory diagnosis, physical contact and the trust that comes with it.

Another point of exclusion concerns the blurring of boundaries between private and professional life through video-mediated work from home. Rather than meeting in offices, the employees working from home have to allow a glimpse into their private sphere. This required insight could further complicate the employee’s ability to separate private and work life. This aspect is strongly related to the gender inequalities.

## Introduction

The use of video-mediated technologies for medical consultations is increasing rapidly but the sensory dimension of clinical practices in this context needs further investigation by analyzing the patient/physician interactions (Lupton & Maslen, 2017; Gibson & Vom Lehn, 2020). The purpose of our study is to understand the ways in which sensory information is redistributed by the use of video-mediated technologies.

## Data & Method

To do that, we used a methodological approach based on video-ethnography. We have privileged the video recording of patient/physician interactions during teleconsultations because it allowed us to access details of workplace activities (Heath, Hindmarsh, Luff, 2010). Our study was conducted with 10 physicians participating in a teleconsultation for a postoperative visit in orthopedics to address a critical issue: how the sensory work of medical decision-making is accomplished during teleconsultations. We conceived a method that first capture patient/physician interactions during teleconsultation in real time (Heath & Luff, 2018). Then, we allow physicians to ‘look in’ by engaging them in a process of self-reflection (Paterson & Glass, 2018). Practically, we collected two types of video-recordings. The former can be described as “naturally occurring data” in that we recorded orthopedic teleconsultations. We then used this data (video recordings of the teleconsultations) to provide physicians with a resource to reflect on their clinical practice. The methodology allows to take a detailed look of the interactions between the physician and the patient in order to reveal different aspects of the sensory engagement in telemedicine consultation. All the teleconsultations video-recorded was transcribed and the researcher proceeded with an in-depth analysis of the activities and the interactions that took place within the natural context.

## Results

A multimodal analysis of interactions (Mondada, 2019; Streeck et al., 2011) was carried out and allowed us to identify various ways of “sensing-at-distance” by revealing: (a) the interactional constitution of a “shared place” for creating a sense of co-presence; (b) the sociotechnical arrangements of a “clinical frame” as a way for co-producing “shared sensory cues.”; and (c) the embodied engagements for creating an empathetic relationship at distance.

# Visual Narrative through Dance in the Stage Drama Adaption of Pai Hsien-Yung's Crystal Boys: A Multimodal Social Semiotic Approach

Panel contribution

***Mr. Eryk Hajndrych<sup>1</sup>, Dr. Li-Chi Chen<sup>1</sup>***

*<sup>1</sup>. Kazimierz Wielki University*

Pai Hsien-Yung's *Crystal Boy*, first published in 1983, has been regarded as the first LGBTQ literature in Taiwan. It depicts a story of a group of young boys in the gay hangout of Taipei's New Park during the 1970s. Among them, A-Qing, Little Jade, Wu Min, and Mousey are protagonists, who are each other's shelters and support. Throughout the novel, different stories of these young boys, as well as the story of the Dragon Prince and the Phoenix Boy, are presented through A-Qing's narrative. While many previous studies have shed light on the father-son relationships in the novel (Hung 2011) or on the expressed emotions (Jiang 2019), none of them directed their attention to how the novel is adapted in stage drama from a multimodal social semiotic perspective (van Leeuwen 2005). Based on the videotaped data from the televised stage drama first broadcast on Public Television Service on December 5, 2015, this study intends to analyze and discuss how the literary narrative is visualized and audibilized on stage. Our findings are summarized below:

First, while the novel vividly depicts gay male desire and ordeals in politically unstable Taiwan, the literary narrative is presented multimodally in the novel's stage drama adaption. Second, the literary narrative is visually and audibly presented through the actors' dance, combined with stage music and lighting. Third, dance is used to show A-Qing's transformation, the gay hangout in Taipei's New Park and Cozy Nest, Little Jade's 'femininity', the fateful meeting between the Dragon Prince and the Phoenix Boy, and the four protagonists' self-portraying as 'fairies'. Finally, while the linguistic and nonlinguistic practices observed in most of the gay roles in the stage drama do not show much difference from those of their straight counterparts, Little Jade's feminine traits are highlighted in many of his dances. In a nutshell, the actors' dancing helps not only to visualize the literary narrative in the novel, but is also in an attempt to embody the abstract literary concept within it. The *gayspeak* is also visually presented through the actors' dancing.

# Visuality and co-presence in “face wall”-videoconferences: How participants organize attention and reference when taking turns in digital university lectures

Panel contribution

**Dr. Kenan Hochuli<sup>1</sup>**

**1.** URPP Language and Space; University of Zurich

Analyzing gaze behavior and verbal turn-taking, interaction analytic research has shed light on the routine ways in which participants organize reciprocity, reference and joint attention (Goodwin 1980; Streeck 2014; Stukenbrock und Dao 2019). The self-evidence of this interplay is challenged on digital platforms like *zoom* and *Teams*. These environments do enable face-to-face encounters, however, they are subject to special spatial and configurational conditions.

Using video recordings from digital university lectures and drawing on interaction analytical research on sociality in media space (see Heath 2000; Licoppe und Morel 2012; Arminen et al. 2016 i.a.), firstly, the paper aims at providing fundamental insights into the multimodal aspects of question-answer-sequences under the circumstances of mediated interaction. It thus deliberately connects the question of digital co-presence with the analysis of turn-taking - the basal mechanism of interactive referencing (Sacks, Schegloff, Jefferson 1974). In addition to this, the paper will analyse eye tracking data of students and lecturers who follow these lectures. An important emphasis is on the question of how participants deal with the fact that in moments of turn-taking, any individual on this platform can not only see the face of their conversational partners, but also themselves. Moreover, participants have the opportunity to take the visual perspective of their counterparts. The paper aims at shedding light on the participant's individual understanding of digital “social situations” (Goffman 1964) particularly when reference and joint attention are made relevant.

# Visualizing turn construction: Seeing writing while speaking

Panel contribution

Prof. Tim Greer<sup>1</sup>, Mr. Zachary Nanbu<sup>1</sup>

1. Kobe University

This study uses Conversation Analysis to document the multimodal practices novice language learners use to visualize the grammar of a turn they are currently attempting to formulate.

On occasions in our dataset, speakers will produce a series of beat gestures that assists in formulating the turn and pacing its delivery. They are deployed more or less simultaneously with the production of a word or phrase, although when the gesture comes just prior to the word or during displays of formulation trouble it may be indicative of forward-oriented repair.

However, among the beginning learners of English in our data, we see a hybrid iconic version of such beat gestures that also appears to represent a visualized depiction of the written form. For example, in the following data segment, speaker A cups his right hand (with thumb and forefinger about 7cm apart) and moves it progressively from the left side to the center of the table as he produces his turn.

01 A |I- |(0.8) |work- |at- |part time job,

```
a-gz  |~~>up/left-----~~~>|table---->
a-rh  |touches table far left
      |rh motionless
      |touches table left
      |touches table near left
      |touches table center
```

Each cupping coincides with a word at the points indicated by the vertical bars (|), and the progression is put on hold during the silence, suggesting that the speaker is “doing imagining” the written sentence as it unfolds in his talk. The speaker’s gaze is up and away as he conducts the word search. The cupped hand therefore indicates a word, and its movement and placement along the table displays the participant’s orientation to each beat as a different word in the progression of the sentence.

In other cases, participants use their fingers to “write” key elements of the turn-in-progress on their hands or in the air. These multimodal visualizations provide the speaker with access to an emergently recalled text that helps them arrive at the spoken equivalent.

The study suggests that EFL learners can therefore regulate and support their spoken interaction through the visualization of written grammar, and that multimodal practices such as the precision-timed deployment of gaze and gesture demonstrate to their interlocutor that such text visualization is underway. Our analysis adds to the growing body of work that examines the role of embodied conduct in second language acquisition and the ecology of L2 interactional competence.

The data are taken from a corpus of 93 paired discussion tests video-recorded among Japanese EFL learners and analyzed according to a Multimodal CA approach.

# Vocal accommodation in apology-centred interactions: the role of socio-pragmatic factors

Panel contribution

***Ms. Omnia Ibrahim<sup>1</sup>, Dr. Iris Hübscher<sup>2</sup>, Dr. Elisa Pellegrino<sup>3</sup>***

**1.** Saarland University, Department of Language Science and Technology, **2.** URPP Langue and Space; University of Zurich, **3.**

NCCR Evolving Language, Dept of Computational Linguistics, URPP Language and Space, University of Zurich

When communicating, speakers constantly position themselves in relation to the ongoing social interaction. Depending on whether a person interacts with a senior or a peer, the socio-pragmatic level of their speech is adapted in one way or another. This adaptation may lead to an increase or a decrease in the interlocutors' speech similarity. Such a phenomenon is referred to as accommodation. Factors like perceived social distance/friendliness/competence of the interlocutor have been shown to highly influence the degree of interlocutors' acoustic similarity. In the present study, which is part of a larger project on multimodal accommodation, we aim at exploring the extent to which vocal accommodation in conflicting situations can be explained by socio-pragmatic factors such as interpersonal relationships and pragmatic events occurring in apology-centered interactions.

Speech material: The corpus used for this study has been extracted from a larger audiovisual corpus collected by the second author. Here, we analyzed 12 face-to-face interactions between 6 target speakers and two interlocutors.

The interactions were based on a conflict situation, generated by the target speaker who then had to role-play the conflict resolution with their interlocutor (a friend or a professor). The interactions were characterized by different degrees of power relationship between interlocutors:

- High social distance/Asymmetrical Power relationship: Student-Professor interaction
- Low social distance/Symmetrical Power relationship: Friend-Friend interaction

Annotation: We annotated the interactions' utterances phonetically, orthographically and pragmatically. For the phonetic annotation, the corpus has been automatically annotated in words, syllables and phonemes. Manual revision of boundaries was also performed to guarantee maximum precision. For the pragmatic annotation, we expanded the traditional classification of apology strategies by Cohen and Olshtain, 1983, with novel labels (such as assent vs. dissent) for coding the reactions of the apology receiver and the negotiation strategies used to solve the conflict.

Analysis: To study the accommodation behavior of the target speaker, we quantified the distance between the fundamental frequency ( $f_0$ ) of the target speaker's voice and the "baseline" of their interlocutor's voice over the course of interaction. We chose to focus on  $f_0$  for a variety of reasons: (A)  $f_0$  convergence is common during conversation (De-Looze et.al 2014), (B) listeners adapt and easily identify the pitch of their interlocutors (Zellers 2017), (C) the act of apology has emotional effect on both interlocutors, and  $f_0$  is one of the most reliable acoustic correlates of emotional speech (S. Hareli, Z. Eisikovits 2006)

Preliminary results: We observed a noticeable variability in accommodation over the course of interaction, which is not interpretable only in terms of the social distance/power relationship. Other pragmatic factors seem to trigger convergence or divergence behavior across interactions, For example, we observed that:

1. The level of interlocutors' engagement in resolving the conflicting situation and the target speakers' admission of responsibility trigger convergence behaviour.
2. The positive vs. negative responses of the interlocutors trigger convergence or divergence (respectively).

3. Sequences of negotiations are typically characterized by convergence, except for the target speakers who did not apologize and tried to save his face by referring to external factors.

# Vocal-bodily displays of hesitation in interaction

Panel contribution

**Ms. Heike Baldauf-quilliatre<sup>1</sup>, Dr. Cordula Schwarze<sup>2</sup>**

**1.** ICAR Laboratory, Lyon 2 University, **2.** University of Innsbruck

In conversation analysis, hesitation phenomena have been investigated very widely. It has been shown how they contribute to the interactional construction of tabous or delicates (Gülich 2005 ; Günthner 2006 ; Lerner 2013), of word search (Goodwin/Goodwin 1986 ; Greer 2013 ; Oloff 2015), vagueness (König 2014) or epistemic disclaiming (Stivers/Robinson 2006 ; Keevallik 2011 ; Helmer/Reineke/Deppermann 2016 ; Pekarek Doepler 2016). Hesitation phenomena have been described with regard to turn taking (Schegloff 2006, 2010 ; Hoey 2017) or formulation problems (Gülich/Kotschi 1996). Analyses have hereby drawn on different linguistic and interactional phenomena such as particles (Schegloff 1982, 2010 ; Wetherall 2011 ; Klattenberg et al. 2020), repair and reformulation (Schegloff/Sacks/Jefferson 1977 ; Uhmamn 2001 ; Laakso/Sorjonen 2010 ; Fox/Mascheler/Uhmamn 2010 ; Drew/Walker/Ogden 2011), boundaries of units (Barth-Weingarten 2016) or pauses/lapses (Goodwin 1980 ; Hoey 2017) as display of hesitation. Insofar, conversation analytic research has revealed that « hesitating » is a multifunctional category which involves not only different types of resources but appears in particular turn or sequence positions, related to specific interactional uses.

Despite this multitude of studies, we still know less about the embodiment of hesitation, especially if it is not particularly related to word search. Do (and if so, how) participants indicate vocally and bodily that they are hesitating to take a turn or to continue their turn ? Are there specific vocal-bodily displays of hesitating and to which extend they are related to specific lexical, syntactic or interactional structures ? And what could be the place of nonlexical vocalisations within this range of resources.

In our contribution we investigate sequences in German and French interactions with turn initial nonlexical vocalisations described as hesitation marker (e.g. German « äh »/ « ähm » and French « euh » which are similar to English « uh »). Our analyses show that the vocalisation is generally accompanied by changes in voice (e.g. variation in loudness, breathiness or articulation) combined with other bodily resources (e.g. changes in posture or gaze). These changes seem to be systematic with respect to specific types of sequences (e.g. in question-answer-sequences to indicate « complicated » answers). Interestingly we could find similar displays in other hesitation sequences without the nonlexical vocalisation. We therefore propose to analyse hesitation as an embodied phenomenon which draws on different linguistic, vocal and bodily resources.

Our study aims not only to contribute to a better understanding of hesitation in interaction, it also wants to draw attention to the particular role voice can play in interaction as well as its interweaving with linguistic resources on the one hand and bodily resources on the other.

# Voice Dissatisfaction: Constructed Speech and Thought in Truthful vs. Deceptive Negative Online Hotel Reviews

Panel contribution

**Dr. Mark Visonà**<sup>1</sup>

1. Georgetown University, California University of Pennsylvania

While scholars have examined how writers of online reviews use pragmatic strategies like second-person address and metadiscourse to involve readers in their evaluations of products, services, or experiences (Vásquez, 2015), no studies have yet focused exclusively on how this evaluation in negative consumer reviews may distinguish truthful from fabricated online reviews. In this paper, I analyze seven individuals' pairs of truthful and deceptive online hotel reviews from my dissertation, a study of linguistic indicators of veracity and deception (Johnson & Raye, 1981; Burgoon, 2018) in 93 pairs of truthful vs. deceptive online hotel reviews elicited from undergraduate students raised in the United States. First analyzing pairs of reviews from five individuals, I identify how customers use reported or 'constructed' speech and thought (Tannen, 1986; 2007) in deceptive reviews to voice dissatisfaction about certain aspects of a fabricated hotel visit. I further show that these individuals often construct speech and thought with Extreme Case formulations (Pomerantz, 1986) that are voiced by characters or 'figures' (Goffman, 1981) in narrative storyworlds (Bamberg, 1997; De Fina, 2003) evoked by *irrealisdescriptions* evaluating speech events that did not occur (e.g., *I never received a call back about room service*) (Labov, 1972; 2011). Next, I analyze two individuals' pairs of reviews where the truthful review of their last hotel visit is negative and their fabricated visit is positive, identifying how constructed speech and thought and other linguistic strategies in truthful negative reviews differ from the previous individuals' deceptive reviews. Specifically, I find that individuals often begin both truthful and fabricated negative reviews with references to prior expectations via constructed thought. I also examine how individuals frequently use narrative reports of speech and thought (Leech and Short, 1987[2001]) as a strategy to voice past selves and staff figures during unsatisfactory events of a fabricated visit, arguing that these reports function as *embedded evaluation* (Labov, 1972) implicitly guiding readers to negatively evaluate a hotel.

I further discuss how memory structures encoding people's knowledge of a situation known as 'scripts' (Schank & Abelson, 1977) contribute to negative consumer feedback in these reviews. Exploring how the linguistic strategies of constructed speech and thought in pairs of reviews provide elements evoking a script in the form of objects, roles, entry conditions, sequences of actions, and normal results from performing a situation (here, a hotel visit), I suggest that these elements reveal authors' prior understandings of being a patron of a 'good' or 'bad' hotel. I describe how script elements in negative online hotel reviews reflect participants' knowledge of hotel visits as undergraduate students, suggesting that students in particular may use linguistic features invoking types or 'tracks' of the hotel visit script to claim membership in different 'consumption communities' of hotel customers (e.g. wealthy vacationers vs. businesspeople traveling for work) (Leiss et al., 1986; Talbot, 1995). Consequently, this analysis has implications for our understanding of how shared expectations influence younger consumers to use particular linguistic strategies in conveying dissatisfaction, as well as how these expectations contribute to fabricating reviews (Vásquez, 2011; 2015).

# Vulnerability of augmented speaker' talk: other-initiated repair as a room for (mis)interpretation

Panel contribution

***Ms. Aleksandra Kurlenkova<sup>1</sup>***

*1. New York*

Speech disability has long been treated as a predominantly medical phenomenon, described in terms of individual pathology, or dysfunction. Conversation Analysis has a unique way to contribute to an alternative, social model of disability, first formulated by British activists in the 1970-s. CA has underlined the collaborative character of any social action, and, even more so, when it comes to conversations involving a co-participant who has a speech disability (Wilkinson et al. 2020, p. 12). For the last 20 years, CA research on atypical and augmented interactions showed how competencies and difficulties encountered in face-to-face encounters of people with communication disorders are joint achievements, produced through the actions of all co-participants, objects in the environment, the sequential position of each utterance, gaze, gestures, vocalizations, and assistive technologies, rather than results of individual efforts.

One practice of co-construction of talk of people with dysarthria, who I focus on in my research, is other-initiated self-repair (Bloch 2006; Rutter 2009; Bloch, Wilkinson 2013; Bloch, Barnes 2020). My analysis of video-recordings from a Russian-speaking family who has a daughter with dysarthria shows that child-parent understanding is often achieved through a series of (cascadic) other-initiated self-repair sequences. In these interactions, a child would produce an utterance using a speech-synthesizer followed by their parent's guessing activity which in the 3rd turn is either confirmed or rejected by the child. However, sometimes the structural space of the 2nd turn where a parent would produce a repair initiation is used to do other things: e.g. to do relational work between the parents. I will present one such case where repair is reserved for an activity of advancing parents' agenda, rather than reaching understanding of the child's utterance. This will help me think about the vulnerability of augmented speaker's turns occasioned by the structural possibility of interpretation by others in the form of other-initiation of repair.

# Walking on Wilton Drive: A Linguistic Landscape Analysis of a Homonormative Space

Panel contribution

***Prof. Heiko Motschenbacher***<sup>1</sup>

1. Western Norway University of Applied Sciences, Bergen

This study describes the linguistic landscape (Barni & Bagna 2015, Lou 2017) of Wilton Manors, Florida, as it surfaces on its main street, Wilton Drive. Wilton Manors is a community with one of the largest LGBT populations in the US. The study thus makes a contribution to the field of linguistic landscapes and sexuality (e.g. Milani 2018, Milani & Levon 2016, Zebracki & Milani 2017), using normativity (Motschenbacher 2014, 2019) as a central theoretical reference point. The data for the study were collected during a daytime walk on Wilton Drive and consist of photos of store fronts, restaurants, bars, advertisements and other signs, supplemented by printed material collected on the Drive and information provided by the official website of Wilton Drive. Using a multimodal approach, I investigate linguistic and non-linguistic signage, identifying mechanisms that render Wilton Drive a gay space. It is shown that homonormativity plays a central role in this context. On the one hand, same-sex sexualities are discursively constructed as the local norm. On the other hand, the signage on Wilton Drive is also highly exclusive in the sense that it represents predominantly gay male experiences, whereas heterosexualities, lesbian and other sexualities are discursively marginalized or even silenced. At the same time, a particular version of gay masculinity is privileged by the representational practices on the Drive, namely one that can be described as white, middle-class, and focused on domesticity and consumption (Duggan 2002).

# We need to talk about Hearer's Meaning

---

Panel contribution

---

***Prof. Maj-Britt Mosegaard Hansen<sup>1</sup>, Prof. Marina Terkourafi<sup>2</sup>***

*1. The University of Manchester, 2. Leiden University*

In this paper, we argue that it is time for pragmatic theory to take much more seriously the notion of Hearer's Meaning, as distinct from Speaker's Meaning (Grice 1975) or Speaker's Commitment (Geurts 2019), even where the latter is conceived of as interactionally negotiated (eg Elder & Haugh 2018).

Our central contention is that, in terms of real-world perlocutionary effects, including not only synchronic effects on interpersonal relationships and perceptions of the Other, but also diachronic effects in the form of language change, Hearer's Meaning is, in fact, criterial.

On the basis of examples prominently (but not exclusively) adduced from social media, we will show that hearers not infrequently infer from an utterance or discourse something over and above – and/or even quite different from – what can plausibly be seen as intended, or merely made publicly available, by S. While introspection suggests that such inferences are often covert within the interactional episode that triggers them, they are occasionally overtly thematized. In such instances, we may observe that once H has adopted a certain interpretation, they choose to stick with it despite its being overtly denied by the speaker.

We will argue that assumptions about the speaker's intentions are only one aspect of what informs the generation of Hearer's Meaning. Intention attribution may be given greater or lesser weight depending on the context of communication, not least the nature of the relationship between S and H. Even where intention attribution plays an important role, it relies crucially on the way in which the current interaction is framed by H, which may or may not be identical to the way in which it is framed by S (eg Tracy 1997). In other words, intention attribution is at least partly dependent on the experience and habitus of individual hearers.

A second important, but often overlooked, factor influencing interpretations is H's construal of who S is. This construal may rely on a wide range of factors, many of which are themselves subject to interpretation. On some occasions, possibly because there is cognitive gain involved in operating with simple, mutually exclusive categories, the construal may be determined by nothing more than S's use of a certain "trigger word", which dominates how everything else is interpreted, to an extent where H may end up unilaterally determining not just what was "meant", but – in extreme cases – even what was "said".

Finally, where overhearers are present, calculations of potential social gain associated with adopting certain interpretations, and/or of potential loss of face associated with retracting a previous interpretation, may contribute to tipping the interpretive scales further away from what has been made available by S.

The notion of Hearer's Meaning goes some way towards explaining the impetus for individuals who agree on certain interpretations due to a shared habitus to form social "echo chambers". More broadly, our proposal has consequences for models of pragmatic inferencing and of verbal interaction, but also for models of semantics that put the notion of "common ground" at their center.

# Weaponizing gender: the role of grammatical gender shifts in hate speech

Panel contribution

***Dr. Maria Stroińska<sup>1</sup>, Dr. Grażyna M. Drzazga<sup>2</sup>***

*1. McMaster University, 2. University of Groningen*

In languages that categorize nouns as belonging to distinct ‘grammatical genders’, moving an expression from one class to another implies changes to its status, and is often interpreted as derogatory.

In Polish, shifting nouns with human referents from one category to another is usually perceived as having a “downward” orientation. It can therefore be used as one of the means of verbal aggression, especially name calling.

Polish, with its gender sensitive morphology, has an array of gender shifting suffixes (cf. Swan, 2015; McConnell-Ginet, 2014). E.g. the word *baba* (feminine) is a crude though not vulgar reference to a woman – either one that is rude (e.g. *okropna baba* – ‘an awful woman’) or a peasant woman (*baba ze wsi* – ‘a country woman’). It can be shifted to *babsko* (neuter) or *babsztyl* (masculine) with progressively negative connotations. A compound *baba-chłop* ('woman-man', a masculine looking woman) is used for name calling towards transgender people. Transgender persons are also rudely referred to as *ono* (neuter) instead of *on* (masculine), *ona* (feminine), or a different preferred pronoun. A neuter pronoun used to refer to a person is not a neutral form of reference and is meant as a hurtful instrument of hate speech.

A shift in animacy in order to diminish someone’s position involves the use of inanimate objects with lexicalized negative connotations to refer to people. As all Polish nouns are gendered, such nouns often agree in gender with the perceived sex of the referent, although this is not a rule. Thus, words such as *szmata* ('rag' fem. – derogatory, with reference to morality) are mostly used about women and *burak* ('beetroot' masc., implying lacking intelligence), mostly about men. If used across natural gender lines, the negative connotations become stronger (as in e.g. *Szydło to jednak burak*, 'Szydło is indeed a beetroot' used about former female Prime Minister Beata Szydło).

In this paper, we analyse a corpus of Polish newspaper articles online and readers’ comments, as well as the Polish language corpora (unfortunately lagging significantly behind and not reflecting language changes). We analyse the frequency of the gender shifting suffixes and the nouns they attached to, looking at their collocations to identify semantic effects of gender shift. The results confirm the dramatic increase of verbal violence in Polish public discourse.

Grammatical gender shift is not a new phenomenon but this seemingly innocent linguistic mechanism triggers immediate, even if unconscious negative associations, sometimes acting as dog whistles. As the current Polish government is engaged in a propaganda campaign against the LGBTQ community, the use of grammatical gender as a tool for hate speech and discrimination deserves some urgent attention.

# Well-modulated Bodily Movements in the Japanese Tea Ceremony (Sado)

Panel contribution

***Dr. Daiji Kimura***<sup>1</sup>

*1. independent*

The tea ceremony (*Sado*) is a traditional Japanese *Geido*. In the ceremony, the host (*teishu*) boils water, prepares powdered green tea, and serves it to the guests. This process is called *temae*. The tea ceremony originated in China and was introduced to Japan along with Zen Buddhism more than 1000 years ago. In the 16<sup>th</sup> century, Sen-no-Rikyu established the *wabi-cha* style, which focuses not on brilliance but on simplicity. The ceremony aims to create a sense of unity between the host and the guests in a simple tea room.

In the tea ceremony, the participants must exhibit strict manners in their speech and movement. Thus, the conversations exchanged are routine, for example: Host: “How is the taste of your tea?” Guest: “It is very good.” Such exchanges are unlikely to be modified. For this reason, the tea ceremony is often described as “a series of redundant procedures”. While the ultimate goal of Japanese martial arts (*Budo*) is to “win against the opponent” and that of *Geido* such as *Shamisen* is to “play well”, the practice of the tea ceremony lacks such clear goals. Thus, some critics have asked, “What is interesting about doing such a routine thing with no purpose?” Nonetheless, many people are attracted to the tea ceremony and enjoy it. What exactly is happening here? To answer this question, I recorded the practice of the tea ceremony with a 360-degree video camera and analyzed the recording in a multimodal manner.

Tea ceremony beginners first learn *temae* by focusing on each movement, such as folding the *fukusa* (silk cloth for wiping tea utensils), cleaning the tea whisk, etc.; this is called *wari-geiko* (divided practices). When such lessons are completed, these practices are integrated, and the learners conduct the tea ceremony exercise in the role of a host and that of a guest. The teacher sits in front to observe and provides direction if necessary.

In this presentation, I will focus on the following point. The *teishu* performs *temae* in the prescribed manner, but of course, the actions of each *teishu* include “deviations”. Even the actions of the same *teishu* differ somewhat between *temae*s. The teacher instructs the student to perform such deviations on purpose, using instructions such as, “Handle the *fukusa* as if you were putting eggs under your armpits,” or, “Carry the (heavy) water jar as if you were handling a light object.” These actions deviate from the simple manner of ordinary human movement. If one’s bodily movements are well modulated, a “feeling of tension” is expressed, and the movements look beautiful. Furthermore, guests can feel the personality of the *teishu*. Through experience with expressing these qualities, the meaning of the tea ceremony practice shifts from “a state of *being bound* by the rule” to one of “achieving something *using* the rule”. In Gregory Bateson’s framework, the “logical type” rises by this process. In this presentation, I will clarify such processes by analyzing the movements and conversations that occur in *temae* practice.

# What constitutes a reportable event? Cross-linguistic studies on principles of event construal

Panel contribution

***Prof. Christiane von Stutterheim<sup>1</sup>***

***1. Heidelberg University***

Attention to phenomena in the external world is perspective driven and the decision as to what aspect may serve as a point of focus in a given situation differs across individuals and social communities. But what role does the language we speak play in the process of selecting one aspect over another when conveying information on a change in place, for example? Based on a series of cross-linguistic empirical studies in the domain of motion events, the findings underline how the relevant means of expression in the different languages (verbal, nominal) focus specific patterns of visual attention (eye tracking), information extraction (memory tasks), unit formation (non-verbal segmentation task) and construal (verbalisation). The languages studied are typologically diverse (Romance, Germanic, Arabic, and Chinese). The findings are discussed in the context of theories of event cognition focussing on the role of language in determining what speakers consider to be *reportable event*.

# What do speakers use Predicate Nominal Constructions for in English conversations?

Panel contribution

Prof. Tsuyoshi Ono<sup>1</sup>, Prof. Sandra A Thompson<sup>2</sup>

<sup>1.</sup> University of Alberta, <sup>2.</sup> UCSB

Predicate Nominal constructions (PNs) have long been of interest to typologists and field linguists (e.g., Genetti 2015, Payne 2006). A consensus emerges that PN clauses are one type of ‘non-verbal predicate’ (Hengeveld 1992). For the proposed panel, ‘non-verbal predicates’ can in turn be considered to be a type of ‘low-transitivity predicate’ (Hopper & Thompson 1980, Thompson & Hopper 2001).

From a large corpus of mundane English conversations among friends and relatives, we have collected 103 instances of PN clauses. They present a clear profile of characteristics:

1. PN clauses are **low in Transitivity**, even for PNs; they’re totally ‘intransitive’, with a copula (which is a poor ‘verb’).[1]
2. PN clauses in English interaction are based on a **construction** (Bybee (2010), with a fixed copula and a semi-open predicate nominal. The surprising and new fact revealed by the data is that PN clauses in English are highly constrained with respect to their subject: 75% of these subjects are *it*, *that*, or *this*(whereas inanimate subjects are relatively rarer in **ordinary** (non-PN) clauses (cf. Iwasaki, 1993, Scheibmann 2001, 2002, 2007)).

subject	N	%
<i>it</i>	44	43
<i>that</i>	24	23
<i>this</i>	9	9
subtotal	77	75

<i>s/he/I/you/they</i>	19	18
other	7	7
total	103	100

So what does all this mean?

3. **Question:** It’s been claimed (and widely accepted) that humans talk about themselves and other humans most (cf. Scheibman 2002, and Givón 1979).

- So why does this PN construction so heavily favor **non-human/it/that/this** subjects?
- And why are 1st person singular subjects so rare, when they’re so common in interaction in general?
- What interactional ‘job’ are PN constructions doing that would produce this skewing?

## 4. Our Hypothesis:

- We find that almost all the PNs in our data are non-referential and do categorizing work.
- People tend not to categorize themselves and others except in explicit contexts where categorizing people is of particular interest, as in 4) above (Psathas 1999, Schegloff 2007).
- Instead, when people talk about themselves and other people, at least in English, this is about people **doing** or **planning to do** things, **having things happening** to them, and **taking stances** towards events and situations (Englebretson 2007).
- Thus, in our everyday-talk data, people use PNs primarily to categorize **things, abstractions, situations, and events** rather than themselves or other people, i.e., they categorize their **experiences**.

5. Discussion. We pursue the implications of this hypothesis for the grammar of categorization and of low transitivity in interaction.

[1] It contributes no lexical meaning; it can only do linking work, which many languages don't have a morpheme for at all.

# What is a Noun and What is a Verb in Chinese, Japanese, and Arabic? Examining Functional Morphological Form Classes as Alternatives to Standard Grammatical Categories

Panel contribution

***Dr. William Beeman***<sup>1</sup>

*1. Department of Anthropology, University of Minnesota*

The linguist Benjamin Whorf in a classic article, “Grammatical Categories” presents a general theory of grammatical categories independent of the Indo-European Latin and Greek model categorization of “form classes” (e.g. Noun, Verb, Adjective, Adverb, Preposition). Whorf suggested three contrasting dimensions of form variation: overt, covert and isosemantic. Each of these three was further divided into “selective” and “modulus” categories. The need for a more flexible view of form class was also promulgated by John R. (Haj) Ross in suggesting that linguistic analysis should emphasize ‘nouniness’ and ‘verbiness’ rather than rigid form class categorization.

In this paper I will explore Whorf’s system and Ross’ call for form class flexibility in three non-Western languages, Chinese, Japanese, and Arabic, whose morphosyntactic systems are not easily analyzed using the form classes of Indo-European languages. In Chinese, individual “words” 词 cí can be seen simultaneously as “nouns,” “verbs,” or “adjectives.” For example the morpheme 长 (cháng, zhǎng) can be classified as a noun, a verb, an adjective or an adverb indicating “length” among numerous other meanings.

Chinese and many Japanese “compound words” generally consist of two or more character-morphemes that can be interpreted semantically as “phrases,” for example, in Chinese 买卖 (mǎimài—lit. buy-sell) “business.” Japanese has several other grammatical structures that do not fit easily into Western form class systems. One example is the “adjectival verb” (形容詞 keiyōshi) in which no formal distinction exists between “verbs” and “adjectives” in that both can be “conjugated,” for example, 赤い (akaii) “red,” 赤だった (akadatta) “was red.”

Arabic has a system of differentiating form classes by creating 15 (10 in common use) separate structural categories based on triliteral consonant roots which transcend strict classification into Western grammatical form classes. The Arabic word conventionally translated as “noun” in English, مُسْمَى pl. اَسْمَاءٌ, *ism* pl. *asmaa'* is equivalent in function to a range of Western form classes: nouns, pronouns, adjectives and adverbs. In most cases *asmaa'* are derived from structures that also yield equivalent verbs, for example, يَكْتُبُ كِتابًا *yaktub kitabanaan* “he writes a book,” where both words are based on the same triliteral root, ك ت ب k-t-b.

In this paper I maintain that it is more accurate to look at the grammatical form classes in these non-Western languages by examining their specific functions within their respective languages rather than trying to forcibly analyze them through the lens of structures dictated by Western languages. Taking Ross’ notion of flexibility in form classes and Whorf’s more universal typological proposal, I will show how a more universal form class analysis can provide a more accurate picture of form class, one that might productively be applied to a revised analysis of Western languages as well.

# What is a ‘pronoun’ in East and Southeast Asian languages? Reconsidering a traditional grammatical category through EP’s lenses

Panel contribution

***Prof. Federica Da Milano***<sup>1</sup>

*1. University of Milano-Bicocca*

The aim of this paper is to contribute to the discussion of the notion of ‘descriptive categories’ in linguistics, through the analysis of a case study, namely the debated notion of ‘pronoun’ in East and Southeast Asian languages, with a special focus on Japanese. The question of the status of linguistic categories implies first of all a reflection on categorization from a cognitive point of view.

In the typological community and in linguistic literature there is a heated discussion about the status and the epistemological value of the notion of ‘category’ and around the question whether grammatical categories can be considered universally valid entities or rather as language-specific phenomena. One of the last examples of this debate is witnessed by the discussion on the LingTyp mailing list on 2016, partly published in a special issue of Linguistic Typology and, by the forthcoming volume *Linguistic Categories, Language Description and Linguistic Typology*, Benjamins, edited by Alfieri/Arcodia/Ramat.

After a description of the main aspects of the notion of person as a grammatical category, the focus is devoted to personal pronouns in general and then to personal pronouns in East and Southeast Asian languages. Special attention is devoted to Japanese personal pronouns, taking into account the Emancipatory Pragmatics approach and more specifically the concept of *ba*, a theory of contextual interdependence, alternative to our Western more familiar ones, and which speaks directly to what we commonly call ‘situatedness, indexicality, co-presence and context’.

I will suggest, on the one hand, that a prototype-oriented scalar approach could best describe the notion of ‘pronoun’: the difference between nouns and pronouns cross-linguistically can be considered a matter of degree, with conventionalized expressions of person deixis in Indo-European languages lying on the pronominal side of the scale, while Japanese and other East and Southeast Asian languages forms further towards the nominal side. On the other hand, I will propose that Japanese and other East and Southeast Asian languages can be considered as empathy-prominent languages, whereas Indo-European languages as person-prominent languages. The concept of *ba*, the semantic space where the speech event takes place, can be thus considered as the field in which the relational features of psychological proximity and distance are negotiated.

# What's Important is the Copula: The Role of LT Constructions in Creating Opposing Stances

Panel contribution

***Prof. Patricia Mayes***<sup>1</sup>

1. University of Wisconsin-Milwaukee

Verbal disputes (or arguments) are sequences of utterances that display opposing stances (Maynard 1985; Hutchby 1996). In addition, participants use sequential patterning of actions such as questioning to position their opponent as the recipient of further oppositional action (Reynolds 2011). What has not been explored in detail is the linguistic resources used to deploy these opposing actions. It is known that low transitivity (LT) constructions saturate everyday English conversation, but is this also true when participants are arguing, and if so, how do these forms function to accomplish opposing actions? Thompson and Hopper (2001) explained that the preponderance of LT forms in conversation is due to participants' actions, which involve displaying subjective stances in terms of "identities," "attitudes," and even "views of the world" (p. 53). Each of these constructs is relevant for engaging in political disputes, which is my focus here. Examining the interaction of strangers arguing in English at organized political protests, I analyze the types of LT constructions used. Then, I examine how these linguistic resources function in displaying the opposing stances that characterize the protest disputes. My findings show that, as in conversation, there is a preponderance of LT constructions in these disputes. Indeed, one-participant clauses are 87% of the data and break down as follows: Copular clauses (*I'm up here every day*) – 49%; other one-participant clauses (*it should never happen*) – 21%; and epistemic clauses (*I know*) – 17%. Although the remaining 13% of the clauses technically have two participants, they are not high in transitivity, according to Hopper and Thompson's (1980) parameters.

Du Bois (2007; 2014) has shown that participants use sequentially positioned linguistic resources that "resonate" with prior utterances to create stances that either are aligned or opposed. The example below shows some of the more obvious resources such as repetition of words and phrases and the overlapping positioning of utterances, but it also shows the importance of copular constructions in creating opposing stances. Here, the copula itself seems to have a pivotal function, which essentially concerns whether the quote "workers of the world unite" is or is not "a communist slogan." Indeed, W's turn in line 12, consists of only the copula, which is produced with lengthening and a rising pitch.

01. W: but what do you think more generally about using a:;
02. (.)
03. W: communist uh: (.) ^slo:gan,
04. in: connec[tion]
05. L: [I don't] think
06. W: [with this uh:]
07. L: [that workers of the world unite,]
08. W: protest.
09. L: -> is a ^communist slogan.
10. W: you don't think [work(.)ers: (.) of the world uni:te?] ((HONKING))
11. L: [workers of the world unite,]
12. W: -> i:s?
13. L: -> is a communist slogan.
14. -> what's communist about ^worke:rs.
15. W: -> i- isn't it the ^quote from *The Communist Manifesto*?

I argue that copular constructions, along with other LT constructions, are important resources in conveying how the world is from the speaker's perspective, which is essential for creating such opposing stances.

# What's my name in absolute solitude?: the essence of monologic selves in Japanese

Panel contribution

***Dr. Takeshi Koguma<sup>1</sup>, Dr. Katsunobu Izutsu<sup>2</sup>***

***1. Kanazawa University, 2. Hokkaido University of Education***

This study explores the linguistic nature of Japanese monologic speech as it refers to the speaker. The essence of this speech resides in absolute solitude: the conceptualization of a speech event with no addressee. The monologic self-reference in Japanese does not permit or tolerate either a second-person pronoun or a name referring to the speaker. This may be observed in (1) and (2), where the speaker is thinking aloud or to him/herself:

- (1) a. *ore[(w)atasi]-nara dekiru!*  
 I[II]-be.if can(.do.it)  
 'I can do it!' 'You can do it!'
- b. \**omae[an(a)ta]-nara dekiru!*  
 \*you[you]-be.if can(.do.it)

- (2) \****Haruhiko[Hiromi], nani yatten-no?***  
 what do:prog-thing  
 'Haruhiko[Hiromi], what the heck are you doing?'

The comparable English expressions, given as intended readings in (1b) and (2), reveal the existence of another type of conceptualization that gives birth to such types of permissible English monologic self-referential utterances, wherein the cognized-self is split and mapped onto a pseudo addressee (Koguma, Izutsu & Kim 2020). Hasegawa (2005: 155) refers to this type of speech event conception as "pseudo-conversation setting."

Japanese has a varied repertoire of the first-person reference (e.g., *boku*, *ore*, *(w)atasi*, *zibun*'self,' *otoosan*'dad,' *sensei*'teacher'), but the choice of reference to the speaker is commonly interactional and context-dependent. The monologic speaker exhibits different behavior from that of the dialogic speaker in that the monologic speaker can refer to him/herself by *boku*, *ore*, and *(w)atasi*, but not by the other interactional and context-dependent nouns. The pronouns *boku*, *ore*, and *(w)atasi* are not fully context-independent in that they are all inherently associated with gender and/or formality, but they are not necessarily interactional. On the other hand, the first-person pronominal use of kinship or status terms like *otoosan*and *sensei* presupposes essential reference to an addressee. Those expressions are therefore not available in terms of absolute solitude.

The (reflexive) pronoun *zibun* referring to the speaker is actually disfavored in monologue, contrary to the corollary of "public-self vs. private-self" characterization (Hasegawa and Hirose 2005*inter alia*). Substituting *zibun* for *ore[(w)atasi]* in (1a) renders the utterance infelicitous, as shown in (3).

- (3) ??***zibun-nara dekiru!***  
 myself-be.if can(.do.it)  
 'I can do it!'

This suggests that the notion of *zibun* is interactional in assuming more or less an addressee. This pronoun actually exhibits a unique referential behavior. It refers to the speaker in declarative sentences as in (4a), but to the addressee in interrogative sentences as in (4b) (Koguma & Izutsu 2017: 4-5). This characteristic of alternative references could be partially responsible for the unacceptability of *zibun* referring to the speaker her/himself in a speech event of absolute solitude.

- (4) a. (soo iu) *zibun-wa dekinai-kedo-ne*. [Declarative, with Speaker]  
 so say self-TOP cannot-though-FP  
 (Having said that,) I myself cannot do it.'
- b. (soo iu) *zibun-wa dekiru- no.* [Interrogative, with Addressee]  
 so say self-TOP can-FP  
 '(Having said that,) can you yourself do it?'

The theoretical view that the pronoun *zibun* represents “private self” in “private expressions” with no addressee (Hasegawa and Hirose 2005; Hirose 2005) fails to explain why it can refer to the speaker in dialogue but not in monologue.

# When is it Great Again? Vagueness and Ambiguity as Communicative Strategies in Rhetorical Questions

Panel contribution

***Mrs. Maren Ebert-Rohleder***<sup>1</sup>

1. University of Tübingen

Gricean approach to communication as a form of rational action views the speaker and listener as rational and cooperative conversation partners who optimize their utterances to transfer information efficiently. Following this approach, one could assume that speakers in political settings should use precise wording to avoid any form of misunderstanding. In this paper, I investigate ambiguous and vague questions in Donald Trump's presidential election campaign in 2016. According to the empirical investigation of 16 speeches and 709 questions of Donald Trump, I claim that neither ambiguous nor vague expressions are avoided, but rather intended to reach communicative goals other than an efficient transfer of information. Due to the form-function ambiguity of questions, they can either be understood as rhetorical or ordinary. However, embedded in the campaign context, the rhetorical reading is salient and creates a rhetorical effect (Knape 2015).

I will show that a pragmatic approach offers tools to elaborate on the implicatures, differences, and functions in the context of speeches. Vague predicates make the truth conditions of utterances looser, making it difficult to define exactly what conditions need to hold for the statement to be true. Such expressions are not as easily proven to be wrong whereas e.g. lexical and referential ambiguity are characterised by distinct readings. I show that the effect of vagueness is intensified even further when vague expressions are embedded in rhetorical questions, such as in (1).

(1) How are we gonna – how are we gonna go back and make it great again?

(Donald Trump, speech on June 16<sup>th</sup>, 2015)

In (1), the predicate "great" selects a very broad region in the semantic space that depends on the intentions of the conversation partners and the surrounding discourse. Trump points to a scale of values on the "go back" answer scale to find greatness. "Great" is positively connotated and the boundaries of "great" are fuzzy since there is no beginning and no end of "great" (see Sorites Paradox). In addition, the referentially ambiguous "it" can refer to e.g. topics as economy, social services, domestic policies, or America in general. Therefore, the speaker is able to address various hearers, even though they might have different interests, at the same time, and achieve a strong persuasive effect.

Upon the analysis of rhetorical questions collected in the course of this study, I conclude that vagueness and ambiguity are both, when used strategically, special rhetoric devices that allow the speaker to address a large and heterogeneous audience opening interpretative options wide enough to suit a diverse crowd.

# When silences are problematic: Pursuing response with address terms in post-gap position

Panel contribution

**Mr. Pepe Droste**<sup>1</sup>

1. University of Münster, German Department

Silences that embody someone not responding are recurrently treated as indicative of trouble. Previous conversation-analytic research has documented a set of practices for pursuing response when, following a sequence-initiating action, a responsive action is not produced next (Jefferson, 1981; Davidson, 1984; Heritage, 1984; Pomerantz, 1984; Stivers & Rossano, 2010; Bolden, Mandelbaum & Wilkinson, 2012; Kidwell, 2013; Romanik, 2013). This paper extends this line of research by examining pursuits of response with address terms in post-gap position. The analysis suggests that incremental address terms provide a grammatical flexible resource that characterizes the preceding gap specifically for who is not responding, but not for what response the person is not producing. This allows for dealing with multiple interactional troubles, which is demonstrated by specific sequential trajectories. By showing how participants mobilize address terms as a resource to manage troubles beyond problems of speaking, hearing, and understanding within the inescapably incremental and interactive production of turns at talk, this paper invites to discuss the boundaries of the “organizational domain of repair” (Schegloff, 1982: 91). Data are in German.

# When strangers meet: On passing-by interactions in public space

Panel contribution

***Ms. Julia Schneerson<sup>1</sup>, Mr. Philipp Hänggi<sup>1</sup>***

***1. University of Basel***

First-time encounters between strangers are omnipresent in everyday life. While urban public space has been described as the locus of the “world of strangers” (Lofland 1973) in which *civil inattention*—“the slightest of interpersonal rituals” (Goffman 1963: 84)—constitutes the *sine qua non* of quotidian public life, how unacquainted people actually transition from *unfocused* to *focused* interaction (Goffman 1963, 1971) remains under-studied (but see Mondada 2009, De Stefani & Mondada 2010, 2018). While previous CA studies of openings have fruitfully analyzed how participants initiate an interaction across a large variety of settings (see Pillet-Shore 2018 for an overview), investigations that focus explicitly on emergent first encounters between unacquainted parties in nonprivate, public territory are scarce in extant interactional literature on openings. This paper contributes to this topic by addressing one form of everyday public sociality between ‘unacquainted’: passing-by interactions. Drawing on video recordings of naturally occurring interactions collected in public space in German, French and Italian-speaking parts of Switzerland, collected within the SNSF-project *The First Five Words*, we adopt an ethnomethodological (Garfinkel 1967) and multimodal conversation analytic approach (Goodwin 2018; Mondada 2016; Sacks 1992; Schegloff 2007) to investigate how incidentally co-present individuals co-accomplish fleeting forms of co-participation when passing by each other. Mobility in interaction is now an established topic in EMCA (Haddington, Mondada & Nevile 2013) and has produced work on how passing by each other involves mobile parties in public space, who mutually adjust their trajectories (De Stefani, Broth & Deppermann 2019; De Stefani & Mondada 2018). Relatedly, Gardner’s (1980) early ethnography of “street remarks” by unacquainted passersby has informed both everyday forms of public sociality and the animus so often evoked by urban public space. By contrast, González-Martínez et al.’s (2017) video-based study of “on-the-move” interactions focuses on fleeting greetings in hospital corridors, building on Mondada (2009) in terms of spatiotemporal contingencies and the co-established interactional space between participants.

In line with this body of work, our paper centers on the transient and mobile nature of passing-by encounters in public space. It focuses on interactions strangers engage in while passing by and continuing to walk, without stopping. Starting from the most minimal form of interaction and progressing toward more complex cases adapted to emerging local contingencies, this paper thus sets out to i) pinpoint the interactional work that goes into mobile “greetings-only interactions” (Sacks 1992: 193); ii) show how ‘minimal forms of proper interaction’ can be minimally expanded after greeting, for instance in one-word-only topical talk; iii) describe how language choice in multilingual settings is demonstrably oriented to in and through greetings in these mobile encounters. This paper adds to research on mobility in interaction and the dynamic nature of interactional space. It addresses the diverse dimensions and resources that characterize openings in the fleeting context of passing-by encounters while at the same time highlighting ways in which “fellow users of a public space” (Sacks 1992, cited in Goffman 1971: 7) engage in pro-sociality *en passant*.

# When words don't come easy: resources for responding to drunk customers' unintelligible turns in police interaction

Panel contribution

***Dr. Samu Pehkonen<sup>1</sup>***

***1. Police University College***

This paper studies police officers' responses to drunk persons' problematic turns in face-to-face encounters. The challenge for the officers is intertwined with drunk persons' (dis)ability to engage in the production of orderly conversation. Five practices in responding to drunk person's unintelligible and therefore repairable turns are identified.

Officers can treat drunk person's (non)lexical turn-in-talk as irrelevant and unwarranted for the ongoing action; thus 1) noncommittal is preferred.

01 P1: Tää on poliisi. Me- menoks.

This is the police. Le- let's move on.

02 DP: (äoO:::::::[tia] boe iä: (.) miordemän.)

03 P2: [Tuu].

Come.

Drunk turn can lead to 2) other-initiated repairs (e.g., officers repeat their previous turn or produce open-class repair-initiator after drunk person's turn).

01 P1: Moro.

Hiya.

02 Poliisista.

This is the police.

03 (1.4)

04 DP: ö:::::

05 P1: Moro.

Hiya

06 DP: Ei toimi.

Doesn't work.

07 P1: Mikä ei toimi.

What doesn't work.

A further practise is to provide 3) other-initiated repair with explicit categorization of drunk person's impairment or status as a problematic speaker.

01 DP: (sä totannii anteetsi(.)anto-)

(you well forgiveness-)

02 P2: Häh?

What?

03 DP: (antasitsi)

04 P2: Nyt on semmone salaus päällä että sanoppa uuelleen.

Now there's such an encryption that why don't you say again.

There are also 4) acquiescing responses by the officers: here, the officers align with whatever the drunk person is saying but only on a surface level while being ignorant to the drunk person's intended actions.

01 DP: (Se on tääl kylhyl) >nolla ysi ysi (ja< ylh-)

(it is here - ) zero nine nine (and - )

02 P2: Joo-o?=

Okay?

03 P1: =Kyllä kyllä.

Yes yes

04 DP: (Mun poika on) [ ( - - ) ] (-lisesti).

(My son is -----ingly)

05 P1: [((coughing))]

06 P2: No niin sekin vielä.

Okay I see that one too.

Finally, officers can provide 5) uncandid candidate understanding of drunk person's turn and hijack drunk person's effort to produce talk for e.g. humorous project.

01 P2: Mikä sun kotiosote on.

What's your home address.

02 (0.6)

03 DP: @<Jaa kotiotote o: (.) taa ta[vallaa),>@ ]

Well home address is ( ----- )

04 P1: [heh heh heh]

05 Jaakon jäät(h)elöautossa a(h)suu.

She lives in Jaakko's ice cream van.

06 P1: £M(h)itä s(h)e s(h)ano£.

What did she say.

Because police officers orient to drunk persons' impairment as self-inflicted, the moral accountability for the interaction differs from cases where speakers suffer from a long-term seizure, for example. These claims are illustrated with examples from video-recorded encounters between Finnish police officers and drunk persons (from a television documentary and simulated police training) and analysed by using conversation analysis.

# When-clause constructions in English conversation: A special type of complex syntax

Panel contribution

***Prof. Sandra A Thompson<sup>1</sup>, Prof. Elizabeth Couper-Kuhlen<sup>2</sup>***

***1. UCSB, 2. University of Helsinki***

Studying the recent literature on complex syntax in conversation, we have been struck by the discrepancy between English *when*-clause constructions and other clause combinations. On the one hand, *when*-clauses adhere to the principle that grammatical resources serve the purpose of either projecting what comes next or backlinking to what precedes, or both (Pekarek Doehler et al. 2015); on the other hand, they provide an interesting exception to the claim that in conversation, clause-combining patterns are often “patched together on the fly”, emerging online, e.g., in response to local contingencies (e.g., Horlacher/Pekarek Doehler 2014). Our paper seeks to account for this discrepancy.

Our study is based on a collection of more than 100 *when* and *whenever* clauses in everyday English conversation, including video-recordings of face-to-face interaction and audio-recorded telephone calls. We have tracked the position of the *when*-clause in relation to the main clause (pre-posed or post-posed), its prosodic design in relation to surrounding talk, and its role in turn construction and sequence organization. Gaze and gesture behavior accompanying *when*-clause constructions were noted where relevant.

*when I see it it's my whole body.*

*I like the way it looks when you use it,*

There is little skewing in the relative frequency of pre-posed vs. post-posed *when* clauses: we have roughly the same number of each type. Furthermore, as we might expect, pre-posed and post-posed *when* clauses are oriented to as two separate formats, rather than as one format with two different positions. In particular, speakers produce pre-posed and post-posed *when*-clauses with markedly different prosodic features. Specifically, the pre-posed *when*-clause tends to have higher pitch onset and wider pitch range than the post-posed *when*-clause, and is more likely to be prosodically separated from the following clause, creating an opportunity for the recipient to produce a *continuer*. The post-posed *when* clause has lower pitch onset and narrower pitch range than the pre-posed *when*-clause, is more likely to be prosodically integrated with the preceding main clause, and is rarely separated from the prior clause by a *continuer* from the recipient.

We argue that the prosodic features of *when*-clause constructions are related to the specific affordances that *when* clauses provide as resources for speakers (Ford 1993). The prosodic features of pre-posed instances are related to their work in temporally framing the talk that follows, e.g., a story or telling, while the prosodic features of the post-posed instances are related to their work of more narrowly providing a temporal setting for the situation named in the prior clause. *When*-clause constructions are thus not like other ‘bi-clausal’ constructions, which have been described as normativizations of conversational fragments (Hopper/Thompson 2008, Hopper 2015, Couper-Kuhlen/Thompson 2008). We provide sequential and embodied evidence that English *when*-clause constructions do not ‘emerge’ online like the more ‘patched together’ types described in the literature. We conclude that they represent a special type of complex syntax, and welcome further research to determine whether these findings hold cross-linguistically.

# Where is the virus? Political manipulation of the language about coronavirus in a far-right Brazilian news website.

Panel contribution

***Mr. Heronides Moura***<sup>1</sup>

1. Universidade Federal de Santa Catarina

I try to show that the Brazilian far-right site *criticanacional.com.br* manipulates the language about the coronavirus, in order to sustain some biased and unjustified claims about the Covid-19 pandemic and to promote on line hate speech. Data analysis shows that the most noteworthy manipulation found in this website is the concealment of relevant information about where the virus is. In the large majority of sentences about the virus found in the corpus, there is no indication of where the virus is located or of how it is spreading. It is argued that this concealment is a way of strengthening the unjustified claims of a hate speech.

This study also addresses the question of how language works in this context of cyberhate. It is argued that there is no way, based on the linguistic level, of defining a specific manipulative stance of language usage. Sperber and Wilson (1995) have pointed out that not all pieces of information are equally accessible to a hearer. On the other hand, if persuasion is defined as “a discursive attempt at strengthening an utterance *U* by ensuring that *U* is consistent and, ideally, strengthened in all relevant subsets of  $CE^H$  (cognitive environment of the hearer)” (Maillat, 2013), the suppression of information found in my data should be considered a garden-variety persuasion and not some noteworthy kind of manipulation or cyberhate speech.

If we were bound by linguistic and cognitive considerations, there would be no way of distinguishing persuasion from hate speech as found in the corpus.

As there is no linguistic or cognitive way of distinguishing persuasion from manipulative hate speech of this kind, I argue that only an ethical stance (Graham, 2018) can provide such a distinction. My point is that some cases of cyberhate speech are apparently indistinguishable, on linguistic grounds, from ‘normal’ persuasion, but they deserve to be examined from an ethical point of view.

# Where's the vaccine for racism? Expressions of hope in COVID-19 and Black Lives Matter Semiotic Ephemera

Panel contribution

***Dr. John Hellermann<sup>1</sup>, Dr. Jenny Mittelstaedt<sup>1</sup>, Prof. Janet Cowal<sup>1</sup>, Prof. Steven Thorne<sup>1</sup>***

***1. Portland State University***

The COVID-19 pandemic, recognized in the United States in mid-March, 2020, and the George Floyd murder by police in Minneapolis, U.S.A. at the end of May, 2020 have both catalyzed public displays of a range of expressions of hope in a range of forms including the production of handmade graphical messages. Building on the concepts of 'linguistic landscapes' (Landry & Bourhis 1997; Cenoz & Gorter, 2006, Smakeman & Henrich, 2018), discourse in place (Scollon & Scollon, 2003), and dialectical utopianism (Harvey, 2000) our project focuses on local public linguistic expressions that have emerged from these globally-significant events.

Publicly visible graphical messages may often have a degree of permanence such as inscriptions on edifices carved in stone (Coulmas, 2008). Others are of variable permanency, including graffiti (Hanauer, 2010; Pennycook, 2010), the mobile signs of protests (Seals, 2011, Kasanga, 2014; Rudby & Ben Salim, 2015), and mourning (Kailauweit & Quintana, 2020). We are interested in this ad hoc, less permanent aspect of non-mobile handmade messages, both in public spaces (on telephone poles, walls, fences) and visibly displayed on private property. We examine the materiality of the messages, the timing of their production, the placement in the environment, and the social actions inscribed in the signage that signal emotional expression (Borba, 2019) in these semiotic ephemera.

For our research, a team of faculty and students collected over 200 photographs of handmade messages related to COVID-19 and anti-racism in a wide range of residential districts of our metropolitan area. The photographic data were tagged for speech act, location in the city, placement, and materiality, and each was digitally pinned to a map. Using methods from nexus analysis (Scollon, 2001), we focus on the materiality, speech acts, spatial distribution and clustering of the messages.

Preliminary findings show a wide variety of placement (e.g. windows, sidewalks, vehicles), material composition (e.g. chalk, spray paint, yarn), and speech acts. We also saw a marked reduction in new COVID-related messages corresponding to the massive increase in anti-racism messaging as well as evidence for palimpsests of expression (adopting the language of the first crisis in the second) and materiality (reuse of space for new messaging).

Expressions of hope have been described as oriented toward a mediate future, connecting the present to the remote future (Minkowski, 1970, discussed in Crapanzano, 2003). However, the COVID-related speech acts in our findings were primarily expressions of encouragement and hope for a return to 'normal,' suggesting an anaphoric reference to the better days of the past. In contrast, the anti-racist sentiments express grief, frustration, and anger and suggest a cataphoric and transformational forward-looking version of hope. Both COVID and BLM signage embody the conception of hope as "the semiolinguistic work in which people oppose violence and destruction with some collective construction of a survival perspective" (Silva & Alencar, 2018: 685). The COVID-related messaging expresses hope without accompanying calls to action, arguably necessary for a survival perspective. But it is in the anti-racist messaging where hope is expressed as a "reorientation of knowledge" (Miyazaki, 2004).

# Who gets their pronouns? Gender, ethical reasoning, and English pronoun use.

Panel contribution

**Dr. Evan Bradley<sup>1</sup>, Dr. Laura Evans<sup>1</sup>, Ms. Haley Grossi<sup>1</sup>, Ms. Eliana Peretz<sup>2</sup>, Mx. C. Feng<sup>2</sup>, Ms. Gillian Knox<sup>2</sup>, Mx. Faye Winer<sup>2</sup>**

*1. Penn State Brandywine, 2. Mount Holyoke College*

Personal pronouns as a reflection of gender identity have been integral recent LGBTQ+ language reform efforts. Such efforts are not simply a matter of linguistic change, because the acceptability of gender-neutral/nonbinary pronouns (i.e., singular *they*) in English (and others, including Swedish) is affected by extralinguistic factors including personality, language ideology, and social attitudes. We wanted to know how English speakers decide which pronouns to use when talking about other people; specifically:

1. Who is misgendered, and how are they misgendered?
2. Which speakers use pronouns correctly and who misgenders others?
3. How do speakers integrate linguistic/nonlinguistic context with prior attitudes?

U.S. English speakers (n=112) read 12 profiles of students who were interested in joining a club. Students were referred to using one of several pronoun sets (*they/them*, *she/her*, *he/him*, *ze/zir*). Text profiles were accompanied by stock photos, which in a separate sample (n=50) were rated on the femininity and masculinity of gender presentation and sorted into feminine, masculine, and nonbinary categories (those with similar masculinity/femininity ratings). Photos were paired with profiles such that each pronoun set occurred with each photo type.

Participants typed responses to questions about the students in the profiles (e.g., “Would this student be better as the secretary or treasurer of the club?”). Finally, participants took the Moral Foundations Questionnaire, which measures ethical reasoning along five dimensions (Care/Harm, Fairness/Cheating, Loyalty/Betrayal, Authority/Subversion, and Sanctity/Degradation) and answered demographic questions. We hypothesized that adherence to different moral foundations would lead to different linguistic choices; for example, a speaker who values Care avoids misgendering another person, while a speaker who values Authority defers to prescriptive linguistic/gender norms.

Responses were coded by five coders using a consensus coding procedure to identify patterns in pronoun use. Cases in which participants used pronouns other than those given were classified into several subtypes, including Picture Preference (using a pronoun matching the apparent gender of the individual, rather than that given in the text); and Degendering (using singular *they* instead of a given gendered pronoun). Coders also identified other patterns, such as Pronoun Avoidance, in which participants use no pronouns in their responses, instead using full noun phrases or other circumlocutions.

Responses which least often matched the pronouns given in the prompt were those including neopronouns (*ze/zir*), apparent mismatches between photo and pronouns (e.g., *he* with feminine photo), and singular *they* used with feminine/masculine photos. Participants who scored above average on Care and Fairness (associated with social liberalism) use more pronouns correctly and misgender subjects less often, while those who score above average on Sanctity, Loyalty, and Authority (associated with conservatism) use correct pronouns less often and misgender others more often. These findings suggest that selecting pronouns in a non-trivial, active process in which speakers integrate multiple sources of information from the linguistic and nonlinguistic context, and which is subject to pre-existing knowledge or biases.

# Who gets to be a hero?: Hero discourses in the Anglosphere

---

Panel contribution

---

**Dr. Lauren Sadow<sup>1</sup>, Dr. Katie Cox<sup>1</sup>**

**1.** the Australian National University

In times of crisis, you can rely on a hero to save you. At least, that's what English media would like you to think. The word "hero" is on an upward trend in English-language publications across the globe, tipping us into its discursive world at its every use. This paper proposes that "hero" is an Anglo cultural keyword (Levisen and Waters 2017) which comes laden with its own discourses regarding courage, sacrifice, and saving lives. The 21st century has seen unprecedented media communication, at the same time as political, humanitarian, and health crises, changing our priorities and the ideals we look to (Porpora 1996, Schlenker et al 2008). By examining the media use of hero narratives, we can see how this keyword is reflective of the current cultural landscape in different Anglo countries: whose lives we value, what actions are worthy, and who our ideal person is (Butler 2009). We use literary discourse analysis of written and recorded media, corpus data, and cultural semantics to show the depth of meaning in the word "hero" and untangle the distinct public narratives between 'unsung heroes', 'war heroes', 'healthcare heroes', 'local heroes' and 'sporting heroes'.

# Who gets to decide? How does political discourse frame the role of politicians and scientific experts in times of pandemic?

Panel contribution

***Prof. Philippe Hambye<sup>1</sup>, Prof. Min Reuchamps<sup>1</sup>, Ms. Coline Rondiat<sup>1</sup>***

***1. Université catholique de Louvain***

After the outbreak of the pandemic in Belgium in March 2020 and after a national lockdown was decided by the Belgian federal government, an important public controversy arose about the political measures that should have been taken and that should follow, in order to cope with this unprecedented situation. Amongst other issues, there was a heated debate about the role scientific experts and politicians should take in designing the appropriate strategy to face the crisis. Beyond their explicit arguments, stakeholders from both sides refer implicitly to a certain conception of the democratic process of decision making in time of crisis and more generally in a democracy facing exceptional conditions (Farrelly 2015; Mey & Ladegaard 2015): some consider the experts should decide because they have knowledge about the pandemic, others think politicians should keep the high hand on decision-making process, because they are the legitimate representative of the people.

This paper aims at studying the discourse strategies politicians have used in order to justify (i) the way they have aligned or disaligned with scientific experts and (ii) the role they have assigned to these experts in the decision-making process. Our corpus is made of all the instances of politicians' discourse (interviews or quotations) evoking the scientific experts (their role, the relevance of their advices, etc.) published during the first wave of the pandemic in Belgium (March-July 2020) either in two important French-speaking newspapers or on the Facebook pages of the 5 main political parties in French-speaking Belgium and of their president. In this paper, we will focus on the date of one newspaper. Our analysis will study all the pragmatic means used to support, invoke, qualify, contest or reject experts' statements and recommendations, as well as the way discourse constructs and legitimize a particular vision of the roles of politicians and experts should take in democracies. We will focus on implicitness in discourse (Cap & Dynel 2017) and explore how implicatures and metaphors in particular contribute to conveying a particular image of the role each kind of actor is expected to play.

# Who is offended? The endless cycle of causing and taking offence on social media

Panel contribution

***Dr. Tahmineh Tayebi<sup>1</sup>***

***1. Aston University***

In this presentation, I will discuss the complex nature of taking offence and its different layers. I will look at both the explicit and implicit ways people can cause offence on social medias and will specifically look at the implied impoliteness (Tayebi, 2018) and the linguistic creativity (Culpeper, 2011) which are common in today's social media interactions. In my analysis, I will be drawing on several examples from a personally collected corpus of taking offence on different social media platforms and will discuss how some social media users in some comments tend to justify their causing of offence by casting themselves in the role of the offendee (Parvaresh and Tayebi, 2018) and how that leads to an endless circle of causing and taking offence.

# Who is the actor? What is the action? Managing the problem of multiple categories in relation to the formation and ascription of actions

Panel contribution

***Prof. Kevin Whitehead<sup>1</sup>, Prof. Geoffrey Raymond<sup>1</sup>***

*<sup>1</sup>. University of California, Santa Barbara*

Sacks's foundational observation that any member of society can always potentially be categorized in multiple ways (see Sacks, 1972a, 1972b, 1992; Schegloff, 2007) – which we refer to here as the problem of multiple categories – has reshaped how analysts have approached the relationship between category membership and action. This insight was initially introduced and subsequently elaborated (see, e.g., G. Raymond & Heritage, 2006; Schegloff, 1987, 1991, 1992a, 1992b, 1997, 2002, 2007; Whitehead, 2020) as posing analytic challenges in relation to social scientific description, and addressed by proposing an approach to analysis grounded in the use of observable evidence of participants' orientations to the relevance and procedural consequentiality of a particular category or categories for the action in question. A substantial body of further research across a wide range of membership categorization devices (MCDs) and action types has considered how participants treat membership in a particular category as implicating entitlements (or lack thereof) to act in particular ways (e.g., Hester & Eglin, 1997; Kitzinger, 2005; C. W. Raymond, 2019; G. Raymond & Heritage, 2006; Rossi & Stivers, 2020; Watson, 1978; Whitehead, 2020). In this presentation, we build on this research by re-centering the problem of multiple categories as a participants' concern, showing that speakers attend to systematic interactional contingencies associated with the multiple ways in which participants can potentially be categorized. We explicate this by showing that participants orient to a party's membership in one category versus (an)other(s) as shaping the action-import and/or valence of a speaker's conduct, and thus the relevancies it establishes for next speakers. In such cases, participants' choices reveal how they monitor and manage associations between category-based entitlements and the specific actions they produce. Drawing on video- and/or audio-recorded data from a range of naturally-occurring conversational and institutional settings, we begin by examining cases in which a speaker's conduct evidently produced by reference to their membership in one category comes to be negatively sanctioned by reference to their membership in another category. We then consider various Self- and Other-oriented ways in which speakers can manage potential trouble of this nature across a range of sequential positions. Based on this analysis, we propose that the problem of multiple categories constitutes a generic organizational matter for talk-in-interaction, and thus should be considered a locus of organizational practice alongside those previously described by Schegloff (2006) as comprising the procedural infrastructure of interaction.

# Whose common ground? - Analyzing communication between physiotherapists and patients in a Hungarian hospital

Panel contribution

***Ms. Anna Udvardi<sup>1</sup>***

***1. Semmelweis University***

**Aim:** The present talk argues that 'knowledge translation' is a two-way process in the medical interview. Furthermore, it is suggested that this approach of bidirectional 'knowledge translation' is inevitable for the creation of common ground and shared understanding between healthcare professionals (HCP) and patients.

**Background:** In HCP-patient communication the two parties represent two different worlds, namely the voice of medicine and the voice of the lifeworld [1]. Much emphasis is put on the 'knowledge translation' from HCP towards patient, to reach a shared understanding regarding the problem itself and the recommended course of treatment.

However, 'knowledge translation' should also occur the other way around, from patient towards HCP. The creation of common ground should include a continuous information exchange between the interlocutors. In other words, common ground should be dynamically co-constructed [2] among participants. In order to arrive at an accurate diagnosis and a workable treatment recommendation, the HCP should first understand the lifeworld of the patient (views, ideas, opinions, concerns) and then incorporate this information into their medical perspective.

**Problem:** What dialogical mechanisms or interactional features may help or hinder the creation of common ground in healthcare settings?

**Data and Method:** The data consist of audio recordings of first encounters between physiotherapists and their patients, collected in a major hospital in Budapest, Hungary. Twenty-two physiotherapists took part in the research, and each recorded 3-5 sessions with different patients. The qualitative analysis focuses on the opening turns (opening question and problem presentation) of the visits.

The analysis examines topic development on a turn-by-turn basis, with the idea that the physiotherapist's opening question typically frames the encounter as a medical encounter, thereby influencing patients' way of answering, i.e. patients' answers align with the expectations of the medical world rather than personal experience. Considering the development of common ground between the participants, two main types of communication styles are described. One I call the "flow of conversation", where the physiotherapist does not interrupt patient's answer, and builds on this information in the next turn (topic continuity). The other style is the "rigid question-answer style", where sticking to the fixed structure of an assessment form seems to be dominant. It seems that the main goal of the latter is to fill out the form properly and less to have a conversation and to build rapport with the patient.

**Conclusion:** The "flow of conversation" realized by topic continuity helps the voice of medicine and the voice of the lifeworld to converge and thereby favours the development of common ground.

# Why have linguists overlooked silence all together? Explaining the past and examining what linguistics has gained once silence had been integrated as part of language

Panel contribution

***Prof. Michal Ornan-Ephratt<sup>1</sup>***

*1. University of Haifa*

By its definition, silence involves absence. Noticing the silence, distinguishing between different sorts of silence, and questioning the role of the various silences, not only make these silences present, but more so constitute an accurate representation of silence.

Examples of silences made present by their integration as parts of scientific apparatus come from the zero in mathematics, the null-empty group in logic (group theory) and the black hole in physics. Likewise, silences have been acknowledged as significant components of artistic compositions, such as the *tacet* in music, spaces and void in plastic arts and in architecture (such as Berlin's Bebelplatz).

While, as these examples demonstrate, silence is present in almost any field, and as many scholars have noticed it plays a significant role in the discipline they investigate, it seems that linguists overlooked silence all together. The current presentation aims to explain (regarding the past) why that was the case, and looking at the present—such as our session and many other linguistic frameworks devoted to the study of silence—what linguistics has lost from that neglect, and what it now gains from making verbal silences present.

To explain the past, we employ and analyse statements made by scholars offering their explanation why linguistics had overlooked silence. To see the loss caused by overlooking silence and the gain offered in considering silence, relevant linguistic concepts will be classified and analysed in terms of absence: (1) linguistic concepts which prior to their examination in light of silence were not considered as concepts involving absence; (2) linguistic concepts which were associated with absence whose linguistic role was misinterpreted; (3) linguistic concepts which were erroneously associated with absence.

# With and without touching: the partner's body as an option in and for improvised dance

Panel contribution

***Dr. Alain Bovet<sup>1</sup>***

***1. University of Lausanne***

This communication explores how improvising dancers produce on the spot accountable interactive configurations. In the absence of a pre-existing choreography, plan or structure, the participants rely on an openness and availability to any emerging feature of the ongoing situation (Bowers, 2002). Such features may include previous episodes of improvised choreographies, music (also improvised on stage), and various aspects of the material environment (floor, walls, objects).

However, an exploration of video recordings of improvised dance workshops suggests that the mostly used and oriented-to resource is the partner(s). Be it through extended bodily contact or distant interaction, the dancers systematically organize their activity with reference to the partner(s).

This contribution analyzes a three-and-a-half-minute sequence where the workshop teacher and a student produce an improvised choreography. I will attempt to show how their dance achieves an accountable character, practically oriented to by each dancer but also visually recognizable by the audience. This accountability is produced through “configurations”, which serves as a gloss for emerging assemblages of recognizable or meaningful bodily interaction.

Such configurations may be assembled with or without bodily contact between the dancers. I will first try to show that this distinction makes sense to the dancers, as it provides for a broad narrative structure of the choreography: an “approach” where the dancers orient to one another and get closer, a touching phase where the dancers establish and maintain a constant bodily contact, and a quick and visibly hostile “separation”.

I will then focus on the touching phase and analyze how the dancers practically exploit the tactile interaction between their own and the partner's body to assemble an accountable climax in the improvised narrative.

This exploratory study is taken as an occasion to understand how touching and being touched, in the notable absence of talk, contributes to the organization and coordination of an interaction (Lefebvre, 2020). By relying on visible aspects of the choreography, this video analysis stands in contrast to the idea, espoused by practitioners, theorists and analysts (Damian, 2013), that such dance is an interior phenomenon in which “there is nothing to see”. While video data certainly may not be sufficient, they do give access to aspects of its accountability. At least, as Merleau-Ponty (1964) would insist, when they are looked at from embodied viewpoints by incarnate viewers.

# Word in context – Digitalizing language in action for digital second language learning games

Panel contribution

***Dr. Louise Rasmussen<sup>1</sup>, Dr. Catherine Rineke Brouwer<sup>2</sup>***

***1. Roskilde University, 2. University of Southern Denmark***

This paper explores the potential of producing Simulated Immersive Environment (SIE) games for second language learning (Tranekjær, 2021) on the basis of authentic contexts of interaction. Research on second language learning outside the classroom setting (Firth and Wagner, 1997) have pointed to the need to anchor second language learning processes in authentic interactions. Furthermore, language teachers and researchers in language acquisition emphasize the need for acquisition of lexis (e.g. Kasper & Kellerman 1997), as it enables learners to understand, interact, and act meaningfully within a given social setting. The implications of both is that, ideally, the acquisition of words and utterances needs to be contextualized and linked to not only practices, but to social relations, contextually specific knowledge and particular activities in order to appear meaningful and relevant to the learner. One way of securing this is to organize 'language learning in the wild' activities (Wagner, 2019) another is to establish contextualized virtual learning spaces such as digital SIE games.

Building on multimodal EMCA (Hazel, Mortensen & Rasmussen, 2014), user-based design (Mack, Buur, Clark, & Larsen, 2013 ) and Computer Assisted Language Learning (Garreth, 2009), this paper explores how native-speakers use (or fail to use) contextual resources to communicate the meaning of lexis to non-native speakers. Based on recordings from an industrial laundry facility and a kindergarten involving, respectively, second language speaking adults and children, we analyze and discuss how context-related conduct may be translated to SIEs, thus providing contextually embedded second language learning opportunities.

The paper argues that SIEs can provide a virtual learning space for interaction based language teaching that, on the one hand, mimics social practices but on the other hand preserves the features of the social practice that are relevant and familiar to the members within a particular social context.

# Working offline: common ground in written discourse

Panel contribution

**Prof. Ivana Trbojevic Milosevic<sup>1</sup>**

**1.** Faculty of Philology University of Belgrade

In this paper, we try to reexamine the concept of Common Ground in the production of written discourse, in particular the written discourse intended for international readership. The Common Ground issues are dominantly addressed in regard to spoken discourse, such as conversation or other kinds of interaction that (more or less) happens *online*. Since ‘language is primarily a form of social interactive behaviour in which a speaker, **writer** or signer [...] addresses utterances [...] to an audience [...]’ (Allen 2012), the construction of CG in written discourse seems to be a legitimate research topic that, due to the specific circumstances in which written texts are produced, requires somewhat broader view on factors that influence its building, as we shall call it here, *offline*. Retaining the dynamic understanding of CG as proposed by Kecske & Zhang (2009), and bearing in focus Kecske’s (2007) observation that in intercultural communication lingua franca speakers rely more on linguistic means than on CG, we shall look into factors such as recipient design, perspective taking, controlling egocentrism and salience, lesser reliance on presupposition and ‘cultural knowledge’ (van Dijk 2001), preference for explicitness and absence of immediate rapport - in a corpus consisting of a number of newspaper articles published in the *New York Times International* in Serbia in 2007. *The New York Times International* supplement to the Serbian daily *Politika* brought to the Serbian readership the articles (in English) that had been originally published in the NYT with a five-day lapse. Comparison of the original headlines and articles with the versions published in the supplement showed consistent alterations to suit the international audience, which gave rise to the question of *offline* construction of CG addressed in this paper.

# Working together to agree: Dynamic common ground in BELF correspondences

Panel contribution

***Dr. Yi Zhao<sup>1</sup>, Mr. Mian Jia<sup>2</sup>***

*1. Beijing University of Technology, 2. University of Texas at Austin*

Drawing on insights from the dichotomy of “basic joint activity” and “coordinating joint actions” (Clark 1996; Clark & Henetz 2014), the basic joint activity in intercultural business negotiations among participants of Business English as a Lingua Franca (hereinafter BELF) is to get business done. And communicative acts such as speech are coordinating in nature because they facilitate the basic joint actions. However, little is known about the coordinating mechanism of reaching agreements in BELF communication where egocentrism also plays a role (Kecske & Zhang 2009). Specifically, there is a paucity of knowledge about the joint coordinating activities in terms of chaining, embedding, presequencing projective pairs (Clark & Henetz 2014).

To that end, we have self-compiled a 187,617-token corpus of business negotiation correspondences circulated among a Chinese-based and five European-based international trading companies. We then take a dynamic approach (Kecske & Zhang 2009) to examine the construction of common ground and emergent ground in terms of projective pairs among different BELF participants. Research questions are: What projective pairs are used to reach joint commitments among BELF participants of different L1s? How is common ground dynamically constructed by way of projective pairs?

The data are segmented in five different BELF communication pairs and then annotated in terms of projective pairs in order to compare between cultures. Analysis of Variance (ANOVA) will be employed to pinpoint the differences in national culture (assumed common ground) and business culture (defined by different companies). Besides, Chinese participants as an invariant factor of the five BELF communication pairs serve to compare individual differences contributing to emergent common ground. A preliminary study shows that business protocols tend to be most influential on the choice of projective pairs. We therefore argue that business cultures of multinational companies would guide the BELF participants to establish a core common ground, and the emergent common ground is mainly constructed by individual factors such as the readiness level of doing business. Overall, the dynamic process of reaching agreements in terms of projective pairs among BELF participants is coordinated out of intelligibility. On this view, we propose an interpretation of linguistic economy to describe the hierarchy of tripartite variants (individual, business, culture).

# Young, female, and empathetic: The identities of emerging new politicians in Japan

Panel contribution

**Dr. Kazuyo Murata<sup>1</sup>**

**1. Ryukoku University**

It is generally agreed that the typical image of a politician in Japan includes characteristics such as old or middle aged, male, hereditary, socially distant, and having an indirect way of speaking (Azuma, 2010). Recently, however, this image has been changing, albeit very slowly. The purpose of this study is to illuminate the identities of emerging new politicians through the lens of an analysis of press interviews concerning Covid-19.

Around the time of Japan's state of emergency declaration, two politicians, Mr. Yoshimura (Governor of Osaka) and Ms. Koike (Governor of Tokyo), attracted particular attention among the public and enjoyed the positions of first and second in the top favorability ratings among politicians. According to the literature on risk communication (ex. Nishizawa, 2013), press interviews provided by community or organisation leaders, especially at times of crisis, play a significant role in their favorability ratings. This study analyses the press interviews concerning Covid-19 given by these two politicians from April to July in 2020, including when the state of emergency was declared, which was when the public felt most fearful and anxious. It explores how their 'new' professional identities are manifest through their speeches, focusing on the salient linguistic features in their interviews.

The analytical framework I employ in this presentation is interactional sociolinguistics (Holmes, 2008) and the notion of 'identity' referred to in this study is conceptualized not as a fixed attribute but as what is actively and discursively performed and carried out in social contexts (Marra and Angouri, 2011).

The analysis results include the following: in Mayor Yoshimura's speeches, (1) a casual form of the first person pronoun is selected, and (2) casual dialectal forms are often used. In Mayor Koike's speeches, (3) English terms are often inserted, and (4) comments related to her make-up are often made. In both mayors' speeches, (5) positive politeness strategies are often utilized, and (6) their explanations are easily understood and logically constructed. These linguistic features of the mayors' speeches illustrate their attempts to construct their identities as new era politicians who are young (in the case of Governor Yoshimura), female (in the case of Governor Koike), socially close, and global.

# You're so mean but I like it – Metapragmatic Evaluation of Mock Impoliteness in Danmaku Comments

Panel contribution

***Ms. Shengnan Liu<sup>1</sup>***

***1. Lancaster University***

Danmaku, a commenting system that displays users' synchronous or asynchronous comments within the videotream, is widely used in Asian countries, especially in China and Japan (Wu & Ito, 2014). In a Chinese online talk show *Roast!* that features mock impoliteness speech events, Danmaku comments provide easy access to a vast amount of third-party participants' evaluations of mock impoliteness. Particularly in *Roast!*, the Danmaku system also allows users to vote for the comments by clicking on a thumbs-up button at the end of each comment and automatically displays the count of such votes. This possibly unique system renders the phenomenology of the Danmaku a two-stage process: i) the third-party participants make qualitative evaluations about the mock impoliteness speech events; and then ii) the third-party participants vote for the evaluations made via the form of Danmaku, leading to the number of votes. Thus, the aim of this paper is to investigate: i) what factors contribute to the qualitative evaluations; and ii) what factors contribute to the number of votes that each comment gets. By creating an effective coding scheme which captures intertextual references, sequence of speech events, metapragmatic evaluations, count of votes, etc. a large number of raw data was annotated for further analysis. Then, a conditional inference tree model (Hothorn et all 2006; Tagliamonte and Baayen 2012; Tantucci and Wang 2018), which is “a method for regression and classification based on binary recursive partitioning” (Levshina 2015:291), was fitted to answer these two questions. This method generated clear data visualizations by displaying the ranking of contributing factors to i) qualitative evaluation; and ii) the number of votes. The quantitative results are then interpreted in terms of qualitative analysis of typical examples from the data.

# You're the asshole: Building online community norms around Twitter's AITA account

Panel contribution

**Dr. Alba Milà-Garcia**<sup>1</sup>, **Dr. Elizabeth Marsden**<sup>2</sup>

*1. Universitat de Barcelona, 2. University of Huddersfield*

This paper concerns the affinity space created around the popular Twitter account @AITA\_reddit, which is specifically set up to repost AITA ('Am I the Asshole') posts from the Reddit community of the same name, where users share tricky or questionable situations in which they have found themselves, and ask other users whether they are at fault. The Twitter AITA account is not affiliated with Reddit in any way: it just shares the posts made on that platform with Twitter users, whose comments will (likely) never reach the original Reddit posters. These comments are a mix of serious judgements on the original posts and many different forms of online creative conversational humour (Dynel & Poppi, 2020), which includes meme usage, in-jokes and intertextuality. Twitter users' known tendency to exaggerate opinions and emotions (Terkourafi et al., 2018) is clearly reflected in this case of radical stance-taking, concerning (sometimes deceptively) common everyday situations.

The analysis of @AITA\_reddit's most popular Twitter posts reveals the intricacies of the affinity space created around this account. In this space, certain users emerge as key figures due to the specific roles they play in the community, and ambient affiliation (Zappavigna, 2011) among users is expressed through likes and retweets to (mostly) stand-alone comments. The users that interact with @AITA\_reddit's posts (and who do not necessarily follow the account) focus on justifying/condemning the OP's (original poster's) behaviour according to the moral order (Kádár et al., 2019, p. 8; Kádár & Haugh, 2013, pp. 93–94). The ingroup subscribes to a particular understanding of justice and morality, typically defined by leftist political views; in turn, those who have a different understanding of morality are viewed as the outgroup and are generally subjected to insults (both written and via images/gifs) and seen as a challenge to the (unwritten) norm.

# «.... i pečenegi ee terzali i polovcy. So vsem spravilas' Rossija. Pobedim i ētu zarazu koronavirusnuju!» How Twitter makes fun of Putin's communicative management of the coronavirus crisis

Panel contribution

**Prof. Nadine Thielemann**<sup>1</sup>

1. Vienna University of Economics and Business

Russia is among the countries that have been severely affected by the coronavirus crisis in several respects. The coronavirus not only triggered a crisis in terms of public health, but it also hit Russia in an already difficult economic situation and in lack of a welfare system that could soften the social and economic impact of a lockdown on its citizens' lives. Lastly, the constitutional referendum aiming to pave the way for Putin remaining in charge beyond a limited set of election periods as president initially scheduled for March also had to be postponed. The coronavirus crisis has had its impact on the preparation of as well as protest against this change in the constitution.

After an initial and rather short episode during which COVID in political communication has been framed as the *annual pneumonia*, however, the Russian government took more serious measures including a rather strict lockdown starting in late March and labelled as *holiday / days off work*. On 8<sup>th</sup> April, Putin addressed to the Russian citizens via video message during a virtual meeting with Russian governors in order to motivate them to maintain the announced measure of *self-isolation* (e.g., broadcast on <<https://www.m24.ru/videos/politika/08042020/235586>>). The tone and line of argumentation adopted by Putin in this short address is surprisingly comforting and calming. He signals understanding of the challenges but also tries to reinforce Russians' sense of community / community-mindedness. In this context, he draws a historic not entirely correct comparison between the Polovtsians and the Pechenegs, two nomadic tribes who have attacked the Kievan Rus, and the coronavirus attacking Russia, which allows him to derive that Russia this time will overcome the challenge too: "... both the Polovtsians and the Pechenegs tortured her. Russia has overcome everything. We will also defeat this coronavirus pandemic!" This very line of the address triggered lively discussions on Twitter which in this context turns into a platform for counter-discourses subverting and ridiculing official political communication and projects of Putin's government.

The paper analyses the discourse elicited by Putin's quote on Twitter, using a sample selection of 100 Tweets (posted from April to August 2020), including an explicit reference to «половцы и печенеги» ('the Polovtsians and the Pechenegs') with or without the according hashtag (#половцы #печенеги) and adopts a multimodal perspective on the data. It aims at identifying the predominant stances adopted and thematic strands emerging as well as pragmatic strategies characterizing the given discourse. Particular attention is paid to the role of humour which occurs in various guises such as:

- bathetic lists adducing the Polovtsians and the Pechenegs among Russia's economic, social and political problems;
- intertextual references (e.g. to Putin's rhetoric, Russian popular culture or folklore) in order to ridicule official political communication and projects;
- irony achieved by overstatement;
- memes (mostly image macros) based on punning and often including visual content (mostly referring to objects, persons etc. sounding similar to the Polovtsians / the Pechenegs).

# Ánda! Patience! Assiah! Sorry! : an investigation into the expression of sympathy in every day's interactions in Ngemba society of Western Cameroon

Panel contribution

***Ms. Solange Mekamgoum<sup>1</sup>***

*1. University of Hamburg*

The expression of sympathy is generally viewed in English-speaking cultures as attending to someone else's emotional pain following some experience of misfortune, bereavement being a salient example. How is sympathy understood in other parts of the world? This paper investigates the communicative acts Ngemba people perform when another person is experiencing emotional pain. Bereavement in Ngemba constitutes a special activity type in which sympathy is shown. It has its own contextual structures and expressions for sympathy, that differ from those one says to the other in day-to-day encounters. Though bereavement will be briefly spoken about as one context where sympathy is expressed, the main focus of the study is on how the Ngemba express sympathy in everyday situations. These include when a child falls and is crying or when someone carries a heavy load, etc. Against this backdrop, the following questions arise: What are the contextual configurations in which this act is performed? What does this act tell us about interpersonal relationships in Ngemba? This paper identifies the interjection *ánda* as a primary linguistic resource used in Ngemba society to show that one cares about someone who is in a painful emotional state following an act of misfortune. It analyses occurrences of this expression in context, and links it to ethics of social conduct within this socio-culture. As this form emerges in the data, its performance is motivated by a number of factors including a sense of mutual affectedness. I also examine pragmatic repairs when a member fails to perform the act of *ánda*, revealing how the expression of sympathy is strongly normative in this community. Furthermore, this work briefly analyses uses of *assiah*, *patience* and *sorry* as secondary linguistic items involved in expressing sympathy among Cameroonians in general and Ngemba in particular. They share the same semantic notion and sociopragmatic functions as the primary one as they are borrowings from Cameroonian official and local languages, commanded by the multilingual nature of the country.

Taking an interactional approach, this study analyses data extracted from multimedia recordings made in the Ngemba-speaking area. The Ngemba society comprises of five groups – Bamendjou, Bameka, Bansoa, Bamougoum and Bafunda – spread in four administrative Divisions of Western Cameroon. The people speak the Ngemba language, as well as French and/or (Pidgin)English/other neighbouring languages. This paper shows that investigating language practices, and specifically, performance of *ánda*, can greatly enrich understanding of human socialities and the communication of sympathy, which is understood here to be a culture-specific form of behaviour grounded in local concepts of community and personhood.

# Exploring linguistic hybridity and lexical creativity in the UK's Greek Cypriot diaspora: the Grenglish Project

Panel contribution

***Dr. Anna Charalambidou<sup>1</sup>, Dr. Petros Karatsareas<sup>2</sup>***

***1. Middlesex University, 2. University of Westminster***

This presentation explores the relationship between linguistic hybridity in the UK's Greek Cypriot community and sociocultural changes (migration from Cyprus to the UK and subsequent geographical and social mobility in the UK). It also addresses the methodological challenges of researching the acquisition and spread of linguistic changes in the 20th century through a community engagement project. Like many other community languages that were transplanted from their places of origin to the UK as a result of migration, Cypriot Greek developed in a unique way in the British capital in the 20th century (Papapavlou and Pavlou 2001). This presentation focuses on the borrowing of English words and their incorporation into the Cypriot Greek grammatical system. These words, typically labelled Grenglish, are collectively recognised as a key part of a new linguistic variety unique to the UK's Cypriot Greek speakers. They include everyday terms such as πάσον/pason 'bus', μουβάρω/muvaro 'I move' and place names like Φίσμπουρι Πιπάρκ/Finsbury Park 'Finsbury Park'.

Grenglish words were created by first-generation migrants who arrived in the UK throughout the 20th century (mainly between the 1940s and 1970s) with limited command of English. Grenglish was later adopted by second-generation members of the community, but some speakers assigned negative values to these diasporic lexical creations often referring to them as "Greek slang" and showing preference for the Standard Greek or Standard English equivalents. As a result, this unique lexical stock that is emblematic of the community's linguistic history is facing the threat of disappearance as new generations of speakers tend to avoid Grenglish words (

The data for this presentation are derived from The Grenglish Project website ([www.grenglish.org/](http://www.grenglish.org/)), which was set up by the presenters in May 2019 aiming to create a permanent digital and print record of Grenglish (Karatsareas & Charalambidou, forthcoming). This presentation will provide an overview of the entries collected and of their contributors, focusing on recurrent patterns in semantic fields and morphological adaptation. The grammatical analysis of morphophonologically adapted words will show that the basis for the adaptation was the phonetic realisations of the borrowed words in (London) English and the way these realisations were perceived by speakers of Cypriot Greek, and not orthographic pronunciation as in the borrowing observed in 'homeland' varieties of Greek in Cyprus. This is taken to be reflective of the limited command of English among the first generation of Greek Cypriot borrowers.

Changing perceptions of and attitudes towards Grenglish will also be explored. Finally, through a comparison with other diasporic Greek varieties (especially in the USA and Australia) we will explore convergences and divergences in morphological adaptation in the context of 20th century migration.

Karatsareas, Petros, and Anna Charalambidou. Forthcoming. 'Exploring linguistic hybridity and lexical creativity in the UK's Greek Cypriot diaspora: the Grenglish project'. *Cahiers d'Études Chypriotes*, 50.

# '...But the Client Insists': Translators' Perceptions of Client Dissatisfaction

Panel contribution

***Ms. Sara Orthaber<sup>1</sup>, Prof. Rosina Marquez Reiter<sup>2</sup>***

***1. University of Maribor, 2. The Open University***

The work of freelance translators is mostly project-based. This means that they are paid for the work that they do, either directly by their clients, or indirectly by translation agencies. While effective translator-client communication, including a clear understanding and assessment of the client's needs, is critical, this is not always the case and translators must sometimes tactfully deal with challenging situations (e.g. contradictory information, clients' requests for clarifications, technical and localization issues). With most freelance translators working from home, profession-specific online communities have become a particularly important source for professional support, including discussions on delicate client-professional relationships. Customer dissatisfaction has received considerable attention in the literature. However, relatively few studies have looked at the behind-the-scenes activities when dealing with client dissatisfaction. To fill this gap, this study examines the translators' perceptions of client dissatisfaction in an online translators' forum. Specifically, we look at how the clients' concerns are presented and interpreted by the group members and what solutions are offered. The group members' contributions shed light on a hard industry where client satisfaction is the translator's top priority.

# 'Anybody can read Japanese?': Mobilizing multilingual, multicultural and multimodal knowledge for social support in mothers' discussions about face masks

Panel contribution

***Mr. Wai Sum Tse<sup>1</sup>, Dr. Olga Zayts<sup>1</sup>***

***1. The University of Hong Kong***

Over the past year, wearing face masks has acquired a myriad of meanings in Hong Kong. In a series of protests against the extradition bill, masks are regarded as an artifact of hidden identities and a symbol of freedom of expression in some people's eyes (Lau, 2020). The HKSAR Government saw masks as a threat to public security and eventually banned face coverings at protests. Not long after this, however, face masks became the most sought-after item in light of the COVID-19 pandemic. Hong Kong citizens were quick to (re)adopt their mask-wearing behavior because of their 'collective trauma' of SARS in 2003. Masking then transformed from a political hot potato to a preventive measure and even a form of civic responsibility.

From January to March 2020, there were territory-wide shortages of face masks. Many people went online to find masks and exchanged information about masks, including their types, prices, and effectiveness. Such a phenomenon echoes increasing evidence demonstrating that people exchange and learn about health-related knowledge in online environments (Bellandera & Landqvist, 2020). Thanks also to COVID-19-induced work-from-home and social distancing practices, more people have been prompted to discuss COVID-19-related issues online. Additionally, previous discourse-analytic studies cast light more specifically on the use of online spaces by mothers who seek and offer help on different issues, including health and parenthood (Jaworska, 2018; Lyons, 2020). Aligning with the work mentioned, this paper analyzes how mothers in Hong Kong mobilize their multilingual, multicultural, and multimodal knowledge to provide support for other mothers during the COVID-19 pandemic.

We focus on mothers' interactions in internet discussions primarily about buying face masks. These threads are drawn from a corpus of 300+ online discussion threads collected for an ongoing project that examines how mothers utilize online platforms to cope with the pandemic. The data is collected from two popular fora used by mothers in Hong Kong. One forum uses English as the medium of communication while the other uses Chinese. Our analysis draws on CA-informed methodologies for analyzing digital interactions (Giles et al., 2015) and epistemic discourse analysis (Heritage, 2012; Van Dijk, 2013). Preliminary findings suggest that aside from sharing where to get masks, a clear instance of gathering communal effort in combating the pandemic, some mothers also request peers to help with choosing reliable masks. These requests contain verbal texts of masks-buying queries and photos of masks packaging. The packaging in question contains texts written in Japanese or Korean, which presumably is incomprehensible to those who need help. In this exchange process, we first argue that mothers' multilingual, multicultural, and multimodal knowledge is mobilized for social support. The reason is that a relevant and useful response requires literacy in Japanese or Korean or knowledge about specific types (or brands) of masks. We further show that in responding to requests, mothers in fact draw on a sophisticated epistemic repertoire that goes beyond lay expertise on health-related issues based on individual experiences.

# 'Black Swans' on the Coast: Regional risk cultures and the pragmatic re-framing of coastal protection in East Frisia (Germany)

Panel contribution

**Dr. Martin Doering<sup>1</sup>**

*1. University of Hamburg*

Climate change represents one of the most pressing risks and challenges societies, policy and the sciences face at the moment. A global issue with regional and local impacts, it has led to the development and implementation of national and regional risk policies which – in some places and countries – are lagging behind. This might, however, change in the near future as indications of climate change such as an increase in droughts, heat waves, storms, extreme weather events and storm surges are currently linked to climatic change by the sciences. Some of the previously mentioned phenomena also concern the region of East Frisia in the north-western parts of Germany which lies below sea-level and is protected by a historically grown drainage and dike system. Based on the motto "Who does not want to dike, has to give way", the regional risk culture, risk mentality and the risk discourses revolving around coastal protection are based on the rationale of a constant fight against the water. This contributed to establishing pragmatic and meaningful ways of dealing with the risk of flooding which are currently challenged by climate change that seems to trigger the scientifically possible phenomenon of so-called 'black swans'. 'Black swans' are situations in which various meteorological phenomena such as a winter gale and extreme precipitation come together and produce the dangerous situation of a storm surge in front of the dike and a flooding behind the dike. This water-from-two-sides-situation requires a pragmatic reframing and restructuring of established risk discourses dealing with coastal protection because it goes beyond current forms of language use and how it represents aspects of life associated with new risk. The paper takes these insights as a starting point and empirically investigates the pragmatic handling and framing of this emerging situation against the background of historically established ways of dealing with storm surges. The question hence arises: Does the anticipated but altogether possible context of 'black swans' contribute to developing new meanings and risk mentalities in coastal protection? The paper elaborates on this question to conceptually and empirically explore the still unused potential of a pragmatic approach for analysing interpretative repertoires conceptualising new ways of executing coastal protection, and by doing so detecting change in existing risk cultures. The approach was applied to 15 qualitative interviews conducted with experts in the region which were firstly analysed as outlined in Grounded Theory and then studied from a linguistic point of view. The aim of the paper is twofold: to empirically study the processes of semantic change in coastal protection against the background of anticipated 'black swans' and to conceptually investigate the potentials of a pragmatic approach to tackle change in regional risk cultures.

# 'Diplomatic Request': A Contrastive Analysis of Chinese and American Corpora

Panel contribution

***Mr. Yulong Song<sup>1</sup>***

**1.** Dalian University of Foreign Languages

This paper aims to examine the pragmatic properties of 'diplomatic request', a requestive form of behaviour embedded in political language use. I will focus on cross-cultural variation in the realization of this requestive behavior, by contrastively examining discourse produced in the context of political actors making major demands. The corpus investigated is drawn from Chinese and American press conference events. The current study is based on naturally occurring data. The analysis will show that press conferences represent a ritual event, whereby both Chinese and American political stakeholders ritually display their diplomatic requests. Those diplomatic requests, while most of them are 'demands', are ritual because they are made in front of, and towards international audience in a highly ceremonial fashion, instead of being transmitted directly to the 'hearer', who is the target of the diplomatic requests.

The results of our analysis show that diplomatic request manifests itself in a continuum according to the event which triggers it. The way of delivering the target speech act is highly different between Chinese and American. Chinese diplomatic demand is conducted mainly by the conventional indirect way, while American is mainly by the direct way. In pragmatics, a research gap exists in the study of the upgraded request and its difference between Chinese and American press conferences, and so the current study fills a knowledge gap.

# 'D'ya know what I mean?' Striving for shared understanding in multilingual healthcare communication: affordances, interaction, recommendations

Panel contribution

***Dr. Demi Krystallidou<sup>1</sup>***

*1. University of Surrey*

Recent migration waves have resulted in an increasing number of multilingual encounters in healthcare in many parts of the world with healthcare professionals and patients not always sharing a common language. In order to bridge language barriers and achieve shared understanding between patients and healthcare professionals a number of language support solutions are currently available. These include -but are not limited to- interpreters, both on site and remote, as well as communication technologies, either used on their own or in combination with interpreters, patients' companions and healthcare staff performing interpreting tasks. Despite recent technological advances in multilingual healthcare communication and the increasing awareness of cultural competency in healthcare, both healthcare professionals and patients experience difficulties when interacting with each other through (technology-enhanced) language support solutions. The current COVID-19 pandemic has brought to the fore a set of challenges patients and healthcare professionals experience when trying to reach shared understanding through available language support solutions and which might at times undermine their participation in the medical encounter. In this paper I will draw on the latest available evidence and I will discuss: i) the affordances and shortcomings of available language support solutions in healthcare, ii) the ways in which patients and healthcare professionals' participation in the communicative encounter is shaped by variables associated with the participants in the clinical consultation and specific language support solutions, and iii) how this affects the process of reaching shared understanding during the language-discordant consultation. I will argue that in order to ensure patient and healthcare professional participation in the language-discordant clinical encounter through shared understanding, a set of skills that are tailored to the technical and communicative features of each language support solution are required of all participants in interaction. I will conclude with a set of recommendations for improved shared understanding through technology-enhanced language support solutions in language discordant patient-provider healthcare encounters.

# 'Fancy replying?' Reactions to Ryanair's customer service tweets

Panel contribution

***Dr. Ursula Lutzky***<sup>1</sup>

1. Vienna University of Economics and Business

Today, the social networking platform Twitter is used widely by companies when communicating with their customers. It has been appropriated as a channel for customer service interactions and customers are often encouraged to tweet a company if they have a question or need assistance. While customers thus engage in numerous exchanges with social media managers on Twitter on a daily basis, their reaction to and perception of the replies they receive has not been studied extensively to date (but see Abney et al. 2017; Lutzky forthcoming). This study aims to provide further insights into the nature and structure of customer service interactions on Twitter, and to explore customers' attitude towards the answers social media managers post in reply to their tweets. It focuses on the airline Ryanair, which was voted worst airline for the sixth time in a row in January 2019 (see e.g. Topham 2019), and the tweets that customers addressed to the airline over the course of a year as well as the airline's replies. This corpus of tweets includes a total of 2.8 million words and 136,833 tweets that were posted between August 2018 and July 2019. It is explored from a quantitative perspective by studying expressions that are characteristic of customers' language use through keyword and collocation analyses and from a qualitative perspective that focuses on the unfolding of tweet threads. This will uncover the discourse-pragmatic strategies used by customers when voicing their frustration about the airline's customer service and yield further understanding of the way in which they express their dissatisfaction online. By investigating their often negative evaluation of Ryanair's approach to customer service on Twitter, this study will reveal the causes of customer complaints about the responses they receive online and point out how changes in the linguistic and communicative features used by the airline could potentially improve levels of customer satisfaction.

# 'Getting on the same page' – How participants' reading aloud from an interactive tabletop facilitates joint game participation

Panel contribution

***Ms. Svenja Heuser<sup>1</sup>, Dr. Béatrice Arend<sup>1</sup>, Prof. Patrick Sunnen<sup>1</sup>***

***1. University of Luxembourg***

This paper addresses how adult participants in a multiparty serious game-activity (ORBIT project, see Sunnen et al. 2018) at an interactive tabletop (ITT) use *reading aloud* (Heuser et al. 2020) to co-facilitate joint accessibility to interactionally relevant text information about the unfamiliar game they are engaging in. These so called 'written informings' displayed on the horizontal interface are designed to serve as a game-manual. Since the activity is new to the participants, they rely on these informings in order to jointly accomplish the game. We consider participants' *reading aloud* as an interactional practice for participating in the interaction and getting each other 'on the same page'. By verbalizing and thereby also emphasizing specific (parts of the) text at a specific point in the interaction, participants make written informings from the ITT interactionally relevant and mutually accessible within the group.

In the sequences selected for the analysis we show, that participants' *reading aloud* of written informings processes the interactional challenge of enabling and maintaining joint participation among the players in the game activity. Their *reading aloud* provides access to co-player's perspectives at the shared interface and, furthermore, localizes and specifies one part of the ITT-mediated game that was marked 'unclear' or 'problematic' by a participant.

So far, the video recordings (95 min.) of three participant groups have been scrutinized for this phenomenon and lead to the identification of more than 70 *reading-aloud* cases. We could observe across our video corpus, that participants who make their hesitations of understanding accountable, receive support by their co-players *reading aloud*. In this paper, relying on a conversation analytic approach (cf. Goodwin & Heritage 1990) in its multimodal understanding (cf. Deppermann 2013), we consider two cases of *reading aloud*. Here, participants rely on the interface's written informings to co-organize *reading-aloud* utterances alongside finely tuned local referencing gestures and bodily orientation (onto the informings on the ITT) in order to either address or raise a question. *Reading aloud* as an interactional practice is used to mark and process both addressing a question (understanding) as well as raising a question (a problem with understanding). Both cases show the participants' fine-grained co-organization of joint successive *reading-aloud* actions *with* and *for* each other when dealing with the interactional challenge of gaining shared understanding and enabling joint participation.

# 'I was hoping I didn't need to clarify - that was typed in sarcasm font' – Norms and knowledge construction in the /r/conspiracytheories affinity space

Panel contribution

***Prof. Nuria Lorenzo-Dus<sup>1</sup>, Prof. Pilar Garces-Conejos Blitvich<sup>2</sup>***

*1. Swansea University, 2. UNCC*

This presentation examines the intricate connections between knowledge co-construction, norms, and their ongoing negotiation in the /r/conspiracytheories sub-Reddit. Created in 2011 and with 212k members at data collection point (2020), its users describe this sub-Reddit as 'the place to discuss every aspect of conspiracy *theorism*', from theories and current events to debunkings and popular culture'.[1] The sub-Reddit has been selected because of its explicit focus on knowledge construction, in this case, members' discursive negotiation of what makes conspiracy theories so. Participatory affinity spaces (Gee, 2005) such as the one under scrutiny facilitate users' co-construction of knowledge about their common endeavour; this is, however, highly depended on their finding participation meaningful and rewarding (Kessler, 2013). Norms, like knowledge, are socially co-constructed (Tomasello, 2008) and provide the bases for those meaningful interactions. Further, inter/intra group interaction is key in the understanding of CT which have been defined as eminently social (van Prooijen & Douglas, 2018)

Data for this presentation comes from Content Analysis of the 100 top (i.e., most voted) threads in the /r/conspiracytheories sub-Reddit since 2011, focusing on their topics, length, participation levels and actual theorising about conspiracy theories therein. This is followed by Thematic (Fereday & Muir-Cochrane, 2006) and Im-politeness Analysis (Garcés-Conejos Blitvich, 2010; 2013; Garcés-Conejos Blitvich, & Sifianou, 2018) of the six threads (circa 25,000 words) in which members engaged in sustained co-theorizing about conspiracy theories. The analysis reveals that the community engages in active discussion of external norms derived from Reddit content policy (e.g. regarding 'censorship' of content by Reddit bots), as well as its own internal norms for interactionally achieving their shared goal of advancing knowledge about conspiracy theories. Within the latter, the community actively promotes, and practices, the expression of dissent (alongside that of rapport, albeit that less frequently so). Dissent is realised via conflict sequences that, for the main part, lack in heightened emotion features, favouring instead rational argumentation. This is characterised by a *sui generis* adaptation of scientific methods of knowledge discovery, corroboration, and dissemination. The community moreover co-constructs the rationale for adapting such methods on legitimisation grounds of differentiation from – specifically superiority of - their object of study (conspiracy theory) and their own social identities as conspiracy theorists, when compared to other theories/theorists.

Despite the networked individualism (Chua & Welman, 2016) fostered by digital affinity spaces, social norms emerge as powerful bases upon which to co-construct knowledge participatorily. Importantly, measured dissent here functions as a crucial knowledge co-construction mechanism which proves, once again, that conflict – far from being always pernicious – serves many functions that promote communal life.

# 'It can get a little bit – you know': specific reference in incidentally observed vague language

Panel contribution

***Dr. Joan Cutting<sup>1</sup>***

1. N/A

Studies of vague language tend to explore a systematically collected corpus of naturally occurring discourse in a particular genre. This study analysed English vague language fragments which were incidentally observed over 10 years, in a variety of genres: 70% were spoken, in casual conversations, radio/TV interviews, public announcements, service encounters and jokes, and 30% were written, in advertisements, official notices, mobile phone texts, menus and greetings cards. The aim was to discover the predominant lexico-grammatical features, and determine the frequency of specific reference and the tendency as regards social functions.

50% of the fragments contained general noun phrases (e.g. 'Is that whatsisname's thingy?', 'Just some sit-down little quizzy things', 'Five weeks to go till you know what'). The rest were mostly pronouns (e.g. 'My father's doing a PhD in something'), modifiers (e.g. 'We had umpteen jackets on'), hedges (e.g. 'I've got spaces kind of morningish'), and conversational implicature (e.g. A: 'Did Mrs X get the best out of you?' B: 'Well we all did our homework').

80% of the vague language had specific reference, in the sense of speaker/writer pointing to an identifiable referent (e.g. 'an end-of-semester do-dah', 'Well it can get a little bit - you know', 'There's a sort of banky building at the top'). The unspecific (e.g. 'Happy whatever', 'Some things are the same everywhere') were mostly in casual conversations and greetings cards. Ambiguity of reference was rare (e.g. 'Like it hot and steamy? So do we').

As far as social function is concerned, a third of the fragments used vague language to show friendliness and reduce face threat (e.g. 'Let's go onto the pavement thing', 'I've got this appointmenty-type thing'). A few used it for covering taboo (e.g. 'It can save you from so many things, it should wear a cape and fly'), persuading and threatening (e.g. 'Use sectarian language on this train and who knows where you'll end up') and excluding the hearer/reader (e.g. A: 'Why have you changed your mind about the referendum?' B: 'Well, things are moving forward everywhere', 'This is due to a line-side incident').

Taking into account the incidental nature of the research method, it is hoped that the findings will inform language teachers and learners how vagueness can be expressed in English across genres, how it relates to specificity and ambiguity, and why it tends to be used.

# 'It's as natural as having a child': How health ideologies surrounding menopause are expressed in women's magazines

Panel contribution

***Ms. Pernille Bogø-Jørgensen<sup>1</sup>***

*1. Lancaster University*

This paper addresses how ideologies of health and illness are expressed by use of the term 'natural' in articles about menopause from US American and Danish online women's magazines. Menopause has, like many other conditions, been subjected to medicalisation (Conrad, 1992; Ussher, Hawkey, & Perz, 2018). This process entails that menopause is construed as a medical problem. Coupland and Williams (2002) find that the term 'natural' is used as a positive attribute of 'solutions' to the perceived problem of menopause in three different discourses that reflect ideologies such as ageism and naturalism.

I address the following research questions: What aspects of menopause do the terms 'natural\*/'naturlig\*' describe in a selection of online articles from US American and Danish women's magazines? How are women and menopause represented by these terms? What do these findings indicate about ideologies underpinning discourses on menopause? The text collection comprises 72 articles in total, 36 in each language, with 27,595 words in American English and 29,684 words in Danish. Four American and two Danish magazines with different readerships are included. Drawing on White's appraisal framework (2002) I analyse how the terms are used to express attitude, in particular judgement and appreciation. This will contribute to a discussion of represented beliefs, values and norms, and how these indicate different ideologies across the data (Koller 2014, pp. 210-211).

My findings are in line with those of Coupland and Williams (2002), in that 'natural' is used as a positive attribute for potential 'solutions' for menopause in conflicting discourses. In addition, different attitudes to aging are expressed. One example from the Danish data claims it is 'natural' to look at younger women first, while another text discusses how to preserve 'natural' beauty. In contrast, an example from the American data proposes to embrace the 'natural' changes of aging. In my data, the terms 'natural\*/'naturlig\*' are also attributed to menopause itself. Across both languages, the terms are used for maintaining particular social beliefs, values and norms. I will discuss how these observations align with cultural beliefs about the connection between 'nature' and 'health' (Thompson, 2004).

# 'It's like we are not human': discourses of humanisation and otherness in the positioning of trans identity in British broadsheet newspapers

Panel contribution

***Ms. Camila Montiel McCann<sup>1</sup>***

*1. University of Liverpool*

This paper examines how transgender identity is positioned across articles from three British national newspapers, *The Guardian*, *The Telegraph* and *The Times*, in order to demonstrate a political stance in an increasingly divided Britain. Transgender identity has become a highly contentious issue in contemporary western culture, with heightened visibility leading to a backlash against the rights of trans people to protection, and even recognition, in law. The news media itself is a hegemonic institution that wades a huge influence over public discourse (Fairclough, 1995; Fowler, 1991). However, the influence of broadsheet or so-called "quality" newspapers has often been under-researched, particularly in regard to their role in shaping the debate over transgender rights. Using Feminist Critical Discourse Analysis (Lazar, 2005), I assess how the above "quality" newspapers use indirect indexing to alternatively legitimize or "other" transgender identity – through discourses of humanisation in *The Guardian*, and of dehumanisation in *The Times* and *The Telegraph*. Discourses of humanisation are intertextually linked to practices of resistance and inclusion, as shown in *The Guardian*'s decision to spotlight the role of transgender individuals in various activist movements, including the 'Me Too' and civil rights movements. On the other hand, discourses of dehumanisation rely upon the textual differentiation of trans identity through the (re)production of an "us versus them" consensus (Bucholtz and Hall, 2005; Fowler, 1991). Despite this polarisation on issues of trans rights, this paper finds that both discourses appropriate feminist themes in order to justify their stance and foster division within wider society along party political lines. I conclude that feminism has become a vehicle to further political agendas that can be crudely cast as either "progressive" or "conservative". Whilst the stance of *The Guardian* articles seeks to authenticate trans identity, the traditionally right-wing *Telegraph* and *Times* illegitimate it through interdiscursivity with essentialism that upholds cisgender as both hegemonic and a precondition for feminist engagement. I argue that this is representative of the wider appropriation across the media of an individualised feminist discourse, which seeks to uphold hegemonic femininity through superficial calls to feminism that give the impression of change whilst maintaining the patriarchal status quo (Lazar, 2014; McRobbie, 2004).

# 'I'm not flattering you, but ...': The metapragmatics of the complimenting act of native Chinese speakers

Panel contribution

***Dr. Chengyu Zhuang<sup>1</sup>, Dr. Yun He<sup>2</sup>***

*1. Oxbridge AcaVice, 2. (a) University of Edinburgh; (b) Oxbridge AcaVice*

This paper explores the metapragmatics of politeness in Chinese, focusing particularly on the complimenter's metapragmatic comments on their own complimentary utterance that has hitherto received little attention despite the exponential growth in compliment research. As a point of departure, we begin with a brief account of how the compliment *wo bushi gongwei, nijia liangge zhende shi...* ('I'm not flattering you, but you two really are...') one of the authors of this paper received in the past. We then establish this as an important research gap by surveying previous studies of compliments in Chinese spanning about three decades (e.g., Chen 1993, Zhuang & He 2020).

To address this understudied subject, a corpus of compliments was constructed that contain what we call 'distracting device' (*wo*) *bushi gongwei* or its variant (*wo*) *bushi fengcheng* by conducting searches in the Centre for Chinese Linguistics Corpus and the social media platforms Twitter and Weibo. We then carried out a qualitative content analysis and found that the first turn of a compliment and compliment response sequence is typically composed of three or four discursal elements, which are used by the complimenter to

- (a) distance themselves from flattering the addressee;
- (b) issue the compliment *per se*, and in some cases;
- (c) claim sincerity in the praise within the compliment; and/or
- (d) justify the credit they evaluate positively.

Underlying these findings, we argue, is the complimenter's view of what counts as a polite or appropriate compliment, although configurations of the four discursal elements in only one conversational turn may be culture-specific. We maintain that (a), (c) and (d) serve as metapragmatic devices the speakers employ to support their compliment (b), the core of the speech act of complimenting. Drawing on previous metalanguage and metapragmatics studies (e.g., Silverstein 1993), we proceed to argue that the complimenting is carefully crafted as such because the speakers intend to show that they have no ulterior motives in offering the 'verbal gift' while explicitly expressing sincerity in praising their addressee. It not only exemplifies the appropriate 'linguistic form in relation to context' but signals 'the language users' reflexive interpretations of the activities [complimenting in this case] they are engaged in' (Verschueren 2000:339). Moreover, we argue that the offering can be interpreted as manifestations of a well-intended politeness strategy rather than as part of a larger strategy of manipulation that is closely associated with *fengcheng* (flattery) and less so with *gongwei* (ritual compliment).

# 'Let's play crocodiles': Rules and game participation in a school playground

---

Panel contribution

---

***Dr. Maryanne Theobald<sup>1</sup>, Prof. Susan Danby<sup>1</sup>***

*<sup>1</sup>. Queensland University of Technology*

The ways children go about making up games in the school playground are often overlooked due to minimal adult supervision. School playgrounds are physical and social spaces for children to assemble social orders as they create games. Unlike organized games with pre-existing sets of rules, spontaneous games do not tend to have rigid procedural pre-determinants for how to play, but they do occur in cultural and peer contexts to which children orient as they participate in making up and playing games that require their ongoing negotiations. Sequential analysis of the video-recorded interactions of children (7-9 years) during lunch recess in an Australian school shows how children competently create and negotiate a game of 'crocodiles' that involves including and excluding others. This ethnomethodological approach using conversation analysis identifies the ways in which the children create, challenge or resist rules, in order to ensure their ongoing involvement or to influence the participation of others. Five categories for participation are identified: 1) *Formulating play – the basics*; 2)*Constructing beginnings - being ready*; 3)*Creating conditions - getting special treatment* 4)*Establishing districts - the safe zone*; and 5)*Assembling justice - being fair & playing by the rules*. When educators understand how children assemble their talk and actions in games to include or exclude others, they can better support children's participation in playground activities.

# 'Ren Zhongping' and the others: Renmin ribao subgenres of commentary articles and the Covid-19 crisis

Panel contribution

***Prof. Emma Lupano<sup>1</sup>***

**1.** University of Cagliari

As the mouthpiece of the Central Committee of the Chinese Communist Party, *Renmin Ribao* (人民日报) holds a special position in the country's state media landscape. While news articles are a substantial part of the paper's production, its commentary articles are particularly relevant in China's political life, since they are the expression of the CCP's orientations and, traditionally, a fundamental source for cadres and intellectuals to study the 'correct line' and to follow internal debates. They are also widely republished by the other national and local media, therefore they can be considered an important ingredient in the process of meaning generation in the Chinese official media discourse and in the effort to align Chinese citizens to the state narratives.

Within the journalistic genre (Bhatia 1993; Swales 1990) of commentary, *Renmin Ribao* (as well as its online edition, *Renmin Wang*) publishes a number of sub-genres (some of which are unique to the outlet) whose characteristics and communicative goals have only partially been explored by academic research (Lupano 2018). Most attention has been paid to commentary articles produced under pseudonyms by anonymous writing teams that represent the voice of the Central Propaganda Department or other departments within the CCP, the most authoritative of which are 'Ren Zhongping' articles (Shen 2009; Tsai and Kao 2013; Gitter and Fang 2018).

This contribution looks at the existence of shifts of meaning on its journey of re-publication within a strongly propaganda-oriented Party paper, and points them out in order to draw conclusions on whether distinguishing characteristics and communicative goals can be attributed to the different sub-genres of commentary articles that are published by *Renmin wang*. It does so based on a case study on the opinion articles related to the Covid-19 crisis that have been published by the Party's outlet in 2020. Following the publication of one 'Ren Zhongping' commentary on the topic in March 2020, the research has been carried out by applying qualitative text analysis and discourse analysis to a corpus of commentaries on Covid-19 that have appeared on *Renmin wang*'s 'Important opinion army' page - the page that collects the most relevant commentaries of the paper. The study focused on linguistic choices and shifts as well as on keywords and themes.

# 'So just be clear on that. You're saying...': Formulating Hypothetical Talk in Business meetings

Panel contribution

**Prof. Almut Koester<sup>1</sup>, Dr. Helena Lohrova<sup>2</sup>**

***1. Vienna University of Economics and Business, 2. University of South Bohemia in České Budějovice***

This paper brings together research on hypothetical talk (Myers, 1999; Simmons and LeCoutur, 2011; Koester and Handford, 2018) with the extensive literature on formulations and demonstrates how these two discursive phenomena are combined creatively by speakers to achieve desired outcomes in business meetings. Formulations (Heritage and Watson, 1979) have been examined within a variety of discursive contexts, including business and professional discourse, and these studies have shown how their function is closely tied to professional practice (e.g. Walker 1995, Antaki et al. 2005). In business meetings, hypothetical talk has been identified as a persuasive device frequently employed to bring about change in action (Koester and Handford, 2018).

The study focuses specifically on the role of formulations in relation to hypothetical talk in both internal and external meetings and explores the transformative role of such formulations in extended sequences in these meetings. Our exploration begins with the observation that meeting participants occasionally develop hypothetical scenarios, for example in the form of hypothetical reported speech (e.g. "if you say to somebody, we can find you contact services..."), and in doing this seem to side-step (potential) disagreements. Hypothetical talk, therefore, involves a kind of 'suspension of reality' which allows participants to freely explore alternative courses of action. However, for such free-ranging explorations to contribute to meeting outcomes, a version of 'reality' needs to be reintroduced at some point, which, in a best-case scenario, all meeting participants can agree to. This is where formulations may be produced by participants in order to transform some aspect of the hypothetical talk into a new version of 'reality'.

Adopting a talk-in-interaction approach involving a close analysis of the hypothetical talk-formulations sequences, we identify a discourse pattern, often spanning extensive segments of talk, comprising three stages: **Reality – Suspension of reality – Reintroduction of reality**. By analysing these large discourse patterns, we demonstrate how meeting participants, through the use of formulations, transform hypothetical talk – which is essentially unreal and speculative – into an accepted version of events, thus determining the direction of a meeting and contributing to its outcome.

# 'Talking through' the child to maintain multigenerational relationships: The case in video calls between migrant parents and their left-behind children in China

Panel contribution

***Prof. Christian Greiffenhagen<sup>1</sup>, Dr. Yumei Gan<sup>2</sup>***

*1. The Chinese University of Hong Kong, 2. Shanghai Jiao Tong University*

The participation status of children in interactions can be distinct, since adults often treat children, especially very young children (e.g. infants), differently. While adults talk 'to' children (by selecting them as direct addressees), they also talk 'about' children even in their presence. In this context, some authors have noted that in many societies it may not be permissible to tell stories about co-present adults, it is acceptable for talking about children and pets (Bergmann, 1988: 307; Roberts, 2004: 224). In this paper, we explore a third possibility, which to our knowledge has only been received passing mention, and which is related to what Sacks (1992, Vol. I: 553) has termed "talking to each other through another": one adult talking 'through' the child in order to address another adult (see also Scollon, 2001: 930).

Our data are based on video recordings of naturally occurring video calls in migrant families in China (N=34 hours). In these families, the biological parents are migrant workers who leave home and are in a different city from the children. The children are left behind and raised by their grandparents. In this situation, the grandparents become the primary caregivers of the child and act as the parental figures in the children's daily lives (Santos, 2017). We used a combination of an external camera (e.g. Sunakawa, 2014) and a screen capturing technique (e.g. Licoppe, 2017) to collect their video calls. This method allowed us to capture all the three parties in interaction: migrant parents, grandparents and children.

In this paper, we adopt the methodology of conversation analysis to examine two types of sequences 'talking through' children in order to address the other adult. Firstly, from the grandparents' side, we show that the grandparents work to be "a good caregiver" by asking the child questions in order to solicit an answer which could potentially be interested to the migrant parents. As Pillet-Shore (2015) has noted, being a good parent requires the parent to be knowledgeable about their children and to be competent in overcoming the children's shortcomings. The grandparents here employs their knowledge about the children to display their competence of taking care of the children. Secondly, from the migrant parents' perspective, we show that parents talk through children to manage disaffiliation (e.g. Zanini & González-Martínez, 2015) with the grandparents. For example, a parent talks to a two-year old child and complains about him not wearing appropriate trousers. In that case, the "overhearing" (Heritage, 1985) grandparents immediately responds to the complaint (even though it was not directly addressed to her).

Our analysis shows that people's conduct in interaction is shaped by their relationships, but in turn, their conduct also reshapes their relationships (Hayano, 2008). It is the grandparents or the parents' careful recipient design in interactions and their orientations towards seeing moments as a part of their larger multigenerational relationships that accounts for their conduct of talking through children.

# 'Terrorists', 'gangs', 'thugs', 'thieves' and now they also spread the virus! - Portraying immigrants and ethnic minorities in populist digital spaces in times of Covid-19, IPrA 2021

Panel contribution

***Dr. Sarali Gintzburg<sup>1</sup>, Dr. Sílvia Melo-Pfeifer<sup>2</sup>***

*1. UNIVERSITY OF NAVARRA, 2. University of Hamburg*

In this paper we present preliminary results from the first phase of our project CoMMiTTEd (Erasmus +, Extraordinary call for digital education readiness): a model for analysing fake news, as well as several samples of statistical data from our multilingual (English, German, Dutch, Spanish and Portuguese) and multimodal observatory of fake news related to negative portraying immigrants and minorities with the focus on data produced by politicians. We will use a mixed methodology: critical discourse analysis and multimodal analysis.

The main aim of CoMMiTTEd is to address the issue of stigmatising immigrants and ethnic minorities during the pandemics of Covid-19. From historical perspective, xenophobia often follows the footsteps of pandemics. Moreover, anti-immigrant discourses are routinely used to explain social, educational, health, and economic problems and therefore are often used by populist politicians. Although the above discourses were already present online before the crisis, the Covid-19 pandemic caused their absolute and, perhaps, irrevocable exodus from paper to digital spaces. This means that a high level of digital literacy, i.e., the capacity to critically read, interpret and engage with (multimodal) news and discourse, is needed to navigate information on these hot social themes and their educational implications. Our project CoMMiTTEd addresses these issues by planning, developing, testing, and evaluating resources for digital teaching education, aiming at enhancing student teachers' critical thinking through enriched critical discourse analysis abilities.

# 'We will take care of you': Identity categorisation markers in intercultural medical encounters

Panel contribution

***Dr. Valentina Fantasia<sup>1</sup>, Prof. Cristina Zucchermaglio<sup>2</sup>, Prof. Marilena Fatigante<sup>3</sup>, Prof. Francesca Alby<sup>4</sup>***

**1.** NextLab, Department of Developmental Neuroscience, Università Campus BioMedico, Rome., **2.** LInC - Interaction & Culture Laboratory, Department of Social and Developmental Psychology, Sapienza, University of Rome, **3.** LInC, Interaction & Culture Laboratory, Department of Social and Developmental Psychology, Sapienza, University of Rome, **4.** LiNC, Interaction and Culture Laboratory, Department of Social and Developmental Psychology

Ethnomethodology research has systematically investigated discursive practices of categorisation, looking at the various ways by which social actors ascribe both themselves and others to identity categories to accomplish various kinds of social actions. Drawing on a data corpus of oncological visits collected in an Italian hospital, involving both native and non-native patients, the present work analyses how participants in these intercultural medical encounters invoke and make relevant social identity categories by the marking of collective pronouns in their talk. Our results showed that whilst institutional identities (e.g. those of the doctors, the local hospital or the Tumor Board) prevailed, categorial formulations related to cultural or linguistic identities were rarely displayed in interactions with non-native patients. Conversational participants made very little of their linguistic or cultural background and when they did so, their cultural and linguistic identities were deployed for rhetorical and pragmatical aims, such as testing and negotiating common knowledge and epistemic authority. This study shows how even speakers' minimal lexical choices, such as marked pronouns, impact the negotiation of meanings and activities in life-saving sites such as oncological visits.

# “All’s Well that Starts Well”: An Intermodal and Interlingual Perspective on the Use and Translation of Well

Panel contribution

***Dr. Carla Quinci<sup>1</sup>, Prof. Maria Teresa Musacchio<sup>1</sup>***

***1. University of Padua***

Metadiscourse markers are explicit linguistic items used “out of consideration for our readers or hearers” to “help them process and comprehend what we are saying” (Hyland, 2017). By their very nature, metadiscourse markers are particularly frequent in oral discourse to catch the audience’s attention and get it involved, to make the argumentation clearer, and as discourse fillers. *Well* is one of the most used (Zarei, 2012) and versatile (Aijmer, 2011) discourse markers; it may be considered as a frame marker (Hyland, 2005) or topicalizer (Crismore et al., 1993) indicating a shift in topic or turn taking, as a marker of insufficiency modifying or qualifying a previous utterance, a face-threat mitigator, and a delay device (Jucker, 1993) or gap filler for pausing and planning (Aijmer, 2011, p. 237). Given its multiple functions, *well* may pose considerable challenges to translators, especially in hybrid settings where oral texts are transcribed and/or translated, as is the case for TED Talks, short talks delivered by high-profile experts and freely available online. Most talks are translated in a variety of languages; they are not dubbed, but time-coded transcripts and subtitles are provided thanks to crowdsourcing. Translation involves in this case not only the code switch from one language to another, but also a shift from the oral to the written medium that is not reflected in the content, form and style of the text. Hence, discourse markers typical of oral discourse, e.g. *well*, are replicated in the talk transcript and often also in its translations. This paper will investigate the presence and function of the metadiscourse marker *well* in a parallel aligned corpus of 56 English TED talk transcripts and their respective Italian translations. The analysis will aim at identifying and classifying the utterances of *well* in the English subcorpus, on the one hand, and investigating whether and how this metadiscourse marker has been translated in the Italian transcripts, on the other hand. This study will thus combine the pragmatic analysis and the interlingual perspective to observe how and to what extent pragmatic devices can pose a translation problem in terms of readability, naturalness and idiomticity of the target text, particularly when the translator fails to consider the medium switch implied in the transcription of oral discourse.

# “An Domhan”: immersive narrations and participative experiences in a mixed reality project

Panel contribution

***Ms. Ghislaine Chabert<sup>1</sup>, Mr. Gaetan LeCoarer<sup>1</sup>, Mr. Marc Veyrat<sup>1</sup>***

***1. Savoie Mont Blanc University, LLSETI Laboratory***

“An Domhan” is a multidisciplinary project coming from LLSETI laboratory which allows to represent a celtic legend[1] and its heritage through a new communication technology. This proposes a digital mediation inspired by the world of comics and combines augmented reality (AR) and virtual reality (VR) technologies. This mixed reality device has been chosen with respect to the legend story which makes two main characters (Lugh and Brian) oppose in their quest. Thus, the narrative is thought as a collective and participative experience. Indeed, by playing the different characters and entering in the body of each one alternately through AR and VR, the users can experience different interactional modes, less or more constraining and restrictive with the feeling of participation. One of the main objectives with this research is to observe multiusers activities and their embodied social interactions during “An Domhan” experiences. In this communication, we would like to focus specifically to the social practices increased with the device. We would also present the original approach followed combining sensory design and visual methods to answer such questions and to make the participative experience more visible. But, in addition to this first aspect, the study will also highlight and discuss the importance of a “creation-research” project for understanding contemporary social issues.

# “And I know because I’m an influencer and I’m guilty of telling you to buy things”: The role of emotions in eco-activism on YouTube

Panel contribution

***Dr. Małgorzata Sokół<sup>1</sup>***

*<sup>1</sup>. University of Szczecin*

Taking a sociopragmatic approach to emotions and drawing on the resources of Positive Discourse Analysis and Ecolinguistics (Stibbe 2015, 2018), this paper will explore the role of emotions as a persuasive and empowering tool in social media eco-activism. The research data come from YouTube channels run by young non-expert vloggers, popularising a sustainable, eco-friendly lifestyle. The qualitative analysis of the vlogs and the comment sections reveals expression of both positive and negative emotions in relation to the environmental issues that are advocated or challenged. For one thing, through self-disclosive and emotional talk, the vloggers aim to be more relatable and credible to their audience. For another, the vloggers’ expressiveness seems to elicit emotions in the comments, which may indicate that the audience attributes much relevance to the addressed topics (see e.g. Lazarus 2001). The vloggers appear to exploit the affordances of the medium to positively influence attitudes, and in this way they construct the new stories of consumerism and everyday, eco-activism based on private, green lifestyle choices. An emotional appeal encourages conscious consumption and collective action, but also promotes self-education and performance of an individualised, non-political form of eco-activism.

# “Awating her kind reply, i extend my Best regards” – native vs nonnative speaker status and communicative performance: student email requests to faculty in Italian L1 and English L2

Panel contribution

**Dr. Elisabetta Pavan<sup>1</sup>, Ms. Sara Gesuato<sup>1</sup>**

*1. University of Padua*

The contrastive analysis of Native Language (NL) and NonNative Language (NNL) users' discourse typically assumes that the former is a standard of adequacy, and the latter a defective deviation from it. However, even in the NL, communicative competence cannot be assumed to be homogeneous among speakers, since it is shaped by variable socialisation practices.

We explore manifestations of NL and NNL communicative inaccuracy/inappropriateness in student email writing in Italian L1 and English L2. Our research questions are: Can comparable communicative inadequacies be noticed in NL and FL discourse? If so, what kind are they? C) How frequent are they?

Our study participants were 60 English as a Foreign Language (EFL) Italian university students, attending B1/B2-level English language classes in various degree courses. They completed 2 online Written Discourse Completion Tasks (DCTs), one in English and one in Italian, relevant to academic scenarios familiar to them, and which were meant to elicit requestive email messages addressed to faculty members known to them.

We examined the texts inductively, with a qualitative bottom-up approach, through repeated readings, intuitive classification of problematic phenomena and revisions, at first independently and then together, until we agreed on our understanding of the texts.

The Italian and the English texts displayed strategic, content-related and formal drawbacks: the students often used their non-institutional email account; they failed to properly edit their writing; they provided limited contextualising information; and they revealed unawareness of the legitimacy of the imposition. Additionally, the Italian texts displayed misalignment between conceptual and typographic paragraphs, while the English texts contained occasional reference to irrelevant contextual details.

Overall, both in the NL and in the FL, the participants were partly oblivious to these variables: the addressee's perspective, which detracted from their communicative effectiveness (i.e. they did not follow the Cooperative Principle); the addressee's permanent social and temporary interactional roles, and the formality of the situation, which undermined their communicative appropriateness (e.g. they chose an inappropriate register, or did not hone the graphic quality of the messages).

Our findings suggest that NL user status is not a fully reliable predictor of effective communicative performance, that is, the level of interactional proficiency is variable across NL users. From this we infer that NL users may face some of the same challenges as SL/FL users (e.g. lack of instruction in, and limited familiarity with, topic- and context-specific interactions). The implications are that both in NL and FL education, it may be desirable to draw speakers'/writers' attention to the key determinants of communicative acceptability, namely, reducing addressees' processing efforts and handling their face needs.

# “Boy, do I love your sources on the Spanish civil war!”: User-generated norms of political debate in alternative online media – The case of Athens Indymedia

Panel contribution

***Prof. Ioannis Saridakis<sup>1</sup>, Prof. Ourania Hatzidaki<sup>2</sup>***

*1. National and Kapodistrian University of Athens, 2. Hellenic Air Force Academy*

The purpose of this paper is to account for the norms of political debate postulated by the users of the leftist-anarchist-antifascist forum *Athens Indymedia*(IMC Athens) during their online exchanges. *Athens Indymedia* is an online affinity space (Gee 2005) cultivating information acquisition, opinion formation, political discussion, identity building and collective action (Milioni 2009). It is a highly active collective digital agent in the Greek extra-parliamentary, anti-hegemonic political landscape, both discursively and operationally.

This study is based on an 80 million-word corpus of all user posts appearing on the forum's site over a period of 18 years, i.e. since its establishment in 2000 and up to 2018. More specifically, it critically analyses the 2,818 occurrences of the multifunctional discourse marker *ρε παιδί μου* -singular /*ρε παιδιά* -plural /*ρε παίδες* - plural, high variety (roughly equivalent to ‘man’/‘guys’) (Karachaliou 2015), the most frequent instantiation of the 3,227 different *ρε+noun* clusters in the corpus. This characteristically conversational marker affords a highly involved tone, simulating an offline exchange between members of a close-knit group, even though it is often made obvious that interlocutors are not aware of each other's real world identities.

The analysis of the marker's contexts reveals that it systematically introduces statements taking a critical stance vis-à-vis the state of the unfolding exchange, therefore acting as a debate regulator. Forum participants use this expression as a norm-postulating device both with respect to manners and netiquette, e.g. to voice their disapproval of specific behaviours (bickering, spiteful personal attacks, etc.), and to alert fellow-posters to issues of political, ideological and communicative substance. Thus, users are urged to justify their statements with rational, and theoretically/factually bolstered arguments; to constantly self-educate especially by (critically) studying the authorities on leftism/anarchism so as to be able to distinguish its multifarious strands, and thus demonstrate well-rounded and refined ideological self-identities; to maintain awareness of the bigger picture and not get wrapped up in their own ideological or operational microcosm; to strive to transform words into actions, i.e. to build a (street) activist mindset; etc.

Overall, it emerges that this affinity space does not merely act as an alternative online medium of information dissemination, but also as a site promoting the political and ideological edification of its participants, with many of its (especially seasoned) users acting as self-appointed mentors on political dogma and on the conventions and ethics of online anti-establishment argumentation and rhetoric, and, generally, as guardians of the forum's cohesion and integrity in the face of the participants' physical and micro-ideological dispersion.

# “By then you’d say ‘Why hadn’t I hung on a little bit longer?’”: Indirectness in the speech acts of complaining and suggestion in medical encounters

Panel contribution

***Ms. Linlin Fan<sup>1</sup>, Prof. Yongping Ran<sup>2</sup>***

*1. Center for Linguistics & Applied Linguistics, Guangdong University of Foreign Studies, 2. Center for Linguistics and Applied Linguistics, Guangdong University of Foreign Studies*

This research explores indirectness in the performance of speech acts in Chinese medical encounters. To be more exact, we examine a specific type of indirectness, ventriloquizing, which Tannen (2010) argues involves putting the utterance in the imagined voice of someone other than the speaker. In ventriloquizing, by framing their utterances as others' voices, speakers borrow those others' identities in order to temporarily assign to themselves characteristics associated with those others. Drawing from Chinese data on 'doctor-patient and/or companion' interaction in the obstetrics department and neonatology department of a hospital in China, this study identifies two types of speech acts in which doctors employ ventriloquizing as indirectness: complaining and suggestion.

The analysis of the data shows the following results: (1) In the case of complaining, doctors use ventriloquizing as an indirect way to challenge the medical decisions the patient has made. Instead of doing it directly, doctors complain about the patient by portraying a complainable side of the patient or a third party (e.g. a family member of the patient's) using an imagined voice of that person (e.g. "You were probably still thinking 'Humph! It's no big deal.'", in an imagined voice of the patient), thus temporarily positioning themselves as simply the animator of this face-threatening information rather than the principal (Goffman, 1981). In this case, ventriloquizing works as a politeness strategy, distancing the speaker from the face-threatening message involved in the compliant (c.f. Defibaugh 2014). However, what has not been reported in the literature is that the above logic doesn't always hold on the receiver's side, as the data indicates that the receiver may not appreciate such indirectness and evaluate it negatively. (2) When making medical suggestions, doctors use ventriloquizing as an indirect way of promoting their medical plans. Instead of directly pushing the preferred plans, doctors describe the patient's possible reactions to different possible results ("By then, you'd say 'I've done everything I can.'" or "By then you'd say 'Why hadn't I hung on a little bit longer?'"). On the one hand, ventriloquizing distances the speaker from the message, making the suggestion sound more objective; while on the other hand, ventriloquizing aligns the speaker with the patient by putting the speaker into the patient's shoes, making it an empathic way of giving suggestions. The speaker imagines the possible experience of the patient and temporarily assumes the patient's character, which can be perceived as a way of displaying empathy.

To summarize, ventriloquizing as a specific form of indirectness can be viewed as avoidance of face-threatening acts (i.e. in the case of complaining), but the receiver may not evaluate it positively as politeness. It can also be used as an empathic way of making suggestions, which has not yet been reported in the literature.

# “Corona-Virus” in easy-to-read language: inclusive popularization in German and in Italian?

Panel contribution

***Dr. Valentina Crestani<sup>1</sup>***

***1. Università degli Studi di Milano***

## *“Corona-Virus” in easy-to-read language: inclusive popularization in German and in Italian?*

The **pandemic situation** we are experiencing has led to a proliferation of texts relating mainly to interrelated social, health and economic aspects. Communication as **content popularization** (CALSAMIGLIA/VAN DIJK 2004; GARZONE 2014) should take place in an inclusive way and reach most citizens as heterogeneous groups. The process of popularization of specialized knowledge involves both a **reformulation** and a **recontextualization** of this knowledge. Popularization of knowledge aimed at people with intellectual disabilities is a new form of barrier-free communication (BOCK 2017) and a new area of investigation from a contrastive perspective (CRESTANI 2020). Specifically, popularization of coronavirus knowledge is, as far as I know, an under-explored area of research. In the last year, documents written in **easy-to-read language** concerning coronavirus have been published on the official websites of various institutions. If we consider German- and Italian-speaking countries, communication for people with cognitive disabilities has taken place in recent months and is currently taking place in a very differentiated way. Moreover, **pragmatic aspects** of texts written in easy-to-read language have been considered to a lesser extent than morphological, lexical, and syntactic aspects. This paper seeks to reduce this gap by looking at the ‘deconstruction’ and ‘reconstruction’ of **meaning** in German and Italian texts written in “Leichte Sprache” (BREDEL/MAAß 2016)/“linguaggio facile da leggere e da capire” (SCIUMBATA 2020). The replacement of specialized terms with generalist words and with non-verbal elements, which is one of the main characteristics of easy-to-read language, always means a change in the semantics and functionality of words and texts. Given the **complexity** involved, it is interesting to investigate if and how implicit meaning of specialized terms is transformed into explicit meaning of generalist words. The analysis is based on a corpus of texts from February 2020 to April 2021 taken from official websites of ministries and public institutions (e.g. *Bundesministerium für Gesundheit, Bundesamt für Gesundheit BAG*) in Germany, Switzerland, and Italy. The main questions of the research are:

- A. How do institutions address the issue of coronavirus?
- B. What communication strategies do they use to achieve a balance between implicitness and explicitness in German and in Italian?

# “Crown Jesus, not the virus!”: Intersections of nationalism, ultraconservative Catholicism, antigenderism, anti-ecologism, and pandemic denial in Poland

Panel contribution

***Dr. Dominika Baran<sup>1</sup>***

*1. Duke University*

On October 25, 2020, ultraconservative Catholic Archbishop Carlo Maria Vigano wrote an open letter to US president Donald Trump regarding the upcoming election, asserting that only Trump’s victory could avert global calamity, and specifically the “suicide of Western culture and its Christian soul” (<https://nw-connection.com/?p=7224>). Fears expressed by Vigano resemble conspiracy theories circulating among QAnon followers, but here they are being validated by an influential senior Church figure who also openly rejects the legitimacy of Pope Francis’ (Jorge Mario Bergoglio’s) papacy. Vigano’s fears center around COVID-19 as a manufactured pandemic allowing dangerous “elites” to “enslave” the rest of the world, crucially, through the deliberate destruction of Christianity.

Ultraconservative Catholics and Francis-opponents have embraced COVID-denial as a way to mobilize believers for other rightwing causes, capitalizing on growing pandemic fatigue (Zerbe 2020). This paper investigates how ultraconservative Catholicism in Poland intersects with COVID-denial – as expressed in a sign at a pandemic-denying protest on July 10, 2020, in Warsaw: “Crown Jesus, not the virus!” (*Koronuj Jezusa, nie wirusa!*) – and with other aspects of the rightwing agenda, notably antigenderism and anti-ecologism. I explore how these discourses are being linked with the construct of a fused (Grzymała-Busse 2015) Polish-Catholic identity in rightwing media on one hand, and in pandemic-denying protest signs on the other. Using Critical Discourse Analysis and methods for studying the linguistic landscapes of protests (Seals 2017), I examine ultraconservative Catholic portrayals of COVID-acceptance, alongside “genderism” and “ecologism,” as anti-Christian and anti-Polish. I situate my analysis in the context of the Church’s fight to stay relevant in Polish public life, and its complex relationship with rightwing politicians who have built their following by aligning themselves with the Church and by emphasizing the inseparability of Polishness from Catholicism (Żuk and Żuk 2019). I argue that embracing COVID-denial, and persuading COVID-fatigued religious Poles that complying with pandemic restrictions is both sinful and unpatriotic, becomes a tactic for reinvigorating nationalist sentiments around the Polish-Catholic identity.

# “Excuse me, what’s wrong with the greetings?”

## Metapragmatic negotiation of action ascription and blame (re-)attribution in accusations and denials of racism

---

Panel contribution

---

**Dr. Valeria Sinkeviciute<sup>1</sup>**

**1.** University of Queensland

Social media has become an important source of many metapragmatic discussions in relation to situated behaviours and social actions that happen face-to-face or in online communities themselves (e.g. Sinkeviciute 2018; Dynel & Poppi 2019; Garcés-Conejos Blitvich & Lorenzo-Dus, 2010). The participants in such instances of meta-talk discursively negotiate the behaviours that have generated claims to offence taking and giving and have been initially treated as (moral) transgressions (e.g. Sinkeviciute, 2020). In order to contribute to this line of research, this paper aims to explore how action is ascribed and blame (re-)attributed in online multi-party interactions. The dataset analysed is a corpus of approximately a thousand comments that have been posted on two different Facebook pages as a response to a *MasterChef* Australia contestant of Malay descent being greeted with ‘ni hao ma’ on a radio station. The contestant labelled such situated behaviour as a racist greeting, thus publicly engaging in moral judgement and claiming offence being taken. This metapragmatic discourse analytical study primarily focusses on how social media users negotiate the action behind the greeting as well as how the blame for what happened is (re-)attributed in their comments. The preliminary results show that the majority of the online interactants do not display alignment with the initial claim and renegotiate the contestant’s accusations of racism by regarding the verbal action not as an insult, but a friendly greeting. In doing this, the users engage in the denials of racism, which frequently result in re-attributing the blame (being a racist and giving offence) to the initial accuser. Furthermore, the analysis also indicates that participants discursively negotiate actions and meanings on two different levels: (1) in relation to the greeting and the accusations of racism and (2) via their own *in situ* emergent interactional behaviours.

# “I’m Mike’s PhD student”: Uncertainty reduction in introductory business emails.

Panel contribution

***Dr. Elizabeth Marsden<sup>1</sup>, Dr. Xiaoyi Bi<sup>2</sup>***

***1. University of Huddersfield, 2. Shandong Normal University***

This paper contributes to the discussion on technologically-mediated interactions by examining an under-studied area of email communication – introductory emails in 19 business-client relationships, between clients and a sole trader (i.e., the manager and only employee of the business). By using real-world email data to examine introductions, this paper aims to give explore the process of ‘getting to know’ someone in a task-focussed manner.

The analysis, by focusing on the clients’ linguistic behaviours, demonstrates that a large proportion of these relate to self-disclosure and uncertainty reduction, where email partners try to rapidly give as much pertinent information as possible about themselves, and to discover what they need to know about their co-participant. The findings suggest that other than launching self-disclosures (as observed in prior studies focusing on face-to-face introduction between previously unacquainted people [e.g., Coupland et al., 1988; Pillet-Shore, 2011]), additional strategies are drawn on by the initiators on a CMC platform to reduce uncertainty, including naming mutual connections, using third-party knowledge and stating paid service needs. Compared to a face-to-face introduction, where introducing is a sequence of turns, hence a symmetrical process (Berger & Calabrese, 1975, p. 100) with disclosure prompting disclosure (Haugh & Carbaugh, 2015, p. 480), email writers deliver their introductions all in one go, and without the benefit of immediate feedback, thus showing how the process of introduction making is reshaped by the mediated context of email.

# “Is Alex ever gonna be married?” – Boys’ jocular teasing practices about romantic love and sexual relationships in everyday peer group interaction

Panel contribution

***Mr. Fredrik Andreasson<sup>1</sup>, Prof. Ann-Carita Evaldsson<sup>1</sup>***

*<sup>1</sup>. Department of Education, Uppsala University*

This study explores how fifth grade school boys (age 11-12) talk about and handle sexual relationships in and through jocular teasing practices. More specifically we examine *how* young boys use jocular language practices (such as teasing, insulting, derogatory sexual category work and story-telling) in same- and cross-sex relationships to address intimate relations related to romantic love and heterosexual relationships (Eder, Evans and Parker 1995). The study draws on a long-term ethnographic study based on video recordings of middle school children’s everyday peer group practices. The ethnographic analysis combines a peer language socialization approach (Goodwin & Kyrtzis, 2012) with ethnomethodological conversation analysis (EMCA) and membership categorization analysis (Stokoe, 2006; see also Evaldsson 2005).

It is found that teasing and other forms of jocular play fulfill a range of local purposes within the boys’ social interplay among peers. In *same-sex interaction* the boys build up jocular in-group relationships through humorous language, laughter, teasing, and sexual insults. The use of playful sexual insults and derogatory sexual categories function as face-saving strategies to address and handle romantic and sexual matters that may be experienced as embarrassing in same sex relations. At the same time, jocular teasing practices strengthen within group alignments and enable the boys to bring up and share romantic (heterosexual) experiences, rather than continuing to make fun of each other. The analysis also shows how boys (and girls) in *cross-sex interaction* target each other and specifically makes fun of cross-sex relationships as being romantic and in love. The use of playful teasing functions both to draw up social boundaries between boys and girls and to handle the risks of participating in cross-sex activities and to pursue romantic feelings without getting teased and made fun of by other peers. It is found that playful teasing simultaneously provides a tool to strengthen verbal and embodied alignments and build local relationships with girls.

In all the analysis, demonstrates the importance to focus on not only on power and sexuality, but also romantic feelings and intimacy as central for young boys as well as girls in their everyday lives. However, even if the boys use teasing to initiate and manage romantic and sexual matters by the help of humor, the use of more aggressive forms of “teasing” may easily tear down the playful framing of the ongoing jocular play, and thus separate boys and girls from each other.

# “Is it painful...”: Emergent fear of pain in the consent-taking of a diagnostic recommendation

Panel contribution

***Dr. Ni Eng Lim<sup>1</sup>, Prof. Kang Kwong Luke<sup>1</sup>, Dr. Keng Siang Png<sup>2</sup>***

***1. Nanyang Technological University, 2. FeM Surgery***

Patients' emotional fear of pain in diagnostic or treatment procedures are common occurrences in medical consultations. During these moments, doctors have to assuage these fears in a manner that is empathetic, but at the same time coax patients into accepting a medically prudent course of action, while fulfilling the requirements of obtaining informed consent. How do patients' fear of a procedure emerge in the course of a medical recommendation, and how do doctors deal with them? Based on 150 video-recordings of authentic first-visit consultations in the Urology clinics of a Singapore hospital, this presentation uses conversation analysis to examine how doctors formulate the diagnostic recommendation of cystoscopy or ‘scope’ for common cases of hematuria (blood in urine). A regularly found feature in the doctors' recommendation is the conveyance of medical rationale, explaining the risk of the procedure, and detailed procedural description of the test, as would be expected for diagnostics that require informed consent. However, such trajectories of talk also often lead to patients' orientation to pain, thereby prefacing resistance and withholding of agreement to the procedure. In the face of resistance, it is found that doctors do different sorts of actions that can all be seen as further counselling for “informed consent”, but with questionable effect in persuading patients toward acceptance. However, one practice that seems to resonate with the patients' concern and efficacious towards an agreement to the scope, is talk about experiences of others. This leads to reflections on how the provision of medical information in informed consent, as a ubiquitous practice in clinical consultation, can in fact be counter-productive to the goals of getting consent; and how doctors need to deploy other interactional strategies to achieve institutional objectives hindered by emotive participants.

# “It is with great pleasure that I will see all those shipwrecks hanging on to their rescue boat...”: emotion on football radio phone-in interaction

Panel contribution

***Prof. Carla Almeida<sup>1</sup>***

**1.** Open University of Portugal

The expression of emotion can be analysed under the frame of interactional work (Goffman 1981), that is, by analysing discourse strategies that create a “conversational involvement” (Gumperz, 1989). The analysis of discursive strategies allows the understanding of the co-construction of the “shared expectations” that are associated with “frames” (Tannen 1993). Taking as reference an oral *corpus* of a Portuguese football radio phone-in programme (Almeida 2012), we will analyse “involvement strategies” (Tannen 1989:1) developed through a discursive mechanism based on the expression of imagined metaphors and images. Considering emotion in the frame of interactional work developed by interactants in conversation (Edwards 2001: 236) and based on the studies that focus on impoliteness (Terkourafi 2008; Culpeper, 2011), we analyse the pejorative action that disqualifies the listener and the functioning of reparatory acts, such as apologies, that occur in interactions of polemic tone. The construction of an emotional discourse on radio shows characterised by a controversial tone is based on verbal rituals with sequences of threatening speech acts and the development of rhetoric devices aimed at interactional objectives of impoliteness. In radio phone-in interaction on institutional topics such as football, we see that irony, sarcasm and insulting are part of a rhetoric-pragmatic skill that shows the sharing of a *common knowledge*. In these controversial interactions, speech repetitions, intensifying formulas of discourse, threats, pejorative labelling, rhetoric questions, insults, irony and sarcasm are linguistic devices of a rhetoric meant to undermine, revealing the emotion of speakers who produce these discourse strategies that disqualify and offend (Almeida, 2013). Thus, we will analyse the functioning of intensification devices that are performed under the frame of rhetorical strategies oriented towards interactional efficiency and argumentative activity. The repeated use of intensifiers such as “great” and adjectives such as “náufragos” (shipwrecks) are some of the intensifiers analysed in these interactional contexts.

# “It’s a long story”: setting up off-topic narratives in response to questions

Panel contribution

***Prof. Neal Norrick<sup>1</sup>***

*1. Saarland University*

Formulations with “long story,” “interesting story,” and “funny story” can create an interactional space for an unexpected narrative in response to a question. In deploying these expressions, potential tellers may override presuppositions of a question to produce dispreferred, digressive responses, as in the examples below:

Bob: What were you doing in Bristol Bay, Alaska, in July of a year you probably don’t want to mention?

Eliz: it’s a long story. I- there was just always something pulling me to Alaska. When I was small I never liked to fish. ...

Terr: You went to a tiny island that has naturally occurring gas bubbles, and there’s carbon dioxide in those gas bubbles. So what kinds of experiments are going on in this island?

Meli: Well, that’s a really interesting story, and it involves a great guy whom I went out with ....

Thematizing the category “story” for a (projected) spate of talk, the speaker engages in metacommunication, produced to perform social actions in the telling (Stokoe and Edwards, 2006), here to make room for an extended narrative performance including background details that may initially seem irrelevant. In the first passage above, Eliz begins a whole life story with no obvious relevance for her actions in Bristol Bay; in the second excerpt, Meli launches into a narrative which initially seems to ignore the question asked entirely.

The formulas “It’s a long/funny/interesting story” set up a potential side sequence, in the sense of Jefferson (1972), with a slot for the original questioner to respond directly to the formula and thereby negotiate the story performance, as in the next example.

1 Larry: Then to college where?

2 Moni: Up in Oregon, at Lewis & Clark.

3 Larry: Why there?

4 Moni: It’s a really long story. But it...

5 Larry: Shorten it.

6 Moni: Shorten it? It was a choice between Lewis & Clark and Berkeley ...

Lines 4-5 “It’s a really long story” - “Shorten it” constitute a side sequence, an interactional pair which practically lifts out of the surrounding conversation. Following her questioning repeat of Larry’s “Shorten it,” Moni moves the interaction forward with “It was a choice ...” answering the original question from line 3. Metacommunicative characterizations like “long story” constitute accountable actions and stand open to responses in their own right.

My paper will describe negotiations in and around the constructions “long/interesting/funny story” in response to questions, comparing them (1) with the formula “here’s the thing,” which also looks forward to the response story, (2) with partially parallel formulas like “good question” and “glad you asked,” which look backward toward the question, and (3) with phrases like “to cut/make a long story short,” which occur during a narrative already in progress. These characteristic phrases and responses to them constitute narrative practices of special sorts in conversational interaction.

# “It’s good to send SMS because then they can use google translate”, or how to avoid indexing exclusion in mediated migrant-host community interaction

Panel contribution

***Dr. Kristin Lexander<sup>1</sup>, Mrs. Hilde Thyness<sup>1</sup>***

***1. Inland Norway University of Applied Sciences***

The affordances of digital tools open new possibilities in the interaction between migrant workers and their host community, including possibilities of inclusionary and exclusionary practices. Choice of linguistic resources is an obvious aspect of this, as is spelling (Jaffe 2009, Sebba 2007), while choice of modality and tool make up other important dimensions. In order to investigate these features in a perspective of distinction and adequation (Bucholtz & Hall 2005), our paper focuses on the digital communication of Lithuanian work migrants in Norway in two sectors, at work and in education. It is based on a four-year project (2020-2024) on multilingual digital interaction and inclusion in Norway where interview data and digital conversations are collected with Lithuanian migrants and their interlocutors, more specifically employers, clients and colleagues, as well as parents and their children’s teachers in school.

The interview data shows that the interlocutors are conscious about the exclusionary potential in their communication and seek to avoid such practices. Our first research question therefore evolves around the participants’ reflections on exclusion: on which ideological assumptions do they evaluate interaction as potentially exclusionary? Do the migrants and their interlocutors agree on these assumptions? We are further interested in how this leads to practice, and our second question focuses on what measures the participants take to avoid exclusion in interaction. Here we examine interlocutors’ interpretations of specific interactional data, again comparing both migrants’ and host community perspectives and interaction in the work and school sectors. The analysis draws on indexicality (Silverstein 1976, 2003, Ochs 1992) to investigate how social categories like “migrant parent”, “Lithuanian worker”, “farmer employing Lithuanian worker”, and “Norwegian teacher”, as well as stereotypes related to these categories, are negotiated and contested through interaction.

# “It’s possible you could have it but really nobody can say for sure.” The social functions of low-risk communication in Coronavirus forum discussions.

---

Panel contribution

---

**Ms. Eva Triebel**<sup>1</sup>

1. Lancaster University

Social platforms on the web have long become, for most, the first source for sharing, retrieving and negotiating information, helping people make decisions not only regarding trivial issues such as everyday consumption choices (Zou, Yu & Hao 2011) but increasingly also in matters potentially perceived as more serious and thus riskier, especially health concerns (Sosnowy 2014).

The possibility to interact online on the one hand serves a democratisation of knowledge, enabling people to share information irrespective of their social background. This can serve to undermine the notion of traditional expertise, since features such as authenticity, first-hand experience, and personal channels of information are seen as more important for credibility than abstraction, institutionalisation and establishment (formal education, science, mainstream media). On the other hand, discussions among laypeople often may become conflictual in connection with subjects associated with risk because it is exactly the notion of expertise and credibility that become foregrounded. Invoking the concept of risk itself helps to characterise some people, who pass on unsolicited information based on experience rather than expertise, as (risk-)ignorant and thus a social threat and morally problematic. However, providing information in a traditional top-down fashion, emphasising one's epistemic and educational status and the assumed competence gap between speaker and addressees, goes against the community-building function that lay forums have. This could mean that representing oneself as uncertain and unauthoritative is the preferred, because socially more advantageous, strategy of linguistically interacting online.

This paper examines how risk-related topics lead to an increased and variable use of epistemic strategies in the self-representation of people interacting online. More specifically, this study analyses a corpus of 100 forum postings and their responses taken from two UK Covid-19 discussion boards. It examines which kinds of epistemic strategies are used and what social functions they serve, focusing on a possible conceptual relation between epistemic certainty and notions of morality, with low epistemic certainty potentially serving to construe participants as cautious, risk-aware and thus morally integer.

# “It’s the worst thing to happen to anyone ever”: The usage, discourse goals, and perception of hyperbole in victim testimony

Panel contribution

***Ms. Shreyasi Desai<sup>1</sup>, Dr. Janet McLean<sup>2</sup>, Dr. Claire Lawrence<sup>1</sup>, Dr. Ruth Filik<sup>1</sup>***

***1. University of Nottingham, 2. Abertay University***

This research investigates hyperbole (purposeful exaggeration) specifically in the testimonies of victims of sexual crime. Despite being one of the most commonly used literary tropes, the comprehension of hyperbole has been largely ignored in the psycholinguistics literature, and despite detailed literature outlining the emotional behaviour of victims, the use of figurative language has been largely ignored in the forensics literature. In the present research, three main methods of investigation have been adopted – a corpus study to explore realistic language use within victims, a quantitative survey study to explore the perceptions of figurative language in victim speech, and finally, a qualitative interview study with law enforcement officers to further the depth of understanding on the professional perception of rape, victims, and investigations.

A specialised corpus of 543,399 words was compiled to examine the language use of victims of sexual crime. This corpus involves victim testimonies provided in informal and non-consequential settings over the internet such as open Facebook groups, tweets, blogposts, and websites for victim aid organisations. A general analysis of the corpus suggests three prominent deviations from previous corpus-based research on hyperbole. First, quantitative hyperbole is rarely used to fulfil a humorous discourse goal and almost never exists in a purely objective-gradational realm. Second, the importance of recognising the subjective-emotional functions of hyperbole in its definition. Finally, the corpus provides insight into the importance of hyperbole in building creative metaphor, (e.g. “I was beaten to look like a bag of mulberries”) prevalent in victim-speech.

To explore the perception of hyperbole in victim testimony, 64 participants from two groups (professionals such as law enforcement and victim-aid workers (32) and non-professional but jury-eligible individuals (32)) were presented with 16 hypothetical scenarios containing either hyperbolic or non-hyperbolic victim statements in legally relevant settings. Participants rated the statements on different measures of credibility: belief, sympathy, victim-impact, and likeability. After providing the ratings, participants also answered a singular open-ended question following the ratings: “What made you believe/disbelieve the complainant?”. The results suggest that hyperbole significantly negatively impacts professionals’ perception of victims whereas it significantly positively impacts non-professionals’ perception. The qualitative data was used to support the quantitative.

In order to further understand professional perceptions of rape, victims, and investigations, a qualitative study is underway. For this study, 12-18 law enforcement officers will be interviewed using a semi-structured interview format. Participants will be presented with four open-ended questions pertaining to characteristics common to victims of sexual crime, indications of false allegations in victim speech, and victim-behaviour or speech that may hinder a successful investigation or trial. The responses will undergo an inductive thematic analysis with a special focus on mentions of victim language and victim demeanour.

The corpus study explicates the role, nature, and prevalence of hyperbole in victim speech. The quantitative study explores the impact of hyperbole on the perception of victim testimony. Conclusively, the aim of the qualitative study is to provide a rationale for the negative perception of victims who exaggerate, among professionals.

# “I’ll never call them by their names, because it’s rude.” - Kinship terms used by Chinese native speakers in daily interactions

Panel contribution

**Dr. Xiangdong Liu<sup>1</sup>**

1. Western Sydney University

This paper discusses results of a survey on kinship terms in addressing practices of Chinese native speakers. It is part of the initial step of our cross-linguistic project investigating address practices in Chinese, Japanese and Korean languages.

The results reveal that (1) kinship terms are the dominants used by all age and gender groups when addressing senior family members; (2) Chinese native speakers often use kinship terms (e.g., 妹妹 younger sister, 弟弟 younger brother) to address their siblings even when the addressee is younger; (3) Fictive use of kinship terms is the first choice among the participants when addressing an elder non-kin person. Over 90% of the participants of the survey wrote that they will “never call a senior family person by their name”, because “it’s rude” or “impolite” according to the “convention” or the “culture”.

Moreover, responses to the survey also show that there are more varieties of male kinship terms in Chinese than female ones, and that kinship terms of siblings (e.g., 姐姐/妹妹 elder/younger sister, 哥哥/弟弟 elder/younger brother) are widely used among people of a same generation, either blood-kin or non-kin. However, unlike in some other languages (e.g., Korean), kinship terms of siblings are rarely used between couples.

These preliminary findings of the current study provide further support to previous claims regarding the influence of Chinese family culture in addressing practices (Chen & Ren, 2020; Wu, 1990). More importantly, the findings suggest that the hierarchical Chinese family culture forms the foundation of interpersonal relationships within as well as outside a family. This explains why Chinese native speakers turn to use kinship terms for senior family members (e.g., aunt, uncle) to address non-kin people as devices of politeness, while it may not be the case in other cultures (e.g., Japanese).

Many scholars claim that Confucianism have great impacts on the cultures, traditional values and language use of Chinese, Japanese and Korean (Richey, 2013; Yum, 1988). The findings of this study provide us with up-to-date resources to compare addressing practices in the three East Asian languages, in order to not only confirm similarities but also identify differences, and, more importantly, explore what are behind the differences of the cultural meanings of address terms in each of the three languages which are said to share common traditional values.

# “I’ll splash vitriol on your pretty little face”: Instances of verbal and non-verbal aggression against eminent intellectual and professional Greek women of the 19th and early and mid-20th century as recorded in their autobiographies

Panel contribution

***Prof. Ourania Hatzidakis<sup>1</sup>***

**1.** Hellenic Air Force Academy, Greece

This paper analyses historical cases of gender-driven verbal and non-verbal aggression against distinguished Greek women of the arts, the sciences, and education who were born in the 19<sup>th</sup> and the first quarter of the 20<sup>th</sup> century, as related by them in their published autobiographies.

The four women whose cases are addressed here are educator and benefactor Sevasti Kallisperi (1858-1953), artist Sofia Laskaridou (1876-1965), medical doctor Angélique Panagiotatou (1878-1954), and dancer, choreographer and dance educator Rallou Manou (1915-1988). All were born into families of the financial and intellectual elite of the newly independent Greek state and the thriving Greek diaspora of the time, but became high-achievers in their own right, having consciously chosen to challenge the generalized expectation of spouse-hood cum motherhood as the prime/sole occupation of the middle- and upper-class female (Varikas 2004), and to become active in the public sphere by pursuing professional careers. They also published autobiographies (Kallisperi 1911, Panagiotatou 1951, Laskaridou 1956, Manou 1987), in which they recount their accomplishments, and also the trials and tribulations caused by this choice. Therein are reported instances of individual or collective (non-)verbal aggression inflicted upon them by male members of the educational or professional establishments which these women aspired to penetrate, with an obvious view to quashing these aspirations. The discourse analysis of these narrations reveals striking similarities, amongst all autobiographers, in the treatment of instances of gender-related aggression. Humiliating, intimidating or threatening male acts are described in a detached and highly dignified manner, with tinges of irony and humour serving to depict men’s behaviours as antediluvian, and also as futile: each story of (non-)verbal attack is invariably followed by a bold statement of defiance and of determination to adhere to the planned life course in the face of such reactionary attitudes. The discursive formulations attested in these self-narratives reveal a heightened sense of self-worth, an acute awareness of gender identity, and a spirit of pragmatic idealism on the part of the four self-writers, who all eventually went down in Modern Greek history as female pioneers in their respective fields.

# “I’m so angry!” Taking offence in calls to an insurance company

Panel contribution

***Dr. Carmen Santamaria-Garcia<sup>1</sup>***

**1. UNIVERSITY OF ALCALA**

In the context of telephone calls to an insurance company call centre, it seems preference for agreeability is suspended and claiming offence might work as a persuasive strategy encouraging empathy. Offence is analysed following Haugh (2015), as both (a) an emotional response on the part of recipients, which varies in degree of intensity (e.g. a feeling of anger, displeasure or annoyance that is caused by an offending event), or as (b) a source of such feelings (e.g. a source of feelings of anger, displeasure or annoyance). Taking offence is understood as a social action initiated by the recipient in which he or she construes the actions or conduct of the prior speaker (or some other person or group of persons) as offensive. Customers are seen to sanction offence with a moral claim of a prior affront on the part of another participant and to register offence with an affective stance, indicating a negative emotive state of feeling bad, stressed, annoyed, angry etc. Attention is paid to the evaluation of callers' actions by both telephone operator and translator, as calls happen in the context of telephone interpreting. Participants' perspective will be essential in the analysis of the interpretation of interaction as (im)polite (Mills, 2003; Kádar and Haugh 2013; Watts 2003).

I hope this presentation contributes to improving our understanding of the interactional dynamics of taking offence. My work is part of research in the project *Analysis of face-threatening acts in telephone interpreting*, Ref. CM/JIN/2019-040.

# “Laughing together, coping together”: The role of humorous memes in the Covid-19 crisis

Panel contribution

***Dr. Carmen Maiz-Arevalo<sup>1</sup>, Dr. Francisco Yus Ramos<sup>2</sup>***

***1. Universidad Complutense de Madrid, 2. UNIVERSITY OF ALICANTE***

Research in different fields has repeatedly proven that humour is multifunctional. Among these functions, humour has been shown to “pervade the rhetorical process of forming and maintaining online groups” (Hübler and Bell, 2003: 278), hence boosting community bonding and the feeling of connectivity (Norrick, 1993). From a psychological approach, scholars from Freud (1991 [1905]) onwards have claimed in favour of a continuum with two extremes: aggressive humour, which is targeted at diminishing others, and innocent humour, which does not involve hostility (e.g., droll humour). Martin et al. (2003) speak about aggressive and affiliative humour, also considering related categories such as self-enhancing and self-deprecating humour. Psychologically, humour is often employed as a coping mechanism, with therapeutic effects on those producing and receiving it (Christopher, 2015; Samson and Gross, 2012). This might explain why, at the time of an international pandemics like Covid-19, we have resorted to humour as a common means to alleviate uncertainty and fear (Chiodo et al. 2020; Stefani 2020; Jensen et al, 2020), to enhance feelings of connection and bonding with others, and to remind others of their virtual co-presence. Thus, the present paper focuses on this social function of humour with the aim to find out whether some humorous patterns (e.g. affiliative-aggressive) are more frequently employed than others (e.g. surreal humour) by Spanish users as a means to cope with such a dramatic situation. To this purpose, a corpus of circa 250 memes was gathered from media and the messaging app *WhatsApp*. Results show that self-deprecating and aggressive humour are often employed to boost morale and create a “common front”, and with parallel aims such as using covid-19 humour for building up subsequent interactions and bonding.

# “Laughs in Swedish”: Indexical indications of shifting paradigms in online forum discussions of paternity leave

Panel contribution

**Ms. Kate O’Farrell<sup>1</sup>**

**1. Stock**

In September of 2020, French president Emmanuel Macron announced that paternity leave for new fathers in the country would be doubled, from 14 days to 28. The news was shared on the website Reddit with a link to a New York Times article titled ‘France Doubles Paid Paternity Leave to 28 Days, One of Europe’s Most Generous Plans.’ This study analyses how commenters on the World News subreddit (forum) reacted to and discussed the announcement in the days after it was posted. The study uses the ten comment threads which generated the most interaction, ranging from 32 to 664 subsequent comments, for a total of 1,801 comments (62,709 words). Indexicality within the comments is then analysed in relation to the identity categories of gender, parenthood, and nationality (Ochs, 1993). Comments which indicate a relevant identity enact epistemic status within the discussion (Raymond & Heritage, 2006). This epistemic status strengthens the position from which commenters may then index something about their ideology. The study primarily addresses the research question: How are commenters indexing epistemic status in relation to paternity leave in order to furthermore index a progressive ideology of masculinity?

In a preliminary review of the data, themes which emerge include rejection of traditional gender roles (“Aside from breast feeding, what can a father not do?”), camaraderie between and support for fathers and expectant fathers (“You sound like you’re going to be a good dad :)” ), and satisfaction or dissatisfaction with available paternity leave. Within this last category, satisfaction is overwhelmingly linked with more generous paternity leave and is frequently indexed through pride in a country or administrative region in general. Aside from overt congratulations or lamentations, a common method of indexing (dis)satisfaction is to use the language of subtitles (e.g. “Laughs in Swedish,” “Laughs along in German,” “Cries in American”). The commenters are firstly indicating their nationality and general mood towards the announcement, and in doing so are secondly indexing certain ideologies towards the macrosocial gender roles in western society. Thus, commenters are creating a sense of a community which defies national and/or language boundaries; rather, the community is constructed using humanistic perceptions of masculinities. The appropriateness and effectiveness of certain linguistic devices in the online context- such as overt/hypothetical questions and subtitled voicing- results in them more frequently being used for the dissemination of ideologically-informed stances (Silverstein, 2003). As such, the device itself can come to represent certain ideologies. In analysing this online discussion of paternity leave in France and more broadly in the western world, an ideological shift away from traditional male gender roles and conceptions of masculinity can be observed.

# “Let’s Just Forget It!”: Discourse of Inclusion in a Japanese Nursing Home

Panel contribution

***Dr. Toshiko Hamaguchi***<sup>1</sup>

*1. University of the Sacred Heart, Tokyo*

Latest statistics by the Japanese Ministry of Health, Labor and Welfare shows that 28.7% of the population in Japan is over 65 years old, which is the highest in the world and makes Japan a “super-aged society” by the WHO definition. In addition to the large aging population structure, one in four over 65 is said to have some kind of dementia or mild cognitive impairment (MCI). This suggests that everyday interactions older adults, particularly those with dementia or cognitive decline, have often involve younger conversational partners with varying degrees of shared knowledge and experiences. Such intergenerational communication can be challenging and stressful for both participants not only due to lack of mutual understanding but also due to accentuated cognitive and epistemic gaps between them. It is reported that the number of people who have used care facilities in Japan was over 51 million in 2018, of which those who have used long-term residential care facilities was well over 12 million. As a result, healthcare professionals deal with older people on a regular basis more and more, and thus their communicative skills affect the quality of living of those with dementia who struggle to fight against the sense of alienation as well as loss of self. Needless to say, acquiring effective communicative skills on the part of the professional caregivers is as important as understanding communicative skills of older people with diverse physical and cognitive statuses. Nevertheless, empirical studies that analyze discourse strategies of younger professional caregivers in interactions with older adults in residential care facilities is underdeveloped.

Using recorded interactions between nursing home residents with dementia and care staff in Japan, this study demonstrates how interactional strategies used by female recreation workers in their 40s serve to reduce generational as well as epistemic gaps with residents in their late 80s and 90s. I will use weekly conversational activities to show how older residents’ reference to memory loss or forgetfulness is deindividuated by recreation workers’ framing as something the participants all forget together and laugh off. Also, I would like to show how the recreation workers elicit the residents’ personal experiences related to a topic of conversation and include these short narratives not only as a source of developing the ongoing conversation topic but also as a mutual learning opportunity. I will claim that such collaborative conversational exchange on a regular basis helps maintain dignity of and respect towards the older residents, who often feel the sense of exclusion from ‘here and now’ and allude to their departure from the current world.

This study will conclude by suggesting that more research on discourse at care facilities is expected since it can contribute to better training of caregivers’ linguistic professionalism on the one hand, and life satisfaction of residents on the other. Wisdoms and knowledge of those with dementia should not diminish but remain accessible and sustainable in the super-aged (and still aging) society.

# “Let’s see what you’ve got America”: Humble expressions as mock politeness in online comments in Japanese

Panel contribution

**Ms. Vera Hanaoka<sup>1</sup>**

**1.** University of Hawaii at Manoa

The internet has proved to be a fertile ground for impoliteness and conflict between often anonymous parties. While “face-attacking” (Culpeper, 2011) impoliteness found online is often blatant, this study analyzes instances of *mock politeness* in which the use of conventionally (Culpeper, 2011) polite linguistic resources are used to index an impolite stance through implicature (Haugh, 2014; Taylor, 2015). Japanese humble expressions, which have the function of lowering the user while simultaneously raising the addressee, are used to show the contempt of online Japanese commenters for both the US government and the US media.

The data comes from the comments section of several news articles, from early March 2020, about the discovery of COVID-19 cases on the Grand Princess cruise ship off the coast of California. This comes after Japan was criticized, notably by the New York Times, a US newspaper, for their treatment of COVID-19 cases aboard the Diamond Princess cruise ship which was harbored in Yokohama, Japan in early February 2020. The majority of the comments employ mock politeness saying that the commenter is looking forward to seeing America’s “superior response”. The phrase *o te nami haiken* ‘let’s see what you’ve got’ which sarcastically employs the humble expression *haiken* ‘to see’, and the passive form with the benefactive humble verb *sasete itadaku* ‘let me receive’ in phrases such as *benkyoo sasete itadakimasu* ‘let us (humbly) learn from them’ are frequently used to create a situation in which the Japanese commenters will “learn” from America’s “example” (*telon*).

This study aims to contribute to the nascent work on Japanese impoliteness (Nishimura, 2010) as well as to research that shows how honorifics are used to express impoliteness (Brown, 2013; Okamoto, 2002). Additionally, while most online impoliteness research involves a direct exchange between the aggressor and the victim, this study is unique in the fact that commenters criticize and defend their country from the criticisms of the US in a forum that is only accessible to Japanese language speakers, meaning that the impoliteness is performative with it unlikely to reach its target.

# “Making the invisible visible: showing extimacy in video interaction”

Panel contribution

***Dr. Samira Ibnelkaid***<sup>1</sup>

*1. University of Oulu*

As the global pandemic has shown us, embodied social interactions are a necessity if one is to actively take part in the sociocultural world. Self-isolation, lockdown, curfew, “social distancing”, are all meant to prevent a virus from spreading but they also constitute a risk for people to develop negative affects, solitude and exclusion. Video calling, a seldom practice until recently, has become extremely popular. This increasing popularity finds its ground in the growing need for “extimacy” in informal settings. This notion has first been coined by Lacan (1959) referring to “the essential identity between [...] the outer world and the inner world of the subject” (Pavón-Cuéllar, 2014).

This concept of extimacy has then been renewed by Tisseron (2011), in relation to the modern era, defining it as “the movement that repositions some elements of our intimate lives into the public domain so as to have a feedback as to their value”. Extimacy contributes to “the development of self-esteem, to the establishment of a richer intimacy, and to the creation of additional social ties” (*Ibid.*). Therefore, video calls constitute a way of enacting extimacy by sharing with others one’s intimacy on screen. Video calling is not only an act of showing one’s face to the other participant(s), it is also about showing their surroundings, their relatives, their activities, etc. These showing sequences emerge from the fact that “we increasingly define our identity as what we can exhibit and what others can see. Intimacy is so important to define ourselves that we have to show it. It confirms our very existence.” (Pérez-Lanzac & Rincón, 2009).

To further understand the on-screen display of extimacy we have gathered data of video calls in between French friends and family members from various generations during the 2020 global pandemic. Drawing on visual ethnography (Pink 2007) and multimodal interaction analysis (Goffman, 1973, Goodwin 1981, Traverso 2012), our study of a collection of showing sequences reveals that showing is not a unilateral accomplishment but rather a co-constructed participatory activity aimed at involving others in one’s daily life, be it a recent achievement, a joyful event, or even the simple presence of a pet around. Our analysis of showings of otherwise non participatory third parties (namely, here a baby, a cat, etc.) led us to identify the multimodal structure of the interactional technobodily process of online showing from the preface to the initiation (self-initiation or hetero-initiation) and to the showing itself (guided or non-guided) and finally to the closing (direct or indirect) and the transition to another conversational topic. This intersubjective process of showing extimacy allow participants to make the invisible visible, it prevents social exclusion and it fosters participation even remotely.

## “Marielle, presente”: Metaleptic temporality and the enregisterment of hope in Rio de Janeiro

---

Panel contribution

---

***Dr. Daniel Silva<sup>1</sup>***

**1.** Universidade Federal de Santa Catarina

This presentation looks to the assassination of Marielle Franco, a queer Black councilwoman from the Complexo da Maré favela in Rio de Janeiro, to outline a principled metacommunicative action towards “hope.” Empirically, it unpacks features of the pragmatics of her discourse, along with that of mourners who knew her. We identify two main features in their discourse that point to the enregisterment of hope, i.e., to ways in which their communicative practices have been attuned to avoid despair by propelling an alternative indexing of time, authority, and forms of life. These features are: metaleptic temporality, i.e., the reinsertion of Marielle’s agentive time into the temporal universe of heroes; and *papo reto*, a translational and performative practice of scaling bureaucratic and economic talk into local registers. Finally, we point to the habituated and pedagogic dimension of this sociolinguistics of hope, in part responsible for the fractalization and performativity of the mourning movement.

# “Martin left the group”: Covid-19 crisis management as a source of conflict among Spanish workmates using WhatsApp

Panel contribution

**Dr. Lucía Fernández-Amaya<sup>1</sup>**

**1. Pablo de Olavide University**

Covid-19 pandemic has changed our life in many different aspects, becoming an everyday topic of conversation. However, this topic can be very sensitive sometimes, since interactants may not agree on the different measures taken by their Government to manage this health crisis. Due to the fact that these measures affect directly their jobs, economy and health, they have good reasons to defend them or position themselves against them. The main purpose of this talk is to explore disagreement and impoliteness in a Spanish workmates' *WhatsApp* group, before (from October 2018 until October 2019) and during Covid-19 pandemic (from March 2020 until August 2020). After analysing the conversations using categories of disagreement strategies proposed by previous authors (Pomerantz 1984, Brown and Levinson 1987, Rees-Miller 2000, Locher 2004, Kreutel 2007, Malamed 2010, Shum and Lee 2013) a total of 1.466 instances of disagreement were identified, 161 before Covid-19 pandemic started and 1305 during it.

The main results show a higher presence of disagreement during the pandemic period. Initially, this speech act was not seen as face threatening by participants who even explicitly stated they were glad to have the opportunity to show very different opinions openly, without risking their personal relationships. However, as the pandemic went on, impoliteness increased during disagreements, turning the interaction so conflictive that one of the members even felt the need of leaving the group. This increase towards disagreement is also corroborated by the choice of the linguistic strategies made. Whereas the second most used strategy from October 2018 to October 2019 was ‘using mitigating expressions’, during the pandemic this was ‘giving negative comments’. One of the main consequences derived from this study is that the silent norms that ruled this online affinity space changed from that moment and no more opinions regarding how the Spanish Government was managing the COVID 19 crisis have been expressed since then.

# “Maybe someone has answers?”, advice-seeking in parenting forums

Panel contribution

***Dr. Olga Zayts<sup>1</sup>, Dr. Mariana Lazzaro-Salazar<sup>2</sup>***

***1. The University of Hong Kong, 2. Universidad Católica del Maule***

Online parenting communities have become popular sources of advice-seeking for parents around the world (e.g. McKenzie, 2020; Mungham and Lazard, 2011). Previous research suggests various reasons why people turn to advice-seeking online, such as when advice from offline networks is unavailable, or when people experience social and emotional loneliness they tend to turn to online communities for support (Feng et al., 2018). Research also suggests that women are more likely to resort to advice-seeking online, particularly when it relates to their psychosocial concerns (Addis and Mahalik, 2012). The COVID-19 pandemic that has swept the world in 2020 has put these observations in perspective: with global lockdowns, closures of schools and childcare facilities, work from home requirement by employers, parenting online communities have become critical, and arguably the most readily available platforms for parents, and mothers in particular, to seek advice about changing, and often contradictory, health information, to vent their emotions and concerns, and to draw support from their ‘virtual alliances’.

In this paper we focus on popular online forums for mothers in Hong Kong and Chile and examine the posts related to COVID-19 that appeared on these forums in the first 6 months since the outbreak in each country. The data corpus comprises the posts in which the starting/trigger comment is an advice-soliciting move. Drawing on an integrated discourse analytic approach combining both quantitative and qualitative investigation, we compare: a) the types of advice solicited and provided by the forum participants, b) the way epistemic rights and epistemic authority are discursively managed when seeking and providing advice, and c) the ways in which alignment (or misalignment) and empathy and rapport (or their lack) are built and negotiated through advice in both contexts. We also examine those instances where advice seeking or giving have gone awry, that is, the instances that have been contested or denied by other forum participants, and discuss these instances with regards to participants’ epistemic authority.

Finally, building on previous discourse literature on online health advice-seeking, we reflect on the value of parenting forums for mothers as powerful tools for navigating the health crisis from a multi-layered perspective that considers how these forums may provide strong informational and psychosocial support to its participants and serve as important platforms for negotiating health literacy during the current COVID-19 pandemic.

# “Ni yiwei/dang nishishui?” (“Who do you think you are?”): A Chinese Identity Negation Marker Used in Weibo Posts

Panel contribution

**Dr. Hao Liu<sup>1</sup>, Prof. Xinren Chen<sup>1</sup>**

***1. Nanjing University***

The Chinese discourse marker “ni yiwei/dang (X)” has been a subject of much uncertainty and controversy, as researchers have proposed various disparate functions and meanings of this small chunk on the basis of limited, isolated and everyday conversational data. This study aims to explore one of its variants, namely “Ni yiwei/dang ni +” (“Who do you think you are?”) to show how this negative marker is used and perceived in asynchronous computer-mediated communication (CMC) on Chinese social media, Sina Weibo. Attending closely to the interactional environment of 529 pieces of extended examples of online interaction where “ni yiwei/dang nishishui” is used, we find that “ni yiwei/dang nishishui” is generally deployed by speakers as an explicit negation of the addressee’s identity and is understood by recipients as an indication that a particular stretch of talk, belief, behavior, etc. of the addressee is denied, scorned or even disdained, such that the addressee might take, while not necessarily claim, offense. However, particularly in CMC, when “ni yiwei/dang nishishui” is either enclosed within a humorous frame (regardless of whether or not the negation of identity is truthful, i.e. communicate the addresser’s true beliefs about the addressee’s identity), or when it is employed in the case of overtly ambiguous addressivity, online users may sometimes conceive it as innocuous, conveying mock impoliteness oriented towards amusement and solidarity-building between speakers and recipients. It is further argued that the use of “ni yiwei/dang nishishui”, which can be viewed as a metapragmatic marker indexing the speaker’s reflexive awareness of self, others, and/or the relationship between two or more parties, can engender a range of context-bound interactional effects.

# “Poetry of prose” as imitation: An empirical examination of psycholinguistic models of interactive alignment

Panel contribution

***Dr. Masataka Yamaguchi<sup>1</sup>***

***1. Kobe City University of Foreign Studies***

Alan Rumsey (2021) calls for the cross-fertilization of psychology and linguistic anthropology, arguing that both disciplines “have a lot to learn from each other about the nature of ‘mind’” while specifically referring to the ontogenetic studies of “theory of mind” (see Rumsey 2013; Schieffelin 2008; de Villiers and Pyers 2002). Yet, linguistic anthropology has not adequately conceptualized the cognitive aspects of discourse, despite the Boasian-Whorfian heritage (Hill and Mannheim 1992). From this perspective, I propose that “poetry of prose” be conceptualized as “aligned mental representations” and naturally-occurring conversation be used for confirming the validity of psycholinguistic models. For illustrative purposes, empirical evidence is taken from three sets of data: a fragment of a Japanese talk show on TV, and two sets of interaction in English (one from discussion about the Atlanta Spa shootings in 2021 on NPR by two Asian Americans and the other from an experimental conversation between two Americans in Japan in Mr. O-Corpus) in which interlocutors are aligned through the use of discursive recursivity (Silverstein 1985, 2004; cf. Kataoka 2011; Yamaguchi 2012).

By reviewing the literature on “coherence” in discourse-pragmatics (e.g., Halliday and Hassan 1976; Tyler 1994; Hill 2005; Bublitz 2011), “poetic structures” in linguistic anthropology (e.g., Silverstein 1985, 2004; cf. Lempert 2014), and “catchment” in gesture studies (McNeill 2005), I synthesize these lines of work to obtain a more integrative perspective of the phenomenon of “poetry of prose” (Kataoka 2009, 2010, 2011). In doing so, I take up the challenge of conceptualizing the pragmatics of poetry as a cognitive-psychological phenomenon by taking the model of Pickering and Garrod (2013) as example. Specifically, they propose a psycholinguistic model of “interactive alignment” in conversation (cf. Levinson 2016; Roberts and Levinson 2017) in which they schematically represent a model of how both production and comprehension of discourse involve “covert imitation and forward modeling to make predictions” in conversation. The model “assigns a central role to prediction-by-simulation” in that interlocutors use the structurally identical phonological, lexical, and syntactic representation in conversation.

Through the analysis of the data, I make explicit “poetic” structures in them. One of the data sets indicates that the model of “prediction-by-simulation” is employed because the interlocutors create alignments with the equivalent phonological, lexical, and syntactic tokens. However, the analysis of the rest of the data shows that the interlocutors are aligned interactionally by drawing on semantic associations such as paraphrasing or listing stereotypes about Asian women, among other semiotic resources. A critique is made of Pickering and Garrod’s model because it simply assumes that language comprehension and interaction involve “prediction-by-association” but it does not provide explicit models. Implications are discussed and an argument is made that research on the pragmatics of poetry benefits not only from the psycholinguistics of interactional alignment but from evolutionary theories of “imitation” and “empathy” (Tomasello et al. 2005; Iacoboni 2005; cf. Dunbar 1997; Boyd and Richerson 2005; Levinson 2019). I conclude by describing further issues to be addressed, with specific reference to neuroscience (cf. Duranti and McCoy 2021).

# “Routinizing” in parent-teacher conference interaction: How teachers enact expertise, attenuate advice, and preempt parent resistance

Panel contribution

***Prof. Danielle Pillet-Shore<sup>1</sup>***

*1. University of New Hampshire*

This presentation documents a social action that adults use when talking about a child-as-student during parent-teacher conference interaction.

Part of a larger conversation analytic investigation of 41 video-recorded naturally occurring in-person parent-teacher conferences between English-speaking persons in the United States, this research examines sequences in which conference participants discuss a potential/actual trouble with the focal student’s academic performance, behavior, and/or effort.

Previous research demonstrates that, during parent-teacher interaction, participants time and design their unfavorable (and favorable) comments about students in patterned ways constituting a structural preference organization (Pillet-Shore 2017) that enables participants to forestall conflict (Pillet-Shore 2016). While parents routinely express student-troubles straightforwardly with preferred design—without delay, qualification/mitigation or account (Pillet-Shore 2015), teachers systematically delay, qualify/mitigate and/or account for their articulation of student-troubles, using dispreferred turn/sequence design.

Courtesy of the complementarity built into this preference organization, parents and teachers can often tacitly collaborate to produce sequences in which a parent is first to state a particular student-trouble (Pillet-Shore 2015). Teachers, however, do not entirely escape their institutional obligation to articulate potential/actual student-troubles. As part of their extra interactional work to manage these sequences, teachers perform the action of “routinizing,” shifting from the specific focal student’s case to invoking other comparable cases.

This presentation demonstrates that teachers *routinize referents* (focal students) and *routinize recipients* (addressed parents/caregivers), situating the focal student—and by association, that student’s parent(s)—within a larger social category of like others with whom the teacher has had experience. Routinizing constitutes the potential/actual student-trouble as not unique to the focal student and his/her parent(s)/caregiver(s). Analysis shows how routinizing enables teachers to enact expertise, attenuate advice, and preempt parent resistance.

For example:

- 01 Teacher: HE is meeting all standards. Which is a
- 02 good thi(h)nghh! .h[h >I mean I'm-< An' I've=
- 03 Dad: [Mmhmm,
- 04 Teacher: =been telling parents if: (.) a lot of parents
- 05 hav:e (.) freaked out about sees? ((Cs)) (.) (tsh-)
- 06 Cause their kids have never gotten a see?
- 07 .hh [But they're meeting=
- 08 Dad: [Mmhmm,
- 09 Teacher: =standards: with a see, and so that's not a bad gra#de.

By *routinizing*, teachers manifest their epistemic authority and primacy, implicating their past experience(s) with ‘cases like this’ to situate the focal student and parent(s) as ‘one among others/many.’ Teachers recurrently use routinizing to:

- mitigate and credential their advice-giving to parents (cf. Heritage & Sefi 1992);

- parlay their past experience with ‘cases like this’ to reassure parents (conveying “You’re not alone”);
- preempt parents from disaffiliating via challenge/complaint (e.g., about lower-than-expected report card grades).

# “Shambolic blunder”: Boris Johnson’s Communication of Failure During the Covid-19 Pandemic

Panel contribution

***Ms. Regina Holze***<sup>1</sup>

**1.** University of Passau

Since the start of Covid-19, most heads of governments have had to communicate unpopular and sometimes drastic measures to combat the spreading of the virus. One country that has been heavily affected is the United Kingdom. Prime Minister Boris Johnson has been proclaiming various measures to contain the virus, like calling on citizens to stay at home, to wear masks or to shield the elderly and vulnerable. Besides imposing and explaining new regulations, he has also faced several instances of having to admit to failure of his measures, of U-turns in legislation as well as several mistakes of his ministers or advisers. These failures have provoked the opposition to accuse the Prime Minister of “serial incompetence” (Busby 2020).

This analysis examines Boris Johnson’s strategies of communicating failures during the ongoing pandemic relying on a research corpus, which consists of official press statements, interviews and statements from Prime Minister’s Questions by British Prime Minister Johnson spanning the period between 1 March 2020 and 1 March 2021.

Issues discussed encompass how he addresses failures of his administration and how he justifies changes in legislation. Examples analysed in more detail include the postponed NHS contact-tracing app in June, his refusal of a second lockdown in October as well as the promise to keep schools open in January 2021. Drawing on both quantitative and qualitative corpus methods, Johnson’s main strategies of communicating failure are analysed by examining typical speech acts he uses for articulating failure as well as frames employed to convey ‘bad’ news. Additionally, his communicative tactics of taking responsibility are classified according to the accountability model introduced by Boin et al. (2017: 119).

# “So I know how to do this.” The argumentative structure of U.S.A. Presidential Debates.

---

Panel contribution

---

***Mr. Menno Reijven<sup>1</sup>***

*1. University of Massachusetts Amherst*

Presidential debates are one context in which argumentation is a focal activity. By elucidating which disagreements are pursued, and how these disagreements are organized and interconnected, I show which differences of opinion participants believe are worthy to elaborate on and for which reason they are deemed relevant. This enables to reconstruct the implicit elements in this argumentative discourse and characterize the orientation of the participants towards the argumentative activity at hand. To do this, I employ insights from the pragma-dialectical theory of argumentation, particularly work on argumentative indicators and argument schemes. As data are used the first Presidential debates of the U.S.A. Presidential elections since 2000.

By identifying the critical questions which are anticipated by the candidates, it is possible to further detail how disagreements are developed. Specifically, the first layer of argumentation is pragmatic argumentation. In this context, the candidates deal with in total 6 critical questions.

Explicating these critical questions relevant in Presidential Debates shows which disagreements are meaningful in this context, and helps reconstruct the discourse by suggesting which premises are left implicit. It can also help make sense of candidates' strategic maneuvers. Specifically, it helps make sense of presuppositions, implicatures and entailments providing an answer to one critical question, while the candidate is defending another.

# “Sorry go ahead”: resolving simultaneous starts in a Zoom tutoring session

Panel contribution

***Ms. Anna Carolina Oliveira Mendes<sup>1</sup>, Dr. Taiane Malabarba<sup>2</sup>, Mr. Revert Klattenberg<sup>3</sup>***

*<sup>1</sup> University of Pot, <sup>2</sup> University of Pots, <sup>3</sup> Universität Hildesheim*

The COVID-19 pandemic has had a significant impact on education as instructors and students at all levels had to rapidly change to emergency online teaching enabled by ‘new media’. The present paper investigates how a learner and a tutor negotiate participation in a language lesson through a video conferencing tool (Zoom). In this environment, the smooth multimodal organization of speaker change may be severely affected by limitations in the visual channel as well as by transmission lags.

Our database comprises over 20 hours of video-mediated English tutoring lessons involving an adult learner of English and his tutor. Through *unmotivated looking* (Sacks, 1984), we noticed that in instances of overlapping talk, (Schegloff, 2000) the participants used a distinctive set of practices to return to a *one-speaker-at-a-time* (Schegloff, 2000, Sacks et al., 1974) situation. Specifically, we have identified ‘go-aheads’ as part of the participants’ video-mediated interactional repertoires. These actions ‘offer’ the floor to the co-participant, supporting the resolution of *simultaneous starts* (Auer 2021, Schegloff 2000). Whereas in ordinary telephone and face-to-face conversations, simultaneous talk is mainly resolved with the employment of prosodic resources (e.g. cut-offs, changes in loudness) (Schegloff 2000) and gaze (Auer 2021), our data show that in video-mediated interactions, simultaneous talk is often oriented to via a package of multi-semiotic resources that can include, besides prosodic resources and gaze, more explicit methods, such as the formulation of the directive ‘go ahead’ and variations (e.g. ‘go ahead please’) as well as other bodily-visual resources such as torso and head movements, and lip pressing.

Our findings shed light on how participants adapt their turn-taking practices to reflect their orientations to the constraints and affordances of this specific medium. Micro-level insights into Zoom-based institutional interaction as co-constructed *practical action(s)* (Garfinkel, 1967) highlight the fine-grained details of “being a competent video-mediated conversationalist” (Gan et al., 2020, p.379). These findings, therefore, have the potential to influence macro-level policies and teachers’ professional development.

# “Stop” or “STOP, STOP, STOP!”: Directives orienting to threats, urgency and parallel activities in UN military observer training during car patrolling

Panel contribution

***Mr. Pentti Haddington<sup>1</sup>, Mr. Antti Kamunen<sup>1</sup>, Ms. Tuire Oittinen<sup>1</sup>, Ms. Iira Rautiainen<sup>1</sup>***

*1. University of Oulu*

When car patrolling a crisis area, UN military observers' task is to monitor and make observations about people, events and activities. The observers often must stop the vehicle immediately due to requirements posed by another activity (e.g., making observations, sending a radio message), when they encounter hostilities, new minefields or other life-threatening situations, or when they have made a navigational mistake. In this talk, we focus on directives that urge the driver to stop the vehicle with the token ‘stop’ and its variants. Directives are actions that attempt to get somebody to do something or to prevent somebody from doing something (e.g. Craven and Potter 2010; Ervin-Tripp 1976; Goodwin 1990, 2006). We focus on directives that are grammatically formulated as imperatives, and which function as commands or orders. By building on a collection of directives produced with ‘stop’ and on the principles of interactional linguistics (Couper-Kuhlen and Selting 2001; Ford et al. 2003; Ochs et al. 1996, Keevallik 2003) and conversation analysis (Sidnell and Stivers 2013; Schegloff 2007), we study how the linguistic design of the directive is motivated by the emergent situation and accomplishes the stopping of the patrol car. The analysis is based on observations made from video recordings of interactions inside patrol vehicles collected in two UN military observer training courses. The corpus includes interactions of ten teams and totals approximately 170 hours. The working language on the course is English.

Our findings indicate that ‘stop’ is frequently used when the teams encounter simulated incidents that are perceived as potentially ‘life-threatening’ or dangerous. In such cases, ‘stop’ is a forward-looking action; it orients to the emergence of sudden, observable events, the nature of which may not yet be clear but that may pose a danger to the team. ‘Stop’ also orients to sense-making: by stopping the car’s movement, the teams buy time to build a better understanding of what is seen and, thus, how to act. Furthermore, in such situations, ‘stop’ is often produced as multiple sayings (Stivers 2004), such as “stop stop stop stop”, which communicate increasing urgency and orient to the possible non-compliance of the driver. Less urgent situations may also demand the stopping of the vehicle: tasks such as navigating or radio communication are sometimes time consuming, easier to carry out while stationary, and direct attention away from other tasks (e.g., monitoring, observing), and thus make stopping necessary. The driver’s role in the team is crucial, being the only participant controlling the vehicle. ‘Stop’ is always produced by someone else in the team (or communicated through the radio), and the driver’s actions are related to the directive’s design. If the driver is not on top of the situation — does not understand, does not pay attention to, or ignores the directive — they may react late or not at all. The findings contribute to a better understanding of the projective nature of directives and their consequences for action, and they also have practical implications for the training of military observers.

# “Team of 5 million”: The joint construction of leadership discourse during the COVID-19 pandemic in New Zealand

Panel contribution

***Dr. Christoph Hafner<sup>1</sup>, Dr. Tongle Sun<sup>1</sup>***

*<sup>1</sup>. City University of Hong Kong*

The COVID-19 pandemic that swept the world in 2020 demanded action from political leaders, eliciting a range of responses globally. Leadership can be seen as involving a range of activities like envisioning goals, making decisions, organizing, and co-ordinating, motivating others, and providing autonomy and support to members of the team. In all of these things, effective communication plays an essential role. New Zealand provides an example of a context that was widely regarded as a success story in the Covid-19 crisis. Furthermore, the leadership of NZs female prime minister, Jacinda Ardern, is widely credited with playing an important role in that success. This study examines the role of language and discourse in Ardern’s leadership and communication practices and the ways in which these are jointly constructed. The study draws on a corpus of press briefings surrounding significant events in the development of the pandemic in New Zealand. It identifies discursive strategies used by Ardern to frame the issues raised by the pandemic, engage with her audience, and promote political and health goals related to management of the pandemic. It also examines the extent to which such discursive strategies and framings were picked up by the mainstream media in question and answer sessions at the press briefings. By considering the discursive contributions of Ardern and the mainstream media, the study demonstrates how leadership is not only discursively constructed but also how this discursive construction is *jointly achieved by multiple actors*, who may have competing agendas but all have a role to play in communicating leadership in a crisis.

# “The EU gave us a new beginning”: Liquid racism and refugees’ personal experience storytelling in the ‘EU Protects’ campaign

Panel contribution

***Dr. Korina Giaxoglou<sup>1</sup>, Dr. Tereza Spilioti<sup>2</sup>***

*1. The Open University, 2. Cardiff University*

Storytelling plays a key role in the construction of migrant identities (De Fina 2015), including hybrid resistance identities (Archakis 2020), the reproduction of racism (van Dijk 1993) as well as the promotion of positive representations of the ‘Other’ (Aliai & Tsakona 2020).

In this paper we examine how stories told by migrants or refugees for online and other media publics construct conventionalised migrant identities and affective positions, which reproduce subtle forms of racism, also known as *liquid racism* (Weaver 2010). By this term, we refer to the generation of ambiguous cultural signs that encourage the development of entrenched socio-discursive positionings alongside reactions to racism.

We focus on a refugee personal experience story featured on the EU Protects campaign, part of European Commission’s Civil Protection and Humanitarian Aid Operations (EU Protects campaign). Our analysis draws on the heuristics of *small stories* research (Georgakopoulou 2016) and the study of *affective positioning* as a key site of identity construction (Giaxoglou 2021) combined with a multimodal approach to *metaphor scenarios* (Spilioti 2018).

We show how the multimodal positioning affordances of online storytelling reshape a personal experience story into *a public story*, contributing to the transformation of the ‘ordinary person’ to the ‘next door hero’. Rather than subverting or challenging dominant attitudes to migrants, this type of personal experience storytelling invokes a range of discriminatory discourses that fossilise subtle racist positions in the context of seemingly anti-racist discourse.

Our paper contributes a critical narrative analysis angle to the tracing of racism in anti-racist discourse (TRACE 2019).

# “This is not the place to bother people about BTS”: Interaction within timed comments on the video streaming platform Viki

Panel contribution

**Mr. Thomas Messerli<sup>1</sup>, Prof. Miriam Locher<sup>1</sup>**

***1. Universität Basel***

The community of users on *Viki.com*, a video streaming platform distributing Asian television to an international audience, use the site to engage with streams of Korean television dramas. Far from being passive viewers, many members of the community use language to engage with video streams and with each other in a range of different ways. *Viki*users interact with each other asynchronously (e.g. through reviews of episodes or forum posts on *Viki Discussions*) or pseudo-synchronously, when they make use of *Timed Comments (TC)*. TC are comments users post while viewing Korean dramas, which are tied to the video stream and can be read by subsequent viewers while they are streaming the same episode. Users can read and respond to comments by previous viewers as if they were written at the time of watching (similar to Danmaku; e.g. Zhang/Cassany 2019). In our study, we explore some of the specifically interactive features that arise in timed comments and in particular conflict as one exemplary type of interaction between *Viki*users.

We build on our previous work on TC which explored the general functions of comments within the community, which includes the translation of culture and the negotiation of meaning (Locher/Messerli 2020). We have also examined the sharing of emotional stance and humour support – as examples of harmonious practices within the community. Based on this trajectory, our understanding of TC has framed the community mainly as a harmonious collective engaged with a culturally and linguistically other artefact. However, in order to fully understand the communicative practice of TC, it is important to pay attention also to interactivity among the users and to include moments of disagreement and/or conflict that stress individuality and difference over community and unison.

Given the asynchronous nature of TC, we explore first what evidence for interaction and what marked absence of interaction (e.g. questions without a response) we can find in our data, which consists of a corpus of 320,000 multilingual, but predominantly English comments (2.9 million words). We make use of an exhaustively annotated sample of 5'900 comments to extract and formalize patterns of interaction, locate them in the corpus using corpus linguistic methods, and relate them to particular moments within the Korean drama.

Based on case studies, we observe that interaction takes place in connection with a plethora of topics related to the drama itself (culture, politeness/language, plot). More conflictual interaction arises especially in connection with plot spoilers, negative comments on actor appearance, the technical use of the platform (missing subtitles, ads), and commenters using the space for fan interaction outside of the drama-scope (e.g. fans reaching out to each other because they are fans of a K-pop group). We argue that these conflictual interactions often function as negotiations of the platform norms, socialize newbies into how the space works (Graham 2008) and can thus also be linked to community building.

# “This is” Not as Simple as It Appears: “Copula + One + Classifier” Constructions in Mandarin Conversation

Panel contribution

***Prof. Hongyin Tao<sup>1</sup>***

**1. UC**

Like many other languages, the Mandarin copula (COP) *shi* can be used in an equative construction, as illustrated in *zhe shi yi ba dao* [This COP one classifier knife] ‘This is a knife’ (Chao 1968). While most previous studies have been centered around the syntactic and semantic features of such constructions, an inspection of conversational data shows that in everyday interaction such constructions have rather specific configurations and their use goes well beyond the basic semantic propositions commonly associated with them.

In this paper, I use both face-to-face and telephone conversations (LCD CallFriend) as data. About 290 tokens are identified for analysis. My findings indicate that formally speaking, the often discussed and taught sentence pattern in foreign language classes, Demonstrative + COP + One + CLF ‘this/that is a...’ is rather rare (22/290, 7.6%) in conversation. Instead what we find in the corpus are highly specific and recurrent configurations as schematized in (1) and illustrated in (2):

(1) An identifiable/inferable referential form + COP + *Ge/Zhong* + A qualified assessment

(2) Ranhou=, hen guai de, danshi zhe jiush- dagai shi/COP

Then, very strange PRT, then this was- probably COP

yi zhong wenhua de yi zhong, yi zhong, yi zhong.. bu yiyang,

one CLF culture DE one kind, one kind, one kind .. not same

‘Then, very strange, but this is just, probably, is a kind of culture, a kind of cultural difference.’

where the identifiable referential form can be either what has been talked about in, or inferable from, the prior context, or some entities introduced just before the statement; the classifiers mostly manifest as either *ge* (an all-purpose classifier, 195/290, 67%) or *zhong* ‘kind, type, sort’ (41/290, 16%), while all the others, though possible, are combined for just 13%.

This paper further identifies three prominent functions from the data, including 1) making a qualified statement, indicating the speaker’s less committed stance; 2) making an affectively loaded assertion; and 3) ascribing people or object to a category for categorization.

To summarize, copular constructions in Mandarin have preferred configurations. Unlike what has been implied in standard grammars, they often appear as qualified statements or categorization expressions – through which speakers take a position with regard to the nature of the assessed entity and engage with the interlocutor in negotiation of evaluative stances.

# “To better understand it, join me and imagine...”: The use of code glosses in Three Minute Thesis presentations

Panel contribution

***Mr. Yanhua Liu<sup>1</sup>, Dr. Ramona Tang<sup>1</sup>, Dr. Fei Victor Lim<sup>1</sup>***

***1. National Institute of Education, Nanyang Technological University***

Making academic research comprehensible to diverse audiences is gaining interest worldwide because of an increasing emphasis on democratisation of knowledge, a recognised need for public accountability, and the growing importance of cross-disciplinary collaborations. This trend has given rise to new forms of research communication such as the Three Minute Thesis (3MT). 3MT presentations are delivered in a university competition context where doctoral students are challenged to communicate their thesis research within 3 minutes to a largely non-specialist audience comprising a judging panel, faculty and graduate students from diverse disciplines, as well as an online audience in some cases. Given their popularity and potential pedagogical value, 3MTs have recently been examined in terms of genre moves (Hu & Liu, 2018), recontextualization strategies (Rowley-Jolivet & Carter-Thomas 2019) and neoliberal discourse practices (Rossette-Crake, 2020). While these studies have offered us insights on linguistic patterns in 3MTs and social perspectives on them, there is not yet a focused investigation of linguistic features related to comprehensibility, a key requirement of the 3MT competition.

This study investigates how 3MT presentations are made comprehensible to non-specialist audiences. Drawing on Hyland's (2007) metadiscursive notion of code glosses, we examine how research is made accessible to audiences through reformulation and exemplification. Based on a corpus of 50 transcribed 3MT presentations, we found that code glosses are frequently employed by the presenters. More significantly, our analysis shows that, to clarify the complex concepts being discussed, the presenters in many instances deployed exemplification strategies (using examples, making comparisons or analogies, and creating imagining scenarios) instead of simply reformulating what had been said. The results point to the distinctive linguistic features of 3MTs which are attributable to the communicative context of speaking to a non-specialist audience. The study contributes to the study of research communication targeted at non-specialists and has pedagogical implications.

# “War against COVID-19”: Is the pandemic as war metaphor helpful or hurtful?

Panel contribution

***Prof. Andreas Musolff<sup>1</sup>***

**1.** University of East Anglia

The use of war-related metaphors by Western political leaders to announce and advertise their efforts to deal with the COVID19 pandemic and its socio-economic consequences has drawn scientific as well as journalistic criticism, some of which cited or referred to linguistic and/or philosophical theories about metaphor usage ‘causing’ socio-political attitude changes (e.g. G. Lakoff, S. Sontag). A particular reference point has been the illness-as-war metaphor complex, which has been denounced as hindering an efficient treatment of illnesses because it treats patients as *war victims* and favours ‘radical cure’ solutions that prioritise elimination of the *illness agent*. In the context of the COVID19 pandemic debates, pandemic-as-war metaphors have also been linked to the spread of conspiracy theories.

This paper studies the public receptions to political announcements of governments ‘waging war on COVID-19’ in Britain. The database is a corpus of 110 online articles in British media, which interpret, metarepresent and evaluate metaphor usage; these are analysed using conceptual metaphor theory, discourse analysis, specifically the discourse-historical approach (Wodak et al.) and metarepresentation theory (Wilson, Sperber). We argue that uses of the pandemic (management)-as-war metaphor fulfil diverse rhetorical and argumentative functions: to rally support, including emotional identification, to frame a narrative that ‘explains’ public health management and to justify specific policies. Public reactions to it are varied, too: they selectively echo and comment on diverse implicatures. In view of this multi-functionality of metaphor use and reception, a ‘blanket criticism’ of all war/fighting terminology seems unjustified. Instead, detailed pragmatic analysis is needed to help raising public awareness of politicians’ instrumentalisation of metaphors for strategic and ideological purposes.

## “We are stronger and happier ....”: Gender, power and Covid-19

---

Panel contribution

---

***Dr. Taiwo Oloruntoba-Oju<sup>1</sup>***

*1. University of Ilorin*

Much of the discourse on the gender dynamics generated by the Covid-19 pandemic has focused on apparent female vulnerabilities in relation to the pandemic. However, the surprising data of male vulnerability to Covid-19, contra emerging displays of female strength in relation to the pandemic, has also given impetus to contestant discourses on the actualities of behavioural and power asymmetries between the genders. This paper examines the construction (and deconstruction) of gender asymmetries in conversations between men and women in the wake of the Covid-19 pandemic in the Nigerian setting. The conversations have become available in different media, including televised and social media exchanges. The objective is to build a composite picture of contested gender representations and particularly examine how individual linguistic acts portray group gender identification, while drawing polemically on established gender stereotypes, in these conversations. Emphasis is on the complex ways in which linguistic acts are deployed to either approbate or reprobate gender stereotypes. I apply a pragmasociolinguistic analytical framework (Adegbija, 1989) for the analysis, while following the work of Eckert and McConnel-Ginnet (1998) on the catalytic role of Communities of Practice in the analysis of gendered conversations.

# “Wei mer eifach mau” – “yeah just do that” Directives in Swiss-German- and English-Speaking Multicultural Teams

Panel contribution

***Dr. Larssyn Staley<sup>1</sup>, Ms. Sabine Künzi<sup>1</sup>***

***1. University of Applied Sciences and Arts Northwestern Switzerland***

Language and culture are often portrayed as clear reflections of each other. But in a multicultural, multilingual world, these reflections are complex. Culture groups are not as distinct as often described. They have fuzzy boundaries (Spencer-Oatey 2000), as culture is not only enacted on a national level but also in group cultures which may contain speakers of multiple languages and backgrounds. In this paper, we adopt a broad understanding of cross-cultural pragmatics as “the study of pragmatic phenomena relating to cultural differences (in either the static or dynamic sense...) either within a specific speech community or across speech communities, irrespective of whether such differences are due to the use of interlanguage” (Kraft & Geluykens 2007: 9). We aim to investigate how multilingual project teams structure and coordinate their work through directives (requests, suggestions and orders) and how their choice to work in Swiss-German or English affects their pragmatic resources.

The participants in this study are enrolled in a BSc International Management program. They speak a range of languages at home, including Swiss-German, French, Serbian, Turkish, Albanian, Portuguese, and Tamil, but have established a cohesive class culture over the course of their time in this degree program. As part of a required assignment, the students were given two and a half hours to analyze an international business case, in groups of five to six, and then present their findings and recommendations. The students recorded their preparation, and these recorded discussions are the basis of our analysis. The consistent context allows us to analyze and compare the directive strategies of Swiss-German- and English-speaking multicultural teams in highly comparable, naturally occurring conversations. We take an interactional approach and consider the conversational context, sequence and interactional resources.

These data provide insight on the importance of the conversational context, as direct strategies are predominantly used at the end of a discussion on a specific point, after some agreement has been expressed, while indirect and conventional indirect strategies are more frequently used to initiate action on a new point. Conventional indirect strategies were used more frequently than direct or indirect strategies in both the English and Swiss-German speaking groups. This trend was, however, more pronounced in the Swiss-German groups. The English-speaking teams show indications of transfer from the speakers' first languages; however, there are also clear indicators of common ground and shared understanding. This combination warrants the need to better understand the pragmatic repertoire of multilingual and multicultural groups.

# “We’re not acceptable”: The discursive othering of Asian American before and after the COVID-19 outbreak

Panel contribution

***Dr. Arisa Koba***<sup>1</sup>

**1.** Nagoya Bunri University

This presentation aims to examine the “othering” experienced by Japanese Americans and Japanese immigrants in the United States (U.S.) before the coronavirus disease 2019 (COVID-19) pandemic and consider its connection to hate crimes and speeches against Asians after the outbreak. Since the beginning of the outbreak, the U.S. President, Donald Trump, has used terms such as “Chinese virus,” “China virus,” and “Kung Flu.” Critics have pointed out that these slurs would legitimize anti-Asian sentiments and can potentially increase the risk of hate crimes. In fact, the Stop AAPI Hate —website where people in California can self-report incidents of hate against the Asian Americans— registered more than 800 anti-Asian American hate incidents related to COVID-19 in just three months between March and June 2020. This number is alarmingly high compared to that reported by the Federal Bureau of Investigation in 2018: of the 4,954 single-bias offenses motivated by race, ethnicity, or ancestry, only 171 cases were reported as arising from anti-Asian bias (<https://ucr.fbi.gov/hate-crime/2018/tables/table-1.xls>). Indeed, Gover et al. (2020) have identified a relationship between the rising number of anti-Asian hate crimes and the racial slurs used by Trump and his close politicians.

This is not the first time that Asians in the U.S. have been targeted for discrimination by politicians. The anti-Chinese movement in the 1870s and anti-Japanese movement in the early 1900s were motivated by frustration from employment instability and a growing suspicion of Asian immigrants as their population increased. Instead of protecting Asian laborers, the U.S. government responded with the Chinese Exclusion Act of 1882 and “The Gentleman’s Agreement” of 1908 respectively. These anti-Asian movements are considered to have led to the internment of Japanese and Japanese Americans during World War II. From wartime exclusion acts to the present day anti-Asian rhetoric linked to COVID-19, the discrimination of Asians has been buttressed by “othering”; it is a process where a dominant group defines which members do or do not belong to the society (Gover et al. 2020.) Thus, we need to take into consideration historical discourse that positions Asians as “perpetual foreigners” when analyzing the anti-Asian rhetoric of today.

I interviewed 26 Asian people in the Bay Area, and based on that data, I would like to demonstrate how xenophobic policies and “othering” have been experienced by Asians in the U.S. even before the outbreak of the pandemic. In one instance —just after Trump had been elected— a Japanese American interviewee was intentionally targeted and almost knocked down by a white driver. The interviewee and her partner (also Japanese American) expressed how they perceived their minority status and felt they were targets of hate crime due to their ethnicity as well as their political or religious beliefs; that is, Christians but not supporting Trump. Through this presentation, I intend to uncover the underlying political and discursive othering of Asian Americans and analyze their influence on the current xenophobic attitudes against them.

# “What do you expect being on Tinder?” – meta-pragmatic discourses of (im-)politeness and gender norms in @tindernightmares posts

Panel contribution

***Dr. David Matley***<sup>1</sup>

**1.** University of Zurich

Online communities may be transgressive in terms of how impoliteness strategies such as insults, expletives and negative evaluation of interlocutors are used. Some studies of DMC have shown that digital spaces may sanction face-attacking behaviour and impoliteness in a manner that can be seen as ludic such as RoastMe subreddits (Dynel & Poppi 2019). Nevertheless, other forms of transgressive behaviour online are perceived as harassment, particularly from the perspective of women in the field of online relationship initiation and dating apps (Gillett 2018). Thus whether face-attacking behaviour is seen as ritualised and ironic, or intimidating and “toxic” may depend on the norms of appropriateness of the community of practice or affinity space in question. This study focuses on the Instagram feed @tindernightmares as a case study of pragmatic norm negotiation within the context of online “hook-up culture” (Hess & Flores 2018). @tindernightmares documents instances of “toxic masculinity” on the dating app Tinder in the form of screenshots of private chats between men and women. The posts highlight the verbal sexual harassment that women are frequently subjected to, and the responses by women to abusive comments and threats.

While @tindernightmares has recently been examined via the lenses of gender studies and psychosocial discourse analysis (Hess & Flores 2018; Thompson 2018), it has not been studied from a pragmatic perspective. This is perhaps surprising, as @tindernightmares is of dual linguistic interest: the posts themselves document what is seen to constitute transgressive linguistic behaviour in the context of online relationship initiation, while user comments on the posts reveal further meta-pragmatic conceptualisations of the normativities of interaction in online dating.

The current study uses a random sample of 200 posts from @tindernightmares to examine the pragmatic norms of interaction apparent therein. It also examines the strategies used by commenters such as insults and negative evaluation of female interactants and positive re-evaluation of male interactants’ behaviour to (re-)negotiate gendered norms in online dating. The results provide further insights into the functions of impoliteness in online spaces and add to an understanding of how in- and out-groups use language to challenge or reinstate ideologies regarding the normalisation of abuse in dating apps.

# “Who is the boss?” - Staging of conflicts in everyday acts of performance in the pre-school

Panel contribution

***Ms. Marie Rickert<sup>1</sup>***

**1. Maastricht University**

In pre-schools, socialization into conflict management in culturally appropriate ways includes participation across different relations and interactions with peers and teachers (Burdelski, 2020). Thereby, children do not only get socialized through tackling their own conflicts, but also through observing and engaging with those of others. In this presentation, I analyse how two pre-school teachers use a ‘breakthrough into performance’ (Hymes, 1981) in which they spontaneously stage a playful conflict between themselves around the question “Who is the boss [in the kindergarten]?", socializing the observing and participating children into moral order and conflict management.

Deploying multimodal video analysis, I zoom in on this extended sequence of interaction which was documented during 4.5 months of ethnographic fieldwork in a kindergarten in Limburg, the Netherlands. Thereby, I seek to illustrate how a conflict is staged collaboratively by teachers and children, including an enactment of various strategies to find solutions which respectively get attributed lower or higher value throughout the interaction. Participating children co-create an engagement with the problem at hand through taking part in negotiations and sharing their processes of making sense of power relations. It becomes clear that spontaneous everyday acts of performance may have a strong socializing character, which seems to be more accessible for the older children in the pre-school than for the younger ones.

# “Wow, just look at that!”: Performing affect in YouTube reaction videos

Panel contribution

***Dr. Jan Chovanec<sup>1</sup>***

***1. Masaryk University, Brno***

Successful social media communicators tend to be highly skilled in relating to their followers, employing a range of practices to create authenticity. They are, however, experiencing a tension between the desire to appear unique and remaining relatable as ordinary individuals. In the case of influencers, one's self-stylization as 'ordinary' is, ultimately, linked to the promotion of one's online media presence (attested by one's growing fan base or likes), with the ultimate goal of self-branding and, thus, marketing oneself (Page 2012; Marwick 2013). This presentation looks at a well-established, though still under-researched, phenomenon of reaction videos on YouTube, with the aim of showing how their producers handle affect as a way of relating to their audiences. Reaction videos are produced by various YouTube (micro-)celebrities who record themselves while watching other videos, and comment on them. Due to intertextuality, i.e. the dependence on some other visual input, they may resemble video responses (Adami 2015) and gaming videos where players comment on the on-screen action (Fägersten 2017). However, since reaction videos depend on the showing of pre-existing video content which is simultaneously watched by the YouTubers and their audiences, what is characteristic of this genre is that YouTubers provide only a limited running (live) verbal commentary on the video clips. What predominates are emotive – rather than referential – responses.

Based on a qualitative analysis of 40 response videos to clips from various humorous sketches and series, the study documents how YouTubers manage affect in their verbal and physical responses to the visual input. The data indicate that they tend to frame the act of recording themselves as 'first-time viewings', thus priming the audience to expect spontaneous, unpremeditated and unscripted reactions. The analysis shows that reaction video producers (RVPs) employ diverse forms of affect, with their responses ranging from highly appreciative to extremely disaffiliative. However, while they strive to be ordinary and authentic, the palpable absence of unemotional watching marks their responses as less than natural – as ostensible display of affect. In the case of reaction videos, the 'new authenticity' of YouTube (Tolson 2010) is, then, best seen as an "apparently truthful disclosure of oneself" (Johansson 2017: 185), i.e. a matter of stylized performance of a mediatized self. The findings reveal some striking forms of self-presentation, as well as engagement with the multimodal content of the watched videos, whereby the YouTubers strive to relate to their audiences in a seeming authentic way.

# “You very böse”: Dealing with moments of conflict in parent-child interaction

Panel contribution

***Dr. Younhee Kim<sup>1</sup>, Dr. Andrew Carlin<sup>1</sup>***

***1. University of Macau***

Securing child compliance during moments of conflict presents a constant challenge that parents face on a routine basis and has been an important theme in parent-child interaction research (Goodwin & Cekaite 2018). Conflict may arise when the parent thwarts the child’s desire, rejects the child’s request, or when the child resists the parent’s demand for the target action, e.g. brushing teeth. Existing research on negotiation in parent-child interaction has focused on parental practices in the face of the child’s initial non-compliance, such as downgrading and/or upgrading of directives, e.g. using threats (Aronsson & Cekaite 2011). Drawing on and expanding this line of research, the current study examines sequences of distressing incidents where the child expresses his/her distress at the thwarted trajectory of his/her projected action, and how parents subsequently respond to these. Close sequential analysis reveals that parents’ subsequent move involves two aspects: providing rational grounds for their action; and addressing the emotional state of the child. More specifically, parents provide accounts/grounds to justify their action, i.e., non-grant, and at times respond/non-respond to the child’s grumpy accusation of the parent as “bad/naughty”. Accounts provided by the parent include invoking family rules, reminding the child of future reward, or reminiscing about past experience, which is tied to the child’s identity as a ‘good boy/good girl’. Interestingly, this parental strategy of identity attribution parallels that used by the child in expressing his/her distress by calling the parent “bad/naughty”. The study suggests a close link between moral predicates and emotion and discusses how these are oriented to in action negotiation sequences in parent-child interaction. The data for the current study are comprised of 34 hours of video recording of parent-child interaction collected from four bilingual families within a home setting, involving at least one child (2 – 4 years old) and his/her parent.

# “Your future, it is that of the righteous and not that of the deceivers”: The pragmatics of a hopeful chronotope in Occupied East Jerusalem

Panel contribution

***Prof. Chaim Noy***<sup>1</sup>

*1. Bar Ilan University*

This paper examines the pragmatic and discoursal constructions of hope, as performed in a small political dissent event, that takes place weekly in East Jerusalem. The event consists of a talk, given by Mr. Samer, immediately following Friday's Shu'fat demonstration. The Shu'fat demonstration has been taking place weekly since 2010, protesting Israel's forced evacuations of local Palestinian residents from their homes in the neighborhood (which are then sold to Jewish Settlers, as part of a State-backed policy to demographically and symbolically transform Occupied East Jerusalem).

Mr. Samer is a Muslim Palestinian resident and activist, who has participated in the demonstration since their onset. He delivers the talks in Hebrew to a small audience of mostly Jewish-Israelis protestors. The talks are a speech event, and are local, small, and to the degree that they entail a Palestinian who regularly speaks to a Jewish-Israeli audience, also rare and marginal. Mr. Samer's talks are mixed and fluid in terms of genre. They mainly consist of reporting on violent/oppressive anti-Palestinian activities, executed by Israel's police authorities in the neighborhood and beyond (East Jerusalem, the Occupied Territories, and Gaza). The talks' discourse establishes a dichotomous politico-moral distinction between good/bad, oppressed/oppressors, the seemingly weak – who are in fact powerful because they are morally just, and the seemingly powerful – who are in fact weak because they are profoundly corrupt. Heroes and villains are casted in and by Mr. Samer's discourse into a historical moral chronotope (Bakhtin, 1981, p. 84). Yet despite the persistence of the atrocities – as (re)established discursively in the talks – Mr. Samer's rhetoric is explicitly and deliberately hopeful. How this is pragmatically accomplished in the topic of this paper.

The corpus includes eighteen talks, that were videorecorded during 2018-2019, each of which lasts approximately ten minutes. Bakhtin's concept of the chronotope (space-time narrative) lends itself productively to the study of the pragmatics of hope, as constructed vis-à-vis the politics of continuous oppression (Bakhtin, 1981; also Blommaert, 2015; Lawson, 2011). Hope emerges as intertwined in/with a morally-imbued chronotope, and is pragmatically constructed via temporal and interactional means: i. It is brought up towards the end of the weekly talk, serving as a narrative coda, ii. It occupies future projections of current activities, iii. It is evoked as part of an explicit address to the audience (which is irregular in the talks), and iv. It takes the pragmatic shape of a commissive speech act – a promise that the speaker assures his audience of. Overall, politically indexing the ongoing here-and-now moral actions of resisting lasting injustice to ongoing immoral here-and-now atrocities, harbors the same chronotope wherein lie hope in the yet-to-be future.

# “Zhendema?” vs “Really?”: A Contrastive Study

Panel contribution

**Dr. Xiaojing Wang<sup>1</sup>**

**1.** China University of Geosciences(Wuhan)

While metapragmatics has continued to play a significant role in pragmatic studies, there have increasingly been calls for culturally-situated metapragmatic studies, including contrastive studies. Against this backdrop, this study draws on Culpeper and Haugh's (2014) theoretical insights into metapragmatics, explores the usage of Chinese metapragmatic expression “zhendema?” in comparison with its English metapragmatic equivalent “Really?”. The data are restricted to spoken Chinese and English and are collected from two corpora: *BLCU Corpus Center (BCC)* and *Corpus of Contemporary American English (COCA)*, containing 200 expressions for “zhendema?” and “Really?” respectively. The tentative study reveal that the pragmatic functions of English “really” and Chinese “zhendema” share something in common: in terms of occurrence frequencies, denoting interrogation and astonishment are the highest in both languages. However, the frequencies of some non-interrogative functions of Chinese *Zhendema* are higher, that is, Chinese are more inclined to use “zhendema?” as a non-interrogative metapragmatic marker to (i) signal “indirect disagreement”, (ii) signal the act of “pre-advice”, (iii) counteract a potential face-threatening act, (iv) help the listener interpret information segments, and (v) help the speaker perform the act of evaluation. Based on these findings, the study argues that the Chinese “zhendema?” when used as a non-interrogative metapragmatic marker, reflects the user's (i) reflexive presentation of the negative cognitive status of certain information or different understandings of context/common ground amongst participants (i.e., marker of metacognitive awareness), and (ii) reflexive evaluation of reciprocal interpersonal relations with and attitudes towards others (i.e., marker of metacommunicative awareness). Moreover, we suggest that cultural variability such as interpersonal notions (face, reciprocal consideration etc.) may account for the cultural-specific non-interrogative uses of Chinese “Zhendema?” vis-à-vis “really?” in English.

# Lectures

# “¡Mirá si tendrá razón!” On dialogic causes of mirative enunciations with the discourse marker “mirá”

Lecture

***Dr. María Marta García Negroni<sup>1</sup>, Dr. Manuel Libenson<sup>1</sup>***

***1. Universidad de San Andrés***

As it is well known, the concept of mirativity is related to the speaker's expression of surprise and refers to the linguistic marking of an utterance conveying information which is new or unexpected to the speaker (De Lancey 1997, 2001, 2012; Aikhenvald 2012). In this presentation, after describing the different meanings of surprise associated to different uses of the discourse marker *mirá* in the Spanish of Argentina, we will focus our analysis on consecutive structures that combine *mirá* with the non-tonic exclamation adverb *si* followed by the future or the conditional of surprise (Álvarez 1999; Escandell Vidal 2019; Rodríguez Rosique 2019). Examples: *Mirá si tendrá razón* *Fayt que recién publicaron la nota y ya están todos los kichneristas agrediendo e insultando.* *Mirá si sería fanático del Lobo que su primer hijo, Lautaro, rompió bolsa en la cancha de Gimnasia.*

Our theoretical approach to mirative meaning is rooted on the Dialogic Approach to Argumentation and Polyphony (henceforth DAAP, García Negroni 2016, 2018, 2019; García Negroni & Libenson 2018 and 2020), which integrates a dialogic perspective (Bakhtin 1981, 1984) into the field of argumentative and polyphonic semantics (Ducrot 1984, 2004; Carel and Ducrot 2005, Carel 2011). When it comes to the mirative meaning of *mirá*, the aim of this work consists in spotting and describing the *mirative discourse frames* (MDF) that are dialogically evoked by the utterances with *mirá* as the argumentative “causes” that justify the different subjective stances of surprise. In other words, these mirative subjective stances are to be seen as dialogic responses (Bakhtin 1981, 1984) to a particular MDF that each enunciation with *mirá* brings forth. The qualitative analysis related to the mirative values of the discourse marker *mirá si + future/conditional of surprise* is based on a corpus of authentic utterances taken from the CREA and from Mark Davies's corpus.

According to the results of our analysis, mirative enunciations with *mirá si + future/conditional of surprise* can be explained as dialogically “caused” by an MDF related to a sudden discovery of something that exceeds its ordinary magnitude or degree. In the presentation, we will show the argumentative bonds between the MDF that must be recovered in each case and the different subjective stances that emerge in response to those MDF.

# #BestNYAccent: Centering folk-linguistic perceptions of language variation and authenticity in New York City on Instagram

Lecture

**Mx. Emily Corvi<sup>1</sup>, Dr. Cecelia Cutler<sup>2</sup>**

*1. Hunter College, CUNY, 2. City University of New York*

New York City English (henceforth NYCE) is a highly enregistered dialect associated with a myriad of features, including post-vocalic non-rhoticity and BOUGHT raising (Newman 2014). Historically, NYCE has been studied through a largely quantitative/variationist lens (Labov 1966; 1972; Newman 2014). Previous work on NYCE shows that listeners associate the dialect with older, white and Italian or Jewish speakers with “negative personality attributes”, and that neither native nor non-native New Yorkers can accurately discern what borough a NYCE speaker is from (Becker 2014; Becker et al. 2018).

In contrast with these First Wave variationist approaches, a Third Wave approach calls for analyses of qualitative data and the interplay between signs to study emerging and co-constructed ideologies about language varieties and their speakers (Eckert 2016). Where variationist approaches analyze targeted linguistic variables across a single axis of difference, qualitative data allows linguists to discover orientations and ideologies proposed by language users/listeners that provide a more nuanced, inclusive understanding of a language variety. With NYCE, there is a paucity of qualitative analyses and in turn, a lack of a diverse and socio-historical understanding about how speakers/listeners understand themselves in relation to it. Third Wave analyses allow linguists to study folksonomic descriptions proposed by emic speakers and etic listeners that act as the discursive framework for enregisterment. Comments on platforms like Instagram and YouTube can provide sociolinguists with insight about how users, i.e. the general public, understand and (re)contextualize language varieties and their associated meanings (Androutsopoulos 2010, 2013; Cutler 2020; Rymes et al. 2018).

In order to arrive at a more inclusive understanding of emic ideologies toward NYCE, I analyzed six videos and 1,852 Instagram comments from an “accent challenge” created by Nicolas Heller (@newyorknico) in which New Yorkers were encouraged to upload dialect performance videos with the hashtag “#BestNYAccent”. From the 1,261 videos listed on the hashtag, Heller, along with New Yorkers actor/comedian Michael Rappaport and rapper Princess Nokia, chose the seven “best” performances - one from each of New York City’s five boroughs, and two general winners. The winners were semi-diverse - three winners were white, three were Black, one was mixed race, four were men, and four were women. In the comments, I looked for evaluations of the NYCE dialect performances - positive (n=1,098) /negative (n=33) sentiments, mentions of extralinguistic phenomena (n=77), metalinguistic (n=165) and/or metapragmatic (n=289) commentary, and mention of place (n=173). Two ideologies immediately emerged in the comments: 1) that “real” NYCE and its features are now associated with demographic range beyond older, “mean”, white Italian or Jewish people and 2) that New Yorkers, can, in fact, discern which borough speakers are from. Even though these ideologies do not corroborate the claims of linguists, they are omnipresent and reflect a more nuanced understanding of how people themselves understand NYCE. The analysis of emic metacommentary allows us to discern the degree to which ongoing demographic shifts and awareness of language variation and change are reflected in folk linguistic knowledge.

# (De)constructing the indexical meanings of the terms '(im)migrant' and 'expat' in conversation

Lecture

**Ms. Fien De Malsche<sup>1</sup>, Prof. Mieke Vandenbroucke<sup>1</sup>**

**1. University of Antwerp**

One of the most prominent and ideologically debated distinctions made between different types of individuals who live international lives is between the 'expat' and the 'migrant' (Yeung, 2016), in which immigrants, refugees and asylum seekers are conflated on the end of the 'migrant' category (Leinonen, 2012) and 'expats' are represented on the other end as a diverse group of cosmopolitan individuals (Yeung, 2016). However, consensus is still lacking on how to refer to individuals who fall in between those two opposite categorical ends, and there is no uniformity regarding the way in which the individuals refer to themselves. In this contribution, we examine how individuals who fall between the traditionally conceived definitions for expats and (im)migrants construct their identity with regard to international mobility and how they categorize themselves vis-à-vis terminology such as 'migrant', 'immigrant' and 'expat' throughout a research interview. The gathered dataset consists of 31 semi-structured interviews with people who currently live in Brussels and have a documented past of international professional mobility, and who in the interview were asked to share their experiences with language throughout their international lives. Participants were also explicitly queried to reflect on how they identify or describe themselves as citizens from another country currently residing in Belgium. Follow-up questions included whether they would consider themselves as (im)migrants and/or expats, and what they believe to be the difference between those categories, if any. Based on a micro-level discourse analysis of the data, this presentation will explore how the meanings of the categories of (im)migrant and expat are interactionally constructed and continuously negotiated in conversation. We show how these terms can be considered interactionally floating signifiers whose meanings and associated characteristics not only vary significantly for different participants, but are also subject to change for the same participant during the course of a conversation. As a result of this, we shed a light on the indexical fields (Eckert, 2008) of the terms 'immigrant', 'migrant' and 'expat' and how the participants' constructions of their categorical self emerges as a nuanced, polymorphic entity throughout the duration of the interview interaction. This contribution therefore highlights the wide array of potential indexical meanings that can be constructed and negotiated for migration-related categories. Our conclusion underlines the importance of self-identification, categorical embodiment and personal interpretations of meaning in categorizing individuals, while also problematizing the application of these categories for participant classification purposes in research paradigms (Jacobs, 2018).

# (Im)politeness of masked and non-masked faces in the COVID-19 pandemic: Japan and Australia

---

Lecture

---

***Dr. Jun Ohashi***<sup>1</sup>

**1.** *The University of Melbourne*

The COVID-19 pandemic has been distressing for people and societies and has induced many forms of abnormalities and newly adopted behaviours in our social life. Mask-wearing has become a new habit in many parts of the world. The decision making process of wearing or not wearing a mask involves social actors' anxious consideration of what is correct in terms of their perceived ever-changing social norms, sense of security, consideration to others, and public self image. Therefore, the topic of (non-)mask-wearing provides interesting materials for the studies of interpersonal pragmatics and (im)politeness.

This study investigates from a cross-cultural perspective, how social norms and social identities emerge in online discussion forums comparing Australian and Japanese popular social media platforms. In Melbourne, mask-wearing was mandated on the 23<sup>rd</sup> of July and a hardline measure including a lockdown was imposed for 112 days to avert the second wave of infections. Since then wearing a mask became the norm very quickly. In Japan on the other hand, mask-wearing has never been mandated but few people fail to wear masks in public spaces. Unlike Australia, Japan continues to employ lenient policy in containing the highly infectious disease (i.e. minimum testing, a voluntary approach to lockdowns and travel restriction within Japan).

The specific aim of the study is to elucidate how social actors engage in the topic of mask-wearing on social media outlets where cultural insiders interact, position themselves and form social identities 'here and now'. The study employs Elster's (1989) emergent and fluid notion of social norms which is defined as "emotional and behavioural propensities of individuals" (p.102). It is understood to be "shared by other people and partly sustained by their approval and disapproval" (*ibid.* pp.99-100) and also "by the feelings of embarrassment, anxiety, guilt and shame that a person suffers at the prospect of violating them" (*ibid.* p100).

Social norms and social identities are closely related in the sense that mask-wearing involves people's understanding of and enacting social norms with which they position and categorise themselves according to their needs. According to Social identity theory (Tajfel & Turner, 1986; Turner et al., 1987) people accentuate intergroup differences, amplifying positive attributes of their perceived in-group members in relation to their perceived out-group members in order for the in-group members to attain positive social identity.

The study utilises social actors' emic understanding of mask-wearing from an analyst's outsider view and observes with a discourse analytic lens, the features and patterns of discourse presented by social actors through interaction in an online discussion forum. It illuminates the complex symbolic representations of (non-)mask-wearing, induced by the unprecedented COVID-19 chaos, as a mirror of two contrasting societies.

# A Case Study on a Novice Japanese Teacher's Enacted Identities through a Lens of Storytelling in Online Weekly Meetings

Lecture

***Ms. Junyuan Chen<sup>1</sup>***

*1. Department of East Asian Studies, The University of Arizona*

The topic of language teacher identities (LTIs) receives strong attention recently in the field of language teaching and learning (Kayi-Aydar, 2019). LTIs are significant because what kind of perceptions and beliefs teachers hold for themselves strongly affect both teachers' pedagogy choices inside the classroom (Duff & Uchida, 1997) and their interactions with colleagues outside the classroom (Kayi-Aydar, 2015). In large public universities in the U.S., graduate teaching assistants (GTAs) teaching in class is a very common phenomenon. Therefore, GTAs who teach in language classes are also eligible to be considered as foreign language teachers and their identities are worth being explored as well.

English, as a lingua franca, has been deeply and extensively examined, as well as English foreign language (EFL) teachers. Moreover, English language teacher identities have received strong attention in Japan through a large number of case studies (e.g., Duff & Uchida, 1997; Tsui, 2007). However, on the contrary, the identities of Japanese language teachers in English-speaking countries were rarely investigated. In addition, although GTAs' identities are examined by some scholars through the perspectives of the portfolio (Antonek, 1997) and autobiographical reflections (Lim, 2011), these studies are more focused on dominant languages such as English. Research on Japanese language GTAs' identities is a notable absence. Thus, GTAs' identities as professional Japanese language educators would be an interesting and meaningful topic to explore. Therefore, this study aims to explore more about Japanese language teachers' identities to fill the gap in terms of approaches, types of data, and target languages.

This study consists of data from video recordings of weekly meetings between one full-time lead instructor and one GTA of the intermediate level Japanese. I recorded their weekly meetings for 6 weeks, which makes 6 hours in total.

For the recordings of weekly meetings, I will mainly utilize conversation analysis and positioning analysis to examine how institutional interactions are organized, as well as to analyze how participants reflecting "selves" when talking about "others". Georgakopoulou (2007) pointed out that representations of "others" are actually "constructions of social and moral orders and realities" (p. 120). Since weekly meetings offer chances for GTAs to report problems or confusions they encountered during the past week, when a teacher comments on some students' behaviors, it actually reflects the teacher's perceptions of "good/bad behavior" or in the classroom, which is an aspect of the teacher's teaching beliefs.

The results reflect GTA's self-perceptions and teaching beliefs from two aspects. First, the GTA positions herself as an instruction follower rather than a problem solver, when the lead instructor discusses some problems she encountered in the classroom. Second, the GTA believes a "good student" needs to focus, while jokes by students could be distracting and against her teaching beliefs sometimes.

# A closer look at refusers' counters: benefactive changes and interpersonal implications

Lecture

***Ms. Isabella Reichl<sup>1</sup>***

**1.** University of Kent

This paper examines an understudied way of refusing: countering. Taking a Conversation-Analysis-informed Interpersonal Pragmatics approach (Locher and Graham 2010), I demonstrate that a) counters can be categorised in terms of the benefactive changes they aim to implement and b) refusers format counters in distinct ways in order to orient to the eliciting utterance as either interpersonally problematic or unproblematic. When we think of the act of refusing, we tend to think of utterances which simply disalign from the proffered action. However, refusers may also put forward an alternative action instead of the original one. This constitutes a 'counter' (adapted from Edmondson 1981; Schegloff 2007).

Although Beebe et al.'s (1990) seminal classification of refusal strategies includes 'statements of alternative', there is no research focusing on different kinds of counters and their interpersonal implications. This paper address that gap. The analysis of data from the *SPICE-Ireland* corpus (Kirk et al. 2011) and *theSwitchboard Dialog Act Corpus* (Jurafsky, Shriberg, and Biasca 1997) shows that three types of counters can be distinguished based on the benefactive differences between proffer and counter:

1. Neutral: same benefactor/beneficiary as proffer, e.g. countering request with offer;
2. Altruistic: different benefactor/beneficiary, e.g. countering offer with offer;
3. Egoistic: different benefactor/beneficiary e.g. countering request with request;

It is furthermore demonstrated how, by formatting counters in specific ways, refusers treat the original proffer as either interpersonally problematic or unproblematic. Problematic here means that the refuser orients to the proffer as face aggravating (Goffman 1967). As the analysis reveals, this can be grounded in perceived transgressions regarding any of three core organising facets of both interpersonal relations and social (inter)actions: participants' deontic, epistemic, and affective rights and obligations (Stevanovic and Peräkylä 2014). It is further argued that the ways in which refusers orient to these facets do, in turn, frame proffers as problematic or unproblematic.

# A Cognitive Pragmatic Account of Word Associations of Verbs of Perception in the Interactions of English as a Lingua Franca

---

Lecture

---

***Dr. Yang Pang<sup>1</sup>***

*1. School of Foreign Languages, Donghua University*

English as a Lingua Franca (ELF) interaction is regarded as a temporary variety of English produced by speakers with different socio-cultural backgrounds, which is often characterized by variability and dynamicity. Taking a socio-cognitive pragmatic perspective, we propose that ELF speakers develop their own norms and cultures in their temporary speech community. Through comparing the associative tokens of *see, look, hear, feel, listen* and *watch* retrieved from the Asian and European ELF corpora, this study reveals that word associations of the verbs of perception are similar among ELF speakers with distinct socio-cultural backgrounds. Based on the overall analyses of the word associations of the verbs of perception in ELF and English Native Language (ENL) corpora, we argue that ELF speakers do not follow the conventions in the target language system; instead they create their own temporary word associative patterns and idiom-like constructions. In addition, this study has analyzed the co-construction of metaphorical meanings in naturally-occurring conversations, thus providing some basis for the characterization of non-literalness in ELF interactions. The results of the study suggest that ELF speech community endeavor to develop their own temporary formulas, formulaic language and metaphors in their interactions.

# A comparative case study of disagreement strategies in intercultural conflict resolution meetings

Lecture

***Dr. Ping Du<sup>1</sup>***

**1.** University of Nottingham Ningbo China

This study compares the disagreement strategies of two north American managers in an intercultural conflict resolution process at a Chinese organization, drawing on an ethnographic case study data set that comprises 16 audio-recorded meetings (29 hours), ten interviews, field notes, organizational documents and emails. The organization in question has seen continuous conflicts and non-cooperation between the international and Chinese middle managers, which has evolved into a major management crisis when I started the data collection, culminating in the incident that four Chinese managers handed in their resignations. Vincent and Jack, the two managers from north America, hold similar managerial positions, experience similar difficulties in communication with the Chinese CEO and middle managers and share similar views of the problems in the organization. However, they employed very different approaches in their everyday communication as well as during the conflict resolution process. Vincent applies an integrating approach (Rahim, 1983) to disputes and is regarded highly by his Chinese colleagues for his outstanding interpersonal skills, while Jack adopts a dominating approach (*ibid.*) and is in fact identified by the Chinese managers as the major culprit for the continual conflicts. By the end of the three-month conflict resolution process, Vincent remained on the same position and was given more responsibilities, but Jack was demoted. The analysis will focus on comparing the linguistic features of Vincent and Jack's disagreement strategies at the conflict resolution meetings, drawing on the analytical frameworks from politeness studies and Conversation Analysis. Preliminary analysis indicates that Vincent employs constructive disagreement strategies with problem-solving and persuasion as the aim while Jack tends to adopt disruptive disagreement strategies that not only constantly threaten or attack his colleagues' face but also orient to demarcation based on perceptions of cultural values and professional competence. It is also argued that the different disagreement strategies employed by Vincent and Jack serve to construct very different professional and cultural identities (Benwell & Stokoe, 2006; Schnurr & Chan, 2011). I will discuss the evidence from the data analysis for these findings at the presentation.

# A comparative study of different features for efficient automatic hate speech detection

Lecture

***Mr. Nicolas Zampieri<sup>1</sup>, Dr. Irina Illina<sup>1</sup>, Dr. Dominique Fohr<sup>1</sup>***

***1. Universite de Lorraine, CNRS, Inria, Loria***

Commonly, Hate Speech (HS) is defined as any communication that disparages a person or a group on the basis of some characteristic (race, colour, ethnicity, gender, sexual orientation, nationality, etc. (Nockeby, 2000)). Due to the massive activities of user-generator on social networks (around 500 million tweets per day) Hate Speech is continuously increasing on the web.

Recent initiatives, such as SemEval2019 shared task 5 Hateval2019 (Basile et al., 2019) contribute to the development of automatic hate speech detection systems (HSD) by making available annotated hateful corpus. We focus our research on automatic classification of hateful tweets, which are the first sub-task of Hateval2019. The best Hateval2019 HSD system was FERMI (Indurthiet al., 2019) with 65.1% macro-F1 score on the test corpus. This system used sentence embeddings, Universal Sentence Encode (USE) (Cer et al., 2018) as input of a Support Vector Machine classifier.

In this article, we study the impact of different features on an HSD system. We use deep neural network (DNN) based classifier with USE. We investigate the word level features, such as lexicon of hateful words (HFW), Part of Speech (POS), uppercase letters (UP), punctuation marks (PUNCT), the ratio of the number of times a word appears in hateful tweets compared to the total number of times that word appears (RatioHW) ; and the emojis (EMO). We think that these features are relevant because they carry feelings. For instance, cases (UP) and punctuations (PUNCT) can carry the intonation of the tweets and can be used to express a hateful content. For HFW features, we tag each word of tweets as hateful or not using the Hatebase lexicon (*Hatebase.org*) and we associate a binary value to each word. For POS features, we use twpipe (Liu et al., 2018) for tagging the words and this information is coded as an one-hot vector. For emojis, we generate an embedding vector using emoji2vec tools (Eisner et al., 2016). The input of our neural network consists of the USE vector and our additional features. We used convolutional neural networks (CNN) as binary classifier. We performed the experiments on the HateEval2019 corpus to study the influence of each proposed feature. Our baseline system without proposed features achieves 65.7% of macro-F1 score on the test corpus. Surprisingly, HFW degrades the system performance and decreases the macro-F1 by 14 points compared to the baseline. This can be due to the fact that some words are hateful only in a particular context. UP, RatioHW and PUNCT slightly degrade the baseline system. The POS features do not change the baseline system result and so are probably not correlated to the hate speech. The best result is obtained using EMO features with 66.0% of macro-F1. EMOs are largely used to transmit emotions. In our system, they are modeled by a specific embedding vector. USE does not take into account the emojis. Therefore, EMOs give additional information to USE about the hateful content of tweets.

This work was performed in the context of Franco-German ANR projet M-PHASIS.

# A comparative study of nominal stance constructions in English scientific research article introductions written by Chinese and native authors

Lecture

***Prof. Xiaoming Deng<sup>1</sup>***

***1. Harbin Engineering University***

The deepening process of globalization in China has increased the role of English in academic communication as evidenced by the considerable number of research articles published in international journals. Hence, the study of academic writing has attracted growing interest. It has been recognized that academic discourse is no longer seen as an impersonal, objective, and absolutely factual piece of writing, but valued as a dynamic process of positive engagement and constant interaction with the potential readers in which stance is established to convey authors' opinions and assumptions. This paper investigates how stance is constructed through nouns in published English papers written by native speaker authors and Chinese authors. We tend to believe that every genre of writing is highly representative of the real world language use in a specific context. It is assumed that Chinese scholars' construction of stance in academic discourse is characterized by its own features. Two corpora were established to conduct a comparative study of the features and functions of stance expressions in English academic papers written by English native writers and Chinese scholars. Our study indicates that though nominal stance constructions in two corpora exhibit similar grammatical patterns of usage, differences do exist in the pragmatic functions of stance expressions. Detailed analysis is made to examine how stance construction is realized by the appropriate use of nouns to enhance authors' commitment to a scientific endeavor. We conclude that the author's stance and attitude towards a specific event displayed by the specific use of nouns is strongly shaped by the social community that he/she is in.

# A comparative study of yakuwarigo in Japanese and Swedish

---

Lecture

---

***Mr. Sebastian Lindskog<sup>1</sup>***

1. Osaka University

The term *Yakuwarigo* (=“Role language”) was coined by Satoshi Kinsui in *Virtual Japanese: enigmas of role language*(2003), and refers to a style of stereotypical language, often used in works of fiction, that conveys certain traits about its speaker such as age, gender, and class. In Japanese *yakuwarigo* often relies on the usage of personal pronouns and sentence-ending expressions such as auxiliary verbs. For example the English expression “*I am a...*” can be rendered in vastly different ways in Japanese, depending on the character who utters it. An old man type character would say “*washi ha...ja*”, while a samurai character in a period piece would say “*sessha ha...degozaru*” and so forth.

While Japanese is a language extremely rich with *yakuwarigo*, European languages like English and Swedish which do not possess, for example, the same variety of aforementioned personal pronouns have to rely on different strategies to express speech patterns of specific character types. For this reason *yakuwarigo* expressions can pose problems for translation into English and Swedish, and are often standardized in the target text, even when it negatively impacts the characters’ depiction.

One such *yakuwarigo* speech pattern that often ends up translated in a standardized way is what can be called *era-language*. *Era-language* is a speech pattern that designates characters usually belonging to a past historical era such as a samurai, a knight or a princess. An example of how this specific *yakuwarigo* is often translated can be observed in the example below:

Japanese: *Maa, maa, maa, maa, sore ha tomokaku, kimi ha nanimono degozaru?*

English: *Oh, dear... Do simmer down, sirs! And thou, o wild one... Who might thou be?*

(from the popular Japanese video game *Final Fantasy VI*)

The line above is uttered by Cyan, a samurai-type character and this aspect of his identity is explicated through classic samurai auxiliary verbs such as *degozaru* in the original Japanese. This type of *yakuwarigo* however is rendered in a relatively more archaic register in the English translation and it does not inherently differentiate a “samurai” character speech from other types of historical characters.

But if this type of *yakuwarigo* is adapted into Old English in translations, how is it rendered when all the characters communicate in Old English in the original text? This presentation will examine William Shakespeare’s *Hamlet* and *King Lear* instances of *yakuwarigo* translated in two languages with vastly different speech traditions: Japanese and Swedish. By comparing the two translations, an attempt will be made to outline the different strategies in translating *yakuwarigo* and argue not only the existence of *era-langauge* in Swedish but also examine how specific speech patterns (such as use of particular pronouns) are actually used to define certain characters or character types.

# A Comparison of Two Forms of Suggesting: Speech Acts and Grammar

Lecture

***Dr. Hidemitsu Takahashi***<sup>1</sup>

1. Hokkaido University

This paper discusses two syntactic forms in English speakers use when making suggestions: *Why don't you* and *Why not*. The latter form is sometimes treated as an abbreviation of the former—with the sole difference being the presence vs. absence of semantic ambiguity. That is, while *Why not let him drive your car?* has only a directive interpretation, *Why don't you let him drive your car?* is potentially ambiguous between directive vs. non-directive reading (Huddleston and Pullum 2002: 906). While there is a wealth of literature on directive speech acts, research has largely been focused on requests but hardly on suggesting. Moreover, most studies are either essentially qualitative or case studies in nature; little research has been conducted on directive expressions in quantitative terms (though notable exceptions include Couper-Kuhlen 2014). In particular, the problems of how speech act types determine verbs and sentence organization patterns preferred in directive expressions have escaped serious attention. The aims of this paper are: (i) to clarify commonalities and differences between the *Why don't you* and *Why not* forms regarding their frequent verbs, preferred grammatical arrangements and interpretation; and (ii) to examine ways in which the act of suggesting shapes the grammar of directive constructions. The discussions are based on a total of 1368 tokens of the *Why don't you* form and 1203 tokens of the *Why not* form collected from COCA, although other corpora are consulted.

The findings made include the following: (i) Frequent verbs significantly differ between the two forms of suggesting; *go* and *come* are the most frequent verbs (10.3%, 141/1368 and 9.5%, 130/1368, respectively) with the *Why don't you* construction, whereas *have* is the most frequent verb (5.3%, 64/1203) when it comes to the *Why not* construction; (ii) *Tell* and *give* exhibit a subtle contrast regarding argument realization patterns between the two directive forms. *Give* prefers a third-person object with both the *Why don't you* and *Why not* constructions (e.g. *Why don't you/Why not give her a break?*), while *tell* prefers a first-person object with *Why don't you* (as in *Why don't you tell us what's bothering you?*) but a third-person object with *Why not*; and (iii) The *Why not* construction tends to involve a somewhat simpler syntax with some verbs, compared with the *Why don't you* version.

It is also found that while the addressee is invariably the agentive subject of the *Why don't you* construction, this is not necessarily the case with *Why not*. Depending on context, the bare infinitival form is interpretable in terms of “*Why don't they*” or “*Why don't we*” instead of “*Why don't you*.” All these findings suggest that speech acts have a significant impact on verbs and sentence structures (hence propositional contents) selected in directive constructions, which indicates just another aspect of grammar shaped by social pragmatics.

# A Metapragmatic Study on Chinese and Japanese Acronyms on Social Media

Lecture

***Mr. Chen Tiancheng<sup>1</sup>, Prof. Saeko Fukushima<sup>2</sup>***

***1. UCL, 2. Tsuru University***

This study aims to compare acronyms on Chinese and Japanese social media from a metapragmatic viewpoint. Previous studies on Internet acronyms or initials, usually restricted to one language context, mostly focus on English acronyms (e.g., OMG, lol, ASAP, IDK) (e.g., Baron, 2004; Lewin & Donner, 2002; Rúa, 2007). To date, few studies have compared Chinese and Japanese acronyms on social media. Among existing studies, some researchers investigate the word-formation principles that lie behind acronyms (Baron, 2004; Crystal, 2006; Lewin & Donner, 2003), while some others have shed light on the functions which acronyms perform in Computer-mediated Communication (CMC). It has been argued that acronyms can replace some taboo words to avoid insults, sexuality-related phrases, or politically sensitive phrases (e.g., Al-Sa' Di & Hamdan, 2005; Chen, 2014; Zhou, 2010). However, these studies have not addressed people's metapragmatic awareness that acronyms reflect in online communication, another gap that this study will aim to fill. The data in this study are drawn respectively from Weibo (for Chinese data, such as ZQSG 真情实感 zhēn qíng shí gǎn, doing something with true feelings) and Instagram and Twitter (for Japanese data, such as KY (kuuki yomenai 空氣読めない, lit. 'cannot read the air', meaning someone who cannot read the atmosphere)). Based on an in-depth analysis of the pragmatic functions of the creative acronyms in the two languages, the study finds that acronyms in the two languages are used online to meet both common and different censorship requirements and to express both common and different attitudes such as irony, humor, and euphemism, which might have resulted from their related yet different language and social-cultural backgrounds. Hopefully, this study will expand the application of metapragmatics into the online communication in social media and enrich our understanding of CMC across different language contexts.

# A Pragmatic Study of the use of Deixis in the Inaugural Speeches of Civilian Heads of Government in Nigeria

---

Lecture

---

**Mr. Damilola Fafiyebi<sup>1</sup>, Mr. Ayokunle Osakinle<sup>2</sup>**

*1. Ekiti State University, 2. The Federal Polytechnic, Ado-Ekiti*

An inaugural speech is a comprehensive piece of discourse which affords the speaker the opportunity to say many things at once. It is crafted on the belief that, in political communication, speakers employ language as a strategic tool for identifying individuals, institutions and concepts which combine to enhance the central message and the meaning of the inaugural speech.

The study identified the frequency of occurrence of deictic elements in inaugural speeches, establish the dominant deictic element(s) and advance reasons for the pragmatic implication of the deictic choices employed by the people involved in this communicative genre. The research equally established the importance of deixis as a tool for conveying the intended meaning in inaugural speeches.

The inaugural speeches were delivered by Nigeria's civilian heads of government as part of their official inauguration ceremony. The research data were extracted from seven inaugural speeches with the antconc software. The software gave a frequency count of all the deictic elements in the inaugural speeches.

The research findings showed that a total of 1733 deictic elements were employed in the inaugural speeches. Out of this number, person deixis has the highest frequency with a total of 1,370 followed by place deixis deployed 300 times. The least employed deictic element is time related deixis which is used 187 times.

The researcher concluded that the preponderance of personal pronouns as indicated in items like 'I', 'we', 'us' etc point to the fact that the speeches are people-oriented. The speakers often make effort to carry the people along in the inaugural speech. The study equally discovered that on a lighter mode, the inaugural speeches also focus on institutions because they were considered as central to the objectives of the civilian administrations.

**Keywords:** inaugural speech, context, deixis, politics

# A Tale of Two ‘Viruses’: The Pragmatics of Corruption and the COVID-19 Pandemic in Nigerian Comedic Expressions

Lecture

***Dr. Felix Ogoanah<sup>1</sup>***

**1.** University of Benin

Nations of the world have responded in different ways to the COVID-19 pandemic which has had tragic consequences for lives and world economies. For a country like Nigeria, already grappling with failed infrastructure, extreme poverty, high unemployment and monumental corruption, the emergence of the pandemic was greeted with trepidation and uncertainties, especially in view of its past experiences with Ebola and Lassa fever. But in the midst of these uncertainties, Nigerian Comedians have expressed critical attitudes towards the pandemic situation and its handlers in various ways across different semiotic media. Using the relevance-theoretic framework of inferential pragmatics (Sperber and Wilson 1995), this study explores the use of humour in different media to foreground the endemic corruption among the Nigerian political class, and how such humour provides laughter for Nigerians in the midst of sufferings occasioned by the pandemic. Although scholarly engagements with humour in Nigeria have focused on social pragmatic strategies deployed by stand-up comedians to create humour (Filani 2015, 2016; Adetunji 2016), none has considered the use of humour as a critical and coping strategy against the COVID-19 pandemic. Data for this study comprise jocular verbal and non-verbal behaviour purposively selected from a corpus of Internet memes, tweets, and Facebook.com graphics. Supporting data include news articles on Nigerian COVID-19 and corruption situation as well as focus group discussions. The study shows that the massive presence of the ‘virus’ of corruption in Nigeria makes the advent of COVID-19 pandemic laughable. In terms of critical engagement with the Nigerian public, the comedic expressions achieve relevance (Yus 2003) not by undermining the COVID-19 pandemic, but by drawing attention to a deadlier virus within the society.

**Keywords:** COVID-19 pandemic, corruption, humour, relevance, comedy, virus. Nigeria.

# Accommodating paradoxical tensions in higher education: A critical discourse-analytical perspective

---

Lecture

---

***Ms. Songsha Ren<sup>1</sup>***

***1. The Hong Kong Polytechnic University***

Neoliberalism has become a global phenomenon and infiltrated higher education to the point where it has entailed the de facto internalization of neoliberal ethos in universities. Much literature in higher education swirls around changes wrought by neoliberalism but relatively few research has specifically focused on neoliberalism and its manifestation in the public discourse of higher education in the context of China. Adopting a critical discourse-analytical approach, this paper looks at the case of Chinese higher education to explore how neoliberal ideology is constituted, recontextualized, and legitimated in the public discourse of Chinese universities in a socio-political context marked by the intricate integration of administration and politics. It shows how these universities have endeavoured to respond to economic imperatives of the knowledge-driven global economy while strategically absorbing the socio-political governance agenda inherited from the state's institutional legacies. The paper reveals that the public discourse of higher education in China is a highly contested space for competing imperatives, reproducing a narrative that facilitates commodification of higher education and dismisses the contradictions between ideological values at the global-local nexus.

# Action-depicting gestures in construction-site interactions

---

Lecture

---

**Dr. Paweł Urbanik<sup>1</sup>, Prof. Jan Svennevig<sup>1</sup>**

**1.** University of Oslo

In face-to-face interaction, meaning is very often conveyed by means of coordinated speech and body movements that in conversation-analytic studies have been called *gestalts* (Mondada 2014) or *multimodal* or *composite utterances* (Enfield 2009, Goodwin 2006). Recent research in this area has directed attention to the relationship of embodiment and grammar, showing that the structures of talk and body movements work together in terms of syntactic projection, embodied completion, informational enrichment and action formation and recognition (Keevallik 2013, Olsher 2004, Lilja & Piirainen-Marsh 2019). Yet, there is still little knowledge about the interactional mechanisms that organize the employment of body movements and their association with the lexico-syntactic components of turns.

The present study looks more closely at these mechanisms and examines the relationship between action-depicting gestures and grammatical formats. We analyze interactions between workers speaking 3 languages (Norwegian, Polish, Swedish) in two construction sites in Norway. In this kind of settings, interactions most often center around the performance of physical actions. While formulating instructions, directives or explanations, workers often make use of representational gestures to depict such actions. The employment of gestures normally follows one of two patterns: 1) The action in question is specified verbally (usually with an action verb) and accompanied by an iconic gesture that refers to it; 2) The action is not explicitly verbalized but instead depicted by an iconic gesture and embedded in an utterance that provides other semantic components. In such cases, the spoken and the gestural components of the turn supplement each other and constitute an integrated structural unit (cf. Olsher 2004, Keevallik 2013).

Employing Conversation Analysis as our method, we investigate action-depicting gestures that occur with or without a speech affiliate. We analyze in what interactional configurations they occur and how they interact with the grammatical units they are embedded in or related to. By comparing them, we also examine how the unfolding of interaction regulates their employment and how they contribute to the organization of talk.

# Admissibility of Testimonies in Trial: Reportability, Relevance and Tellability

---

Lecture

---

***Dr. Anna Iegorova<sup>1</sup>***

***1. National Transport University***

This report contrasts the conceptually close (and often interchangeably used in literature) narrative discursive categories of reportability, tellability and relevance, which in the trial context are governed and constrained by the umbrella overarching legal concept of admissibility of testimonies. With the aim of preventing the jury from hearing what is considered inadmissible evidence (which can hinder decision-making process) admissibility provides limitations on allowable contributions in terms of what is said in court, and how it is said. Drawing on the materials of *The People v. O. J. Simpson* criminal trial (1995), the constraining power of objections and rulings of the Judge on the objections is analyzed along with the power of the Judge's admonitions to the jury to disregard the moves made by lawyers and witnesses.

The discussion starts with an attempt to set apart the concepts of reportability, tellability and relevance, relying on the examples from the corpus of testimonies of lay witnesses, and then turns to the notion of admissibility, a legally-based restricting vehicle.

Furthermore the objections are discussed as a restrictive instrument on lawyer and witness interaction drawing on Federal Rules of Evidence (USA) and examples from the witness testimonies. The analysis includes explanation of the legal nature of objections (why they are raised), as well as immediate discursive context where these are voiced in, along with discussion of how objections effect the following interaction of the examining counsel and the witness.

The report finishes by a brief discussion of pragmatic influence on the audience of unanswered questions.

# Affiliation through laughter in WhatsApp conversations

Lecture

**Ms. Bethany Aull<sup>1</sup>**

**1.** Universidad de Sevilla

Laughter has been identified as a strategy not only for marking and reacting to playfulness, but for regulating interaction and enhancing affinity. Existing studies have tended to focus on laughter in spoken conversation, analyzing organizational aspects such as position, turn-taking, and topic development (Bonin et al., 2014), as well as pragmatic (Mazzocconi et al., 2020) and relational aspects such as politeness (Holt, 2011) and rapport-building (Holt, 2017). Some work has associated reciprocal laughter with affiliation and isolated laughter with communication issues (Kangasharju & Nikko, 2009), but other studies find isolated laughter to predominate in spoken interaction (Provine, 1996; Vettin & Todt, 2004) and written electronic communication (Petitjean & Morel, 2017). Still, little is known about the use and interpersonal role of isolated and reciprocal laughter in electronic mediums like WhatsApp, though much relational communication takes place therein.

This presentation explores laughter in intercultural WhatsApp conversations with a focus on its relational workings. It reports on a study in which forty-eight unacquainted participants placed in tryadic WhatsApp groups were asked to converse freely twice a week for four weeks. The analyses of their semi-synchronous conversations aimed to investigate two dimensions of laughter use: isolated versus reciprocal laughter and its main (dis)affiliative functions, identified here as (1) signalling humor/playfulness, (2) realizing (im)politeness and facework, and (3) creating a light tone. Blended analyses look at how these qualitative aspects compare quantitatively across participants and groups.

The findings indicate that laughter tended to be speaker-initiated and was only reciprocated in about 20% of instances. The non-reciprocated laughter in this study did not typically relate to problematic situations; instead, it may have served as a preemptive signal with loosened expectation for reciprocation, particularly in non-humorous situations. When counted by function, laughter relating to humor, politeness, and tone varied in proportion across the tryads. Within each group, nevertheless, participants often converged in how they used laughter, even if at different points in the conversation. These findings support laughter's characterization as a highly accommodative affiliative tool whose terms of use are negotiated and established in the course of conversation.

# Aggressive calling – diminishing the other in Bamako

---

Lecture

---

**Ms. Katharina Monz**<sup>1</sup>

1. Universität zu Köln

Between 2018 and 2020, I conducted my dissertational fieldwork in Mali, addressing socio-linguistic questions in a context of extensive inner African mobility. My interlocutors often would compare the form of address they encountered abroad with the ideal they grew up with in Mali. Here, with a Bambara-leading society, respecting the other is considered to be of high importance and is often mentioned in conversations. The question, whether the other one talks in a respectful manner or not is a crucial point in a debate or a discussion. Following this social ideal of holding the other in high regard, the required form of address is a friendly one. The addressed person should be honoured by calling her *brother /sister, friend* or even *father / mother*, thus establishing a close relation of friendship or family, where the two persons are on a level of equality or the addressed is ranked even higher than the addressee.

Against this background, I made an interesting observation in Malian everyday life: When calling out to an unknown but visibly or audibly stranger person – in the sense of the person not being part of the (ethnic) majority in the Malian society – the social ideal of being respectful, vanishes into thin air and the exact opposite appears. Instead of ranking the addressed person equally or higher than oneself and instead of creating a relation of closeness, the otherness is pointed out. The stranger often is addressed based on his imagined national or ethnic belonging, which is felt to differ from one's own. These ways of naming people considered to be others, are simplistic and often even false. In addition, those categorizations put the addressed in the unpleasant situation of having to justify his ethnic and linguistic background in front of an unfounded assumption. As a third level of unpleasantness, the appellation tends to be at least not positively, if not even explicitly negatively connotated. This negative note often is made clear by using diminutives or pejorative associations in order to diminish, to degrade the other.

Based on the assumption of otherness, the addressee verbally attacks the addressed. The punch line of my observation – its originality – is twofold: The attack is the opening of a conversation, which additionally, is done by the addressee who, whilst insulting and verbally excluding the addressed, still wants something from him.

# An epistemic perspective to the social actions performed by bú shì...ma? interrogatives in Chinese everyday conversation

Lecture

***Ms. Ruiqi Luan<sup>1</sup>***

***1. Beihang University***

In recent years, linguistics pay more and more attention to how interactional context shapes grammar (Couper-Kuhlen & Selting, 2001). Within this trend, a group of studies focuses on how epistemics influences the grammatical formulation of turns at talk (Heritage, 2012). Epistemics is an important component of the interactional context that refers to the knowledge distribution and negotiation in conversation. This perspective enables researchers to identify features of language use that are ignored by previous studies which did not take the interactional context into consideration.

Inspired by this line of thoughts, this study intends to examine the use of *bú shì...ma?* (不是.....吗?) interrogatives in Chinese everyday conversation. By taking an epistemic perspective, this study argues that because of the different epistemic landscapes they project, *bú shì...ma?* utterances can accomplish a series of social actions. This study aims to describe thesesocial actions, distinguish them, and explain the reasons that result in the different uses. It adopts the analytical method of conversation analysis and uses data from the NCCU Corpus of Spoken Taiwan Mandarin (Chui & Lai, 2008).

This study tentatively argues that the general function of this interrogative is to convey knowledge in the speaker's epistemic domain. Based on the sequential position and the nature of the knowledge it introduces, it can perform such particularized functions as constructing common ground, indexing knowledge discrepancy and making assertions.

Previous studies commonly treated *bú shì* as a rhetorical marker, and claimed that *bú shì...ma?*conveys a reversed polarity meaning to its form. However, this study finds that it is just the last kind of function that is its rhetorical use. Therefore, it may be inaccurate to claim that *bú shì* is a rhetorical marker.

On the micro-level, this study clarifies the different functions of *bú shì...ma?* interrogatives in conversation and explores the facors that result the differences. On the macro-level, it demonstrates the complexity of the dynamic knowledge negotiation in social interaction and displays the necessity to conduct usage-based Chinese grammar research from an epistemic perspective in social interaction.

# An interactive study of proximal and distal terms in Persian

Lecture

**Prof. Mohammad Amouzadeh<sup>1</sup>, Dr. Masoumeh Diyanati<sup>2</sup>**

*1. University of Isfahan, Sun Yat-sen University, 2. University of Isfahan*

By adopting a discourse-pragmatics approach, the current study aims to investigate certain proximal and distal deictic terms in Persian to find out why they behave rather paradoxically in certain context of situations. From a typological perspective of deixis, the Persian deixis system is a two-term (bipartite) system distinguishing between proximal and distal with the speaker as the deictic center. We observe cases in which the meaning of some proximal (i.e., *in* 'this', *inhâ*'these', and *injâ* 'here') and distal terms (i.e., *ân* 'that', *ânhâ*'those', and *ânjâ* 'there') are quite reversed in certain interactions. That is, interlocutors use 'proximal' instead of 'distal' terms (and vice versa) to denote the same entity in the same context of situation:

(1) *inrâ bede bere*

this OM give.2SG go.3SG

'Give this/that away!' (Have done with this!)

(here, the referent is an old box in the hearer's hand and in the distal position of the speaker)

(2) *inbehtær-e, unæz mod oftâde*

this better-be.3SG, that from fashion drop.PAST.3SG

'This is better, that one is old-fashioned.'

(here, both referents are located next to each other)

(3) *inhârâ bebin do sâ2æt-e ânjâ istâdæn*

these OM look two hour there stand.PAST.3PL

'Look at them! they have been standing/staying there for two hours.'

(two oppositional terms are used to refer to the same people in an utterance)

(4) *væqtí injâ budim ânhâ exrâj šode budænd*

when here be.PAST.1PL they discharge become.PERF.3SG be.PAST.3PL

'When we were here, they had been discharged.'

(the referent is the factory where the speaker was working in; it is about 5 miles away from the current position of the speaker)

Moreover, there are cases in which the proximal term *in* (this) used for an unspecified/unmentionable reference:

(5) A farmer to a TV reporter:

*in hæme hæzine kærdim, bâr be in xošgeli,*

this all expense make.PAST.1PL load to this beauty

*in juribeše, mæn nemifrušæm*

this way become.PAST.3SG, I not.IMPF.sell.PRE.1SG

'With this amount of expenses, such a fantastic fruit, but it's become **like this**,

I won't sell it'.

(here *in juri* refers to unspeakable situation of farmers' products, which have no market and they have to sell their fruit in a very low price)

Such paradoxical uses are not accountable within the static model of spatial approach which centers on the speaker position. According to this treatment, the proximal and distal terms are used to denote referents close to or away from the speaker, either physically, socially or cognitively. Instead, we need an alternative model to explain for the above-mentioned cases. The argument is that the use of deictic terms is a dynamic phenomenon and the spatial approach cannot handle the examples presented here. Instead, a phenomenological account (e.g. Hanks, 1990, 2005; Enfield, 2003) is required for such instances. This means that the interaction apparatus

by itself defines and redefines the relative indexicalization of an entity in relation to the interlocutors as the discourse unfolds phenomenologically in the course of interaction.

---

# An investigation of modesty and self-effacement in Japanese

---

Lecture

---

***Prof. Saeko Fukushima<sup>1</sup>***

*1. Tsuru University*

The present study investigates modesty and self-effacement in Japanese. ‘Relational’ has been one of the central issues in recent pragmatics research (e.g., Spencer-Oatey, 2011; Walkinshaw, Mitchell and Subhan, 2019); and relational strategies are important from the perspective of interpersonal pragmatics (e.g., Locher & Graham, 2010). Modesty and self-effacement were taken up in the present study, as they are related to politeness (e.g., Gu, 1990; Leech, 1983, 2014; Watts, 2003) and important in interpersonal pragmatics. Moreover, it has often been claimed that modesty is highly valued in Eastern cultures, including Japanese (e.g., Leech, 1983, 2014). The present study aims to clarify what modesty and self-effacement mean in Japanese by eliciting emic data. The present study poses the following research questions:

1. What do modesty and self-effacement mean to the lay Japanese people?
2. Are there any differences or similarities between modesty and self-effacement in Japanese?

The data is drawn from an open-ended questionnaire filled in by one hundred Japanese university students, and from a focus group in which four Japanese university students took part. The results show some nuanced differences between modesty and self-effacement. The major interpretations of modesty include ‘not to be arrogant’, ‘not to be assertive’, ‘to elevate the other’, being ‘reserved’ and ‘submissive’; and those of self-effacement ‘to humble oneself’, ‘to reject compliments’, ‘reserved attitude’, and ‘to manipulate impressions’, according to the results of the questionnaire data.

The results of the focus group did not differ greatly from those of the questionnaire data. Modesty means something opposite to arrogance, and self-effacement impression manipulation. Self-effacement is sometimes for the benefit of oneself, e.g., to be well accepted by the other party. Self-effacement has more negative connotations than modesty. For example, self-effacement is ‘troublesome communication’ or ‘false-sounding when it goes too far’. All these results are related to interpersonal relationships.

# An Investigation of the L2 Writing Challenges and the Influence of L1 culture on the Writing Strategies of International Undergraduate Students in Canada

---

Lecture

---

***Ms. Rubaiyat Jabeen<sup>1</sup>***

**1.** Queen's University, Kingston

Based on the growing evidence that the lack of competence of international undergraduate students in academic writing affects their overall academic performance, this paper reports on a study that investigates the academic English (L2) writing challenges faced by the multilingual international undergraduate students (MIUS) in a university in Canada, and the strategies that are most effective in alleviating those challenges. The study also explores how the MIUS' first language (L1) culture influences their L2 writing strategies. There are many studies that confirmed that the academic challenges faced by international students are mainly because of the inadequate level of their language proficiency (Phakiti, Hirsch, & Woodrow, 2013; Sawir, Marginson, Forbes-Mewett, Nyland, & Ramia, 2012; Robertson, Line, Jones, & Thomas, 2000). However, many international students with strong English language skills report that it takes them extremely long to understand and follow the rules and conventions of second language writing. Most international students also say that in spite of meticulous efforts and practice, it is still difficult for them to write according to the expectations of the native English speakers. Over the last few decades, researchers have observed how the international students' L1 culture plays a crucially vital role in influencing their L2 writing. However, there is a gap in research in regards to understanding the L2 writing challenges and strategies and their interaction with L1 culture from the perspective of the international students themselves. Therefore, framed by the Contrastive Rhetoric theory, the research questions of this study are as follows: 1. What are the academic L2 writing challenges faced by the MIUS? 2. What strategies help to alleviate the academic L2 writing challenges of the MIUS, and how are they modified by the L1 and individual cultures of MIUS? The study employs a mixed-methods approach, drawing on a quantitative questionnaire to gather data from approximately 400 MIUS at the university followed by qualitative semi-structured interviews. The findings of this mixed-methods study will contribute both to the improvement of practice and the advancement of research. It will help the universities in Canada to understand the academic writing challenges from the perspective of the MIUS themselves and identify the strategies that work most effectively in alleviating the second language writing challenges. It will inform the universities as well as the field of second language writing about how to best improve pedagogy, curriculum, and policies and practices pertaining to MIUS and their academic writing.

# Analysing practices of communication between Indigenous and non-Indigenous peoples in Canada: the key role of language in creating change

Lecture

***Dr. Jennifer Hartog<sup>1</sup>***

*1. York University*

While access to clean water, recognition of cultural specificity mainly through language revitalization as well as documentation and redress of the crimes committed against their peoples (Truth and Reconciliation Commission, 2015) are being claimed, it is still the experience of the Indigenous peoples in Canada that programmes designed for them are not being sufficiently implemented in order to create equality with the settlers who came later to Canada and colonized it.

New ideas based on the societal role of language are necessary to create change in practices and laws.

The proposed paper aims at discussing how inclusion, understood as participatory inclusion, is an important concept in order to analyse, understand and resolve problems between Indigenous and non-Indigenous peoples in Canada. This form of inclusion assumes mutual inclusion, not built on power structures, but rather on intercultural competence and multilingualism (learned on both sides) as well as complex models of multilingual communication which allow for dealing with critique of presuppositions in discourse, applying cultural filters or establishing rapport. Critique will lead to new forms of discourse once both sides have understood what is at stake in the ongoing communication. Only then can routine structures be broken up and lead to new practices of linguistic and societal inclusion.

Instances of medical communication between Indigenous and non-Indigenous persons in Ontario will be presented. They reveal the importance of understanding linguistic-communicative structures and the need for multilingualism, thus requiring people to learn other languages, not just the language of those in power at the time. Practices of genuine participatory inclusion are fundamental for developing programmes with Indigenous peoples. It will be shown how understanding the linguistic-communicative structures at hand will be the key to developing an intricately multilingual society with multilingualism at all levels of communication, not just when vital decisions are at stake as in institutional encounters. Participative inclusion and genuine multilingualism in a society are reached when they are practiced in all constellations at all times as a matter of fact (Rehbein 2013). Multilingualism in Canada must take into account the knowledge and practices of Indigenous peoples as well as the complex meshing of various practices of the settlers for, as Maracle (2007, 145) phrased it for the Indigenous peoples: "our stories come from our two threads of history".

# Answering and Evading Questions in Political News Interviews: the Iranian Way

---

Lecture

---

**Dr. Ali Kazemi**<sup>1</sup>

**1.** University of Helsinki

In news interviews, interviewers (IRs) have a certain agenda to pursue. However, interviewees (IEs) may challenge question agenda and push their own political agenda. Given the right of the public to know and keep abreast of goings-on, IRs sometimes challenge the IEs' resisting answering in the interest of public enlightenment. The present study seeks to unearth the dynamics of Iranian politicians' answering and evading questions in broadcast news interviews, making use of conversation analysis (CA) as the frame of reference. The findings reveal that even if question design puts forth certain interactional constraints on how answers could be framed, in the light of local contingencies, including the question design, setting and the potential overhearing audience, Iranian public officials deploy various practices to achieve their interactional ends, ranging from preserving a public image to making a political point. In addition, the findings show that by questioning presuppositions generated by question agenda, and reformulating questions, both of which allow them to sidestep or evade questions, they may resist question agendas and refuse being seen as evasive. The findings provide insights into how differing conditions provide differing resources for respondents to accomplish social actions by answering, resisting or evading questions and what devices they deploy to accomplish communicative goals in news interviews in different settings.

# Anticipating depression diagnosis in a diagnostic evaluation process in psychiatry

Lecture

***Dr. Liisa Voutilainen<sup>1</sup>, Prof. Anssi Peräkylä<sup>1</sup>***

***1. University of Helsinki***

Depression is one of the most common diagnoses in psychiatry. While giving a depression diagnosis is routine for psychiatrists, it can be unexpected for the patients, especially in terms of adherence to medication with antidepressants. Using conversation analysis (CA) as a method, the paper discusses interactional practices of the delivery of depression diagnosis. We will present a longitudinal study of a diagnostic evaluation process consisting of 9 meetings between the patient and a psychiatrist and/or a psychologist in an outpatient clinic. The focus of the analysis is on the ways in which the psychologist anticipates the depression diagnosis and the treatment with antidepressants before the actual treatment negotiation with the psychiatrist. We will argue that the psychologist's interactional work in introducing the diagnosis is critical for the patient's acceptance of the diagnosis and adherence to treatment. In anticipating the diagnosis, the psychologist refers to the patient's descriptions and asks about the patient's opinions of the treatment. Facing the patient's resistance, the psychologist refers to the diagnosis as apparent and to the treatment as optional. In the actual treatment negotiation, however, the diagnosis and the offer of antidepressants is quite straightforward. The paper discusses the institutional aims of the diagnostic evaluation process, and the institutional roles of the psychiatrist and the psychologist reflected in their interactional practices. The paper also discusses interactional difficulties that the professionals face when the patient is reluctant to talk about their experience during the diagnostic process.

---

# Anticipatory openings

---

Lecture

---

**Dr. Elliott Hoey**<sup>1</sup>

1. Vrije Universiteit Amsterdam

Every social interaction is premised upon some reason-for-the-encounter to which participants are mutually oriented. This reason serves as a fundamental interpretive framework for guiding participants' understandings of interactional goings on and the overall organization of the encounter (Robinson, 2013). Typically, a reason is produced near the beginning of the interaction by the party who initiated it. This has been documented in a range of situations: the caller gives the call-recipient a reason-for-the-call (Schegloff, 1986), the patient gives the doctor a reason-for-the-visit (Heath, 1981), the police officer gives the driver a reason-for-the-stop (Kidwell, 2018), and so on.

In some settings, though, the person who initiates interaction does not produce the reason-for-the-encounter. For example, when a 'regular' customer enters a cafe and approaches the counter to order, the barista might recognize them and propose, "The usual?" (cf. Laurier, 2013). This initiating action skips over the normative ordering of opening sequences in such situations, where ordinarily greetings are produced and then the order is solicited or volunteered. By accelerating the progress of the encounter, the barista may be seen as doing 'good service' in recognizing the customer, remembering their usual order, and expediting the transaction. Likewise, the regular customer can be constituted as such, and in this way the social-commercial setting of 'a cafe with regular customers' gets talked into being.

This paper focuses on environments like this, where a) an interaction is recognizably imminent, b) the initiating action is produced by the party who is summoned/approached for interaction, and c) that initiating action incorporates some understanding of the reason-for-the-forthcoming-encounter. These are referred to as *anticipatory openings*. Using conversation analysis, this paper offers an examination of anticipatory openings in ordinary, workplace, and institutional settings where English and Spanish are spoken. The analysis will demonstrate the sequential organization of such openings, the categorization work that goes into their design, and the particular interactional jobs that get done by accelerating the normative sequential ordering of (re-)openings. The paper thus contributes to the renewed interest in conversation analysis on the initial moments of an encounter (e.g., Pillet-Shore, 2018) and growing work on practices for managing progressivity in interaction (e.g., Fox & Heinemann, 2019).

# Assessing the Effectiveness of PechaKucha in an ESL Context

---

Lecture

---

**Mrs. Yasmine Soheim**<sup>1</sup>

**1.** *The American University in Cairo*

This research aims at exploring to what extent Pecha Kucha (“chitchat” in Japanese), which is a fast-paced, time-constrained presentation technique, enhances ESL learners’ speaking fluency and active participation. The restricted nature of the Pecha Kucha presentation format can be identified as an inclusive classroom practice, where learners are in control of their learning process even in a heterogeneous learning environment. This can be explained by the fact that this presentation format restricts the presenters, regardless of their speaking fluency, with 20 slides, containing only pictures with minimal text or no text at all, that are automatically advancing every 20 seconds. In this study, Egyptian ESL university students, enrolled in a Research Writing course, prepared a Pecha Kucha presentation to showcase their final research paper at the end of the semester. A follow-up questionnaire was administered to the 49 students to assess their perceptions of the effectiveness of Pecha Kucha. Results revealed a considerate level of satisfaction among the students who reported that this learning experience was beneficial on numerous levels. A few students, however, noted that additional preparation time and more practice would have yielded better outcomes. The study is concluded with a discussion of the implications of employing Pecha Kucha presentation format on a wider scale for a better learning experience that is offering inclusion even in a heterogenous learning environment.

# Beyond the conceptual-procedural distinction

---

Lecture

---

Dr. Yuji Nishiyama<sup>1</sup>, Dr. Koji Mineshima<sup>1</sup>

1. Keio University

It is well known that Relevance Theory, which takes a particular inferential approach to communication, has implications for the analysis of linguistic meaning. While most linguistic expressions encode complete concepts, there are also expressions which need to be inferentially fleshed out, encoding only schematic concepts, or which constrain the inferential phase of comprehension, encoding only procedures. The fact that these differences exist at the level of linguistic expression implies that the conceptual-procedural distinction is a distinction between two types of linguistically encoded meaning: a given expression is ‘conceptual’ if it encodes constituents that enter into the logical form for semantic interpretation. On the other hand, an expression is ‘procedural’ if it merely constrains how the logical form corresponding to the utterance in which it occurs is interpreted externally in the context of utterance.

In this paper we argue that the standard distinction between conceptual and procedural meaning alone is inadequate to capture the linguistically encoded meaning of an expression. Consider (1):

- (1) Ivanka's father is the president of USA.

It is commonly understood that copular sentences of the form “NP<sub>1</sub> is NP<sub>2</sub>” are ambiguous. On the predicational reading, (1) says of a person referred to by *Ivanka's father* that he has the property expressed by *the president of USA*. On the specifical reading, (1) expresses an answer to the question “Who is the president of USA?”. (1) can also be interpreted as an answer to the question “Who is Ivanka's father?”, which is an inverted specifical reading. On the standard relevance theoretic view, the three-way ambiguity of (1) is explained at the level of procedural meaning, in that it arises from *constraints* on the background context (cf. Sperber and Wilson 1986/95: 202-17)

We claim, however, that the predicational/specifical distinction is not procedural, instead occurring at the level of logical form (cf. Nishiyama and Mineshima 2017). More specifically, the ambiguity of a copular sentence arises from what *semantic function* the concept encoded by an NP plays in the logical form. We propose three types of semantic function: (i) *referential* NP (e.g., *Ivanka's father* in the predicational reading); (ii) *property* NP (e.g., *the president of USA* in the predicational reading); (iii) *variable* NP (e.g., *the president of USA* in the specifical reading; *Ivanka's father* in the inverted specifical reading).

Building on this view, we further argue that the difference in semantic function also plays an essential role in the interpretation of a wider range of constructions such as (2), (3) and (4). In fact, these sentences are ambiguous depending on whether the semantic function of the conceptually-constant NP, *Mary's favorite composer* is interpreted as a *referential* NP or a *variable* NP.

- (2) John is concerned with *Mary's favorite composer*.
- (3) *Mary's favorite composer* does not exist.
- (4) *Mary's favorite composer* has changed.

These considerations indicate a need for *three* aspects of linguistically encoded meaning: what *concept* it provides, what *constraints* it imposes on the inferential phase of comprehension and what *function* it plays in a logical form.

# Circularity Effects and Interpretive Indeterminacy

## Lecture

Mr. Takeshi Tsurusaki<sup>1</sup>

1. Meikai University, Faculty of Languages and Cultures

I argued elsewhere that a certain type of circularity effects results from (i) the *indeterminacy* of the structure in terms of *definiteness* and *referentiality*, and (ii) the pragmatic tendency of the English speakers to interpret all NPs as *definite* or *indefinite, reference-relevant* expressions. This article aims to refine the argument and to provide more data to consolidate the claim.

Among the so-called circularity effects, the ones illustrated below are real:

- (1) a. \*[the fact that you believed *it<sub>i</sub>*]<sub>i</sub>
- b. \*[Everybody who says [Fred proved *it<sub>j</sub>*]<sub>j</sub>] agrees [that Mike denies *it<sub>i</sub>*]<sub>i</sub>

That is, their unacceptability is reducible to “interpretive circularity.” However, the one observed in (2), the “Type-B” circularity effects, cannot be explained in the same way:

- (2) a. \*[*her<sub>i</sub>* childhood sweetheart’s wife]<sub>i</sub>
- b. \*[*his<sub>i</sub>* university’s principal’s daughter’s husband]<sub>i</sub>

The reason is that the standard, well-motivated analysis of the internal structure of major syntactic categories leads us to the conclusion that the unacceptability of these examples does not result from interpretive circularity. In (2a), for example, the antecedent of *her* can be (not the whole NP containing *her* but) the head N *wife* at the level of N’:

- (3) [<sub>NP</sub> [<sub>NP</sub> [<sub>N</sub> *her*]<sub>i</sub>] childhood sweetheart’s [<sub>N'</sub> *wife*]<sub>i</sub>]

The validity of this analysis is supported by such acceptable examples as the following:

- (4) a. [a *woman<sub>i</sub>* [in *her<sub>i</sub>* forties]]
- b. [The *man<sub>i</sub>* who deserves *it<sub>i</sub>*] will get [the prize *he<sub>i</sub>* desires ]]

The question, then, is, “Why are examples such as (2a,b) judged to be bad?” My answer is that their unacceptability results from the *interpretive indeterminacy* of the structure and the English speakers’ tendency to interpret all NPs as *definite* or *indefinite, reference-relevant* expressions.

The Japanese language, which does not require NPs to be marked in terms of *definiteness* and *referentiality*, supports this view. Thus, the Japanese counterparts of (2a,b) are acceptable:

- (5) a. *zibun<sub>i</sub>-no osananajimi-notsuma<sub>i</sub>*  
self<sub>i</sub>-’s childhood friend-’s wife<sub>i</sub>  
“\*her<sub>i</sub> childhood friend’s wife<sub>i</sub>’ (=2a))
- b. *zibun<sub>i</sub>-no daigaku-no gakusho-no musume-nootto<sub>i</sub>*  
self<sub>i</sub>-’s university- ’s principal- ’s daughter- ’s husband<sub>i</sub>  
“\*his<sub>i</sub> university’s principal’s daughter’s husband<sub>i</sub>’ (=2b))

Actually, some of my Japanese informants failed to understand these examples in the intended way and judged them to be unacceptable (or marginal at best). However, given appropriate contexts, their judgements change:

- (6) A: Do you know “Okusama-wa Jyuuhassai,” an old TV comedy?

B: Of course. Yuki Okazaki played the role of an eighteen-year-old high school girl who gets married with her teacher.

A: That’s right. Well, do you remember who played \**his<sub>i</sub>* student’s husband<sub>i</sub>?

To English speakers, the expression *his<sub>i</sub>*student’s husband<sub>i</sub> is unacceptable with or without contextualization. In Japanese, however, the target expression becomes fully acceptable. Consider (7), the Japanese translation of the final sentence in (6).

- (7) Jaa, *zibun<sub>i</sub>-no oshiego-no otto<sub>i</sub>* wa dare-ga enjitano-ka oboete-ru?

' Well, do you remember who played \**his<sub>i</sub>student's husband<sub>i</sub>* ? '

More similar examples will be taken up and discussed in the paper.

# Closer to the people? Deixis and populist rhetoric in presidential speeches in the United States of America

Lecture

***Ms. Lilla Szabó<sup>1</sup>***

**1.** Centre for Social Sciences

The election of politicians such as Donald Trump, Jair Bolsonaro or Boris Johnson, who the media routinely label as “populist,” led to an increased interest in populist politics. Although there is no unified definition of populism in the literature, there are several features of the populist rhetorical style, which can be identified. One of these is that populist politicians exploit the gap between citizens and political institutions and wish to appeal directly to the people (Mudde 2017).

In this exploratory study, I aim to observe how populist politicians position themselves as being “close to the people” via deictic expressions. Deictic language use is considered as egocentric which means that speakers compare other speakers, objects, and time to their own position. I hypothesize that by way of exploiting the CENTER-PERIPHERY image schema (Lakoff 1987), populist politicians rely on deictic expressions to make people feel that they are “close” to them.

The corpus consists of the Inaugural Addresses delivered by presidents whose rhetoric contained elements of populism (Bumes & Mulroy 2004); thus, the speeches given by Franklin D. Roosevelt, Harry S. Truman, Richard Nixon, Ronald Reagan, Bill Clinton, and Donald J. Trump are examined. The analysis consists of the identification of deictic expressions which are categorized in accordance with their proximity to the speaker’s ego. For example, the inclusive use of the first-person plural *wein* “we, Americans” is considered as an expression which makes voters feel closer to the candidate.

Finally, I expect to demonstrate that the populists’ strategy of positioning themselves “closer to the people” is possible to analyze in language use.

# Co-construction in sharing multimodal analyses of learner's own L2 production

Lecture

***Dr. Duane Kindt<sup>1</sup>***

***1. Nagoya University of Foreign Studies***

The importance of considering all three modalities (i.e., vocal, nonvocal, and material) in describing and analyzing the complex, co-constructed nature of human communication has been solidified by recent Interactional Linguistic (IL) studies (Couper-Kuhlen & Selting, 2018). As the focus shifts to multimodal inclusion, L2 educators are now tasked with developing innovative procedures for increasing learner awareness of not only vocal and nonvocal modes, heretofore mainstays of second- and foreign-language education, but also the material aspect and how all three modes contribute in participants' collaborative efforts to establish and maintain intersubjectivity in L2 communication. This paper reports the results of ongoing research into an EFL Communication Skills course at a Japanese university in which materials and pedagogy based on peer modeling (Kindt, 2017; Murphrey, 1998) and recursive practice (Kindt, 2018; Kindt & Bowyer, 2018) were designed to increase students' awareness of and analytical skills in each of the three communicative modes leading to a final multimodal analysis of collaborative production. After introducing the course and procedures, the presenter follows an approach informed by sociocultural theory (SCT) (e.g., Lantolf & Poehner, 2014) and conversation analysis (CA) (e.g., Greer, 2016; van Compernolle, 2016) to provide a detailed examination of the co-constructed nature of effective sharing sessions with a classmate based on a longitudinal collection of students' analyses of video excerpts of their own L2 interaction. The data show a great diversity of contributions from partners that vary greatly in their impact on immediate and subsequent displays of learner's analytical skill development. With this result in mind, one area of future inquiry may be promoting the development of support skills for students who are not only presenting their analysis but those receiving it. This presentation will provide participants with an understanding of the materials and procedures employed in the study, of how select learners interacted to co-construct excerpts which display their analytical skills in each of the multiple modes of their own L2 interaction, and briefly discuss how related materials and pedagogy can support the development of both analysts and their interlocutors' awareness of and analytical skills in multimodal communication.

# Combinations of Procedural Expressions: Domain-specific Procedures and Sequence

Lecture

***Prof. Takahiro Otsu<sup>1</sup>***

*1. Kyushu University*

This paper attempts to investigate a sequence of procedural expressions including discourse markers (DMs) and fillers in their combinations. Regarding primary discourse markers (PDMs), secondary discourse markers (SDMs) and fillers, corpus-based research reveals sequence patterns of these expressions. In the framework based on the corpus data from BNC (British National Corpus) and Wordbanks Online, outstanding combination types are PDM/SDM (e.g. *but nevertheless*), PDM/filler (e.g. *so I mean*), SDM/filler (e.g. *in fact you know*), and filler/filler (e.g. *you know like*). Pragmatics can explain why these three types of procedural expressions usually occur in this order. PDMs determine the direction of inferential comprehension (or directly provide cognitive effects) on utterances including those procedural expressions; SDMs specify the inferential comprehension of the utterance by constructing higher-level explicatures that describe some comment on the embedded proposition, and fillers perform a fine adjustment of the inferential comprehension (Otsu 2018: 403).

However, the categorical distinction between PDMs, SDMs, and fillers cannot sufficiently explain the sequence. Category cannot be an indicator for deciding the order of fillers in their combinations. If interjections are categorized in the same status as fillers, category cannot explain why the order of the two procedural expressions cannot be inverted, as in “Oh well, I’ll go and find a regular job instead (BNC: CL1).” There are further examples that seem to violate the general order of SDM/filler: e.g. “Oh in fact you’re not even you could never have to go back to that same place but depends on where what you’re doing at the time that assignment comes up for reselling (BNC: JA3).”

As the corpus examples above suggest, the order of procedural expressions in a single utterance needs a more cognitive account. Sequences of procedural expressions reflect the way they activate or trigger various kinds of domain-specific cognitive procedures. A massive modularity hypothesis suggests that human brains are constructed by domain-specific modules and procedural expressions activate modules. Procedural expressions do not merely activate inferential comprehension for utterance interpretation, but also other capacities, including mindreading, emotion reading, social cognition or epistemic vigilance (Wilson 2011: 19-26). Domain-specific procedures have a more vital explanation in the order of multiple occurrences of procedural expressions, e.g. “Oh well, you see, Marius had this heart attack while we were out there (BNC: GUF).” The order of these procedural expressions is ascribed to the order of domain-specific procedures being activated and a presumption of optimal relevance being achieved.

# Communication between a Mother with Dementia and her Daughter: Talking and Writing

Lecture

***Dr. Noriko Tanaka<sup>1</sup>***

**1.** Seisen University

Since 2013, I have used telephone conversations between a mother and her daughter (myself) and examined how the aging of the mother affects their communication. Tanaka (2013) considered how aging can change their social roles in communication. Then, focusing on a speech act of ‘thankng’, Tanaka (2014) examined how the change of the roles may affect the speech act. Further, Tanaka (2015) (2017) considered how dementia may be related to Grice’s Maxim of Quality and Politeness Theory by Brown & Levinson (1987) and Leech (1983) (2014). Tanaka (2019) analyzed the data from the view of person-centred care, and Tanaka (2020) also explored some enjoyments which people living with dementia may have in their daily lives.

This paper again examines the communication between my mother and myself, but with some different data sources. As the data for analysis, I employ her letters and notes, as well as our telephone conversations. Since September 2011, when I moved close to her house, my mother often put some letters or notes into my mailbox. For this paper, I use both conversational and written data which were collected in January 2013, when her dementia gradually progressed. Caring my mother at that time made me aware of various difficulties in dementia care by a family member.

First, I will review some literature which highlights the issue: e.g. Anthony (2014), Boden (1998), Bryden (2005) and Iijima & Sako (2011). From the viewpoint of a caregiver or a patient, they discuss what makes the care difficult. With their discussion in mind, I will examine my data, of both talking and writing. What she wrote often contradicted what we talked on the phone. Some of her notes were full of anger or sadness, despite the cheerfulness she expressed on the phone in the morning of the same day. Through the contradiction, we can see her complexed feelings: anxiety, pride, struggle for independence, etc. I hope this paper will be of some help to further understand the psychology of people living with dementia.

# Comparative analysis of biodiversity metaphors in French and American newspapers

Lecture

***Ms. Marie Chandelier<sup>1</sup>***

**1. Université Côte d'Azur, CNRS, BCL, France**

Biodiversity crisis is currently known as one of the major concern worldwide. It has been extensively covered by mass media and has led to the emergence of the *biodiversity* neologism (1985). Despite an increasing use at both scientific, institutional and political level, the neologism *biodiversity* still lacks a stable definition (Barotta & Gronda 2020, Blandin, 2014 ; Casetta et al. 2019). By analysing metaphors of *biodiversity* in *The Guardian* and *The New York Times*, Iina Hellsten (2002) has shown that both scientists and journalists use the concept of richness to define *biodiversity*. Richness metaphors convey two types of meaning. The first meaning encompasses a precious and irreversible property of nature while the second one considers biodiversity as a material and economical product.

In our study, we analyse metaphors of *biodiversity* as richness in a parallel sample corpus of articles extracted from *Le Monde* and *The New York Times* from 1990 to 2018. Our objective was to identify the functions of richness metaphors in both newspapers. In this perspective, we took into account several parameters including enunciative source and polarity in relation to vulnerability within the two meanings we previously introduced. The first meaning focuses on the risks of losing such a richness while the second one builds a robust image of biodiversity based on economic values. We discuss the implications of using such metaphors to define a concept that is known to be intertwined with facts and values (Barrota & Gronda 2020).

This study clearly shows that metaphors are crucial objects to observe, in particular when they apply to critical issues. The environmental questions are indeed at stake today, and these metaphors may impact the choice of the forthcoming actions.

# Compensating Inadequacies while Showing Epistemics: Participating Topic Shift by ‘shi-bu-shi’ Questions in Mandarin Conversation

---

Lecture

---

***Dr. Liyan Liu<sup>1</sup>***

*1. National Institute of Information and Communications Technology*

The ‘shi-bu-shi’ question, which is one of the Chinese Y/N-question formats, is well known as the position of ‘shi-bu-shi’-unit is variable in the utterance (i.e., turn-initial, turn-middle, or turn-final). However, the difference in interactional function due to the difference in positions remains unidentified. Using the methodology of conversation analysis, this study investigates a practice by ‘shi-bu-shi’-question where the ‘shi-bu-shi’-unit is located at the turn-final. The practice concerns topic shift. But in the process of topic shifting, not only the ‘shi-bu-shi’ question but also the preceding utterance by the potential recipient of the question plays a role. The preceding utterances, in some way, contain elements that show the orientation to the new topic, but in the other hand, inadequacy to initiate the new topic fully (e.g., lack of appropriate connection to the previous topic or specific topical content). In the response, the questioners ask for confirmations of specific content by ‘shi-bu-shi’ question. The contents have the property of compensating for the inadequacies of the preceding utterance. By such questions, the questioners show a particular epistemic stance (Tsai, 2017) of the preceding utterances while compensating its’ inadequacies, thereby promote the development of new topics. The findings are discussed in concern with Tsai’s (2011) description about the turn-middle located ‘shi-bu-shi’ questions that are used to introduce the questioners’ own point of view.

# Constructing pragmatic norms in Japanese media: Diverse representations of the non-use of honorifics.

---

Lecture

---

***Prof. Naomi Geyer<sup>1</sup>***

**1. University of Wisconsin-Madison**

In Japanese, the use and non-use of addressee honorifics are one of the key characteristics constituting stylistic variations. While their use and non-use are traditionally considered to indicate formality and intimacy respectively, recent studies claim that honorific usage is related to speakers' linguistic ideology and self-presentation. The non-use of addressee honorifics is a key element of "*tameguchi* ('equalese,' 'friendly style,' or 'buddy talk')," a speech style that started to attract attention in various forms of Japanese media in recent years. The increasing appearance of the term in the online and public sphere signals the growing social awareness of those instances in which the lack of addressee honorifics was noticed and considered worthy of discussion.

In the fields of pragmatics, researchers who take the indexical approach to pragmatic phenomena have called for a re-examination of fundamental concepts such as appropriateness and pragmatic norm claiming that linguistic forms are not directly linked to a particular social variable or social category. Rather, the relationship between language and social category is mediated by language ideology (Johnstone, 2013; Okamoto & Shibamoto-Smith, 2016; Silverstein, 1979). They state that one of the ways to investigate appropriateness as a discursive and indexical phenomenon is to closely examine what is called "metapragmatic discourse," the process in which people discuss whether a certain interaction or language use is appropriate or not.

Using qualitative discourse analysis, this study illustrates how the use and non-use of honorifics are represented in media and how the norms about these usages are discursively constructed and negotiated. It first illustrates representations of *tameguchi* in four Japanese fictional media (1 movie and 3 TV dramas) by showing the range of its usage and the identity traits that are frequently attached to the *tameguchi* users. It also examines forty-three online discussion board entries which discuss these characters' use of *tameguchi* (or the non-use of honorifics). The study shows the commodification of *tameguchi* in media productions and depicts how people ascribe various social meanings to *tameguchi* and its users. Through these analyses, this study indicates competing and multilayered ideologies of honorifics.

# Constructing the suitable future parent. Prospective adoptive parents' communicative strategies in adoption assessment interviews

Lecture

***Mrs. Madeleine Wirzén<sup>1</sup>***

**1.** *Linköping university*

The present study examines how prospective adoptive parents display their suitability as adoptive parents in assessment interviews. The data comprise 36 hours of audio-recordings of 24 adoption assessment interviews between 6 social workers and 11 adoption applicants in Sweden. In adoption assessment interviews, applicants, through question-answer sequences, are invited to present their knowledge about adoption related issues and demonstrate their suitability for becoming adoptive parents. In this high-stake interaction, lack of central knowledge or insight has potential face-threatening consequences (Goffman, 1955). In the present study, I use institutional conversation analysis (Heritage, 2005; Linell, 2009) to analyze adoption applicants' communicative strategies in their responses to social workers' challenging questions. The analysis shows how adoption applicants, in their responses to social workers' questions can engage in a multi-layered task: they adopt perspectives presented by the social workers, and simultaneously maintain their standpoint. They do so by a two-step procedure; first they claim their knowledge and alignment with the social worker and second they demonstrate their knowledge and understanding (cf. Sacks, 1992, Vatanen, 2018). In the second step they present adoption-specific knowledge or personal characteristics that support the presentation of themself as suitable parents. Further, applicants organize their talk in such a way to show their eagerness to claim and demonstrate their knowledge, often in overlap with social workers. The study provides insights into the practice of assessing prospective adoptive parents and contributes to the understanding of how applicants establish their self-presentations presentations as suitable future parents while adjusting to institutional requirements in situ.

# Construction of Metaphorical Text and Talk: Towards an Analytic Framework for Metaphorical Discourse

---

Lecture

---

***Prof. Meizhen Liao<sup>1</sup>***

***1. Central China Normal University***

In view of the rapid development of studies of the discourse function metaphor, the present paper proposes a new framework for analyzing metaphorical construction and organization of text and talk. The research is grounded in Lakoff and Johnson's (1980) theory of metaphorical conceptualization of human thinking and action and Complex Adaptive Systems theory (Holland 1994) and aims at exploring the dynamic, emergent, adaptive and systematic nature of metaphorical interplay in text and talk via representative samples.

Discourse is divided into metaphorical versus non-metaphorical with a focus on the former, where metaphor is treated as consisting of two systems: micro and macro. A micro system of metaphor is canonically and necessarily composed of tenor (T) and vehicle (V), where the two interact by mapping the sub-system of V onto the sub-system of T. There are thus three patterns of mapping: explicit T versus explicit V; explicit T versus implicit V; and implicit T versus explicit V.

Accordingly, there are the following ways of textual extension or development: balanced, lopsided, mixed, radiating, and circular. A discourse may be composed of more than one metaphor constituting a macro system, in which componential metaphors as micro systems interact with each other. As a result, two patterns of textual structure evolve: metaphorical repetition and variation. Repetition may be full, partial, or synonymous while variation may take place within a domain or across domains. As a result of this repetition or variation, many interesting research issues arise in the study of metaphor density and discourse genre.

It is hoped that this unique way of dealing exclusively with metaphorical discourse in its own right will contribute to models for discourse analysis, including, among others, conversation analysis and rhetorical structure theory. Pedagogical applications of the framework can be seen in, for example, the teaching of languages, writing or composition, literature appreciation, and text comprehension.

# Contemporary Forms and Issues of Online Participation

---

Lecture

---

**Ms. Manar Alomran<sup>1</sup>**

*1. Université de Technologie de Troyes (UTT)*

The development of digital communication tools, particularly the socio-digital networks which have given rise to what is known as “digital culture”, recognized as “participative culture”, has led to changes in the conception of certain notions in the literature. Remarkably, the communication via online discussion spaces has broadened the concept of participation, which is a central element of digital culture, and of which discussion remains very limited for the moment. Moreover, because it appears in different fields of application (politics, marketing, education, etc.) and is associated with several issues (economic, media, epistemic, etc.), the concept of online participation today has become polysemic, slippery and quite distinct from that of face-to-face participation as defined by sociologists and anthropologists such as Goffman and Goodwin. This is why, in the contribution panel “Digital speech acts in social media”, we propose to identify and develop the concept of participation through the lens of the interdisciplinary field of digital communication (also known as Computer-Mediated Communication “CMC”). This contribution stems from our current doctoral research in which we have explored the various issues and theoretical frameworks surrounding this concept in order to identify its different relativistic meanings on the one hand, and to identify the new modalities and forms of emerging participation, as well as their socio/psycho-pragmatic aspects on the other hand. In order to help understand the dynamics of online participation and the socio-psycho-pragmatic criteria relating to these emerging forms of participation, this study aims to highlight the following syntheses :

- A typology of definitions of online participation according to its different issues.
- A typology of user figures according to the issues of online participation : produser (producer and user at the same time), amateur vs. professional, citizen vs. politician, influencer, data provider (sometimes without his or her knowledge), consumer, etc.
- The distinction between “participation” and “contribution” in the world of digital communication.
- The relationship between digital discourse analysis and online participation analysis : digital discourse is one form of online participation.
- A synthetic typology of new conversation techniques according to participatory forms, forms of engagement, nature of interactions, levels of participation, psychosocial functions and types of participants.

The typology of new conversation techniques will provide a conceptual and methodological background to help analyse data from online exchange corpora.

# Contemporary present-tense fiction: crossing boundaries in narrative

---

Lecture

---

***Prof. Reiko Ikeo<sup>1</sup>***

**1.** Senshu University

The use of the present tense as the primary tense of narration has become a commonly encountered phenomenon in contemporary fiction over the past two decades. Out of 120 novels shortlisted for the Man Booker Prize from 2000 to 2019, 33 novels (27.5%) are written in the present tense. Texts of contemporary present-tense narrative have not yet been fully examined by researchers partly because the literary and stylistic status ascribed to present-tense narrative is still inconclusive and partly because there is an underlying misconception that the narrative tense does not necessarily affect the temporal structure especially when it is applied to 3rd-person narration (see Cohn 1999. 98; Fludernik 1996. 253). Above all, until quite recently it has not been possible to obtain more comprehensive data of present-tense fiction although the use of the present tense for primary narration can be found sporadically in 19th- and 20th-century fiction.

Narrative is comprised of boundaries and distinctions which relate the narrator to the narrated. Within a narrative, narrated worlds are temporally and ontologically divided, and the narrator's and characters' voices are differentiated. The use of the past tense for narrative constructs fairly clear boundaries for these distinctions. In contrast, the extensive use of present-tense narration can blur or eliminate these distinctions. The use of the present narrative tense can cause ambiguity as to whether a particular segment is narration or a character's thought/speech presentation. Occasionally the boundary between direct and indirect forms can be blurred. These ambiguities and blurred distinctions between a character's voice and a narrator's can lead to a state in which the character's voice is louder and the narrator's voice is less conspicuous than in past-tense narrative. This paper compares contemporary present-tense fiction with 20th-century past-tense fiction quantitatively and qualitatively and analyses how the boundaries that are taken for granted in past-tense narrative can be blurred, crossed within narratorial structures and partly expanded at a meta-textual level from written discourse to spoken discourse.

# Contingency and Action: A pragmatics study of invitations in Japanese

Lecture

***Dr. Chisa Matsukawa<sup>1</sup>***

**1.** University of Central Lancashire

In recent years, there has been a growing interest in the associations between linguistic form of various actions (e.g. requests) in turn design (Drew, 2013) and the specific sequential environments in which different forms are used (e.g. Curl and Drew, 2008). The cluster of studies explored the activity of invitations in authentic telephone calls in seven different languages (e.g. English (Drew, 2018) and French (Traverso et al., 2018) from the CA perspective. The studies provided rich understanding of the action of invitations in various languages, however the action of invitations in Japanese is under-investigated, except for Szatrowski (1993). Therefore, the present study aims to explore invitations in Japanese by focusing on the associations between linguistic form of invitations and the specific sequential environments in which different forms are used from an adapted CA approach. The data used for the present study were collected through role-plays performed by 20 Japanese female university students (inviter) and 4 female student assistants (invitee), where an inviter invites her friend to a surprise party for a mutual friend. It was found that all the invitations are delivered through reporting (Drew, 1984), where the pre-planned event is reported. In the reporting, a certain grammatical structure was identified, namely a subordinate clause ends with *nda keto* + a main clause. In the majority (85 %) of the data, the subordinate clause was followed by the main clause, where recurring three lexico-syntactic patterns (Couper-Kuhlen, 2014) were identified, namely polar interrogative (e.g. *koreru* ‘can you come?’), Question-word interrogative (*doo* ‘how does it sound?’) and imperative (e.g. *ikoo yo* ‘let’s go’). In the case where polar interrogative is displayed, the inviter encourages the invitee to provide a response to the invitation by concerning the invitee’s ability. In the case where *doo* is utilised, the form reflects the indication of anticipatory difficulties shown by the invitee in the preceding turns. For the third case, the form, imperative, is reflected the indication of certainty displayed by the invitee in the pre-expansion. The findings obtained from the Japanese data would contribute to the studies which explore the way in which lexico-syntactic patterns relate to the local interactional contingencies.

# Corpus-pragmatic perspectives on Tolkien's and C.S. Lewis's literary style and authentication strategies

Lecture

***Prof. Péter Furkó<sup>1</sup>***

***1. Károli Gáspár University***

Tolkien's literary style has been an issue of heated debates ever since *The Hobbit* was published in 1937. Equally controversial has been the assessment of Tolkien's prose with reference to his contemporary and friend, C.S. Lewis, whereby Tolkien has appeared as both Lewis's inferior and superior, depending on the individual critic's perspective. The paper will present the results of research in which the two authors' writings have been used as test and reference corpora for keyness analysis with a view to contributing to the ongoing debate.

In the first stage of the analysis, the text of the original edition of *The Hobbit* was used as a test corpus (The Hobbit corpus, henceforth THC, a total of 95,515 words), while *The Lion the Witch and the Wardrobe*, *The Horse and his Boy* were merged with *The Magician's Nephew* until they added up to a reference corpus of equal size. Thus, in the first stage of the research, comparability of the two corpora was favoured over their representativity with a view to calculating keyness of the pragmalinguistic devices under scrutiny. When selecting the test and reference corpora for the second stage of the quantitative analysis, representativity was favoured over comparability, thus, both corpora were extended to include a more heterogeneous set of the two authors' works. The test corpus at this stage included all three parts of the *Lord of the Rings* trilogy in addition to *The Hobbit* (a total of 574,353 words), while the reference corpus contained all seven parts of the *Chronicles of Narnia* series (a total of 322,809 words).

In both stages of the keyness analysis the 'keyword list' feature of AntConc 3.4.4w was used and all lexical items in the respective test and reference corpora were considered, the full lists were then shortened with a focus on items that can be potentially associated with the authentication strategies contributing to Tolkien's unique literary style. In order to complement the keyness analysis, the THC and the CSLC were annotated using the USAS semantic annotation tool and a variety of semantic fields and their respective semantic tags were compared. The results show no statistically significant differences between the THC and the CSLC with regard to a wide range of subjectivity markers including approximators, maximizers, boosters, most of the evaluatives and degree words. However, there are several semantic fields associated with subjectivity – interpersonal and textual markers in general and discourse marking and reporting in particular – in which a Log Likelihood test reveals statistically significant differences between the two subcorpora. It has also been found that whenever one can observe a bias based on the dispersion of USAS tags, the relevant labels are more frequent in the CSLC than in the THC. The paper will consider alternative interpretations of the results with a view to Tolkien's and C.S. Lewis's authentication strategies.

# Correcting and modelling pronunciation through multimodal resources in speech-language therapy

Lecture

***Prof. Sara Merlino<sup>1</sup>***

*1. Università di Roma Tre*

Difficulties in articulating speech sounds are recurrent in people with a speech and language impairment such as aphasia. Some of the tasks performed during speech-language therapy are devoted to the treatment of these difficulties. My paper analyses the way the speech-language therapist instructs the aphasic patient on how to pronounce the linguistic items and models pronunciation through auditory, visual and tactile resources, thus configuring it as a multimodal and multi-sensory experience.

The research is grounded in Multimodal Conversation Analysis (Goodwin, 2000; Mondada, 2016) and is based on the transcription and the analysis of excerpts issued of a large corpus of video-recordings (60 hours) that were made in France and in the French-speaking part of Switzerland. Data was collected in different therapeutic settings (hospital, rehabilitation clinic, private speech-therapy office) along the recovery of people who developed aphasia as a consequence of a stroke.

The analysis of the data shows that the correction of the patients' productions is initiated by the therapists verbally, through repetition of the target item with prosodic features such as emphasis and volume. When these forms of cues reveal ineffective, the therapists make relevant other types of visual and haptic cues: by using their body as an "instructional tool", they represent, with gestures and face expressions, features of the target sound. They can also touch and manipulate the patients' face in order to help them to correctly realize specific articulatory movements.

The paper focuses not only on the multimodal resources used by the therapists in order to model pronunciation, but also on the practices used in order to enhance the patients' visual attention towards these resources (e.g. use of pointing gestures, directives, verbal and haptic summons) (cf. Ronkainen, 2011). It offers an investigation on how multimodal therapies (whose efficacy is often claimed in aphasia literature, see Pierce et al. 2019) are concretely implemented in face-to-face interaction. Finally, a vision of the therapeutic process as an embodied, multimodal and multi-sensory experience is proposed and discussed.

# Countervalue – a grammar-based device for managing inferences in negotiation

Lecture

***Prof. Thomas Bearth<sup>1</sup>***

***1. African Language Consultancy***

A meaning-sensitive typology of focus in the world's languages cannot be satisfied with axiomatics of information structure limiting it to an epi-sentential construct (Lambrecht 1994:49), but must draw on intersubjective validation of competing instantiations of variables across dialogue interactional settings. One implication is that focus-induced inferences may take opposite truth values (strong hypothesis of countervalue) from the predicates from which they are derived and in which their referential triggers are embedded, or, more loosely related to propositional content as "floating inferences", may be coded distinctly for either minimizing or maximizing inferential force.

Countervalue as an embryonic concept can be illustrated from German:

- (1) *Ich möchte, dass SIE mich bedienen.*
- (2) *Ich möchte, dass Sie MICH bedienen.*

While (1), with narrow subject focus, fits a situation where more than one employee heads towards a guest, (2) presupposes the presence of more than one guest. Whereas the physical presence of a plurality of employees in (1), or of more than one guest in (2), counts as a mere contingency, the exclusion of (an) employee(s) in (1) and of guests in (2) is part of the (inferential) meaning of (1) and (2). Guests and employees form countervalue sets. Countervalue requires a double characterization (i) in terms of *exclusion*, as far as the validation of the complementary domain is concerned, and (ii) in terms of *inclusion*, as far as its relevance to current discourse is concerned. The formula

$p \setminus p'$ , where  $p$  is the asserted and  $p'$  the *de-asserted* (cancelled or weakly asserted) but still relevant information, is expanded into a full-fledged heuristics : (3)  $P(x, y) \Rightarrow P\{a|b'; b|a'; A|b'; a|A'\}$ . The extension of countervalue axiomatics to the domain of inferential meaning as outlined in Bearth (2005: 10f.) is based on empirical evidence from the pervasive rationale behind focus marking in Tura, a Mande language spoken in Western Ivory Coast as documented in Bearth (1992). Focus is split into a paradigm compatible with any referential lexical unit in both internal and left-dislocated positions, (i) a high tone clitic (F1) and (II) a neutral tone clitic -le (F2). For a valid comment on a sample of key alternants of focus in Tura analyzed along these lines, see Matić and Wedgwood (2013: 142f.). The fact, noted by them, that F1 and F2 can be used cumulatively on a single constituent to encode consensual vs. conflicting stances taken by dialogue partners, provides ultimately concluding evidence for the prioritization of an interactional framework as a premise to understanding the full range of meaning conveyed through focus in African languages such as Tura, and perhaps in other languages around the world.

# COVID-19 e-consultation discourse in China: Understanding affective acts

---

Lecture

---

**Dr. Yu Zhang<sup>1</sup>**

*1. Beijing Information Science and Technology University*

China is leading the pack in terms of the digitalization of healthcare (Milcent, 2018). Online medical consultation (OMC) plays an increasingly important role among the public for self-care and coping with health problems. At the beginning of the outbreak of COVID 19, many e-healthcare platforms in China set up a “COVID-19 consultation section” for Chinese people at home and overseas to consult doctors about this disease or health problems that can be possibly related to COVID-19. While scholars in the field of linguistics turn to study discourse related to COVID-19, in particular, the representations and discourses about the pandemic (see ViralDiscourse and PanMeMic websites), there is a lack of studies on COVID-19 consultation discourse.

To have a better understanding of the interaction between doctors and OMC users consulting about whether they or their families are infected with COVID-19 disease, the present study examines 65 online consultations about COVID-19 by the approach of discourse analysis. These consultations involve 65 doctors and about 65 OMC users. Each consultation involves only one doctor and one OMC user, and the interaction is like sending WhatsApp messages to each other. Building upon Stevanovic and Peräkylä (2014)’s framework – epistemic order, deontic order, and emotional order, this study focuses on the affective dimension of COVID-19 e-consultation discourse, in particular the emotional facet of OMC users’ messages and the empathic facet of doctors’ responses. It aims to find out how emotional expression by OMC users and empathic responses by doctors are carried out through the use of epistemic stance, deontic stance, and affective stance. Findings show that epistemic facet, deontic facet, and affective facet in the affective interaction are related with each other. Epistemic stance and deontic stance can serve to display affective status, although sometimes there is misunderstanding. This study provides a perspective for studying affective discursive practice in the OMC context, which facilitates a better understanding of affective engagement in e-healthcare settings.

# Covid-19 pandemic reflected in Slavic languages

Lecture

***Prof. Marek Łaziński<sup>1</sup>, Prof. Magdalena Derwojedowa<sup>1</sup>, Dr. Agnieszka Będkowska Kopczyk<sup>2</sup>***

*1. University of Warsaw, Faculty of Polish Philology, 2. University of Bielsko-Biala*

Language does not only denote objects but is a mean to articulate human experience. The lesson of the Covid-19 pandemic outbreak, separation from family members and friends during the lockdown, economic uncertainty, fear of the pandemic situation getting worse reflect in the growing body of new vocabulary in many languages. In our overview, we collect and analyze lexical units that refer to the Covid-19 pandemic in nine Slavic languages: Russian and Ukrainian (East Slavic), Polish, Czech and Slovak (West Slavic), Croatian, Slovene, Macedonian and Bulgarian (South Slavic). Most of the Croatian lexical items also function in Bosnian, Montenegrin and Serbian public discourse; the differences are marked in the text, if relevant. The talk presents Slavic Covid vocabulary against West European languages' background: English, German and French.

The Covid-19 pandemic in Slavic countries proceeded in the same way as in the rest of the world. Like in other languages, specialized terminology used in medicine, particularly by epidemiologists, entered non-professional public discourse about pandemics. Our research focuses on newly coined words and expressions that refer to different aspects of pandemics. They climbed the tops of frequency lists, rushed into general dictionaries, and made collections of "COVID-19" or "coronavirus lexicons".

The pandemic vocabulary we discuss comes from mainstream newspapers and occasional usages in social media memes. We checked the frequency of some words WebCorp Internet caorpus. The collection is organized thematically, i.e. according to lexical fields covering different aspects of life in the pandemics. In pragmatics, the talk focuses on pragmatic schemata of coronavirus's personification as an enemy and war rhetoric used to describe human efforts to bring the disease down.

# Criticisms and Compliments in English and Dutch Discourse Completion Tasks: A View on Gender and Complementation

Lecture

***Dr. Bram Vertommen<sup>1</sup>, Dr. Caroline Gentens<sup>2</sup>***

***1. KU Leuven, 2. University of Zurich***

In the literature on gender-related differences in language use, potential differences in syntax have been relatively understudied (cf. Mondorf 2002 for a counterexample). Jespersen (1922: 252) nonetheless posited the general claim that female speakers use more paratactically related clauses, while men favour hypotaxis. Rühlemann's (2010) finding that in the spoken BNC, female speakers of British English show a much more 'conversational' language profile than male speakers does not seem to contradict Jespersen's intuitions. In this study, we want to add an empirical study to address this question further, by focusing on gender differences in the choice of complementation patterns for native speakers of Flemish Dutch and British English.

The primary data set consists of discourse completion tasks (DCTs, see Blum-Kulka & Olshtain 1984; Blum-Kulka, Kasper & House 1989; Ogiermann 2018) elicited from a relatively homogeneous group of about 60 university students in the UK and in Flanders respectively. The DCTs present situations that are designed to vary for the features of power, distance (acquaintance), distance (emotional connection), and imposition, as well as for same-sex vs. mixed-sex interactions. In terms of speech acts, the focus is on eliciting different expression patterns of criticisms (cf. Nguyen 2013) and compliments, because these expressive speech acts lend themselves well to including the reason for an emotive reaction in the form of a complement clause.

In our talk, we first highlight gender-related differences in the elicited criticisms and compliments in the two Germanic languages. We then zoom in on attested gender differences for specific complementation patterns (e.g. *the fact that-/het feit dat*-clauses). Finally, we evaluate the validity of DCTs as a tool for eliciting complementation patterns in different languages.

# Culture and Identity in the Learning of Pragmatics during Study Abroad: A Longitudinal Case Study

Lecture

**Ms. Xiaowen Liu**<sup>1</sup>

**1.** University of Leeds

This presentation will report on findings from an on-going doctoral research project: a longitudinal case study investigating how five Chinese students sojourning in the UK develop their pragmatic knowledge and skills in English. The research questions are:

(1) In what moments do students notice pragmatics learning in the UK study-abroad (SA) environment?  
(2) What communication strategies related to pragmatics do participants report using in communication, and do these change over the academic year?  
(3) How are these strategies and changes related to the students' evolving sense of self and cultural perspectives?

This study is motivated by my personal awareness of difficulties that international students face and their feelings of being excluded in the SA environment. Many international students in the UK come from countries where English is a foreign language and not used in daily communication. For them, expressing themselves and establishing connections in L2 can be challenging. Their interaction with the L2 community can raise awareness of their lack of pragmatic knowledge, but the only support that most students receive from their universities is related to their academic subjects. They have to deal with the frustrations and confusions of daily L2 communication using their own resources.

In this longitudinal study, the data collection took place over an academic year. Qualitative data were collected through semi-structured interviews and learning logs. Five participants were recruited in the induction week of their courses, their first month in the UK following their move from China. The concept of pragmatics was introduced, and they were encouraged to keep diaries about daily encounters related to pragmatics learning and their reflections on those special moments that caught their attention. The stories they shared, then, fed our discussion in the interviews at the middle and the end of each semester.

The findings indicate challenges SA students face in daily interactions concerning L2 pragmatics: linguistic barriers and unfamiliar cultural conventions in interpersonal communications could hinder them from expressing themselves and forming relationships in the way they desire. This process appeared to be uncomfortable for some learners, but it triggered expansion in intercultural awareness and self-perception. Moreover, differences and difficulties related to L2 pragmatics nudged some participants to go beyond linguistic forms to explore deeper cultural meanings behind the language and to reflect on values they brought with them from their home environments.

Pragmatics serves as a lens in this research to observe how learners form unique perspectives to interpret new cultural phenomena and how they develop new subjective perceptions of themselves and others. In other words, this study focuses not only on how learners acquire greater L2 proficiency but also how L2 learning enables them to change and develop as a whole person in the SA context. This study has implications for institutions and tutors in higher education on how they might facilitate inclusion through helping international students find their place in their adopted communities through providing pragmatic-specific support.

# Customer complaints directed towards private taxi-cab companies on Twitter: a comparison of strategies used in Spain and Mexico

Lecture

***Dr. H Powell<sup>1</sup>, Dr. Maria Placencia<sup>1</sup>***

*<sup>1</sup>. Birkbeck, University of London*

The speech act of complaining is under-researched compared to others in Spanish, and especially in digital environments (Placencia & Powell, 2020). Adopting a variational pragmatics approach (Schneider & Barron, 2008), we examine complaints from customers posted on the Twitter feeds of two well-known taxi-cab companies operating in both Spain and Mexico. This study builds on work concerning complaints in online (e.g., Depraetere et al., 2021; Meinl, 2014; Vásquez, 2011) and face-to-face contexts (e.g., Olshtain & Weinbach, 1987; Pinto & Raschio, 2008; Wolfe & Powell, 2006).

We analysed complaints first in terms of their overall purpose: to threaten, to upbraid, or to call the complaint recipient to account, or to provide catharsis or gain recognition for the complainer (following Wolf & Powell, 2006). Here taxi-cab service users in Spain and Mexico both preferred to frame their complaints as upbraids but differed in their second preference, with Spaniards choosing to threaten the complaint recipient while Mexicans chose to call them to account. Other differences appeared in the use of upgraders with Spaniards preferring moralising terms such as *vergüenza* ‘shame’ while Mexicans used more overtly offensive forms such as *mierda* ‘shit’.

Of particular interest is complainers’ exploitation of the public nature and affordances of Twitter to manage rapport both with the complaint recipient and the audience of other users. The most common complainer strategy was the attachment of screen-shots to either provide evidence for complaints or to name and shame bad drivers. Such devices, which constitute face-threatening acts, can be interpreted as both adding weight to the complaint and as efforts to warn other users, thereby potentially enhancing rapport with this group.

# Deference as a politeness strategy in spoken English business communication

Lecture

**Ms. Isolde van Dorst<sup>1</sup>**

**1. Wi**

This talk stems from the well-known and widely-reported stereotype that British English politeness is often characterised as featuring high levels of negative politeness or indirectness (Wales, 2000). However, more recent research by Culpeper & Gillings (2018) found that this may be more nuanced on a sociolinguistic level. In particular, they found that there are differences in what politeness type is used –tentativeness, deference, or solidarity – depending on one's sociolinguistic background (Culpeper & Gillings, 2018). In the present study, I am interested to see whether this can also be applied to a specialised (in this case, business) context.

My particular interest, and the aim of this paper, is to explore whether these patterns in politeness strategies are reflected in spoken English business communication. For this, I use the Cambridge and Nottingham Business English Corpus (CANBEC) (Handford, 2010). The corpus consists of one million words of transcribed spoken data, recorded in a variety of business contexts, including conversations from large multinational corporations, along with many smaller organisations. In addition, CANBEC contains rich (sociolinguistic) speaker metadata, allowing various comparisons to take place, for example between genders, ages, and professions. Crucially for pragmatic analysis, it also contains metadata on the context of the interaction – categorising, for example, formal meetings, watercooler conversation, and telephone calls (Handford, 2010).

I selected a range of typically British formulaic politeness expressions, based on previous scholarship, that are exemplary of deference politeness and multiple levels of formality. For example, the phrase *thank you* is characterised as a form of deference, but I also included the variety *thanks*. The expressions selected are *thank you*, *thanks*, *cheers*, *sorry*, *pardon*, *excuse me*, *my bad*, *mr*, *mrs*, *sir*, *dr*, and *miss*. They are first examined based on their frequency distribution by several sociolinguistic variables, namely company type, as well as speaker's age, gender and rank. Secondly, a more fine-grained, qualitative analysis of the expressions was performed to consider how they operate in context.

Initial findings suggest that there is indeed some variation in deference politeness used within a business context. All three of the speaker variables show a difference in their use of deference, though this often depends mainly on the immediate context in which an expression is used. There are also some differences based on company type, in which there tend to be more apologetic expressions (*sorry*, *pardon*, *excuse me*, *my bad*) used in smaller firms than in larger corporations. Overall, titles (*mr*, *mrs*, *sir*, *dr*, *miss*) are used similarly in all sociolinguistic groups.

## Dialect and humor: the case of Zerocalcare.

---

Lecture

---

***Dr. Salvatore Attardo<sup>1</sup>***

**1.** Texas A&M University - Commerce

This paper explores the complex tangle of sociolinguistic and stylistic issues in the use of dialect and humor in the work of Italian cartoonist Zerocalcare. Zerocalcare's work is widely recognized as innovative and as reflective of the current cultural landscape. While there has been significant discussion of the use of the romanesco dialect in his work (Viviani, 2013; Urbanova, 2018, Ventura, 2018; Gallarini, 2019; Abella, 2020; Ursini, 2020) to the best of my knowledge there has been no discussion of the discussion of the relationship between humor and Zerocalcare's use of romanesco.

This study is a good test case for the often assumed but never demonstrated connection between use of the dialect and humor. This paper will test empirically whether there is a correlation between use of the dialect and presence humor, using a triangulation technique between dialectology, humor studies, and socio-semiotics.

# Directives in Adult-Child Interaction of Chinese Immigrant Families in Canada

---

Lecture

---

***Ms. Qie Wu<sup>1</sup>***

***1. University of Alberta***

Directives, in the broad sense refer to utterances that are designed to “get someone to do something” (Goodwin, 2006), which include *request*, *command*, *order*, etc. (Searle, 1976). Children by nature make requests to their caregivers frequently in family interaction, for example, ask their parents or grandparents to fetch something out of reach. Parents frequently make directives to their children such as commanding their children to do the dishes or to focus on their assignment. Research has mostly been done on how directives are made from parents to children in English-speaking families. Goodwin (2006) observed that multimodal resources are used by parents to direct/re-direct children to finish a certain task, such as children’s facial mutual orientation , tying utterances to prior discourse, and providing accounts.

Along this line of research, the present study investigates directives in heritage Chinese family interaction in Canada following the theoretical frameworks of Conversation Analysis, Interactional Linguistics and Multi-modal Analysis. More specifically, the study explores how parents and children employ multimodal resources (lexico-syntactic, prosodic, embodied features, relevant objects in the environment) in accomplishing and responding to directives. The data set consist of 5.5 hours of recording of naturally-occurring interactions between adults (grandparents & parents) and children playing games, having meals and gardening at home.

Preliminary analysis of the data shows that imperatively-formatted directives are most frequently observed among adult-child directives. Thus, this presentation specifically focuses on the different grammatical formation of imperative directives and their interactional relevance. More specifically, the imperative directives prefaced by vocatives tend to be used in sequential and activity juncture, where there are competing tracks of activity striking for recipient’s attention. Imperatives prefaced by vocatives are employed by the speaker to manage the participation framework. Further, vocatives-prefacing imperatives are also deployed in activities where task assignment is relevant. Another phenomenon that emerges is the frequent use of *lai* ‘come’-directives, a dummy verb that is used to elicit a more specific, goal-oriented directive. Finally, the use of imperatives with a first person plural subject are observed in proposing joint activity. By using an inclusive pronoun, the speaker forms the directive in a sense of proposal and thus emphasizes the jointness of an activity.

# Disagreement strategies and (im)politeness in Saudis' Twitter Communication

Lecture

***Ms. Sarah Almutairi***<sup>1</sup>

**1.** University of Leeds

This paper is part of ongoing research examining disagreement and (im)politeness in Twitter communication, focusing on sociocultural and political trending hashtags in Saudi Arabia during 2017-2018. The analysis is based on a corpus of 1556 tweets which led to the identification of 582 instances of Saudis' disagreements. The analysis shows that Saudis used 11 distinct disagreement strategies, and these strategies fall into three types: mitigated (i.e. weakened), aggravated (i.e. strengthened), or unmarked (neither weakened nor strengthen). Moreover, it revealed that the majority (61.3%) of Saudis' disagreements belong to the aggravated type. The top five used disagreements strategies are verbal attack, act combination, explanation, verbal sarcasm/irony, and counterclaim.

The analysis further reveals that classifying disagreement strategies as polite, impolite, politic, etc. based on Locher & Watts' (2005) relational work model is not a straightforward process. It is true that some of the disagreement strategies are intrinsically negatively marked, hence they are more likely to be classified as impolite/inappropriate such as verbal attack and verbal sarcasm. However, the majority of these strategies are unmarked thus not easily classified. For instance, a disagreement in the form of explanation can be either impolite/inappropriate, polite/appropriate, or politic depending on the context; specifically how the mitigation or aggravation devices are used with the explanation strategy.

Moreover, it is important to highlight that mitigation in some cases can be ineffective or even impolite, this use of mitigation is mostly found in *sarcastically* mitigated disagreement. Accordingly, the relational work model was slightly modified to include the sarcastically mitigated disagreements, the model consists of 4 major types of disagreements but based on the markedness there are 3 general categories. The first category is the positively marked disagreements, which covers mitigated disagreements. The second category is unmarked, which includes disagreement instances that are neither mitigated nor aggravated. Lastly, the negatively marked category encompasses both aggravated disagreement and sarcastically mitigated disagreement.

# Discourse marker *nizhidaoma* ‘you know + ma (question particle)’ as a device for seeking alignment or affiliation in mandarin conversation

Lecture

***Dr. Li Chen<sup>1</sup>, Dr. Qingqing WU<sup>1</sup>***

**1.** Kyushu University

*Nizhidaoma* 你知道吗, which is ubiquitous in Mandarin interaction, literally means ‘do you know’, and consists of the pronoun *ni*‘you’, the verb *zhidao* ‘know’ and the question particle *ma*. Because of the grammaticalization of the verb *zhidao* ‘know’, *nizhidaoma* has evolved into a discourse marker conveying an interaction-oriented interrogation rather than a proposition-oriented interrogation (Tao, 2003). Previous literature focuses on the positions of *nizhidaoma* relative to the information unit it cues. For instance, Liu (2006) classifies *nizhidaoma* into [...*nizhidaoma*, *X*,... ] and [..., *X-nizhidaoma*,... ]. She suggests that the former is used to initiate a new topic and has a similar function to *you know* in English, which signals the need for the listener to center on the information *X* (Schiffrin, 1987: 267); and the latter is used to provide background information *X* so that the listener can better understand the speaker’s intention. However, our investigation indicates that *nizhidaoma* occurs in different interactive environments and has distinct interactional functions.

By adopting the methodology of conversation analysis, this study explores two interactional practices of *nizhidaoma* occurring during storytelling, particularly in relation to the pursuit of alignment or affiliation (Stivers, 2008). Drawing on the *nizhidaoma* examples collected from 12 hour-long video-recorded face to face conversation and 18 hour-long audio-recorded telephone talk-in-interaction, we outline the following interactional functions of *nizhidaoma* as follows.

One type of *nizhidaoma* occurs in the utterance immediately after the recipient produces an affiliative but structurally non-aligning response in the mid-telling position. *Nizhidaoma* is used to emphasize the continuation of storytelling, display the speaker’s orientation to the preference for progressivity, and alert listeners to prioritize the progressivity of storytelling. *Nizhidaoma* is responded to by the recipient’s minimal response tokens such as *en*嗯 ‘yeah’ to display alignment.

The other type of *nizhidaoma* occurs after the reformulation of the story’s punchline. When the storytelling reaches its climax, the listener’s affiliative response is made relevant. However, on special occasions the listener fails to give a relevant response. The speaker tends to reformulate the climax to make it more understandable. *Nizhidaoma* after the reformulation is used to seek the listener’s affiliative response.

In conclusion, this study shows that *nizhidaoma* has an interactional function of seeking alignment when the recipient interrupts the ongoing storytelling. On the other hand, *nizhidaoma* is used to seek affiliation when the recipient fails to give a relevant response to bring the story to an end.

# Discourse markers that manage stance in speech repairs

Lecture

***Dr. Tomoko Sakita<sup>1</sup>***

**1.** Doshisha University

In past decades, the issue of speech repairs has been studied in various linguistic fields such as conversation analysis, natural language processing, and psycholinguistics. This study explores speech repairs with an original focus on speakers' stance management (Du Bois 2007), in a framework of dialogic syntax (Du Bois 2014), and examines how speakers express their stance when they make self-repairs using discourse markers. It hypothesizes that self-repairs in spontaneous speech are stance acts closely linked to the speaker's self-monitoring (Levelt 1983, 1989), based on the fact that the speaker takes an evaluative stance by monitoring and assessing the preceding part of her/his own speech. Frequently occurring self-repair discourse markers include *I mean* and *well*.

Sequences of self-initiated self-repairs in a variety of settings of conversational American English data are analyzed, with the key notions of stance, resonance, and dialogicality. Examples are shown in diagraphs that highlight structural mapping relations across utterances. The stance alteration at the self-repair is visualized through stance triangles.

The study shows that self-repairs are often not simple error corrections but stance acts, indicating a shift in the subjective evaluation of the stance object (i.e., the originally reported events/facts). When employing certain discourse markers in self-repairs, the speaker bases a repair not on error recognition per se but, rather, on the need for stance alteration, which is being monitored. For instance, 1) the discourse marker *well* indicates the repair of facts, factual relations, or order, to signal and manage the meta-stance relation between the speaker's upcoming stance and prior stance; 2) it signals a shift to a stance that is more appropriate for accepting the remark, when the prior remark's validity is somewhat questionable; and 3) it denotes the clarification of an aspect or the addition of accuracy to the prior remark. Besides, the discussion highlights the dialogic nature (Bakhtin 1981) of the monologic, self-contained part of the speech involving a self-initiated self-repair. The speaker is responding to inner speech questions posed by the speaker's own monitoring self, just as the speaker would respond to a listener's question or challenge in a dialogue.

# Discriminatory linguistic landscapes: a case study from the capital of Finland

Lecture

**Prof. Sofie Henricson<sup>1</sup>**

**1. University of Helsinki**

This talk explores discriminatory linguistic landscapes at three central railway stations of the capital of Finland, Helsinki. In 2016, a report published by the Finnish government shows an increased visibility of racism, hate crimes and extremism (Finnish Ministry of the Interior 2016), while the Police of Finland (2016) reports that both alleged and convicted hate crime rates have augmented. This alarming trend raises a need to examine the discriminatory discourses that are visible in the collective urban space, as these visible discourses contribute to the creation of otherness and the increasing polarisation in our society.

The analysis is based on georeferenced photographs, collected from the same stretches of linguistic landscapes through one data collection per week and four consecutive months. Through repeated data collection of the same focus areas, the analysis focuses on how the discriminatory landscapes of three railway stations in Helsinki change over time and on how practices of resistance evolve in response to this. The data consist of photographs of stickers, attached paper notes, and graffiti with a discriminatory agenda, which attack human diversity and construct otherness. Also non-linguistic signs with the same function are included, e.g. symbols such as a swastika. The study also includes practices of resistance in the same linguistic landscapes, such as attaching stickers embracing human diversity or painting over discriminatory signs. The signs in focus have been illegally and anonymously placed in public places. They offer visible, locally anchored and temporally sensitive evidence of how approaches to human diversity are constructed, perceived and negotiated in public urban spaces.

The research is done within the multidisciplinary research field of Linguistic Landscape (see e.g. Pütz & Mundt 2018). The study employs discourse analysis (e.g. Fairclough 2003) as theoretical framework, and takes an interest in the interplay between discriminatory discourses and linguistic choices as well as the relations between linguistic landscapes and on-going societal processes.

In the presentation, I will discuss publicly displayed discriminatory discourses as well as practices of resistance, by addressing the following research questions: What kind of discriminatory discourses are visible at central railway stations of Helsinki and how are the discriminatory discourses created? How rapidly do the discriminatory linguistic landscapes of these highly frequented stations change? Are there signs of practices of resistance, e.g. destruction of fascist signs or signs advocating an opposite view? Do the discriminatory linguistic landscapes develop in correspondence with specific events of social activism, e.g. public demonstrations?

# Display of Concession: Maa-prefaced responses to polar questions in Japanese conversation

Lecture

**Dr. Yuki Arita**<sup>1</sup>

**1.** San Diego State University

This study offers an empirical analysis of the Japanese turn-initial particle *maa* in the framework of Conversation Analysis. *Maa* is one of the most used turn-initial particles in colloquial Japanese, and it is typically listed in dictionaries as an adverb or interjection meaning “passably,” “probably,” or “for now.” A growing body of Conversation Analytic research shows that turn-initial particles primarily signal a speaker’s stance toward the prior turn (Heritage, 2013, 2015). This study focuses particularly on *maa*-prefaced turns as a response to polar questions.

By asking a question, people seek information, confirmation, or agreement (cf., Stivers & Enfield, 2010). In other words, a question poses constraints on what its addressee is expected to do in the next turn. Raymond (2003) examines responses particularly to polar questions and classifies them into two types: type-conforming and non-conforming answers. Type-conforming answers refer to responses with yes/no-tokens, while non-conforming answers refer to responses that provide (dis)confirmation to the preceding questions without yes/no-tokens. Non-conforming answers are used to problematize or resist the constraints imposed by preceding questions, and they are also grouped as “transformative answers” (Stivers & Hayashi, 2010).

This study contends that *maa*-prefaced responses to polar questions are also one way of performing transformative answers. The database for this study consists of approximately 16 hours of 31 face-to-face video-recorded non-institutional conversations between two to four native speakers of Japanese. Based on the analysis of these conversations, this study shows how the turn-initial particle *maa* projects a retroactive adjustment for a certain term or agenda proposed by a preceding question while also serving as a means to project an avoidance of overt disconfirmation or disagreement and to register a display of a concessive stance toward the proposition in question.

Studies of turn-initial particles are a rapidly growing research domain in Conversation Analysis, and the diverse interactional roles of those particles have been reported across languages (cf., Heritage & Sorjonen, 2018). This study aims to contribute to this line of research by revealing the nuances and stances Japanese speakers convey when using *maa*.

# Does any function as a negative polarity item in affirmatively framed polar questions?

Lecture

***Prof. John Heritage<sup>1</sup>***

**1. UCLA**

While the functioning of *anyas* a negative polarity item is well accepted for declarative sentences, claims for a parallel function in interrogative sentences are more controversial. The negation ‘licensing conditions’ that are a compelling form of evidence in the case of declaratives are generally absent in the context of interrogatives. No less an authority than Quirk et al.’s (1985) *Comprehensive Grammar of the English Language* argues that affirmative questions with *anyare* “generally neutral, with no bias in expectation towards a positive or negative response” (p.808). This position has recently been affirmed in a conversation analytic study by Couper-Kuhlen, Thompson and Fox (frth), who examine whether the use of *any* is associated with responses indexing the recipient’s orientation to such questions as *no*-preferring.

According to Sacks (1987), the preference for agreement involves two elements of conduct: (1) questioners should design polar questions so as to permit ‘agreeing’ responses, and (2) where possible, respondents should produce ‘agreeing’ responses. The present paper presents evidence that is primarily from the first of these elements: the prior contexts of *any*-containing questions rather than from the second: responses to them. This evidence suggests that questions containing *any* emerge in contexts where agreeing and confirmatory negative responses are probable, and thus embody a ‘probability’ dimension of epistemic stance (Kärkkäinen 2003). In addition, the ‘licensing conditions’ for such negatively polarized questions emerge from sequences of talk and their real-worldly contexts rather than from intra-sentential resources. The analysis points to the relevance of distinctions between relational and epistemic dimensions of preference organization (Raymond and Heritage 2021). Research data are from US and UK English and are qualitative and quantitative.

# Doing Power via Impoliteness and Rapport: Exploring reported interactions between voice-hearers and their voices

Lecture

***Dr. Zsófia Demjén<sup>1</sup>, Prof. Elena Semino<sup>2</sup>, Dr. Luke Collins<sup>2</sup>***

*<sup>1</sup> University College London, <sup>2</sup> Lancaster University*

In this paper we analyze (im)politeness and rapport management in reported interactions between voice-hearers and their voices. Voice-hearing involves the perception of verbal content in the absence of an appropriate external stimulus and is a characteristic symptom of schizophrenia-spectrum disorders. While voices can be profoundly distressing, a sizable minority of clinical populations cope well with these experiences. This is because distress depends not on the presence of voices, but also on: what the voices say, and how; the relationship that voice-hearers establish with their voices; their perceived control over the voices; and ultimately their ability to live the life they want to live.

Personal relationships, including power dynamics, are known to be reflected and negotiated in interaction. In this paper we apply this idea to interactions between a voice-hearer and their voices, as it is well-established that voices are primarily experienced as social actors. We use the frameworks of rapport management and (im)politeness (e.g. Spencer-Oatey 2008; Culpeper 2011) because of their strong connections with interpersonal power dynamics, and examine 800 instances of direct and indirect speech reporting (where there is sufficient indication of actual verbal content), identified via corpus methods, in interviews with 40 voice-hearers who used Early Intervention in Psychosis Services in the North East of England. We take people's lived experience as a starting point for investigating how relationships are established and negotiated between voice and hearer, and how this is related to people's degree of distress. We focus on examples of non-prototypical impoliteness and reflect on how a linguistic approach could feed into current therapies for voice-hearing and how the application of these frameworks to this unusual context might contribute to (im)politeness theory.

# Educating attention in Enskillment

---

Lecture

---

***Dr. Eton Churchill<sup>1</sup>***

**1. Kanagawa University**

This presentation examines the education of attention in enskillment through the conceptual framework of Goodwin's (2018) co-operative action. Based on videotaped interaction of a piano practice session of Brügmuller's Arabesque involving an 8-year-old Japanese child and her mother, multimodal analysis drawing on Goodwin's contextual configurations and semiotic fields, existing studies on enskillment, and conversation analysis is used to illustrate how the education of attention is interactionally achieved. As such, this study aims to provide empirical evidence for Ingold's (2001) proposal that enskillment is achieved through the education of attention.

The analysis, focusing on the fingering of 2 notes, reveals that through the use of deictics and indexical gestures, semiotic resources are identified, extracted and deployed within semiotic fields (i.e., the score) and coordinated with other resources in the same field and across adjacent fields in the interest of reorganizing the orientation of the novice. In addition, critical semiotic resources are shown to be marked and anchored through a process of iterative correction. Semiotic resources are coordinated across adjacent fields (e.g., fingering notations and fingers on the keyboard) through concurrent playing, musical vocalizations, and carefully orchestrated indexical work designed to get the novice to properly orient to the score at temporally relevant points in her performance. Interactional phenomena found to facilitate the education of attention include 1) indexical blends that point to and link semiotic resources on adjacent fields (e.g., notes on the score and piano keys), 2) indexical tying that links together corrective work at similar moments in performance across iterations, 3) changes in epistemic stance across instances of correction, and 4) a progressive disintegration of multimodal correctives and the syntax of correctives across similar points in subsequent performances. Aside from empirically addressing Ingold's suggestion that Gibson's education of attention is integral to enskillment, this study provides a case study in how enskillment examined through interactional semiotics can lead to a specification of concepts such as joint attention and scaffolding, and provides a framework for future investigations of how the multimodal analysis of embodied action may be supplemented by a greater sensitivity to the multimodality of the environment in which it takes place.

# Effect of Language Dominance on Implicature Processing in L2 French.

---

Lecture

---

***Dr. Emilie Destruel<sup>1</sup>***

*1. University of Iowa*

This paper investigates the effect of language dominance on the interpretation and processing of one aspect of the French *c'est*-cleft in (1), which is also present in the English *it*-cleft: the pragmatic inference of exhaustivity by which (1) implies that '*nobody else* than John drank wine' (e.g. Velleman et al. 2012; Destruel 2013). Although this inference also arises, modulo lexically conveyed, with exclusives (2), it is absent in the canonical counterpart of (1) in (3).

C'est Jean qui a bu du vin.

'It's John who drank wine.'

Seul Jean a bu du vin.

'Only John ...'

Jean a bu du vin.

'John ...'

The *c'est*-cleft and its associated exhaustive implicature lie at the interface between syntax and discourse-semantics—interface proposed to be the locus of insurmountable challenges for L2 learners by Sorace's (2011) Interface Hypothesis, even at a near-native level. To date though, research on L2 *processing* of interface phenomenon is in its infancy (but see Dekydkspotter et al., 2005), and the role of dominance related to these issues remains under-researched. This paper aims to fill this gap. I present data from two sentence-picture verification tasks for which truth-value judgments and reaction times were recorded. The experiments tested the inferencing behavior of 50 L1 English/L2 French near-native late bilinguals of (a) the *c'est*-cleft, (b) exclusives (e.g., *seulement*/'only'), and (c) canonical sentences in contexts that violated or supported exhaustivity. Participants' language dominance was assessed via the BLP test (Birdsong, Gertken & Amengual, 2012). Results suggest that, while all near-natives pattern with natives offline, dominance plays a significant role in the underlying mechanisms involved in implicature derivation during online processing. The findings contribute more generally to the debate on the integration of external interfaces in highly proficient endstate adult L2 grammars.

# Effects of type of speech acts on pragmatic development in a study abroad context

Lecture

**Dr. Naoko Osuka**<sup>1</sup>

**1.** Meiji University

This study aims to examine whether type of speech acts affects L2 learners' pragmatic development in a study abroad context. There are various factors which could influence L2 learners' pragmatic development, including proficiency, length of stay, and intensity of interaction. Many previous studies have examined the effects of these factors on pragmatic development in a study abroad context. However, few studies have examined the effects of type of speech acts, such as requests, apologies, and refusals, on L2 learners' pragmatic development. Some speech acts may be easier to develop in contrast to others that could be more difficult and take more time to develop. The present study investigates the effects of type of speech acts on learners' pragmatic development, by examining the change of the appropriateness of their performance in requests, refusals, and expressing gratitude, through study abroad experiences. Twenty-two Japanese college students who studied in the U.S. for one semester performed a multimedia elicitation task (MET), which is a kind of oral DCT, before and after studying abroad. Seven native speakers evaluated the appropriateness of all the utterances. The comparison between the appropriateness scores pre and post studying abroad revealed that expressing gratitude is easier for L2 learners to develop than requesting and refusing in a study abroad context. It is suggested that the abundant exposure, the rather simple structure, and the acquisition of some versatile pragmatic routines, such as 'Thank you so much' and 'I (really) appreciate', could facilitate their development in expressing gratitude. On the other hand, requesting could be difficult for learners because there are many politeness levels with various conventional expressions in requests. Furthermore, refusing might be the most difficult speech act because of the complex structure and the lack of versatile pragmatic routines.

# El gringo bruto: heritage languages and migrants' identity

---

Lecture

---

***Dr. Eugenio Goria***<sup>1</sup>

1. University of Torino

This study investigates the relationship between language and identity in a post-migration heritage language community, namely the Piedmontese community of Argentina. From the observation of various types of spoken data (interviews and group conversations), I will try to draw more general conclusions that might be extended to other heritage language scenarios. I will deal specifically with the following topics:

- what part does the heritage language play among other cultural practices of the community?
- how do attitudes and beliefs manifested by heritage speakers interact with observed linguistic practices?
- what linguistic resources are used by heritage speakers to identify themselves as members of the community?

Piedmontese dialect is an Italo-Romance variety that is currently spoken as a minority language in Piedmont, Italy. It is also spoken as a heritage language in Argentina, in the provinces of Santa Fe and Córdoba. As discussed in Goria (2016), immigration towards this area started at the end of XIX century, in the framework of Argentina's agricultural development plan, which involved the foundation of agricultural colonies almost exclusively populated by migrant workforce. A vast majority of migrants in this area was of Piedmontese origin and had Piedmontese dialect as their native language, while only a few were also speakers of Italian. This particular setting caused a more systematic transmission of the heritage language to the second and third generations, compared to other Italian immigration settings, where dialect is often lost within the second generation.

The analysis presented here is based on a corpus of recorded interviews and group conversations, mostly in heritage-Piedmontese (PHL) collected in 2019, involving around 50 speakers (20 hours approximately). I will show that membership in the Piedmontese community is often constructed in direct opposition with other identities either local (i.e. aboriginal) or from other immigrant minorities. A preferred linguistic resource is the use of ethnonyms to refer to members inside and outside the community. An analysis of the term *gringo*, which refers to a foreigner of Italian origin, reveals that after a phase of social stigmatisation, which eventually opened the way to language shift, membership in the Piedmontese community became associated with positive values such as hard work and the search for economic stability, eventually leading to a revival of Piedmontese.

Furthermore, I will argue that linguistic practices involving PHL must be considered in the context of a process of cultural revival set in by second- and third-generation immigrants, and mostly managed through local immigrants' associations. Interaction in Piedmontese occurs as a situated practice among members of these associations, within a set of other non-linguistic practices such as traditional cuisine or singing, sometimes even in absence of a real ethnic affiliation to the community. In this setting, PHL is often treated as a new variety referred to as *American Piedmontese*, with specific structural traits, whose use represents an 'act of identity' (Le Page & Tabouret-Keller 1985).

# Emojis and Affective Expressions in Online Translingual Socialization

---

Lecture

---

***Prof. Mei-Ya Liang<sup>1</sup>***

***1. National Central University Taiwan***

This decade has seen increasing research on the use of emojis in media discourses and social networks. However, little seems to be known about multilingual user interpretations and productions of emojis in online translingual socialization. Emojis are affective expressions that play important structural, social, and pragmatic roles in online written discourse. Regarding emojis and affective expressions in translingual socialization, it is worthy to further investigate three understudied areas: first, discourse analyses of emojis as affective expressions used by multilingual students; second, the stylized multimodal performance of affective languages enhanced by various pragmatic functions of emojis; and third, emojis as collaborative achievements in online informal discourse among peer groups of different languages and language variations. This research project focuses on emojis as a lingua franca by investigating translingual socialization and the embodiment of affect in online text-based discourse among university students of different linguistic and cultural backgrounds. The data sources come from the participants' responses to online media contents on the social networking site Facebook, with initial questionnaires and final interviews being administered. Drawing upon concepts in sociolinguistics, pragmatics, and discourse analysis, this study analyzes how emojis are perceived and used by university students of different languages and cultures, and in particular, how emojis serve social, affective, linguistic and pragmatic functions in online peer-group translingual socialization. This presentation will show the discourse and pragmatic functions of emoji uses in relation to media contents and other textual/speech actions in interactions. By analyzing textual, pragmatic, and affective markers of politeness, mocking, agreeing, or disagreeing in discussions, this presentation will also show the translingual use of emojis concerning the addressee of the speech act or the addressee of the content of the utterance. The occurrences and examples of emoji uses, along with multiple styles of English, other language variations, and multimodal forms, are provided to present both general and critical characteristics of the discussion data. The goal is to develop an understanding of modern affective linguistics and creative translingual practices across cultures and contexts through online socialization and multimodal discourses.

# Employing political persuasion to manage rapport in the UK 2017 General Election: Qualitative analysis of campaign leaflets in Sheffield Central constituency

---

Lecture

---

***Prof. Wuhan Zhu<sup>1</sup>, Prof. Yangfei Zhu<sup>2</sup>***

*1. Zhejiang International Studies University, 2. The Chinese University of Hong Kong*

Rapport management is argued to be a critical antecedent of voter support in election campaigns as it can motivate cooperation. However, little research has been conducted exploring how rapport is managed in such practice. In the study reported in this paper, the campaign leaflets of four political parties in Sheffield Central constituency for the 2017 UK General Election were analysed in relation to rapport-management strategies. Three domains of discourse were identified and classified as one or more of six principles of persuasion: Reciprocity, Consistency and Commitment, Social Proof, Authority, Liking, and Scarcity. The results showed that Reciprocity and Liking were commonly employed principles in the rapport-management strategies. These two principles were established in the leaflets by justifying and explaining credentials. Authority played a major role in influencing the functioning of other principles in the rapport-management strategies. Specifically, the more authority a party had, the stronger the commitment strategy to rapport-management strategies. In contrast, the less authority a party had, the greater the involvement of social proof and scarcity in the strategies. Due to the findings, the study is expected to make a significant contribution to political discourse studies.

# Engaging children in activities and verbal interactions : a typology of the strategies by infant-toddler educators in childcare centres

Lecture

**Dr. Tiphanie Bertin<sup>1</sup>, Dr. Karine Martel<sup>2</sup>, Dr. Caroline Masson<sup>1</sup>, Prof. Anne Salazar Orvig<sup>1</sup>, Ms.  
Eloïse Chartier<sup>1</sup>**

**1.** Université Sorbonne Nouvelle - CLESTHIA, **2.** Institut National Supérieur de formation et de recherche pour l'éducation des jeunes handicapés et les enseignements adaptés. - Paris

This paper addresses the strategies developed by infant-toddler educators in daycare centres in order to engage children in verbal interactions.

According to an interactionist framework, involvement in various activities provide children with the communicative and linguistic experience that is necessary for their language acquisition and its usages (Bruner, 1983; François, 1990; Veneziano, 2005). In childcare centres, not all children participate in the same way in the different interactions. One of the challenges for professionals is to succeed in integrating every child into these activities and, thus, allowing her to benefit from this experience for her language acquisition (Dickinson & Porche, 2011; Rhyner et al., 2012). This goal is all the more crucial when we consider early communication and linguistic disparities among children and their repercussions, later, in literacy and school learning skills (Rescorla & Dale, 2013).

Our study was conducted on a corpus of video data of professional-children interactions (50 hours) in four childcare centres. Children were aged from 0;4 to 3. Professionals had different educational backgrounds and skill training. The analysis focused on those sequences where one or several children stayed in the background with respect to an ongoing activity. These sequences were categorized according to the interactional frame (dyadic or polyadic), the type of the activity (whether involving discourse or not) and the linguistic-practices entailed (e.g. description of the world, language and/or task scaffolding, involving the child).

The interactional moves aiming to facilitate those children's involvement into the activity were analyzed according to their modality (verbal, non verbal, bimodal) and their functions (e.g. invitation, questioning, explanation, phatic moves, demonstration, attention getter, back channel and the crossing of pragmatic cues). The outcome of these strategies in terms of children's participation was also assessed. These analyses lead to the definition of a typology of the strategies developed by the early-childhood professionals.

The discussion will focus on the role and impact of these linguistic practices on children's participation in verbal interactions with adults and with other children. The results of this study will also be discussed for their applied implications since it aims to offer professionals elements of reflection on their own practices and representations (Davis & Torr, 2016).

# Epistemic Access & Decision Making as an Interactional Accomplishment

Lecture

***Ms. Samantha Finlay<sup>1</sup>, Dr. Catrin Rhys<sup>1</sup>, Dr. Adrian Kerrison<sup>1</sup>***

***1. Ulster University***

This paper examines orientations to epistemic access in the interactional negotiation of joint decision making in the epistemically complex context of Dungeons and Dragons (D&D). D&D is a Tabletop roleplaying game in which participants jointly construct a narrative through dice rolling and roleplay. One participant takes on the role of Dungeon Master (DM) and acts as a narrator and arbiter of the rules and narrative, while the others are players who each roleplay as a fictional character within the narrative. The characters' actions, the narrative, and the fictional world are all constructed and negotiated primarily through talk and multimodal resources such as gesture.

Because the world and narrative are constructed through talk, players only gain epistemic access by engaging in interactions about the world and their actions within it. Similarly, the characters' experiences and knowledge are constructed and negotiated through interaction. As such, both players' and characters' epistemic access must be explicitly negotiated in-situ. Furthermore, Finlay (2018) showed that D&D participants display an orientation to two epistemic domains (Heritage, 2012) – one that represents their knowledge and epistemic rights as a player, and another representing the rights and knowledge of the characters they portray. These domains may be asymmetric in that there are contexts where the character is more knowledgeable than the player or vice versa.

Throughout the game, players make various decisions about what their characters will do in the narrative, both as individuals and as a group. When roleplaying as a character and deciding what they do, participants orient to the character domain over the player domain. Failure to orient to the character domain when describing what that character does is treated as a breach. This brings to the fore the epistemic character of decision making: decisions are made based on the information available to the decision maker, and because the players are roleplaying as a character, those decisions are made based on what that character knows.

Using Conversation Analysis, this paper shows how the unseen information gathering done in mundane contexts is done explicitly in D&D which gives us access to the ways in which epistemics is involved in the negotiation of decision making. Building on Finlay (2018), it investigates how participants orient to two epistemic domains and manage the asymmetries between those two domains when negotiating epistemic access in decision-making in D&D. This paper thus contributes to EMCA research on the relationship between epistemics and decision making (eg Lindström & Weatherall, 2015) by showing how epistemic access is explicitly negotiated when making decisions in this context. This analysis has implications for real world contexts in which decision making has lasting consequences.

# Establishing the meaning of instructions in personal training

Lecture

***Dr. Martina Huhtamäki***<sup>1</sup>

*1. University Helsinki*

The aim of this paper is to study how the meaning of instructions develop during the activity of personal training. As the activity proceeds, the instructions concerning a specific aspect of the exercise become simpler. In personal training, participants often rely on few words to get through their messages. For example, PT's frequently use phrasal instructions to instruct and assess their clients (Huhtamäki et al. 2019; Huhtamäki & Grahn, frthc.). Thanks to the overall activity, the institutional roles as well as the embodied features these utterances are understood.

The data consist of 7,5 hours video-recorded personal training sessions in Swedish. The methodological framework is interactional linguistics (Couper-Kuhlen & Selting 2018), and grammar, prosody and embodied features are analyzed. Focus is on series of instructions where the PT uses less and less linguistic and embodied information to convey a certain meaning. For example, the PT five times instructs the client to keep his knees apart during an exercise. The first instruction includes a bodily demonstration and begins with *tänk på en grej* 'think about one thing' and continues with an infinitive clause and three consecutive clauses (cf. Lindström et al. 2020). The fourth instruction is a combination of an imperative and a consecutive clause *men tänk på det att få ut knäna så att dom inte krockar me varandra* 'think of that to get out the knees so that they do not clash with each other'. A moment later the PT uses the phrase *tänk på knä nu* 'think of (your) knee now' and the client responds by correcting the position of his knee.

The analyses show that as the exercise proceeds, the client needs less and less information to understand the reference of an instruction concerning a specific aspect. During the exercise he learns to interpret even an instruction consisting of a short cue the right way. The meaning becomes more local and indexical, concerning a certain movement by the client in a certain exercise. The participants rely on spoken and embodied features for establishing the meaning of certain instructions. However, the numerous repetitions of the instruction show that although the client might understand the meaning of the instruction, they have not yet learned the "thing", the exact way to perform the exercise. In the context of personal training, meaning is thus tightly connected with doing the exercises right.

# Exclusive colonial language laws, policies and practices in a decolonizing world

---

Lecture

---

***Mr. Eric Mijts<sup>1</sup>***

*1. University of Aruba/University of Antwerp/Ghent University*

Linguistic practices in multilingual postcolonial insular societies more often than not echo the former colonizers monolingual European state traditions and language regimes in education, the judiciary and governance (Cardinal & Sonntag, 2015; Mijts 2017). In many of these societies, the compulsory use, status and privileges of the colonial languages and their speakers is laid down in law and policy. The other languages may be given similar legal status in name, but are excluded by law or policy from use in certain domains and lack the status and privileges of the colonial languages. An inventory of the building blocks that underly these law and policies, and a reconstruction of their architecture, helps reveal the specific belief systems and ideologies that drive and perpetuate the colonial language practices. These language practices do not only perpetuate the hegemony of the colonial languages, minoritize the demographically dominant home languages of the populations of these territories and limit the population's access to institutions and to education.

This study aims to explore the colonial building blocks of the justification of language laws and language policies in postcolonial insular societies from a critical perspective (Tollefson 2006). These building blocks will be identified through a thematic text analysis, intertextual and interdiscursive analysis of legislative and policy texts from postcolonial isolated societies such as Aruba, Cape Verde, Haiti, Mauritius and Vanuatu. To understand these language planning and policy processes, one must identify the underlying ideologies of the main stakeholders. These ideologies are constructs of individuals, groups and institutions and are either explicit or implicit and based on beliefs that are treated as truths (Verschueren 2012). The analysis will combine legal perspectives on the nature of language policy (Kochenov & de Varennes 2015) with ethnographic perspectives on the reception of language policy (Canagarajah 2006) to demonstrate that the negotiations for linguistic human rights (Skutnabb-Kangas 2012) in postcolonial multilingual insular contexts are far from over. The adoption of the former colonizer's governmental, legal and educational structures leads to legal frameworks and policy constructions that do not benefit the majorities of the citizens of the island societies, but are geared towards conformity with the former colonizer's frameworks on the basis of a perceived or constructed benefit for the peoples of the societies involved.

# Exposing obscure sexism: mansplaining in talk-in-interaction

---

Lecture

---

**Dr. Bogdana Huma<sup>1</sup>, Dr. Jack Joyce<sup>2</sup>, Dr. Linda Walz<sup>3</sup>, Ms. Hanna-Leena Ristimaki<sup>4</sup>**

**1. York St John University, 2. Ulster University, 3. Leeds Trinity University, 4. Tampere University**

In naturally occurring talk-in-interaction, sexism can range from overt acts, such as using female gender categories to construct insults (Weatherall, 2015), to covert and subtle forms, such as women being corrected by men who have less expertise on the topics under discussion (Bates, 2016). The present paper focuses on accusations of “mansplaining” a term used to highlight sexist behaviour linked to epistemic transgressions as exemplified above. The term has been shown to recur frequently while also being highly controversial (Bates, 2016; Bridges, 2017) due to the danger of calling out subtle sexist behaviour. Thus, though “mansplaining” can empower women to “resist linguistic repressions” (Bridges, 2017, p. 97), accusing someone of mansplaining may be treated as inappropriate and risks disrupting the ongoing activity of the interaction.

Our analysis explored the minutiae features of sequences of everyday talk which are retrospectively labelled as mansplaining. We asked if broad categories of “overt”, “covert” and “subtle” sexism (Benokraitis, 1997) accurately portray what transpires in the interaction. Using conversation analysis and membership categorisation analysis (Sacks, 1992), we examine a collection of 55 cases of possible sexism (Whitehead & Stokoe, 2015) featuring sequences of naturally occurring talk across a variety of settings such as broadcast TV, internet shows, and recordings of political debates. All cases are linked to accusations of “mansplaining” either produced within the interaction or after-the-fact (for instance on social media). We focused on whether an act labelled as “mansplaining” was or was not sexist, or whether the act is designedly ambiguous. Our preliminary findings of after-the-fact accusations show that they closely resemble in-the-moment accusations where women are treated as deficient about certain types of knowledge and a man assumes authority over certain domains of knowledge. However, in many after-the-fact accusations there is no ostensible sexist act and the label hinges on the visible gender identities of the interactants. We conclude that broad categories such as ‘overt’ and ‘covert’ sexism are not straightforward and, through close examination using conversation analysis, we can track whether an act is or is not sexist, or whether it is defeasible by design.

# Finding each other: A video-based study of online-hailing taxi drivers and passengers

Lecture

***Ms. Yani Liu<sup>1</sup>***

***1. The Chinese University of Hong Kong***

Reference and joint attention are important for social actions (De Stefani 2010). Most existing studies from ethnomethodology and conversation analysis have investigated how verbal and embodies resources employed to achieve joint attention in the context of co-present situations under different settings, such as work place, self-service stores or during guided tours (De Stefani 2010; De Stefani 2014; Hindmarsh & Heath 2010; Mondada 2014); also some research in virtual spaces, such as online conference meeting and online games (Brown & Bell 2006). Most studies have looked at situations where participants are next each other in close proximity, but we can also have situations where we want to establish a shared reference in space when we are far apart. For example, Brown and Bell looked at how players establish where they go next to meet in games through instant chat function, and I want to derive this to a perspicuous physical setting: taxi-hailing.

This paper approaches this issue through the phenomenon of picking up passengers by online-hailing taxi drivers. The two participants are initially in two different physical locations and have to try to build up joint attention on their referent as meeting place. Data I used in this study are drawn from video recordings of naturally occurring interactions between drivers and their passengers. Two GoPros and one 360-degree camera are installed in the car. GoPro captures interactions within the car (Brown & Laurier, 2012), but 360-degree cameras also capture front outside view on what drivers could see.

Different from previous studies, how participants build a shared reference in space under a mobile setting where they both far away is the main question I want to deal with. A lot of rides in my data shows that GPS is good enough and no need for additional talk. However, when GPS is vague, or it presents a large area and difficult to locate just one person, drivers tend to make a phone call to confirm the exact meeting place by finding a shared vocabulary. In this case, textual names shown on the GPS are usually confirmed and complemented by related street names, or further information provided by passengers, such as nearest convenient stores to guide the driver. Occasionally, they really can't find each other, especially after drivers arrive at meeting place shown on GPS, then how do they build reference to their meeting place or negotiate a new meeting point they are both aware of becomes important. For example, one driver in a case demonstrates his location by a restaurant with a conspicuous sign and receives no response, so the passenger realize the driver is not in the right place and suggests him go forward a little bit to find an entrance of the residential quarter. In another case, both the driver and passengers confirm that they can see a shopping mall, but they just couldn't find each other, and it turns out they stand at two sides of that street through driver asking exact geographical direction of passengers.

# Focus on Boundedness in the Comprehension of Narrative Sentences: Aspect in Verbs and Text

Lecture

***Dr. Andreas Schramm<sup>1</sup>, Dr. Meghan Salomon-Amend<sup>2</sup>***

***1. Hamline University, Saint Paul, Minnesota, 2. DePaul University, Chicago***

Lexical aspect in English has been defined through phases and presence (“write”) or absence (“seem”) of end points (or bounds) (Smith 1991). Situations may have two end points (“activities”), four end points (“accomplishments”), or none (“states”). Additionally, grammatical aspect contributes information on boundedness by expressing whether situations are completed (perfective) or not (imperfective). Recent cognitive studies also confirm the centrality of boundedness in different situations, tasks, and contexts (Eerland, Sherrill, Magliano, & Zwaan, 2017). Boundedness even appears focal in quantum physics (Rovelli, 2018), where time has been replaced by change as more fundamental. Functionally, lexical aspect of situations can be viewed as providing templates for the expression of change (Binnick, 2006).

However, boundedness in language has not been extensively explored, perhaps because of the elusiveness of lexical aspect (Bardovi-Harlig, 2014). We therefore investigate the interaction of boundedness in lexical and grammatical aspect and how much change readers remember. In four experiments we explore the centrality of bounds in verbs and narrative sentences. First, we study boundedness in bare verbs. Then we combine bounded and unbounded verbs with perfective and imperfective aspect and investigate continued attention to boundedness with decreasing depth of processing.

We gathered ratings of boundedness in 316 English infinitives from 171 native speakers. Participants evaluated them on a 7-point Likert scale. Results show that participants conceive of verbs along a continuum, indicating the central role of boundedness. Rankings generally follow the classifications of verbs by boundedness into states, activities, accomplishments, and achievements. Then, we gauged the centrality of boundedness by tallying participant responses to input sentences requiring decreasing depth of processing. We inserted a subset of bounded and unbounded verbs into 24 narrative sentences. To test grammatical boundedness, there were two versions of each sentence (“The director shot/was shooting a scene”). Each sentence first was shown in two random orders, and participants rated the pleasantness of each sentence. Then, from deepest to shallowest processing (correct cued recalls/forced-choice recognitions/yes-no recognitions) responses were tallied in three experiments.

A general memory bias resulted: participants often remembered described situations as completed regardless of grammatical aspect or depth of processing, indicating the centrality of boundedness. This was further influenced by the boundedness of verbs. Our study will contribute to an understanding in (applied) linguistics of both aspect components indicating change as foundational in comprehending text and discourse.

# Forced Other Positioning by and of Greta Thunberg

---

Lecture

---

**Dr. Marcia Macaulay<sup>1</sup>**

*1. Glendon, York U*

In February 2020, a sticker depicting Greta Thunberg was discovered by Michelle Narang, a city councilor from Rocky Mountain House, Alberta. Narang decided to post the sticker on her Facebook page. The sticker quickly made national and international news and was responded to by Thunberg herself in a tweet. The sticker quite literally positions Thunberg kneeling from the back with her long braids being separated and pushed aside by two disembodied hands. At the base of her spine is the name “Greta,” while below the name is “X-Site Energy Services.” The disembodied hands metonymically represent X-Site Energy Services preparing to rape Thunberg. No source of the sticker has ever been identified but it seems to be the case that it was circulated by those working in the oil industry to be worn on hard hats. It is available on the internet to this day, not having been deemed child pornography by the Royal Canadian Mounted Police. This paper examines this visual positioning of Greta Thunberg. It does so in the context of Thunberg’s famous Speech at the U.N. Climate Action Summit where Thunberg herself malignantly positions the oil industry and those who have facilitated its continuance. Thunberg employs her own particular ‘j’accuse’ in this speech: ‘How dare you continue to look away and come here saying that you’re doing enough...’ (NPR, September 23, 2019). Responses to this speech varied from trivialization to dismissal. Thunberg was positioned as a ‘kid’ who had neither the right nor the responsibility to speak and should be outside playing. The Canadian response, however, was an outlier, because it sexualizes Thunberg. We can understand such positioning of Thunberg as either “deliberate” or “forced positioning of other” in Harre’ and van Langenhove’s theory of positioning (1999). This paper examines the “discussion” attached to the Huffington Post story (February 27, 2020) made by members of the general public. Of the 1100 comments, I examine 250. There are four major positions in this data: Greta is an important activist (“she is influencing the intelligent world”) (10%); Greta has been exploited by her parents and is a “fair target” (10%); the sticker portraying Greta is “pornography,” “child abuse,” “part of rape culture,” “anyone involved should be castrated” (31%); Greta is an adult not a child and so the sticker is “not child abuse” (21%). The largest percentage of commenters (31%) viewed the sticker as “pornography” or “child abuse.” They positioned Greta as a child victim of an enraged adult world. In contrast, only 10% positioned Greta as an activist doing important work in the world. This paper examines the specific discrepancies in the forced other positioning of Greta Thunberg.

# Formulaic utterances as resources for the pragmatic function of noun-modifying reported speeches in English

Lecture

***Dr. Daisuke Yokomori<sup>1</sup>***

***1. Kyushu University***

In English, while the prototypical items that fill a syntactic slot preceding a noun are adjectives, sentential or utterance-like objects such as a reported speech can occasionally appear in such a position, as shown in the examples below.

1. “Please say something. Anything would be better than this “I am so disappointed in you” silence.” (*Gossip Girl*, Season 1, Episode 13)
2. “Are you telling me that you didn’t see all those “Don’t worry, you’ll find someone” looks?” (*Sex and the City*, Season 4, Episode 1)
3. “Look... maybe at your old school, you could get away with the whole “I just stayed in the sun all summer” excuse, but I have three gifts: my voice, my ability to spot trends in men’s fashion, and my ability to know when it comes from a bottle.” (*Glee*)

This phenomenon has long been analyzed by researchers in terms of the formal aspects of the compounding process (Lieber, 1988), the frame-semantic basis that allows people to understand the meaning (Pascual, 2006; Pascual, Królak, and Janssen, 2013), and the construction-grammatician approach to the phenomenon (Hilpert, 2014). In this paper, the author aims to explore the discourse-pragmatic function of the construction in question and to seek the source of the discourse-pragmatic function. Examination of the examples collected from TV drama scripts shows that formulaic, or very mundane, utterances (for example, “I am so disappointed in you” in (1)) are recurrently used to construct utterance-level noun modifiers. In this paper, the author highlights the role of formulaicity (Wray, 2008) of reported speeches that appear in the noun-modifying position. The author will first report that speakers who produce a noun phrase with an utterance-level modifier tend to show their negative, disrespectful, or sarcastic stance toward what the noun phrase refers to. The author will then argue that formulaic utterances contribute to treat someone’s action or attitude that is denoted by the noun phrase as predictable, mundane, or all-too-common one. This paper will contribute to accumulate empirical findings concerning an interplay between pragmatics and syntax.

# Formulating instructions in testing for linguistic and cognitive abilities

Lecture

**Prof. Fernanda Cruz<sup>1</sup>, Prof. Sara Merlino<sup>2</sup>**

**1. Universidade Federal de São Paulo, 2. Università degli Studi di Roma Tre**

People with linguistic or cognitive disorders are often administered clinical tests, either to assess their linguistic abilities and cognitive status, or for therapeutic intervention. These tests, that take place in interaction between patients and doctors or therapists, have received special attention from Conversation Analysis: previous studies have shown that testing activity is a socially organized phenomenon and that the results of testing are collaborative productions (Marlaire & Maynard, 1990; Schegloff, 2003; Wilkinson, 2013). Pursuing this line of investigation, our research focuses on how instructions from standardized tests are introduced and formulated in clinical practice.

The analyses are based on a 12-hours corpus of video-recordings of doctor-patient and speech-language therapist-patient interactions. The data were collected in Brazil and France as part of two projects investigating the dynamics of clinical and therapeutic interactions. The languages involved are Brazilian Portuguese and French. The interactions were transcribed following the multimodal transcription conventions developed by Mondada (2018).

In our data, patients are administered standardized neuropsychological tests such as MMS (Mini-Mental State, Folstein & Folstein, 1975) or naming tests (Kaplan et al., 2001). Even if the instructions and the questions come from a standardized protocol, the way health professionals introduce them at the beginning of the test have implications for the patients' understanding of the task and how they might respond to it (for variation in standardized test, see Jones et al., 2020). A detailed analysis of the sequential organization of these interactions allowed us to identify moments when initial instructions and test questions are: a) repeated; b) reformulated; c) modified by the therapist; or d) checked and assessed by the patient. Moreover, a multimodal analysis of the data allowed us to take into account not only the verbal dimension of testing, but also their *ecology*, that is the contextual configuration of the scene, the material environment (documents, objects) and the embodied resources (postures, gestures, gazes).

The results provide us with evidence to distinguish difficulties of the patients in responding to the test contents from difficulties related to how test instructions are designed. Implications for how health professionals interpret patients' performances are finally discussed.

# Frame Switching and Inferencing among Chinese Users

---

Lecture

---

***Dr. Shuping Huang<sup>1</sup>***

**1.** National Sun Yat-sen University

Studies of cultural-specific cognitive styles have shown that a holistic, context-based pattern of thought is prevalent in Eastern cultures (Japan, Korea, China, etc.) while the Western societies feature analytic, object-based way of thinking (Nisbett & Masuda, 2003; Varnum, Grossmann, Kitayama, & Nisbett, 2010). More recent studies have found that individuals have the ability to shift to the frame that can best complete a task (Lin & Murphy, 2001; Boster & Johnson, 1989) and/or fit the cultural context (Unsworth, 2005; Norenzayan, Smith, Kim, & Nisbett, 2002). Hong (2009), for example, reports that participants demonstrate high flexibility in response to cultural-specific primes such as Superman (Western) or Monkey King (Eastern) and act accordingly. This study examines whether causal inference could be primed by similar cultural inference.

We revised the experiment of Hong et al. (2000). Participants are college students with the experience of living in Western Europe or North America for more than 3 months. They will break into 2 groups. One group will read a story about a boy, Yin-xiong, who had a problem of obesity, yet could not stop eating too many fried rice balls at his birthday party. Another group will read the same story with the name of the boy and the food replaced by “Tommy” and “cheesecakes.” They will then be asked to make judgments about the causal attribution, logical consistency, and consequential effects of each event.

If Hong’s (2009) “Dynamic Constructivist” approach to culture stands true, we expect to see the Chinese group more likely to (a) attribute behavior to external factors, (b) show logical inconsistencies, and (c) make more reversible predictions. Our ultimate goal is to investigate the relationship between culture and thought, and the finding may benefit the growing literature on intercultural communications.

# French Verbs of Appearance in face-to-face Interaction: Forms, Functions and Distributions of paraître [appear], sembler [seem], avoir l'air [look like] and avoir l'impression [feel]

Lecture

***Dr. Jérôme Jacquin<sup>1</sup>, Mrs. Ana Keck<sup>1</sup>, Mrs. Clotilde Robin<sup>1</sup>, Mrs. Sabrina Roh<sup>1</sup>***

***1. University of Lausanne***

The paper focuses on the forms, functions and distributions of French verbs of appearance (“paraître”[appear]; “sembler”[seem]; “avoir l'air”[look like]; “avoir l'impression”[feel] as they emerge in a 28h video-recorded corpus documenting two different “institutional” settings (Drew & Heritage, 1992; Arminen, 2005): (i) Swiss-French public or TV debates addressing various political topics (n=13, h=14; 2007–2009); (ii) Swiss-French work meetings (n=19, h=23; sample: n=13, h=14; 2017–2018). This case study is part of a 4-year project (2020-2024) whose goal is to analyse epistemic (including evidential) markers in “French-in-interaction” (Traverso, 2016), from a discursive, interactional and multimodal perspective, stemming from French Enunciative Linguistics (e.g. Kerbrat-Orecchioni, 1980; Ducrot, 1984; Nølke, 2001), interactional linguistics (e.g. Couper-Kuhlen & Selting, 2018) and (multimodal) conversation analysis (e.g. Deppermann, 2013) applied to epistemic modality (e.g. Lindström, Maschler, & Pekarek Doehler, 2016).

Verbs of appearance have been extensively studied in French Linguistics, but mostly from a semantic and/or syntactic perspective and by using either invented or decontextualized examples (e.g. Bourdin, 1986; Nølke, 1994; Popârlan, 2000; Thuillier, 2004; Willem, 2011). Observations on the distributed meaning of “appearance” across different verbs (e.g. the distinction between “paraître” and “sembler”) as well as on their syntactic behaviour are usually not made from a corpus-based approach considering such verbs as situated verbal resources. Notable exception is the work by Willem and Blanche-Benveniste (Willem & Blanche-Benveniste, 2008, 2014) on French “weak” verbs tackled in naturally collected data, with a special interest in the semantic meaning of “mitigation” (Caffi, 1999) in relationship with the syntactic distribution of such verbs (i.e. weak verbs as being more or less « grammaticalized », see Hopper & Traugott, 1993). The present paper expands this work by adopting a more general pragmatic perspective, integrating pragmatic factors such as sequentiality (i.e. cotextual features), genericity (i.e. contextual features) and multimodality (i.e. polysemiotic features).

Data have been transcribed using ELAN and ICOR transcript conventions. By means of regular expressions, 181 tokens of verbs of appearance have been identified. Preliminary quantitative observations show that these verbs are more frequent in public debates (9.2 tokens/hour) than in TV debates (6.4 tokens/hour) and work meeting (4.7 tokens/hour). Interestingly, the most used expression “il me semble (que)” [it seems to me (that)] (n=50/181) appear seven to eight times more frequently in public debates and work meetings than in broadcasted TV debates. Tokens including the deictic “je/me” [I/me] (n=112/181) are twice more frequent in public debates than in the other contexts. When combining these observations, public debates appear as a genre that favours the mitigated expression of opinions and beliefs, by contrast with TV debates (see also Jacquin, 2017, on the distribution of “je sais”[ know] and “je sais pas”[I don't know] across public and TV debates).

Using the more fine-grained annotation grid developed in the research project (in terms of syntactic, enunciative-discursive, interactional, and multimodal categories), the paper examines – both quantitatively and qualitatively – the pragmatic factors affecting the considered verbs of appearance as they emerge in French-in-interaction.

# Generic analysis of speech introduction in Persian-speaking media: Patterns of religiously motivated language

Lecture

***Prof. Alireza Jalilifar<sup>1</sup>, Dr. Soheil Saidian<sup>2</sup>***

***1. Shahid Chamran University of Ahvaz, 2. Khorramshahr University of Marine Science and Technology***

Since the 1979 revolution in Iran, great changes have transpired in its sociopolitical context. The country, having started massive political and social changes since Reza-Shah Pavlavi toward secularism and having been the closest ally to the West and Israel in the Middle East, suddenly found itself confronting its strategic and cherished partners. Along this line, a host of political and social modifications were induced by the religious discourse that was propagated by the revolutionaries. One of the fundamental tenets of this discourse, as has been numerously quoted in Islamic anecdotes, suggests beginning every act in the name of *Allah*. Accordingly, irrespective of the theme or content of a topic, it is recommended that one starts with the name of *Allah*. This is oftentimes followed by a verse from the Quran to grace the topic, as is practiced by those of the faith.

Knowing that, to date, there has hardly been any systematic investigation of the religiously motivated language as a starting point, this study aims to explore the religiously motivated language that is used in the introductory sections of programs broadcasted in Persian-speaking media. Following the theoretical framework adopted for the study, we describe the data collection procedure and then provide an account of the generic analysis of the religious language that is used as a prelude to the main speech. We aim to show how those introductory insertions that evoke religious thoughts thematize discourse and how they shape the mind of the society. We report our findings in terms of the language in which the religious expressions are realized (Persian or Arabic), the position of these expressions concerning the rest of the discourse, the functions they serve and the targets they address. Two implications are foregrounded. First, the language of the introductory speech in Iranian media is egregiously religious, suggesting that religious discourse is deep-seated in the Iranian society, affecting people in all respects. The second is that, irrespective of the subject, little or even no reference is made to Iranian culture in the introductory discourse. Any religiously unmarked reference to Iranian culture is believed to reinforce pre-Islamic thoughts and traditions which might contradict Islamic teachings and thus should be stymied. Understanding religion in the Iranian context of media may have reasonable prospects for understanding the functions that religion plays in the Iranian social context.

# Getting out of the impasse in research on approximatives: some guidelines for future research

Panel contribution

**Mr. Adrià Llibrer<sup>1</sup>, Dr. Salvador Pons Borderia<sup>1</sup>**

**1.** University of Valencia

In the last years, the once lively field of approximatives has reached an impasse due to three main reasons: first, the reduced number of theoretical pragmatic contributions on approximatives; second, the extremely narrow scope of the field (limited basically to the study of adverbs like *almost* or *barely*); and finally, the explanation of all approximatives on the mold of English, thus hiding linguistic diversity.

This contribution aims at getting out of this impasse by establishing a broader research program on approximatives:

1. The study of approximatives should evolve from the *polar vs proximal* distinction (Sevi 1998, Horn 2002, 2011, Ziegeler 2010, Pons and Schwenter 2011) to a more radical approach, where an emphasis is put on meaning (sub)components and the way they interact in different constructions.
2. Consequently, the study on *approximatives* should turn into the study on *approximation*, a language property found in different levels of linguistic description: from adverbs like *hardly* or *almost* to other word classes – prepositions like Sp. *desde* (*since*) – or constructions –Sp. *estoy por p* (*I'm about p*) or *no veo el momento de p* (*I can't wait for p to q*).
3. As more complex constructions are under focus, intuition must work together with *corpus-based analyses* to fine-tune descriptions and explanations.
4. Construction Grammar (Croft 2001) emerges as the most adequate theoretical framework for this new approach, combined, when necessary, with a theory on Discourse Units (Grupo Val.Es.Co. 2014).

This contribution will illustrate all four points above with the analysis of Spanish approximative constructions *estoy por* and *no veo el momento de*.

# Giving and Responding to Compliments in Hijazi Saudi Dialect: an intralingual study based on naturally occurring data

Lecture

***Mr. Fahhad Alqahtani<sup>1</sup>***

***1. University of Sussex***

The current study aims to investigate the influence which societal values and norms can have on performing compliment exchanges in the Hijazi dialect and show whether aspects of compliment exchanges can be correlated with social variables such as gender, age and relationship. To explore novel features of Saudi Hijazi culture, utmost care was taken to collect naturally occurring data in order to answer the following questions:

## **A. How do Hijazi people give compliments to each other?**

1. Which topics of compliments are preferred by males and females of different ages when complimenting each other?
2. What are the syntactic patterns of compliments used by different genders and age groups?
3. Do Hijazi speakers prefer using direct or indirect compliments?
4. What are the sociocultural phraseologies that may be used in paying compliments in Hijazi culture?

## **B. How do Hijazi speakers typically respond to compliments?**

1. What are the dominant response strategies used by males and females when responding to compliments?
2. Which strategies of compliment responses are preferred by different age groups?

Using the field observation method-note-taking tool, data based on real-life interactions have been gathered from different places in Jeddah city and from various social settings. A database of 872 compliments and compliment responses have been collected and classified in terms of gender (M-M; M-F; F-F;F-M), age which is divided into three groups: a young (18-35) group, a middle-aged (36-55) group, and an elder (55+) group, and the interlocutors' relationship (familiar and unfamiliar). Compliments have been investigated in terms of topics, syntactic patterns, and directness and indirectness. On the other hand, responses have been categorised in terms of response strategies and their correlation with gender, age and relationship.

The investigation of 390 compliments showed that *appearance* was the most frequent topic used by Hijazi people in giving compliments. *Appearance* was on the top of females' preferences, whereas *performance/skill* was the most favourable topic for males. *Appearance* ranked first in young generation compliment topics, while *performance/skill* was the most frequent topic used by middle and older generations.

(*Mashallah*) *NP (INT) ADJ* was the most common syntactic pattern used among Hijazi people in giving compliments. Adjectives such as *helu* 'pretty' and *ijnan* 'stunning' and intensifiers such as *merrah* 'very' and *haqiqi* 'really' were top words used most frequently in giving compliments. Moreover, the findings showed that Hijazi people preferred to use explicit (direct) compliments more frequently to implicit (indirect) compliments. *Mashallah* tended to be a unique marker for Hijazi speakers as the most frequent religious expression used in giving compliments.

The examination of 482 compliment responses showed that *appreciation token* ranked first as the most frequent response strategy, followed by *invocation and blessing*. The findings showed that there were other responses which occurred in the Hijazi dialect such as *evil-eye (envy) protection* and *request interpretation*. Furthermore, the results revealed that Hijazi speakers preferred using single responses more frequently to complex responses. *appreciation token + return compliment* complex response was on the top preferences, followed by *invocation and blessing + return compliment* complex response.

# Greek phone calls at the age of COVID-19: The re-organisation of ‘how-are-you’ sequences

Lecture

***Ms. Stamatina Katsiveli<sup>1</sup>, Ms. Vasiliki Saloustrou<sup>2</sup>***

***1. Queen Mary University of London, 2. King's College London***

Against the backdrop of COVID-19 epidemic, generalised confinement measures and mobility restrictions target or, at times, completely prohibit physical proximity and contact. Sociolinguistic research has already started to investigate the implication of this new social reality in the gradual formation of a “coronavirus culture” (Blommaert, 2020b), which broadly involves two important aspects. On the one hand, there emerge new behavioural formats in face-to-face interactions (see Mondada et al., 2020, on ‘new’ practices in embodied and tactile greetings, Laurier et al., 2020, on walking and social distancing in public spaces). On the other, restricted mobility leads to an “online hypersociality” (Blommaert, 2020a) which involves a significant increase of technology-mediated communication, such as online meetings and phone calls. The present paper contributes to the ongoing investigation of shifts in everyday communication at the age of COVID-19, by looking at emergent patterns in the organisation of Greek phone calls from a conversation analytic perspective.

Extensive research on English phone calls has revealed the systematic organisation of telephone conversation openings and closings (e.g., Schegloff, 1979), as well as their implication in ‘routines’ where interpersonal relationships are negotiated (Schegloff, 1986:113). Among others, this body of work has highlighted a recurrent structure of telephone conversation openings which involves identification and recognition, followed by a set of ‘how are you’s’ (if relevant) and, subsequently, the introduction of the ‘first topic’ (Schegloff 1986:117) or the reason for the call. Moreover, cross-cultural studies in various speech communities have raised the issue of cultural contextualization of phone calls (see e.g., Houtkoop-Steenstra, 1991 on Dutch phone calls; Lindström, 1994 on Swedish phone calls). Within this scope, studies of Greek phone calls have shown the high degree of interlocutors’ orientation to enhancing interpersonal relationships through ‘how-are-you’ phatic utterances, as opposed to other cultural contexts (Pavlidou, 1994).

In the present paper, we draw on this body of work looking at phone calls that took place during COVID-19 confinement in Greece, between March and May 2020. Our dataset includes approximately 50 hours of recorded Greek phone calls between friends and relatives. Preliminary analysis suggests that COVID-19-related conversational topics are systematically inferred since the beginning of the call and are co-constructed as a shared reality between interlocutors. Both parties engage in extensive narratives regarding their confinement experience and the consequences of implemented policies in their – or others’ – everyday life. In this context, ‘how-are-you’ sequences extend from a preliminary routine (cf. Schegloff, 1986) to the ‘first’ and single topic of the conversation. This sequential re-organisation resonates with the callers’ recurrent intention of ‘checking in’, which emerges, in the majority of the analysed cases, as the only reason for the call. We argue that COVID-19-related phone calls instantiate a new interactional activity, through which interlocutors manage their interpersonal relations and affectively co-construct their response to the ever-changing social reality. From this perspective, the findings contribute to the ongoing investigation of everyday communication at the age of COVID-19, showcasing how elementary forms of human sociality are affected by these historical circumstances serving newly emergent needs.

---

# Heckling initiated interactions at the Japanese Diet

---

Lecture

---

***Dr. Ryogo Yanagida<sup>1</sup>, Dr. Seiko Otsuka<sup>2</sup>***

***1. Jissen Women's University, 2. Osaka Institute of Technology***

Heckling, whereby a heckler(s) potentially upset(s) the interactional order by infringing the institutionalised right of a performer or speaker to perform or speak in public with aggressive language (e.g. face-threatening acts). It takes place in various domains such as sports, arts, and politics (see Kádár and Ran 2015 for meta-pragmatic discourses on heckling in several language and cultures), and it is sanctioned in some cases but is overlooked or even conventionalised to varying degrees in other cases. Despite its distinctive features, little attention has been paid to heckling and especially counter-heckling in discourse analytic studies (as for (im)politeness studies see Kádár 2017). To fill in the knowledge gap, this paper examines how Members of the Japanese Diet (henceforth MDs) heckle and how the heckled MDs react to the heckling. The data are collected from several committee meetings of both the House of Councillors and the House of Representatives and analysed in terms of Spencer-Oatey's rapport management (2005, 2008). First, it is identified if audience interjections in the middle of speeches of MDs are affiliative (face-saving or enhancing) or disaffiliative (face-threatening), therefore heckling. Then, it is analysed how the heckled respond to the heckling. The results suggest that the heckled take three countermeasures: meta-commenting, commenting, and non-doing ('eloquent' silence). While the first and third countermeasures rely on the sociality rights/obligations at the Diet (the heckled have the institutionalised right to speak without being disturbed and the hecklers have the obligation to preserve the speaker's right), the ways of the appealing are quite different. The former is quite explicit (such as meta-commenting a heckle(s) "Don't heckle, I cannot speak"), while the latter is implicit (such as staring at the heckler(s) with one's arms crossed without saying a word). In contrast to these two, the second countermeasure is keen on saving one's face by refuting a heckle(s) rather than appealing to the sociality rights/obligations.

# How do you respond when you are told that you are “joshi-ryoku ga takai”(your women’s power is high)-The view of gender behind the words

---

Lecture

---

**Dr. Ryuko Taniguchi<sup>1</sup>, Ms. Shu Yuan<sup>1</sup>, Ms. Yangzi Zhang<sup>1</sup>**

*1. Tokyo University of Foreign Studies*

In recent years, the Japanese media began using the word “joshi-ryoku” (women’s power), and since it was nominated for the buzzword grand prize in 2009, it has also become popular among the general public. Nowadays, it often appears in women’s magazines, and it is even used as a slogan in prospectuses for private schools. In Japanese media and news reports, it is generally used as a positive evaluation in the sense that the women can cook and do housework well or that they wear feminine makeup and clothes, but there are few surveys on the actual state of language use. On the other hand, in China, the expression “nuzili” (women’s power), adopted from Japanese, can be used to mean high ability as a human being, and the actual context of use and language use are different from that of Japan. In addition, it seems that many women oppose the use of this expression. This issue is often debated on social media.

In this presentation, the semantics, pragmatic meanings and actual usage of “joshi-ryoku” (women’s power) in Japan and China are discussed. We examine the use (users, situations and intentions) of the expression and the emotions of the recipients by conducting online and paper surveys. How do individuals use expressions that appear to value women? How do the recipients feel? This presentation analyzes and considers the differences in views of gender between Japanese and Chinese societies.

---

# How is Japanese Youth Language Perceived?

---

Lecture

---

**Ms. Yuning Cao**<sup>1</sup>

1. Stanford University

The advent and development of technology introduces and spreads enormous amount of new words. Together with new words and trendy words, Japanese youth language (*wakamono kotoba*, abbreviated as “YL”) has been widely discussed by scholars from the aspects of morphology, phonology, functionality, characteristics, the reason of its popularity, and historical background, to name a few. However, few investigated real-life YL usages to my best knowledge. The current study adopts an etic perspective and fills the gap by focusing on how speakers are perceived when they use YL in a real-life conversation and their projected persona on hearers’ end. This research provides an updated view on general public’s perception and argues against the stereotype that YL users are more active, outgoing, positive, willing to socialize, et cetera. It emphasizes on the necessity of updating our theoretical argument on latest real-life data.

The data pool of this study includes five face-to-face interviews with female employees / university students in their twenties residing in Tokyo metropolitan area and 113 online questionnaires asking people to rate a speaker after listening to a short conversation. The conversation includes a YL word (contrast) or a common expression of the same meaning (control), and four top-ranking YL in 2018 and 2019 were selected as test stimuli. Paid sampling service was requested to ensure a sample as balanced as possible in terms of gender and age. Each participant only listens to one conversation, depending on which group (contrast or control) he/she was randomly assigned to. After the conversation, participants were asked to rate their perception of the speaker’s age, femininity/masculinity, education level, and twenty items on the personality including “popularity”, “likelihood to be welcomed”, “sociability”, “capability of communication”, “fondness of fashion”, “degree of handsomeness/beauty”, “seriousness”, “interestingness”, “intelligence”, “loveliness”, “determination”, “self-disclosure”, “leadership”, “competitiveness”, “activeness”, “empathy”, “positivity”, “preemptive-ness”, “outgoingness”, and “self-centeredness” on a 1-5 Likert scale. Results show that the only item with a significant difference is perceived age (contrast = 11.54, control = 15.09,  $T = -2.24$ ,  $p = .03$ ), which corresponds to the literal meaning of YL—youth language. No difference in any other items is observed, suggesting that perception of speakers’ personae is not influenced by YL usage. This reflects a high acceptance rate of popular YL in that people listening to conversations with YL do not particularly tend to rate the speaker higher or lower on personality items compared to the control group. Testimonies by informants also prove that people are getting more and more used to the existence of YL in their life. As popular YL permeates into our daily life, it is no longer a powerful predictor of one’s personality, and hearers tend not to judge someone based on a single usage of YL.

This study suggests a new angle in analyzing Japanese YL and provides a more current view on how speakers of YL are perceived by the general public. It is worth examining whether such argument holds true for youth language in other countries in the future.

# Illusions of National Consciousness in Nigeria: A Decolonial Discourse Analysis of Selected Nigeria's Presidential Independence Addresses

---

Lecture

---

***Dr. Yunana Ahmed<sup>1</sup>, Dr. Ruth Ibbi<sup>1</sup>***

*1. Gombe State University*

Existing scholarship in pragmatics which analyses national conflict and crisis in Nigeria have often been narrowed down to the local-national influence with limited attention to the glocal dimension of these conflicts, particularly how colonial legacies influence or complicate the framing of nation-building crisis. Using Nigeria's president Muhammadu Buhari's selected two independence day speeches, with theoretical insights from Ngugi's (2009) decolonial concept of "dismemberment" and Wodak et al's (2009) discourse historical approach (DHA), this paper seeks to fill this important knowledge gap by analyzing the different linguistic means conflict and crisis are framed and how such framing works within the logic of coloniality such as developmentalism, discontinuation strategy and sociative rhetoric. Understanding these appropriated colonial discourses could reveal why Buhari's Independence day speeches are often ill-equipped to forge a national consciousness in Nigeria. The paper concludes that the complex ways in which the rhetorical conception of national conflict is deeply embedded in the multiple layers of imperial and colonial practice reflect the ways language intersects with the larger dynamics of inequality and oppression.

# Impact of professional training on French preschool educators' language and child linguistic complexity

Lecture

***Dr. Caroline Masson<sup>1</sup>, Dr. Magali Husianycia<sup>2</sup>, Prof. Emmanuelle Canut<sup>3</sup>***

***1. Sorbonne Nouvelle University, 2. AsFoReL, 3. Université de Lille, CNRS-STL-UMR 8163***

The following intervention presents the results of a language assessment of educators in a French language training program for preschoolers (4-6 years old). Language training programs were developed to help children with language learning difficulties, mostly from low-incomes families (see Buschmann et al., 2009; Cabell et al., 2011; Justice et al., 2008; Roberts & Kaiser, 2015). The results show that there is a beneficial effect on children's language development, but the variables involved are unclear (Markussen-Brown et al., 2017). Thus, more recently, researchers have looked at the training of professionals in order to identify which adjustments in language practices have had an impact and on which aspects of children's language (Piasta & al., 2012). In line with this work, our study seeks to determine whether the training offered to educators on the favorable pragmatic inputs of child-directed speech (Cameron-Faulkner & al., 2003; Gallaway & Richards, 1994; Snow, 2014) and the role of storytelling activities in language development (Sénéchal & al., 2008; Bus, 2001) generates adjustments in their ways of interacting, and whether this impacts on children's language development.

The data was collected as part of the French language training program *Coup de Pouce Langage* between 2013 and 2019 (Canut et al., 2018). It concerns 26 educators and 131 children in 6 French towns and 20 schools, all located in priority education zones. Each child was registered with an educator at two stages, at the beginning and at the end of the action.

The statistical study of educators' linguistic and pragmatic modalities of language shows adjustments in the modalities of exchange (language-developing strategies) proposed to children, in relation to the training offered: offers (new proposals) and reformulations are significantly more important. However, a multivariate analysis shows that it is the progression of linguistic complexity which has a significant impact on the progression of these same constructions in children and not the modalities of interaction, even though they are presented in studies and programs as particularly efficient.

This study therefore asks more generally the content and methods of knowledge transmission to professionals in an educational context (Canut & al., 2021).

# Inductive Detection of Typical Speech Act Sequences in a Novel

---

Lecture

---

***Dr. Dario Compagno<sup>1</sup>, Dr. Elena V. Epure<sup>2</sup>***

***1. Université Paris Nanterre, 2. Pantheon-Sorbonne University***

Sequentiality of speech acts is still a matter of disagreement: are speech acts the largest form of discourse having logical unity, as J. Searle argued, or instead larger grammatical units at the level of conversational exchanges can be identified? Empirical evidence has been produced since more than forty years, showing how broken adjacency pairs result in the need for conversational repair and finding other clues pointing towards pragmatic coherence relating speech acts to one another (Van Dijk 1979). Furthermore, some accounts tried to identify sequential models by using a quantitative approach (Jose 1987) based on conditional probabilities. This points towards the possibility to inductively identify some appropriateness conditions for entire sequences of speech acts (Ferrara 1980).

Much more recently, Author and colleagues (2018) made use of an inductive modelisation technique called process mining (Alast 2016), and revealed some typical intra-turn chains of speech acts in a conversational corpus. We advanced the idea that typicality can help conceptually to build a bridge between the strong logical grammaticality of individual speech acts (given by the realisation of a single speech intention) and the looser norm-based sociological evidence about conversational regularities. In particular, Author and colleagues found that, first, typical sequences of speech acts can be inductively discovered in a corpus, and, second, when a particular sequence of speech acts does not respect its typical order, some form of conversational repair is needed. These typical sequences go beyond the best known ones (question-answer, etc.) and demand an inductive approach to be made visible to the human eye.

In the present study we aim to inductively identify some typical sequences of speech acts in a novel: *The Death of Ivan Ilyich* by L. Tolstoi. This would challenge J. Austin's view about the absence of proper felicity conditions for speech acts in literature (Margolis 1979, Miller 2002). We would not be looking for clearly bounded felicity conditions for individual speech acts, identified through conceptual analysis, but instead for indirect evidence coming from typical patterns. We aim, at the same time, to put to a test the proposal of M. Sbisà (2002), according to which the understanding of speech acts' illocutionary force depends on a larger context of occurrence, and more particularly on the narrative structure of this context.

We expect to find intra-turn and extra-turn typical sequences and more generally some patterns of speech acts in the novel. Speech acts will be manually annotated (via a multi-label annotation, allowing for the recognition of both direct and indirect speech acts) before applying process mining. Our aim is to produce evidence of interest for pragmatics in general, and at the same time to apply pragmatics in the context of digital humanities research (Moretti 2005, 2013).

---

# Inferentialism, assertions and lies: steps to understand pragmatic manipulative communication

---

Lecture

---

***Dr. Cristian Santibáñez<sup>1</sup>***

***1. Universidad Católica de la Santísima de Concepción***

In this work, I discuss the proposal of Jary (2018) about lies and assertions to revise the definition of lying, the connection between lying and entailment, and how the latter links with manipulation. I suggest that from the point of view of the concept of entailment, the pragmatics of manipulative verbal behavior should be considered as the most instructing frame to understand any subspecific deceptive pragmatic act retrospectively. In other words, when the speaker becomes fully competent in verbal manipulative communication, it can be said that the speaker grasps the pragmatics of deceptive behavior. To make this proposal robust, I retake (Santibáñez, 2017) some of my earlier efforts to distinguish the features of an axiology of deception. To complement this perspective, I will specifically discuss in this presentation the link between lying and assertion, assertion and belief, and special focus will be given to Brandom's (1994, 2000) account of the inferential functioning of assertions in which commitments and entailment are the main dimensions to understand pragmatic communication.

---

# Insisting clients: Professional interaction in a photo studio

---

Lecture

---

***Ms. Parvaneh Rezaee<sup>1</sup>, Prof. Gabriele Kasper<sup>2</sup>***

*<sup>1</sup> University of Hawaii at Manoa, <sup>2</sup> University of Hawai'i at Mānoa*

Institutional interaction between professionals and clients is structured through epistemic and deontic asymmetries (Stevanovic & Svennevig, 2015). Research across a range of institutional settings shows that the local agendas of experts and clients often diverge and that clients seek to advance their goals against expert direction. For instance, in writing tutorials tutees opposed tutor's advice (Waring, 2005), in medical consultations patients resisted doctors' diagnosis through questioning or non-responses (Stivers, 2007), and in retail service interactions, customers engaged in "repetitive loopings of insistence" to pursue their purchase requests when the desired items were not available (Traverso, 2007).

This study extends the data base on status-incongruent professional-client interactions to encounters between a professional photographer and her clients in a photo studio in a city in the west of Iran. The activity type is the selection of photos of important family events such as weddings and anniversaries for inclusion in an album or separate formats. For that purpose photographer and client(s) are seated in front of a computer screen and view, discuss, and select the photos together. In these sessions, we observe recurrently that the client insists on a particular course of action that the photographer has already rejected as unfeasible, such as retouching the entire look of the client's hair. The analysis will focus on the initiation, development, and solution of such insistence sequences. In particular, it will highlight how both parties navigate the conflicting constraints of the preference for agreement (Pomerantz, 1984), the category-bound epistemic primacy of the professional and the deontic primacy of the paying customer. The ongoing collection, drawn from 15 hours of video-recorded photo selection sessions between the photographer and ten clients, includes 25 insistence sequences. The data are analyzed using multimodal conversation analysis (Deppermann & Streeck, 2018; Mondada, 2014).

# Intention Markers in News Headlines

---

Lecture

---

**Ms. Mia Schreiber<sup>1</sup>, Prof. Zohar Kampf<sup>1</sup>**

*<sup>1</sup>. The Hebrew University of Jerusalem*

This study aims to establish the importance and value of intentions in the mediation of the social world. It does so by examining the extent to which journalists engage in interpretation of intentions and the types of intentions that are prevalent in mediating public affairs. We use the term “intention markers” to describe the textual means through which journalists report speech acts and mediate what others mean by what they say. This term covers a range of concepts for describing what people do with words, including illocutionary force indicating devices, speech-act verbs, and performative markers. Analyzing a corpus of 1,138,015 headlines from six leading newspapers in the US and the UK, we point to the prevalence and discursive functions of intention markers in news headlines. The findings show that around one quarter of all headlines include intention markers, led by assertions, warnings, and accusations. Furthermore, in the vast majority of headlines (96.52%), intention markers were used to summarize the journalist’s interpretation of what the quoted source meant by what they said. Our findings indicate a journalistic tendency to fuse information (what others said) with evaluation (what journalists think others meant by what they said), that evokes a theoretical question about the ability to distinguish facts from interpretation in news reports. We conclude by discussing journalistic authority over the reported text, suggesting that the use of intention markers allows journalists to both glean from and give meaning to the social world.

# Interactional management of the presence or absence of nurses in and around the opening phase of Japanese rehabilitation team meetings

---

Lecture

---

***Dr. Hiroaki Izumi<sup>1</sup>***

*1. Kyoto University of Foreign Studies*

In the opening phase of multi-disciplinary rehabilitation team meetings in a Japanese hospital, the presence of nurses is important because they are the first persons to report on the patients' latest status following the chair's opening statement. This study employs conversation analysis to explore how participants, including doctors, nurses, physical therapists, occupational therapists, speech therapists, medical social workers, and dietitians, interactively orient to the presence or absence of the nurse just prior to, during, and immediately after the opening phase of the meetings. Based on 65 videorecorded rehabilitation team meetings (approximately 19.5 hours) collected in a Japanese hospital, the analysis focuses on how participants organize the meeting's opening, treat a nurse's failure to respond to the opening statement, and manage the situation when the nurse is absent or late. Findings show that participants routinely treat nurses as the first reporter. A doctor carefully ensures the nurse's readiness before the transition to the opening phase. When the nurse fails to respond to the opening statement, a co-participant provides a verbal or bodily cue to maintain the "nurse first rule." However, rule modifications do occur, especially when the nurse is absent or late. On such occasions, the doctor modifies the opening components by inserting information that typically belong to the nurse's domain, and then allocates the opportunity of the first report to the next reporter. If the doctor's nomination is absent, the next reporter requests the doctor's permission to provide the first report. Finally, the doctor routinely plays the role of the chair in the meetings. However, the nurse can contribute to terminating pre-opening activities, and even occasionally opens meetings. The study contributes to ethnomethodological and conversation analytic understanding of division of labor among different categories of professionals by revealing how institutional work is accomplished through tacit rules and procedures locally used by participants in ongoing clinical team interactions.

---

# Interpretation of the antecedent for an N' pro-form

---

Lecture

---

***Prof. Nobumi Nakai<sup>1</sup>***

**1.** Meikai University

This paper investigates what kind of semantic and pragmatic constraints are imposed on the relationship between such pro-forms as *one* and *it* and their antecedents in inter-sentences or inside sentences. A pro-form, which lacks its own semantic content, is a kind of anaphoric expression whose interpretation can be obtained only by having an anaphoric relationship with the antecedent (Huddleston & Pullum 2002). A traditional way of representing the relationship between a pro-form and its antecedent is by using referential indices (usually numerical subscripts) as shown in (1) below. NPs with the same subscript are interpreted as coreferential in the sense that they refer to the same entity. The study argues against this view on the following basis: (i) a pro-form is a semantic free variable or a slot which requires filling by pragmatic inference called ‘saturation’; (ii) the semantic function that a pro-form carries out in a sentence is independent of whether it is specific or nonspecific; and (iii) a pro-form occurs not only as a noun phrase (NP) but also as an N-bar (N').

Concerning the sentences in (1), it is usually said that the pronouns *one* and *it* in the second sentence take their reference respectively from *a dugong* in the first sentence.

(1) What is *a dugong<sub>i,j</sub>* like? I have never seen *one<sub>i</sub>*, so I cannot tell what *it<sub>j</sub>* is like.

However, *one* is not referring to a particular dugong since the first part of the second sentence explicitly states that there are no dugongs that the speaker has ever seen. Moreover, what is understood about *it* in the second part of the second sentence is not a particular dugong either but the set of dugongs. Thus, at the level of logical form of the second sentence in (1), both *one* and *it* represent two respective slots and the hearer of (1) pragmatically fills each using the extralinguistic context.

The semantic function of *any books on subculture in Japan* and that of the pro-form *one* in (2) are both nonspecific NPs in the sense that each of them is not referring to a particular book (Nakai 1997).

(2) Do you have *any books on subculture in Japan*? I'd like to borrow *one*.

In (2), therefore, the NP *any books on subculture in Japan* and the pro-form *one* cannot be co-referential.

While the pro-form *one* in (2) is a noun phrase (NP), the pro-form *one* in (3) is an N-bar (N').

(3) Do you have *any books on subculture in Japan*? I'd like to borrow a good one.

Thus, a pro-form could occur not only as a noun phrase (NP) but also as an N-bar (N'). These facts show that it is misleading to represent the relationship between a pro-form and its antecedent with referential indices.

# Intertextuality as a Rhetorical Strategy in the Language of Political Advertisements in Selected Nigerian Newspapers

---

Lecture

---

***Mr. Ayokunle Osakinle<sup>1</sup>, Mrs. Chioma Achebe<sup>1</sup>***

***1. The Federal Polytechnic, Ado-Ekiti***

Many ideological discourse researchers have employed Critical Discourse Analysis to unravel the political meanings of the speeches made by political leaders in Nigeria, as well as power relations and ideology in the media, but have not done much in relation to language use in political advertising in Nigeria with Critical Discourse Analysis (**CDA**). This paper therefore examines the aspect of intertextuality in Critical Discourse Analysis, as a discursive strategy projected tactically to reflect power struggle as well as the ideological assumptions of the authors of the advertisements, taking into consideration the rhetorical effects of intertextuality on the masses. Intertextuality is an ideological assumption, where the meaning attached to a text is said to be determined from the historical standpoint of that particular text in the context where it is used. The theoretical foundation for this paper is Norman Fairclough's and Teun van Dijk's Critical Discourse Analysis (**CDA**) and political theories. The data for this study consist of a total of thirty political advertisements sourced from The Guardian, The Nation and The Punch newspapers published between February and March, 2007, out of which, ten advertisements, were purposively selected and analysed. The data analysis of this study examines the representation of power and ideology in the intertextual relations of language use as a rhetorical strategy in the language of political advertisements in Nigeria. To this end, the findings in this study therefore reveal that Nigerian politicians indeed wield both overt and hidden powers on the electorates by relying on manifest intertextuality as a rhetorical mechanism that is capable of changing the meaning or the interpretation of discourse/text in the mental model of the masses to perform some discourse functions of which; this in itself, has been found to have specific ideological implications they are out to achieve, which is geared towards forcing their ideologies and points of view on the Nigerian electorates.

---

# Invoking the ‘lived body’ in psychiatric physiotherapy as an embodied practice

---

Lecture

---

***Mrs. Katja Mustonen<sup>1</sup>***

***1. The University of Helsinki***

Based on CA, I investigate the interactional practices that physiotherapists working in the psychiatric field use to invoke the ‘lived body’ experience in their patients. Merleau-Ponty (2002 [1945]) distinguishes the ‘lived body’ – perceiving, sensing and subjective body – from the objective or physiological body, these two being two perceptual sides of the one and the same body. In psychiatric physiotherapy, a central therapeutic task is to step from the body perceived as a physiological object to the subjective bodily experience, here-and-now. I will show how this shift is accomplished as an interactional practice relying on both embodied and verbal resources. The data consist of 27 recorded sessions of two physiotherapists, working in the psychiatric out-patient clinics, and their two patients. Psychiatric physiotherapy is a bodily approach to psychiatric problems. As part of the Finnish psychiatric care, psychiatric physiotherapists treat patients with, e.g., eating disorders, psychosomatic symptoms or anxiety. The therapeutic work between a physiotherapist and a psychiatric patient draws on various kinds of bodily practices, including movement, touch and body awareness techniques, as well as therapeutic talk.

Analysis shows that invoking the ‘lived body’ experience is essentially an embodied practice. The participants have to balance between two opposite orientations, the orientation to a face-to-face social situation and the orientation to feel inner subjective sentiments. The physiotherapist mobilizes specific interactional resources, such as spatial positioning and avoiding of gazing, to create a private space within the social situation. In this new kind of intersubjective space, the physiotherapist uses prosodic, embodied and indirect linguistic resources as suggestive cues to invoke and guide the patients inner bodily experience.

Merleau-Ponty, M. & Smith, C. (2002 [1945]). *Phenomenology of perception*. London: Routledge Classics.

# Irony and culture: irony use in Poland and Turkey

Lecture

***Ms. Katarzyna Branowska<sup>1</sup>, Dr. Maria Zajęczkowska<sup>2</sup>, Mr. Piotr Kałowski<sup>1</sup>, Ms. Aleksandra Siemieniuk<sup>3</sup>, Ms. Anna Mitrowska<sup>4</sup>, Dr. Natalia Banasik-Jemielniak<sup>5</sup>***

**1.** University of Warsaw, Faculty of Psychology, **2.** Maria Grzegorzewska University, **3.** University of Warsaw, Faculty of Polish Philology, **4.** Independent researcher, **5.** The Maria Grzegorzewska University

On the basis of research data including more than 70 countries, Geert Hofstede distinguished six dimensions describing the construct of ‘national cultures’ (Hofstede, 2011). It has a significant impact on many aspects of human life, e.g. prior research shows significant cross-cultural differences in communication. It is likely that they extend also to non-literal language and irony in particular, it being a very varied, ambiguous, and context-dependent figure of speech. For example, it is known that people from collectivistic cultures tend to use and look for non-literal meaning in speech more often than those from individualistic ones (Holtgraves, 1997). Despite a large body of research on irony, there remains a need to explore the impact of culture and its aspects on irony use. Most research on irony is conducted with the participation of English speakers; it is impossible to generalize these results to other, non-English populations. Because of a lack of information about irony in other, uncommon languages, it is especially important to take into consideration data from non-English speakers and various cultures, not only separately, but also in cross-cultural comparisons.

Due to this research gap, we decided to examine two uncommon languages connected with two distinct cultures – Polish and Turkish. We looked for differences and similarities in irony use between adult speakers (age between 18 and 75 years) of these languages. Additionally, we examined the relationship between irony use, age, gender and personality (within and between countries). The research was conducted online, using tools and questionnaires adapted to these conditions: The Sarcasm–Self Report Scale (Ivanko, Pexman, & Olineck, 2004) was used for irony use examination, The Ten-Item Personality Inventory (TIPI, Gosling et al., 2003) for the Big Five personality traits, and demographic data questionnaire created for this research. Overall 644 Polish- and Turkish-speaking participants completed the study (N Turkish= 329; N Polish = 315).

Results showed a significant difference between Poland and Turkey in irony use, with Polish participants using irony more frequently than Turkish. Age and gender were related to irony use only in Turkish sample: younger participants were more ironic than older ones, and men were more ironic than women. Between-countries comparisons showed that Polish women reported irony use more frequently than Turkish women, no differences between men were found. Interestingly, the analysis of irony use and personality traits showed that only agreeableness was negatively related to irony use in both samples and in both samples it was a significant predictor of irony use. Additionally, consciousness was negatively related to irony use in the Turkish sample.

The current project seeks to address significant gaps in the existing literature. Whereas a significant body of research has been produced on irony use by adults (Colston & Athanasiadou, 2017), the sociocultural specificity of this phenomenon seems to be understudied, and a majority of data comes from the English language. Moreover, our study combines two understudied areas in irony research: cross-linguistic comparisons and relationship between irony use and personality traits.

# Is the distinction between completion and expansion relevant for lie-judgments?

Lecture

**Prof. Alison Hall<sup>1</sup>**

*1. De Montfort University*

The lying/misleading distinction is widely claimed to track the saying/implicating distinction: to say something you believe to be false with the intention to deceive is to *lie*; to *implicate* something false with the intention to deceive is to merely *mislead*. However, there are various conceptions of ‘what is said’ (WIS), the main ones being the minimalist conception where WIS corresponds closely to the words used (Borg 2012, Cappelen & Lepore 2005, Grice 1989), and that defended by relevance theorists/contextualists (Carston 2002, Recanati 2004, Sperber & Wilson 2005, etc.) on which WIS departs further from linguistic meaning, incorporating not just the results of reference assignment and disambiguation, but also further pragmatic processes (‘ad hoc concept construction’, ‘modulation’, ‘free enrichment’).

Saul (2012) suggests that neither conception serves as the basis for judging whether someone lied or misled. She proposes another version of WIS, including the results of ‘completion’, but not ‘expansion’. Completion is obligatory: WIS by an utterance of “Marie is ready” includes *what*Marie is ready *for*. Expansion is optional: “I left a window unlocked and a burglar got into my house” expresses a complete, truth-evaluable proposition after reference assignment, but, appropriately contextualised, WIS is that a burglar got in *as a result of* my leaving the window unlocked. Minimalists claim neither completion nor expansion contribute to WIS; relevance theorists/contextualists that both do.

We tested whether the relevant ‘said’ content for lie-judgments includes completion and/or expansion. Participants read a short scenario then were presented with testimonies from two informants. There were four conditions: (1) Minimal WIS vs completion (e.g. “Marie is ready for the interview” vs “Marie is ready”), (2) Completion vs implicature, (3) Minimal WIS vs expansion (4) Expansion vs implicature. Both informants are then revealed to have conveyed false information. It is clear from context that they were deceptive, not ignorant. Participants are then asked which informant they trust to advise on an unrelated issue. The results suggest the completion/expansion distinction is relevant to lie-judgments. In line with the prediction based on Saul (2012), participants were significantly more likely to trust the informant who implicated false information (= the ‘implicature informant’) over the informant the completion of whose utterance was false (the ‘completion informant’) (Condition 2), while no clear preference emerged in Condition 4 (implicature vs. expansion). Unexpectedly, participants were less likely to trust the completion informant than the minimal-WIS informant (Condition 1), while they did not show any preference for the expansion vs minimal-WIS informant (Condition 3). We suggest this is because when the testimonies were presented side-by-side, participants judge that the completion informant, by being less explicit than the minimal-WIS said one, was more deceitful because he left room for possible (though not plausible) deniability.

## Issues in investigating context

---

Lecture

---

**Dr. Eva Illes<sup>1</sup>**

1. Eötvös Loránd University

The talk focuses on the often evoked but fairly elusive notion of context. The theoretical investigation presented here draws on and synthesises pragmatic theories which are directly or indirectly concerned with context. In so doing, it addresses three main issues. One of them is the question of how to grasp what this key pragmatic concept entails. The paper argues that context corresponds to the context of situation (Firth, 1957), which constitutes those features of a situation that are defined as relevant (Van Dijk, 2009). Context in this view does not exist independently of the human agent but is, rather, a psychological (schematic) construct residing in the language user's mind (Widdowson, 2007). Despite the necessary common ground between the interlocutors' schemata, there is also considerable variety and variability due to language users' individual experiences and varying lingua-cultural backgrounds. This diversity is particularly prevalent in English as a lingua franca communication (Seidlhofer, 2011). Therefore, the second issue to be addressed through the exploration of selected pragmatic theories is how to provide a systematic account of this diversity, including the question of whose schemata take precedence in particular approaches to the analysis of context: whether it is the outsider analyst's or the insider language user's psychological construct that determines the relevant features of a situation. The two different perspectives then necessarily give rise to differing conceptualisations of the notion (Illés, 2020). The third issue concerns theories which attempt to take an emic approach to the description of context. These theories include, among others, Grice's Cooperative Principle (Grice, 1975) and Relevance Theory (Sperber & Wilson, 1986). The question that arises in this respect is whether the language user's context comprises a complex adaptive system (Larsen-Freeman, 2012; Wildfeuer & Pollaroli, 2018) which requires a complexity rather than a reductive approach to investigation (Culpeper et al., 2018).

# Killing Is Caring: A Case Study of Nurturant Parent Morality in Meat Marketing

Lecture

***Dr. Jessica Tynes<sup>1</sup>***

**1. Marymount University**

While concerns about climate change, increased awareness of cruelty in factory farming, and widespread lifestyle diseases have led to a rising popularity of plant-based options, the idea that meat is the center of our plates is still the norm. While the United States government has famously gone back and forth about sustainability and carbon emissions, many individuals are concerned with their impact on the planet and animal welfare. Despite these environmental and ethical concerns, plus a growing body of evidence that points to a plant-based diet for health, most people still choose to consume animals. America's Trump Era withdrawal from the Paris Agreement hints at a fundamental rejection of the necessity to protect the environment, as well as the shift in eating habits that would likely go along with it, by a significant part of the population. While this makes sense within the structure of Strict Father morality, which understands nature as existing to be used by humans, unnecessary harm to the environment for human pleasure is inconsistent with the Nurturant Parent morality, which sees nature as having value in and of itself (Lakoff 2002).

This study explores the potential of advertising language to undermine (or override) the Nurturant Parent value system. While Lakoff (2002) does not specifically address meat eating or non-endangered animals, marketing that appeals to humanity, compassion, and environmental protection without asking consumers to actually change their eating habits can be understood as an exploitation of this moral framework.

Nakamura (2002, 2003) places great importance on the relationship between media language and proposes a cyclical relationship between media language and ideology. She focuses specifically on gender, but I understand this model, including the potential for positive social change, as one that applies to other cultural beliefs as well. Previous studies have discussed conceptual metaphors and company positioning (Koller 2008), as well as meat as a political and gendered issue (Adams 2000), but conceptualization of food ethics has been largely unexplored, particularly within a cognitive linguistics framework.

This study analyzes language used in marketing media (including websites, social media, and commercials) from companies and organizations that position themselves as providing ethical, humane, and/or sustainable meat products. This paper focuses primarily on conceptual metaphor (Lakoff and Johnson 1980), with an awareness of other factors, such as gender ideology (Nakamura 2002, 2003), framing (Fillmore 1982, Coulson 1997), categorization (Lakoff 1987) and blending (Fauconnier and Turner 2002).

Findings suggest that conceptual metaphors, framing, foregrounding and backgrounding are particularly important strategies in conceptualizing animal agriculture as morally positive or neutral in the consumer's mind. Life Is A Journey (to the table, in this case) seems to be a particularly important metaphor, by which companies frame themselves as helpers in a natural process. Another notable metaphor, Animals Are Plants/Crops, in which livestock is "grown," seems particularly important when backgrounding the less idyllic aspects of the business. This case study uses a critical discourse cognitive linguistic approach to explore what it is that wins over our rational and compassionate minds.

# Kin Terms as Terms of Address and Discourse Markers in Bilingual Arabic/Hebrew Speakers in Israel

Lecture

***Dr. Letizia Cerqueglini<sup>1</sup>***

***1. Tel-Aviv University***

I examine the use of the kinship terms (KTs) “brother” and “sister” as terms of address for non-kin among native Mutallat Arabic (MA) speakers who are bilingual in MA and Hebrew (MAHEs). MA is a Palestinian Arabic dialect spoken in central Israel. KTs are used as terms of address for non-kin in both MA and Hebrew politeness practices (Alenizi, 2019; Borg, 2019; Brown and Levinson, 1978), yet with different norms. The Hebrew KTs “brother” axi/ “sister” axoti are avoided across gender boundaries. Axi is used in greeting and requests, axoti to preface critiques; both are used as discourse markers to disapprove of something said by the interlocutor. MA “brother” āxy/ “sister” uxty are used to express emotional closeness and surprise, without gender boundaries. I investigated whether the use of KTs as terms of address among MAHEs is influenced by Hebrew pragmatic norms, and whether MAHEs use Hebrew KTs to address native Hebrew speakers. I tested 24 MAHEs, 12 women/12 men, aged 19 to 30, who work and/or study with native Hebrew speakers. I distributed a questionnaire modified from Braun (1988) to check KT use with neighbors, work/study colleagues, and strangers, within the MA speaking community and toward native Hebrew speakers. I hypothesized that the socio-cultural boundary that divides Arabic-speaking society from Hebrew-speaking society would prevent MAHEs from using KTs with native Hebrew speakers and that MAHEs’ use of KTs would not be influenced by Hebrew. Five monolingual MA speakers over age 65 were tested as a control group for MA traditional KT practices. Results show that MAHEs used KTs as terms of address differently than elderly MA speakers; informants also used MA āxy/uxty within the MA community to express polite critique and disagreement, as in Hebrew. MAHEs used Hebrew axi/axoti toward native Hebrew speakers, regardless of gender boundaries and degree of intimacy, with increasing frequency of use among less formally educated people.

# Learners of Chinese: from Conversation Analysis Perspective

---

Lecture

---

**Ms. Yan Yan Wang<sup>1</sup>**

**1.** *the Australian National University*

This paper is on Chinese learning. Using conversation analysis (CA) approach , the paer focuses on how second language learners of Chinese do repair when making clarification requests. In order to demonstrate their behavior in interaction, a comparison was made to study the differences between native speakers of Chinese with non-native speakers of Chinese. The significance of the research is to make Chinese language teachers and learners aware of repair in seeking clarification.

The research involved two sets of naturally occurring recordings: native speaker students and non-native speaker students. Both sets of recording were telephone talks between students and teachers. There were 100 students (50 native speaker students and 50 non-native speaker students). From multiple listening to the recordings, the parts with repairs for clarification were selected for analysis which included the moments in the talk when students had problems in understanding or hearing the speaker and had to seek clarification. For example, “sorry, I don’t understand” and “Can you repeat the question?” were the parts as repair to make clarification requests. In the data, there were 43 such cases from native speaker students and 88 cases from non-native speaker students. The non-native speaker students were more likely to use repair to seek clarification. Analysis on how the students make clarification requests during their conversation was carried out by investigating how the students initiate problems and how the teachers repair the problems. In CA terms, it is called other-initiated self-repair (OISR), which refers to student-initiated teacher-repair in this research.

The findings show that, in initiating repair, native speaker students pay more attention to mutual understanding (inter-subjectivity) while non-native speaker students, due to their lack of language proficiency, pay more attention to their status of knowledge (epistemic) switch. There are three major differences: 1, native Chinese students more often initiate closed-class OISR (seeking specific information in the request) such as repeating a word or phrases from the previous turn while non-native students more frequently initiate open-class OISR (not specifying clarification) such as “sorry, I don’t understand”. 2, native speakers’ clarification requests are treated by the teacher as understanding of the content while non-native learners’ clarification requests are treated by teacher as language proficiency problems. 3, native speakers don’t see repair as knowledge issues and there is no third position in the repair sequences to close repair while non-native learners take repair sequence as a time to adjust their knowledge. Generally, there is a clear closing third position token such as “oh” to close repair sequence so that the topic can go back.

This paper uses the conversation analysis approach to compare differences between native Chinese speakers and non-native Chinese learners in their ways of conducting repair when making clarification requests. The findings are useful in future Chinese language teaching and learning, especially in teaching pragmatics such as requests.

# Lexical blends processing by Romanian-English speakers. An experimental study

Lecture

**Dr. Anabella-Gloria Niculescu-Gorpin<sup>1</sup>**

**1. The Iorgu Iordan - Alexandru Rosetti Institute of the Romanian Academy & University of Bucharest**

Lexical blending is a language-internal process allowing speakers to develop new words, but a unitary definition proves to be a real challenge as linguists are still debating the topic. There is at least some consensus: blends are two words put together; but it ends here, as for some linguists all source words need to be clipped (Ralli, Xydopoulos 2012), or the clipping has to take place only on the inner edges; sometimes one (Kemmer 2003) or both words may remain intact, in the case of overlapping segments (Cacchiani 2016).

Focusing on the cognitive reasons leading to blends, this presentation argues that they are the result of blending two concepts; the new baby concept needs to bear a name. True, the name retains part of the parent words, but so does the concept. Metaphorically, conceptual and lexical blends represent the birth of conceptual and linguistic entities.

In contemporary English, lexical blending is very productive (Kemmer 2003), but in other languages it is not (Ralli, Xydopoulos 2012). An increase in its productivity has been observed in Italian or Romanian caused by the English influence (Cacchiani 2016, Vasileanu & Niculescu 2020). Using and understanding blends requires speakers to know the source context – for example, to understand *Brexit*, one needs to know how it came about. The effect is cognitive and linguistic enrichment.

In relevance theoretical terms, lexical blends are ostensive stimuli attracting the audience's attention. As humans are efficient creatures, they are expected to use lexemes that would burden neither their own, nor their audience's processing. Initially, new blends may require more processing effort, but they bring about positive cognitive effects. Once they become established, they should require less processing effort than the two parent words.

To study how blending affects processing & comprehension, appeal has been made to an E-prime time-constrained experiment applied to Romanian-English students to see whether there is a difference between the processing of (a) Romanian and English blends and (b) blends and parent words. The hypothesis is that (familiar) blends should take the same if not less processing time than the parent words. Subjects receive both Romanian and English sentences, containing either a (Romanian/English) lexical blend or its equivalent (*Brexit* or Britain's exit). To distract students' attention from the stimuli, fillers sentences are also introduced. A *post hoc* questionnaire verifying students' understanding of the blends is administered.

# Lexical Pragmatics, Polysemy and Word Meaning

---

## Lecture

---

***Prof. Robyn Carston<sup>1</sup>***

**1.** University College London

There is a body of work on lexical pragmatics within relevance theory which shows how speakers are able to use words to express concepts that are not lexically encoded and are easily understood by their addressees (e.g. Wilson & Carston 2007). In this talk, I take the relevance-driven account of lexical flexibility as a starting point for an investigation into the nature of polysemy (that is, the phenomenon of multiple related senses associated with a word) and its implications for the lexical input to pragmatic processing.

Polysemy is pervasive throughout the substantive vocabulary of a language; consider, for instance, the verb ‘to back’ in utterances of the following sentences:

- a. I backed the car into the drive.
- b. She backed the prints with cardboard.
- c. He backed Clinton for president.
- d. The carpenter backed the chairs.

Each occurrence of ‘back’ expresses a distinct concept/sense, all of which, however, are clearly related to one another.

It is widely assumed that a word has a ‘standing’ or encoded meaning, a stable component which is activated whenever the word is tokened and which underpins the various concepts/senses it can express in specific contexts. The question of the nature of standing word meanings then arises: are they also concepts (that is, semantically contentful entities), or are they some other kind of entity, perhaps a non-conceptual core meaning, which acts as a constraint on the range of concepts expressible with the word?

I shall argue that (a) the standing meaning of a word cannot be a single concept encoded in the word because polysemy is the norm and there is no basis for extracting a single concept as ‘the meaning’; (b) there is no need to postulate a non-conceptual (non-semantic) core meaning for words; (c) rather, the words in the ‘communicational lexicon’, which (together with syntactic constraints) provide the input to pragmatic processing, are each associated with a family of concepts, all interrelated via chains of pragmatic inference (Carston 2019, 2020).

# Liminal Situations of Place Naming: A View from the South

---

Lecture

---

**Dr. Liora Bigon**<sup>1</sup>

1. HIT - Holon Institute of Technology

Assuming that the physical space is not a “still life”, but is rather a socio-cultural, economic and political construct being produced by dialectical processes with a range of meanings – there is a growing understanding in toponymic research that a reliance on “traditional” sources such as maps and gazetteers is insufficient. Though recently critical place-names studies tend to rely more on qualitative methods, they are still preoccupied with spatialities in the global North-West. Inspired by toponymic cultures in the southern hemisphere with an emphasis on cities in sub-Saharan Africa and Israel, the lecture will focus on place- and street- naming processes there. The dialogue created between the official (top-down) and the mundane (bottom-up) forces will be examined, acknowledging the multifaceted agencies that have been involved in the production of the linguistic landscape. Rich research methodologies concerning a variety of cities in Africa (and Israel) will be applied – including secondary sources and work in situ, interviews with street users and visual collection of street signage. We shall therefore attempt to understand the motives, uses, ideologies, language varieties and contestations behind a series of urban toponyms. This analysis of toponymic situations conceptually challenges other toponymic situations as familiar to us in the West, as well as the dominant (mainstream) Eurocentric thinking that passes through the research literature.

We shall first trace the terminological relationship between the colonial period and the post-colonial period regarding names of urban spatialities, while emphasizing a selection of generic names in historical perspective. Then, the current challenge of toponymic ambiguity in sub-Saharan Africa’s cities will be dealt with in terms spatial orientation, urban planning and urban management. The lecture is based on a manuscript, currently in press, that experimentally interrogates a multiplicity of street naming processes, entitled: “Street-Naming Cultures in Africa and Israel: Power Strategies and Place-Making Practices” (co-authored with Michel Ben Arrous). **Keywords:** linguistic landscape, urban toponymy, place/street naming, street signage, sub-Saharan Africa, Israel, (post-)colonial history, urban planning/management.

# Linguistic expression of conflicts in Wikipedia talks : a pragmatic annotation of disagreements and attacks

Lecture

***Dr. Céline Poudat<sup>1</sup>, Ms. Marie Chandelier<sup>1</sup>***

***1. Université Côte d'Azur, CNRS, BCL, France***

Collaborative situations inevitably generate disagreements and even conflicts. Over the last decade, Wikipedia has been extensively studied, but mostly from the perspective of social sciences. Conflicts have been described in great detail, along with phenomena such as quality, coordination, or again in relation to maintenance work. The present paper focuses on the linguistic expression of conflicts in Wikipedia talks in a corpus-based framework. The corpus is made of 8 conflictual talk pages in French, representative of the common conflicts in the collaborative encyclopaedia (Poudat et al. 2017, Poudat & Ho-Dac 2019, Poudat 2020). It includes 484 threads and 3023 posts. A parallel corpus in English has also been developed, in order to compare the linguistic expression of conflicts in French and in English. For the moment, three talk pages are currently under study in the two languages (*Vladimir Poutine*, *9/11 attacks* and *Feminism*).

The corpus was annotated using two sets of pragmatic annotations:

(i) we first developed a typology of speech acts expressing **disagreement** in French (Poudat 2018), including direct (*je ne suis pas d'accord / je suis en désaccord*) and indirect acts, which are besides the most widespread in Wikipedia talks. Although disagreements should not be considered as *a priori* negative acts (Angouri et Locher 2012, Kerbrat-Orecchioni 2016), they may threaten the face of the addressee and they are rather expressed indirectly in order to secure faces in interaction.

(ii) we are currently developing a typology of the most widespread **attacks** in the corpus, based on a systematic annotation of clearly conflictual speech acts, such as insults or derogatory language. Our current system includes three main speech acts: insults, reproaches and threats. After several annotation pre-tests, we agreed with Laforest et Moïse (2013) to specify the three types with an attribute differentiating the subject of the conflict, *i.e.* attacks condemning *being* and *doing*. We will finally discuss the question and the status of irony, which is also a current mean to express attack.

We will present the two typologies in detail as well as the results of the annotation which was carried out on the corpus data. We hope to receive feedback that would allow us to improve the developed typologies.

# Linguistic indicators of critical questioning in press conferences

Lecture

**Mx. Jose Alfonso Lomeli Hernandez<sup>1</sup>, Prof. Andrea Rocci<sup>2</sup>**

**1. Università della Svizzera italiana, 2. Università della Svizzera italiana, Lugano**

With a corpus-based approach, we explore the extent to which lexicon, phraseology, constructional patterns, and turn length can be useful to identify the pragmatic-argumentative function of utterances in dialogical argumentative activity types, specifically in political-institutional press conferences. Argumentation scholars have coined the notion of ‘critical questions’ to specify the dialectical reactions made by the antagonist of a discussion (the journalists in our case) to evaluate the reasonableness of an argument put forth by the protagonist (the spokesperson holding a press conference) (Van Eemeren 2018, Walton et al. 2008). However, critical questions are theoretically defined and little is known about how they take place empirically. Furthermore, the critical reactions that journalists perform in press conferences go beyond classic definitions of critical questions. As the work of Clayman and Heritage (2002) on adversarialness show, there are different ways in which journalists manifest their opposition towards politicians. To understand how critical reactions are displayed in the specific context of press conferences, a corpus analysis is conducted while adopting the pragma-dialectical perspective on argumentation (Van Eemeren 2018). The corpus consists of 50 English language press conferences held by different political bodies and the WHO during the Covid-19 Pandemic. The analytical process is based on a cyclical corpus methodology (Degano 2016) including the following steps: (1) the authors annotated 10 press conferences using the INCEption platform to identify all the argumentative moves present in the texts. The annotation is currently underway. (2) Based on the theoretical concepts of critical questions and adversarialness, the relevant moves for having a critical reaction by journalists are distinguished from the rest of the argumentative moves they can perform. (3) Distinctive lexical and phraseological features in the critical reactions are singled out using key-word and key-phrase extraction (Bondi & Scott 2010). Through the qualitative examination of examples, further hypotheses are made on the prototypical ways of performing critical reactions at a constructional and discourse semantic level (Cf. Rocci 2017 Ch. 2). (4) A set of corpus queries are then defined to search for expected indicators in the whole corpus. The question turns that contain the extracted indicators are analyzed for their argumentative function and annotated. (5) New, refined, hypotheses concerning indicators of critical reactions are formulated on the basis of the extended corpus data and a new round of queries is launched.

# Linguistic tools and practices for inclusive communication in indigenous communities

Lecture

***Prof. Felix Ameke<sup>1</sup>, Dr. Deborah Hill<sup>2</sup>***

***1. Leiden University, 2. University of Canberra***

Languages and communicative resources are tools for sustainable human development. Yet practices and discourses about sustainable human development often do not fully exploit this important tool. How can the resources and practices available through language, be used to promote sustainable human development? This paper argues that awareness and use of appropriate linguistic tools and practices can promote inclusive communication in indigenous communities. Indigenous communities are often multilingual and often value oral over written communication. This paper uses examples from sustainable human development projects in West Africa and the Pacific to illustrate the range of linguistic tools and practices that form the basis of inclusive communication in indigenous communities.

The tools discussed include: conceptual analysis of key terms (Hill in press); prioritisation of indigenous languages in development projects (Bearth 2013); the use of accessible language when using dominant languages (Caffrey & Hill 2019); the balance of oral and written communication in community workshops and training (Ameke 2016); the use of culturally significant language genres (e.g. story telling), and the significance of multimodal prompts (e.g. visual materials and the use of objects) in communicating about projects (Sarvaes & Lie 2015).

The paper argues that appropriate linguistic tools and practices increase inclusivity in the implementation of projects by using local ways of using language, as well as communicating “outside” concepts more clearly. This leads to greater understanding and ownership of human development projects within the community. The paper also argues that a deeper understanding and awareness of the range of linguistic tools and practices, beyond the written text, highlights the interaction between different communicative resources available to us all (e.g. the interaction between illustrations and texts, storytelling and key messaging in accessible language). It reinforces the centrality of language in its many forms and modalities as a tool for sustainable human development.

# Mainstream Media as the Enemy of the People in the Discourse of Trump's Supporters

---

Lecture

---

***Dr. Natalia Knoblock<sup>1</sup>***

**1.** Saginaw Valley State University

One of the prominent aspects of contemporary social sphere as “post-truth” (Keyes, 2004) is the distrust of traditional news media. President Trump made the war on media his signature subject (Kellner, 2018; Meeks, 2020), even tweeting at one point that the “FAKE NEWS media” is “the enemy of the American people” (Roig-Franzia & Ellison, 2020). Criticizing the media has resonated with his base, who see it as fair pushback against a journalism establishment that is “unfair” to their leader. This strategy is troubling because it erodes public trust in media bound by norms of journalistic ethics and instills a worldview where truth is elusive, subjective, and not verifiable. It places tabloids, politically engaged sources, and conspiratorial or sensationalist sources inventing their content as equally good or better than the traditional media.

The material for analysis comes from online message board discussions thus providing us with informal, (mostly) spontaneous, (mostly) anonymous, and fairly aggressive discourse. The corpus of over 2,300,000 word tokens was collected between May 20 and 27 of 2020 when the debates about Trump’s controversial statements on disinfectants and UV light as Covid-19 treatments at a White House briefing were ongoing. Google query results to “Trump say bleach”, “Trump say Lysol”, “Trump say disinfectant”, and “Trump say ultraviolet” were examined, and comments from message boards after news reports or opinion pieces were collected.

*Media* was one of the frequent words in the corpus. A qualitative examination of the corpus showed that the files collected from pro-Trump sources (Fox News, Daily Wire, The Mercury News, Miami Herald, News Break etc.) were much more likely to contain references to “media”, “mainstream media”, or “MSM”. It was also noticeable that commenters felt that any information coming from MSM qualified for automatic rejection as false. They did not feel the need to discuss it as if stating that information comes from MSM was enough to prove it untrue. To move the analysis further, this presentation will lay out the quantitative examination of the discourse with the help of the corpus-management software Sketch Engine (Kilgarriff et al., 2004). It will address the framing of mainstream media in the discourse of Trump’s supporters and answer the questions (1) What semantic and pragmatic areas are covered by the utterances including “media”, “mainstream media” and “MSM”? and (2) What interpretative strategies were used by Trump’s supporters in their construal of MSM? It will include keyword-in-context, collocation, and “word sketch” analyses of these keyterms. Preliminary results show clearly negative semantic prosody of the keyterms with such modifiers as *corrupt*, *leftist*, *hateful*, *propaganda*, and *fake*, and such verbs *twist* and *denigrate* frequently used with them.

This project contributes to the study of “post-truth” communication by concentrating on its receptive rather than productive side. The discourse of populist and cultist authoritarian discourse consumers is less studied than the discourse of their leaders and idols. This is unfortunate, and the study of Trump’s supporters’ framing of mainstream media begins to address that shortcoming.

# Maintaining Intersubjectivity in Finger Braille Interpreter-Mediated Interaction: A Study of Other-Initiated Repairs by a Deafblind Man

Lecture

**Prof. Mayumi Bono**<sup>1</sup>, **Prof. Rui Sakaida**<sup>2</sup>, **Mr. Kanato Ochiai**<sup>3</sup>, **Prof. Satoshi Fukushima**<sup>4</sup>

**1.** National Institute of Informatics, **2.** Future University Hakodate, **3.** University of Tsukuba/National Institute of Informatics,  
**4.** The University of Tokyo

Deafblind individuals, who have both visual and hearing impairment, may use several modes of communicating with others, such as tactile sign language, finger braille, handwriting, and small-scale sign language for limited view. Earlier linguistic and communication research, including sociological, anthropological, and socio-linguistic studies, has examined tactile sign languages found in Sweden (Mesch, 2001), the United States (Edwards, 2014), Norway (Raanes & Berge, 2017), and Australia (Iwasaki et al. 2018; Willoughby et al. 2020). However, few analyses have focused on finger braille because, while it is popular in Japan, it remains mostly unknown outside the country.

This paper is the first to explore the basic system of finger braille interpreter-mediated interaction from the perspective of conversation analysis (CA) (Schegloff, 2007; Sidnell & Stivers, 2013) and multimodal interaction analysis (Streeck, Goodwin & LeBaron, 2011; Mondada, 2018). We chose the other-initiated repair (OIR) (Schegloff et al., 1977; Kitzinger, 2013; Kendrick, 2015) sequence concept to illuminate the nature of intersubjectivity in deafblind people. OIR is a fundamental system that people use to resolve problems associated with speaking, hearing, and understanding during a conversation.

This study explores how OIR sequences enhance deafblind individuals to understand what a hearing and sighted interlocutor is talking about by analyzing data from finger braille interpreter-mediated interaction. We carry out a comparative analysis of two kinds of typical OIR addressing patterns: in the first, the deafblind man asks a question and requests confirmation from the interviewer via his finger braille interpreter (Analysis 1); in the second pattern, he asks the finger braille interpreter a question (Analysis 2). We observed 34 instances of OIR in our dataset; 23 cases involved the first pattern while the other 11 involved the second pattern.

In Analysis 1, we demonstrate that the deafblind man attempts to achieve and negotiate an intersubjective understanding with the interviewer using OIR sequences, category-specific interrogatives, and paraphrasing as confirmation requests. Although the interpreter was present, because the deafblind man and the interviewer had achieved and negotiated their intersubjective understanding, the deafblind man's repair initiation and the interviewer's repair operation resemble general conversation without the need for mediating interpreters. This demonstrates that even if the speaker and recipient experience troubles, the intersubjectivity between them is maintained in interpreter-mediated interaction. In contrast, in Analysis 2, the deafblind man attempts to confirm with the interpreter regarding the unclear phrase, which the interpreter had just previously conveyed. We found that the embodied, paired, multimodal, and haptic interaction between the deafblind man and the interpreter was successful in clearly distinguishing the OIR sequence from the body of the conversational sequence, confirming that the exchange occurred between the deafblind man and the interpreter, independent of the interviewer.

In parallel, in presenting the deafblind man's own impressions of the results through observations collected in a follow-up interview, we demonstrate how OIR sequences facilitate intersubjective connections between individuals and their relationships with the world around them in atypical deafblind conversations.

# Making with the Google: The English Definite Article and Social Ideology

Lecture

**Mr. Evan Ward<sup>1</sup>**

**1.** Ball State University

Recent work on the definite article in English has focused on its meaning in particular social contexts such as political discourse (Acton 2014 & 2019) and with reference to communal possession (Gardner & Tagliamonte 2020). Work remains to be done both with respect to documenting and analyzing the variety of contexts and meanings attached to the definite article in discourse and in terms of theoretical generalization: is there a “basic meaning” of the definite article (Epstein 2002) which may account for social meaning in context?

I argue that the definite article acquires an empathic/disempathic reading (Kuno & Kaburaki 1977) depending on pragmatically conditioned choice, on the one hand, and relevant social ideology, on the other. My data comes primarily from Twitter, the Corpus of Contemporary American English, and Reddit, with tweets collected using the rtweet package for RStudio, and focuses on a particular usage of the definite article in English as seen in 1 below:

1. ...I spent a not insignificant amount of time watching videos to figure out whether one sets up “a slack,” “the slack,” or just “slack” for a project, and the answer is I’m old & dusty as hell (Twitter)

Here “the” followed by a proper noun naming a computer program/technology triggers a distancing that takes on particular social meaning due to relevant cultural ideology concerning technology and age, i.e. unfamiliarity with technology as an index of “oldness” or “backwardness”. This ideology is reflected in 2, where users of a Reddit forum construct imaginative explanations for this phenomenon in a forum entitled “Why do older people put ‘the’ in front of things all the time?”:

2. ...there’s been a shift from tangible things “the phone book” to more abstract, name brand things “Google”. Old people still view everything as “things” like in their heyday.

My data also shows that this ideological reading can also be used to construct ironic personae, as in 3, where the author uses marked language (“made with”) alongside the article to project a lack of familiarity:

3. So I made with the Google and found a gym that’s a mile away from home. (COCA)

Finally, I argue that a prototype approach conditioned by social relevance best captures the variety of discourse-functions and social meanings attached to “the”.

# Managing a Contentious Discussion on Gender Inclusion in an ESL Classroom: A Microanalysis

Lecture

***Dr. Nadja Tadic<sup>1</sup>***

*1. Teachers College, Columbia University*

There has been a growing call for teachers to foster learner criticality by addressing issues of diversity, inclusion, and (in)equity in their classrooms (e.g., Canagarajah, 2006; Hess, 2008; Kubota & Lin, 2009; Motha, 2014)—issues which can be especially delicate and controversial in the adult second language (L2) classroom, where highly varied sociocultural experiences, identities, and ideologies interact. As prior work has shown, L2 teachers regularly report feeling ill-equipped, uneasy, and conflicted about discussing discrimination and inequity with their learners (see e.g., Kubota, 2014; Nelson, 2017). And when it comes to discussing gender inclusion in particular, research has found that sexism and heterosexism are often reinforced as L2 teachers and learners (at times inadvertently) resist and marginalize gender nonconformity (e.g., Liddicoat, 2009; Nelson, 2009, 2010, 2017; Nguyen & Yang, 2015; Rhodes, 2017; Vandrick, 1997). However, prior work on discussing potentially controversial issues in L2 education has largely been based on participant observations, interviews, and reports—offering valuable insights into participant experiences but often overlooking the subtle nuances of how precisely teachers manage these delicate discussions moment-by-moment (see e.g., Lo & Tadic, 2021; Nguyen & Yang, 2015). This presentation aims to address this gap through a microanalysis of one teacher's management of a contentious discussion on gender inclusion in an adult English as a Second Language (ESL) classroom.

The data consist of a 10-minute whole-class discussion in an ESL class at a community language program in the Northeastern United States. The participants (all of whom identified as cisgender) were one American teacher and his five advanced ESL students from four different countries (Belarus, Brazil, Colombia, and Poland). The participants engaged in a discussion on gender-neutral child rearing, gender-inclusive pronouns, and gender-neutral restrooms—issues which they constructed as controversial through conflicting stances and strong disagreements. The discussion was video- and audio-recorded and subsequently transcribed and analyzed in minute detail within the critically-motivated conversation analytic and membership categorization analytic framework, which, through a close, turn-by-turn analysis of participants' verbal and embodied actions, aims to uncover how larger sociopolitical issues (e.g., inequality, discrimination, and inclusion) are instantiated, reinforced, and challenged in talk-in-interaction (Kitzinger, 2000; Talmy, 2009).

The analysis shows that the teacher initiated this potentially sensitive discussion not by eliciting students' opinions or experiences but by repeatedly assessing the issue of gender inclusion as important in the local culture. The teacher subsequently expanded the discussion by alternating between withholding and revealing his personal (negative) stance toward gender nonconforming practices, and he thus prompted further—affiliative and disaffiliative—contributions from his students. The teacher finally terminated the discussion by establishing a sense of shared support for gender inclusion before lightheartedly reiterating his own resistance to nonconformity. The analysis uncovers the difficulties teachers can experience in discussing potentially controversial social issues and the ways in which they can undermine social diversity and inclusion even as they attempt to support it. Findings contribute to research on gender identity, ideology, and inclusion in education and on managing discussions on potentially sensitive topics in the (L2) classroom.

# Managing Learner Participation over Lecture-Talks in L2 Classrooms

Lecture

***Ms. Shengqin Jin<sup>1</sup>***

**1.** University at Albany SUNY

Instructor's methods in maximizing learner involvement in L2 classrooms (Sert, 2017) are regularly observed while students' turns are made explicitly relevant in the ongoing interaction. How does learners' participation get managed when the practical task-at-hand positions learners as recipients of teacher-talk in multiple turns? I examine how instructors produce lecture-talks and how students respond to them using Conversation Analysis. In this paper, I analyze and explicate the instructors' practices that mobilize L2 learners to speak up, with L2 learners routinely being observed as less interactive over lecture-talks. The data are drawn from a corpus of naturally occurring classroom interactions.

Although maximizing learner contributions in class is conducive to SLA (Walsh, 2002), there is a practical task that instructors engage with over lecturing; that is, how to solicit learners' engagement while the instructors have to secure the floor for multiple turns. Analysis suggests that instructors actively attend to this practical matter within which lecture-talks are performed.

Consider the following excerpt, with which a pivot in students' participation arrives as the instructor is specifying how culture shock may occur:

16 T: an' you're happy (0.8) °right° (.) an' then something  
 17 happens (0.4) it'z-it's somethin' happens in your cla::ss,  
 18 you get a BAD gra::de, (.) uhhhh=  
 19 S: [=YAAS  
 20 T: [somethin' happens [ya-  
 21 SS: [hhhhhhhhhhhhhhhhhh-

Here, T specifies the causes of culture shock by using examples (lines 17-18), with which students have first-hand experience. With students being positioned as direct participants of the given examples, opportunities are provided for students to *voluntarily* assess the legitimacy of the examples. Here, one student ("S") pivots from being the recipient of the lecture-talk to giving his overt endorsement ("YAAS"), followed by other students' affiliative laughter (line 21). This example demonstrates how the instructor creates interactional relevancy for students to speak up without pausing the lesson-at-hand.

I have found that students' pivots in participation over lecturing routinely arrive voluntarily when instructors (1) position students as the party who has first-hand knowledge of the relevant content, (2) problematize what has just been imparted, or register what has been imparted as incomplete which requires further elaboration, and (3) display personal take on the relevant instructional content. In addition, *student initiatives* (Waring, 2011) occur more routinely over homework-review-activities.

This paper contributes to learner participation in L2 settings. I examine one instructor's practices over lecturing which make the pivots in students' participation interactionally relevant. In my corpus, the identified practices are routinely implemented by the instructors which lead to students' overt contribution over lecture-talks without being directly called for. The identified teacher practices are recognized as the allusive and artful techniques to draw attention from students and engage them to speak up.

# May Allah Bless You: The use of religious expressions as considerate expressions in Saudi Arabic.

---

Lecture

---

***Dr. Raniah Al Mufarreh<sup>1</sup>***

***1. King Khalid University***

Many cross-cultural pragmatic research has concluded that each culture has its own “interactional style”(Mills, 1992). The researcher, a native speaker of Arabic, noticed that the interactional style of Arab speakers is distinctive because the majority of Arabs are Muslims. Therefore, a frequent use of Quranic verses and the religious lexicon in their daily discourse is salient. Bouchara, (2015) states that the use of religious expressions in daily interactions is a politeness strategy among speakers of Arabic to protect the self-image for both the speaker and the hearer.

The present study investigates the use and function of religious expressions in Face Threatening Act (FTA) contexts: requests. The data were collected using both a written Discourse Completion Test (DCT) and direct observations of naturally occurring data. The participants in the DCT are 50 male and 50 female speakers of Saudi Arabic and their age ranges between 18 and 60 year-old. The analysis indicates that speakers of Saudi Arabic use different types of religious expressions including prayers, Quranic verses and religious praises to tone down requests.

The study concludes that the pragmatic function of religious expressions in Saudi Arabic lessens FTA contexts. Therefore, religious expressions in Saudi Arabic function as considerate expressions.

# Mediated presence and proximity in times of covid-19

---

Lecture

---

***Dr. Monika Kopytowska<sup>1</sup>***

*1. University of Lodz*

The coronavirus disease has affected the world like nothing else in recent history, triggering serious economic crises around the globe and considerably transforming transport and communication dynamics in all possible respects. Lockdowns and related restrictions have put a strain on human “compulsion of proximity” (Boden and Molotch 1994: 258, 277), which is the basic need to achieve a state of co-presence (Kopytowska 2015b: 138). In view of closed borders, travel restrictions, cancellation of flights and public events, not to mention home quarantine, Urry’s (2002) observation that people aim for proximity within three dimensions – with other people in face-to-face interactions, with unique locations in face-to-place interactions, and with special events in face-to-moment interactions – has gained particular relevance. And so have “mediated proximity and co-presence”. The present paper aims to address various aspects of the interface between the pandemic-triggered crisis and online communication. How did the media help to manage social distance, offering, at the same time, a sense of co-presence? How did they manage to replace physical proximity in face-to-face, face-to-place, and face-to-event interactions? We will attempt to answer these questions analysing online data from the perspective of the Media Proximization Approach (MPA) (Kopytowska 2013, 2015a, 2015b, 2018a, 2018b, 2020), drawing on social ontology theory (Searle 1995, 2006, 2010), Chilton’s Discourse Space Theory (DST) (2004, 2005, 2010; Deictic Space Theory in 2014), Cap’s (2006, 2008, 2010, 2013, 2017) STA model and SM-CDS paradigm (KhosraviNik 2014, 2017, 2018). Online discourse (content from Facebook, YouTube, online news sites and institutional websites), understood as both process and product, will be examined with a view to identifying proximization (distance reduction) triggers and processes of cognitive-discursive, verbal and visual nature within five dimensions of distance (spatial, temporal, epistemic, axiological, emotional) along with their potential implications for the audience’s cognitive and affective responses.

# Mitigating teacher feedback: Smiling as part of a politeness ritual

Lecture

***Dr. Hilal Ergül<sup>1</sup>***

**1.** University of Northern Iowa

This study reports on the role of smiling and mitigation in the correction of language learners' spoken errors, or oral corrective feedback (OCF). In the language classroom, students use smiling to manage interactional trouble (Petitjean & González-Martínez, 2015; Sert & Jacknick, 2015), and both teachers and students utilize it to manage sensitive actions (Looney & He, 2020) as well as miscommunication (Matsumoto, 2018). While we are now confident that instructional feedback requires facework and that smiling is an effective nonverbal teacher immediacy behavior (Kerssen-Griep & Witt, 2012; Witt & Kerssen-Griep, 2011), the specific relationship between smiling and mitigation is not yet fully understood. To close this gap, approximately 16 hours of student-teacher interaction were video-recorded in three classes taught by seven different teachers in an intensive English program at a private language school. Students were adult learners of English as a Foreign Language at the intermediate competency level. The OCF sequences were transcribed and annotated using Lyster and Ranta's (1997) analytical framework with the addition of linguistic sources of mitigation (Caffi, 2007) and the Facial Action Coding System (Ekman et al., 2002) to identify the smiles in the OCF turns. Statistical analysis of all OCF instances ( $n = 417$ ) has revealed a significant association between smiling and mitigation  $\chi^2(1) = 43.168$ ,  $p < .001$ , suggesting that smiling is part of a politeness ritual embedded in OCF provision. Additional qualitative findings suggest that when the teachers in these data do not verbally mitigate the error correction, they use smiling as a stand-alone mitigator.

# Mock Affect, and the socio-pragmatics of unlicensed epenthesis

Lecture

***Prof. Rakesh Bhatt<sup>1</sup>, Ms. Taraneh Sanei<sup>1</sup>***

***1. University of Illinois, Urbana-Champaign***

In this paper we present evidence of Mock Affect—a ludic interpellation that is indexically tied to the phonological process of unlicensed epenthesis in non-native language use—and show the various community responses, the meta-pragmatic commentaries, that sustain its ideological dimension: the denigrated Other. The unlicensed epenthesis, phonological relic of native tongues, mobilizes a variety of closely-related socio-pragmatic meanings—rustic, amateur, rural—that easily coalesces into a ‘vernacular voice’ that is picked up in mimetic performances, produced steadily on a jocular key, as shown in (1) below where second generation Kashmiri migrants (R1-R3) in New Delhi, India, mimic how their uncle from Kashmir speaks Hindi with a “Kashmiri Accent”

Excerpt 1. Discussion on Kashmiri Accent

1. I: koi example hai aapke paas (Do you have any example)
2. R1: haaN, aur kyaa (yes, of course)
3. jaise, voh kaheNge, fizikæsexam kaisa hua (like, they will say, “how was your physics exam”)
4. R2:zaraa aaj dæresæd chiken khaane ka man hai (“please today I feel like having dressed chicken”)
5. R1, R2, R3: (Loud laughter follows)
6. (3.0)
7. R3:His wife is worse
8. I: How
9. R2: She does that a [lot
10. R3: [I think she is originally (2.0) {switch to Kashmiri} gaam-ic(of/from village)
11. R1: I don't know that, but not well educated

Even in this short (T: 32 secs) excerpt, taken out of 13 hours of recorded conversations among second-generation Kashmiri migrants in New Delhi, India, ages 20-54, we observe the negative evaluation of the use of epenthetic vowel: unlicensed in formand mocking in function. The switch to Kashmiri, gaam-ic (belonging to village), by R3 in line 10 above foregrounds this Affect—jocular mockery—by relating frequent epenthesis (line 9) to images of personhood: rural/rustic (line 10), and uneducated (line 11). What undergirds Mock Affect is, on the one hand, the low symbolic, cultural and economic capital of Kashmiri, vis-à-vis Hindi and English, and on the other hand, a set of (historical-political and colonial) ideologies that denigrates Kashmiri to the status of a ‘vernacular,’ cumulatively enabling vernacular exhibitions such as (1) above.

The cross-cultural reflex of Mock Affect appears among young Farsi-English bilingual speakers in Iran. The Farsi data also show how the unlicensed epenthesis in English words gets picked up and deployed, through jocular mockery, as a resource to ‘Other’ certain speakers, as lower-class and uncouth. The data further show that the ‘degree’ of epenthesis, the number of epenthetic insertions, in single words impacts how the resolution of the ‘vernacular voice’ is interactionally constructed; that is, the more instances of epenthesis within a word, the higher the resolution of the constructed images of personhood.

In conclusion, we argue that linguistic diacritics of Othering, effecting Mock Affect, serves as a proxy to denigrate groups, stereotyping them as caricatures of their selves.

# Morality in dental consultations: How dentists evaluate patients' oral hygiene

Lecture

***Ms. Song Hee Park<sup>1</sup>***

***1. Rutgers University***

Research in the field of Conversation Analysis (CA) has shown that providers and patients attend to patients' moral responsibility to take care of their own health (e.g., Pilnick & Coleman, 2003). In particular, it has been demonstrated that providers and patients orient to the delicacy of talking about poor self-management as it can be indicative of 'bad' and 'irresponsible' patients (e.g., Lutfey, 2003; Montenegro & Dori-Hacohen, 2020). For instance, in diabetes consultations, physicians present patients' 'good' blood sugar levels with explicit assessments, while presenting 'bad' blood sugar levels in report formats so as to avoid direct criticism of patients (Montenegro & Dori-Hacohen, 2020). Using the methodology of conversation analysis (CA), this paper investigates how the dentist delivers evaluations of patients' oral hygiene condition in ways that are sensitive to the moral dimensions of patients' self-management. Using video-recordings of routine interactions in a dental clinic, this study examines the interactional practices used by the dentist to present oral hygiene evaluations, focusing on how moral implications are managed and attended to by participants.

First, when delivering positive evaluations of patients' oral hygiene status, the dentist produces explicit assessments of what he observes during the examination and treatment. That is, the dentist articulates assessments of 'good' oral hygiene directly and unhesitatingly. For instance, the dentist articulates assessments 'on the spot', i.e. while looking into the patient's mouth, uses explicit evaluative terms (e.g., "good"), and produces exclamations of amazement (e.g., "wow"). By 'exposing' the positive evaluation in these ways, the dentist enacts a strong display of affiliation with patients, which in turn can encourage them to continue self-care efforts. Second, when delivering negative evaluations, the dentist avoids articulating assessments and instead shows patients images of their plaque, directing them to 'witness' their problem first hand. These images are taken in the middle of the dental examination with an intraoral camera – a device used to capture digital images of patients' teeth and gums – and are shown to the patients after the examination and treatment are done. With such photos that display plaque retention, the dentist presents factual information and avoids articulating direct criticisms of patients' self-management. The dentist follows the principle of '*show, don't tell*' by *showing* patients images of their plaque instead of *telling* them what is wrong. In this way, the dentist avoids being overtly evaluative, while motivating his patients to reflect upon their bad habits.

# Multilingualism in the Linguistic Landscape of Vienna, Austria

Lecture

***Dr. Barbara Soukup<sup>1</sup>***

**1.** University of Vienna

This paper reports on the incidence and functions of multilingualism in the linguistic landscape (LL) of Vienna, Austria. It draws on a large corpus of over 17,000 ‘LL items’, i.e., non-ephemeral ‘things’ in public space that bear any written text on them (following Backhaus 2007; for the underlying definition of LL see Landry & Bourhis 1997). The corpus was compiled in 2015 (i.e. pre-Covid19), applying variationist sociolinguistic principles: within judiciously preselected survey areas, all visible LL items were exhaustively recorded (via photography and fieldnotes). Survey area selection was driven by hypotheses regarding notably the occurrence of English, which is the focus of the umbrella project of the corpus (see Soukup 2020). All house façades, sidewalks and roadways along a total of 4.8km of Viennese streets were surveyed.

While multidimensional statistical analysis of the corpus is ongoing, results regarding frequency counts and distributions are already available. These show that only 47% of the LL items could be unambiguously coded for particular languages, the remainder featuring texts like personal names, graffiti, letters, and numbers. Within the items that could be coded for language(s) (N=7999), 69% are monolingual German, followed by 11% monolingual English; and 1.6% feature only languages other than German or English. A total of 819 LL items or 10.2% are multilingual, with any combination of German, English, and other languages. French and Italian have the highest incidence of languages outside of German and English (around N=100 each), while Austria’s official minority languages (Croatian, Czech, Hungarian, Romanes, Slovak, Slovene) and dominant migrant languages (Turkish, Polish, Romanian, Serbian) are hardly evident in the sample (all <0.4% or N=30).

Frequency distributions across domains show that, similar to the findings by Ziegler et al. (2018) in the German Ruhr metropoles, multilingualism in the Viennese LL is strongly associated with commercial activity (sales) and functions (e.g. advertising). The restaurant industry is a particular driving force in multilingualism (e.g. in food ads), which arguably reflects the importance of international tourism for the Viennese economy. Retail sale is another multilingualism stronghold (e.g. product ads in shops). Commercial activity draws on multilingualism as a linguistic strategy regardless of whether such activity is authorized or not: thus, guerilla marketing, particularly via transgressively placed stickers, is a salient domain of multilingual and non-German language use.

This presentation provides the fine-grained details of these findings regarding multilingualism in the Viennese LL, and illustrates its manifestations, constellations, and functions within and across specific social activity domains. This large-scale, systematically compiled corpus being the first of its kind for Vienna, its analysis redresses a salient research gap regarding language choice, display and functions in the public spaces of European non-L1-English metropoles.

# Multimodal Pragmatic Analyses of Defendant's Rhetorical Questions in Chinese Courtroom Context

---

Lecture

---

***Prof. Haiqing Chen<sup>1</sup>, Ms. Runyu Sun<sup>2</sup>***

*1. Dalian University of Technology, 2. Beijing Language and Culture University*

In the joint construction of linguistic modality and non-linguistic modality, speech act metonymy in a specific context is more likely to occur. Based on the speech act metonymy theory, the focus information theory and the corpus of courtroom cases chosen from the program The Scene of Trial in CCTV12, this paper analyzes the pragmatic functions of rhetorical questions in courtroom discourse within the multimodal analyses framework of the defendant's rhetorical questions in the courtroom context. It is found that the usage frequency of rhetorical questions and their quantitative distribution can directly reflect the multimodal features of each participant in the trial. Therefore, this paper empirically analyzes and discusses the three rhetorical questions commonly used by the defendant, the key role in the trial, namely, expressing opinions, the negation and the reply, and their multimodal pragmatic features and functions.

# Narrating in Obstetrics

---

## Lecture

---

**Ms. Sara Honegger<sup>1</sup>**

**1. Universität Marburg**

In conversations between midwives and pregnant women preparing the birth, narrating occurs in characteristic forms, both by the midwives as well as the expecting mothers. While the medical professional's aim is to get a clear view of the patient's medical history and preconditions, the expecting mother herself might as well introduce topics based on her own history and practical knowledge. Narrating might be used as a tool to reduce the gap between the medical expert on the one hand and the mother-to-be as expert concerning her body and her personal experience on the other. Yet, it is up to the participants to navigate which event is relevant and therefore worth telling. Limiting factors in this process might be institutional, e.g. concerning time and resources (Koerfer und Köhle 2009).

This talk addresses the questions in which moments narrating is elicited or discouraged by the midwives and what kinds of narrating emerge in these instances. The corpus I draw on consists of 37 videographed and transcribed conversations in the hospital between midwife and expecting mother. The methodological approach is conversation analytic.

The discourse concerning narrating has shifted from the classical story with a certain structure (Labov und Waletzky 1967) to a broader perspective on narrating as summarized by Bamberg as narrative procedures (Bamberg 2020). Working with a broader understanding of narrating reveals different kinds of narrating both on part of the expecting mother as well as on part of the midwife. Narrating in these conversations ranges from short, rudimental narrating to detailed storytelling. In the data there are narrative practices in most of the conversations on part of the mother-to-be. These practices range from short anecdotal commentaries to longer detailed narrating of a specific situation. Here it is of special interest in which moments those narrative practices occur—especially concerning how their appearance is either encouraged, maybe even elicited by the midwife and in which cases it is discouraged. A noteworthy process is the establishment of what is relevant by the interlocutors. I understand this process to be an interactive one (Sator 2003).

I will argue that midwives in the underlying conversations use different methods to elicit or discourage narrating. Furthermore, I will demonstrate how different kinds of narrating emerge in these instances.

# Narratives of professional identity of Korean performing artists in Japan: A comparison of pre- and during COVID-19 stories

---

Lecture

---

*Prof. Junko Saruhashi<sup>1</sup>*

*1. Aoyama Gakuin University*

The author analyses stories told by professional and semi-professional performing artists of Korean traditional music and dance who work and teach in Tokyo, Japan. Some artists were trained in South Korea and/or in Japan. They work collaboratively with the guest performers from Korea. Working in Tokyo, despite not being physically at the cultural centre, they struggle to be a part of the Korean professional community and realise the role as cultural ambassadors. Their stories about the teachers, colleagues, and performing artists in Korea play a crucial role in presenting their professional identity and the authenticity of their performances in Tokyo. This study compares the performers' stories before and during COVID-19. Before COVID-19, cross-border collaboration and mutual visits were normal. Advantages such as objective perspectives or valuing themselves as an intercultural mediator or interpreter were frequently referenced. The COVID-19 pandemic dramatically changed these narratives. The closing of borders restricted mutual visits, and performances were cancelled. Instead of pursuing the current situation in Korea's traditional performing arts, performers who live in Tokyo recalled what they learned from their teachers in their youth and considered what they could do by themselves. Some even imagined the pre-modern period in which active "traditional" performances emerged. By examining the structure and functional relationships between the narrative of personal experience (NoPE) and the narrative of vicarious experience (NoVE), the author concludes that the primary function of the NoVEs by traditional Korean performing artists in Tokyo, about their teachers and colleagues in Korea as its cultural centre, is to construct their professional identity. The evaluation of NoVEs in pre-COVID-19 stories appears practical. And the link between the NoVE and NoPE is clear and specific. However, the NoVEs of during COVID-19 are more nostalgic and disciplinary, and the link between the NoVE and NoPE contains unreachability and open-endedness. For instance, one performer talked about the monolingual and monocultural other to emphasize bilingualism, the competent self in the pre-COVID-19 narrative. The same person talks more about his teachers' spiritual states in order to relate to a higher self-discipline level in a COVID-19 narrative. This case study presents how voices of teachers and masters are utilized to secure their professional identity as a Korean traditional performing artists facing critical moment with COVID-19 pandemic.

## Networking in the time of Covid-19

---

Lecture

---

***Dr. Jackie Militello<sup>1</sup>***

**1.** *The University of Hong Kong*

This study examines how professionals in the financial sector experienced adaptations to previous ways of networking during Covid; what language ideologies underpinned their experiences and perceptions; and what the material outcomes were. Becoming acquainted is largely a linguistic endeavor that traditionally relies heavily on face-to-face interaction to advance and cement feelings of trust that eventually lead to successfully concluded transactions. Using linguistic ethnography, I interviewed over 30 professionals about networking during Covid. Many, but not all, participants indicated that they had made either no new, or a greatly decreased number of new professional acquaintances, compared to pre-Covid times. Four interrelated language ideologies appear to have emerged shaping the new communicative practices: (1) trustworthy communication requires embodied co-present interaction; (2) when this is not possible, online communication with new contacts under Covid restrictions requires mediation by a trusted third party; (3) pre-covid ways of establishing and deepening business relationships, such as end of year parties, or getting a drink at a bar cannot be replicated on Zoom; and (4) transactional talk is more valuable than relational talk. Additionally, many expressed ‘Zoom fatigue’, leaving them to eliminate elective activities, underpinned by an undervaluing of more socially valenced types of talk at work. The material outcomes were that, for most, new relationships were significantly handicapped, resulting in networks in a state of stasis, a situation that privileged extant connections and those with strong professional networks.

# Nizhidaoba ‘You know + ba (modal particle)’ as A Response Mobilizing Device in Mandarin Conversation

Lecture

**Dr. Qingqing WU<sup>1</sup>, Dr. Li Chen<sup>2</sup>**

**1.** Kyushu University, **2.** Sophia University

*Nizhidaoba*(你知道吧), which is composed of *nizhidaao* and modal particle *ba*, is a variation of *nizhidaao*(you know) as a pragmatics marker in Mandarin conversation (Tao 2003). Literally, *nizhidaoba* means that ‘you know, right?’. In this study, we adopt the methodology of conversation analysis to clarify the interactional functions of *nizhidaoba*.

There has been a lot of discourse-oriented linguistic literature clarifying the function of *nizhidaoba*. For instance, Liu (2006) has demonstrated that the pattern [(X1), X+nizhidaoba, (X2)] is used to monitor whether the listener has background information X in order to understand what the speaker is trying to convey, and it’s also used to monitor whether X has been activated. According to Liu (2006), speakers think that X is the information is more familiar, straightforward, and understandable to the listeners. However, from the view of social interaction, X is not just representing some information, but implementing a social action. And it implements different actions in different interactive environments. Drawing on the *nizhidaoba* examples collected from 18-hour audio-recorded telephone talks, we focus on[X+nizhidaoba] in two different sequential environments. One is in a disagreement sequence and the other is at the end of the telling sequence. Our findings are as follows: First, our result shows that the speaker expresses a disagreement with the listener in the second or third position of the sequence, along with the reason X for the disagreement, followed by *nizhidaoba* ([disagreement + reason (X) + *nizhidaoba*]). In another word, *nizhidaoba* is used to emphasize that the reason is supposed to be knowable and understandable to the listener and increases the listener’s accountability to respond. Usually, the listener tends to respond with *dui*对 ‘right’ to indicate acceptance or agreement.

In addition, our result shows that the speaker gives the upshot of his/her telling by adding *nizhidaobato* display the stance that the speaker thinks the upshot of his/her telling so far is obvious ([upshot of the telling(X) +*nizhidaoba*]). Usually, the listener tends to respond with *dui*对 ‘right’ or *o*哦 ‘oh’ to indicate an acknowledgment. Then, the speaker usually upshot his/her telling again in the next turn and ends the telling sequence.

*Overall*, [X+nizhidaoba] is used to display the stance that the listener is supposed to know and understand X. Therefore, the speaker’s opinion or telling is understandable to the listener. And *nizhidaoba* is used as a response mobilizing device (Stivers and Rossano 2010) to seek acknowledgment, acceptance, or agreement.

# On the de-honorification function of copula ‘achhi’ in Odia: a ‘stance triangle’ analysis

Lecture

***Dr. Anindita Sahoo<sup>1</sup>, Dr. Foong Ha Yap<sup>2</sup>***

***1. Indian Institute of Technology, Madras, 2. The Chinese University of Hong Kong, Shenzhen***

Stance taking is one of the most important things we do with the usage of words in various contexts. Stance is the speaker’s footing that assigns value to the objects of interest and it also positions social actors not only to the object being evaluated but also to others with whom the speakers interact (Du Bois 2007). One’s stance-taking also invokes pre-existing sociocultural values and deploys—even stretches—the linguistic resources of one’s culture.. In this paper, adapting the ‘stance triangle’ framework proposed by Du Bois (2007), we examine how native speakers of Odia, an eastern Indo-Aryan language, deploy the copula *achhi/thile*(the present and past forms respectively) in a 3-hour long Odia conversational discourse. In particular, we examine how *achhi* and *thile* are used as honorification mitigators in contexts where the speaker (i) de-honorifies the referent (in the discussion), and (ii) negatively evaluates the performance of the referent. In analyzing these copulas, we identify how the use of *achhi* and *thile* are hugely motivated by Odia sociocultural values which help the speaker to modulate their internal evaluations and motivate them to carefully position their utterances externally. Our findings indicate that copulas with different agreement markers are used not only toward different interlocutors but sometimes also toward the same interlocutor as the conversation unfolds. Speakers change their choice of stance markers as they interact with interlocutors from different social strata and for different communicative goals. Following Ahn and Yap (2020), in this study we propose a modified version of Du Bois’ stance triangle for situations involving de-honorification acts whereby more complex stance vectors replace simplex ones in representing the speaker’s de-honorific positioning toward the stance object.

# On the epistemic and relational account of definiteness in Persian

---

Lecture

---

**Dr. Ahmad Izadi**<sup>1</sup>

*1. Abadan Branch: Islamic Azad University*

Formal Persian language lacks a definite article, but in informal colloquial conversations, the particle ‘e’ can be suffixed to the nominals to denote definiteness. This particle has been insufficiently described in the literature and even this insufficient description is solely based on constructed examples. The empirical investigation that underlies the present study examines the ‘e’-marked nominal formulations in contrast to its bare (unmarked, but still definite) formulations in the context of making references to persons, animals, and objects in naturally occurring conversations to identify its multi-faceted functions. It is demonstrated throughout the paper that the bare formulations by the speakers indicate their epistemic primacy, while the e-marked form shows both speaker and recipient’s (assumed) equal epistemic access. In the latter case, the speaker may need some interactional work with the recipient to share his epistemic access with them. In the joint collaboration of epistemic work, co-interactants carefully select the formulation that matches their epistemic status. For example, when the marked formulation is expected, the bare formulation leads to a ‘repairable’ moment in conversation. Furthermore, the analyses demonstrate that in using ‘e-marked’ definite nominals, speakers orient to some degree of relational separation with the referent and thereby some degree of connection with the recipient. Overall, the analyses reveal delicate moments of interactional work in terms of epistemic and relational functions of the e-marked or bare formulation of the referents, and as such contribute to the pragmatic and interactional view of definiteness in light of epistemicity and relationality of reference making.

# On the Pragmatic motivations and the non-arbitrary nature of Chinese Characters

Lecture

**Prof. Yantao Zeng<sup>1</sup>, Prof. Yuemei Liu<sup>2</sup>**

*1. School of Foreign Studies, South China Normal University, 2. Yangjiang Open University*

**Abstract:** It is generally assumed the relation between linguistic symbols and the things or ideas they represent is arbitrary (the so-called “first principle of linguistics”), i.e., there is neither intrinsic connection between the symbol (word) and the thing it denotes nor logical (motivated) connection between sounds and meanings. This judgment or assumption, however, seems not applicable to Chinese, which is a language unique in many ways and quite different from all the other languages. This study aims to explore the pragmatic motivation of Chinese characters in form, content and pragmatic force and disclose the unique non-arbitrary relation between linguistic symbols and the things or thoughts they refer to. The key questions to be answered are: (1) How Chinese characters are formed (evidences of motivations from the forms of Chinese characters); (2) How the meanings of Chinese characters are derived (evidences of motivations from the concepts of Chinese characters); (3) How the pragmatic forces of Chinese characters might be intended and extended (evidences of motivations from the use of Chinese characters).

The study consists of 4 parts. It starts with a description of the origin and evolution of Chinese characters, from which initial motivations of formatting Chinese characters can be found. What follows is a detailed analysis of the characters’ morphological configuration in relation to their semantic denotation and connotation. Next is a discussion of the pragmatic explication and implication of the Chinese characters for the purpose of seeking for the trails of the characters’ evolution and development, and discovering the inner mechanism behind it. A preliminary revelation from the description and analysis in the study is the motivations of Chinese characters can be found at various levels, which can be classified into rational and non-rational, explicit and implicit, static and dynamic categories. Whatever categories they belong to, all the motivations of Chinese characters are pragmatic in nature.

A tentative conclusion is: the Chinese characters are invariably pragmatically-motivated or usage-based in terms of either the forms of the characters, or their meanings, or their actual use. In this sense, Chinese is non-arbitrary in nature.

The implications of the study are bidirectional. On the application side, it involves heuristic value for learning Chinese as a second or foreign language. For the foreign learners of Chinese, they may find some helpful strategies and techniques, or at least some enlightenment for learning Chinese. On the theoretical side, the question of whether language is arbitrary or non-arbitrary is worth rethinking.

This is a corpus-based, quantitative as well qualitative study. It starts with an empirical observation of the Chinese characters and words of different periods, different types and different configurations in the Chinese corpus, followed by a quantitative analysis of the data under observation, by means of which the motivation evidences are found of the form of Chinese characters, the concept of Chinese characters and the use of Chinese characters. On the basis of observation and quantitative analysis, a qualitative analysis will be carried out.

# On the Relationship between Iranian EFL Teachers' Pragmatic Awareness, Having sense of humor and Teaching Speaking

---

Lecture

---

***Dr. Zargham Ghabanchi<sup>1</sup>***

*1. Ferdowsi university of Mashhad, Associate pro.*

Students are potentially exposed to higher levels of anxiety due to the discrepancy between their cognitive ability and their linguistic skills. Humor has the potential of creating a relaxed classroom atmosphere. Krashen (1982) concluded that a low affective filter corresponded to high motivation, self-confidence, and a lack of anxiety. In this study, the relationship between Iranian EFL teachers' pragmatics awareness of speech acts, having a sense of humor, and their success in teaching speaking was investigated. To achieve this a two- phase method research was carried out: In the first phase, the speech acts rating questionnaire and teachers' choice of speaking activity questionnaire was used. 150 English teachers with BA, and MA degrees were surveyed, and asked to select the appropriateness of speech acts in the situation, and also their choice of speaking activity including pronunciation, fluency, accuracy, vocabulary, and communication. Pearson correlation test was implemented to search for a possible relationship between Iranian EFL teachers' pragmatics awareness and their speaking methods. The results revealed that there is a significant relationship between teachers' pragmatics awareness and their choice of teaching speaking activities. For the second phase, ten teachers, five who are well known for having a sense of humor and five well known for being very serious and 100 male and female intermediate learners were selected. With the language institution managers' help and cooperation, a pre-test based on IELTS speaking samples was carried out, then both groups of the teachers were asked to teach the same materials for eight weeks, each week two sessions, then a post test was carried out. The scoring system was the IELTS rubric scale. The results revealed that there is not any significant difference between the groups' achievements concerning speaking ability; however, in the interview, one group said we enjoyed every single minute, whereas the other group claims that they were under huge mental strain.

Key words: EFL teachers, Pragmatics awareness, Speech Acts, Speaking activity, Sense of humor

---

# On the ‘request’ use of *be going to*

---

Lecture

---

***Dr. Naoaki Wada<sup>1</sup>, Ms. Haruka Shimura<sup>1</sup>, Ms. Mai Ogawa<sup>1</sup>***

***1. University of Tsukuba***

Previous studies have compared various phenomena of *will* and *be going to*, including speech act ones, from different perspectives (Binnick 1971, Brisard 2001). One difference is whether the two forms can indicate request. It is often mentioned in the literature (e.g. Sadock 1974, Leech 2014) that *Will you...?* conventionally conveys a request because it co-occurs with *please*, as exemplified in (1a), but *Are you going to...?* does not, as in (1b).

- (1) a. Will you please close the door? (Sadock 1974: 108)  
     b. \*Are you going to please close the door? (Sadock 1974: 108)

Although Nicolle (1998) indicates that *Are you going to...?* may imply a ‘request’ based on the confirmation of a prediction about the event involved and the hearer’s ‘ongoing’ intentions, he does not consider the phenomenon in wider contexts nor does he specify triggers for it. Besides, he does not give a general perspective of how indirect speech acts, including request, derive from future expressions.

To solve these problems, we first searched the British National Corpus, finding a certain number of instances with *Are you going to...?* that imply a ‘request’, as in (2).

- (2) ‘So put a clever man out of his misery, and tell me – are you going to marry me?’ ‘You’re sure?’ she asked, scarcely able to believe what he was asking. (BNC JYF)

The sentence in question implies a marriage proposal, a kind of request. One key factor for a ‘request’ interpretation seems to be the presence of expressions indicating the speaker’s involvement, e.g. *tell me* in (2).

Considering these findings, within the framework proposed by Wada (2019)—which is intended to comprehensively treat future expressions, modality, and indirect speech acts—we explain (i) how the ‘request’ implied by *be going to* differs from that denoted by *will* and (ii) under what circumstances and how sentences containing *Are you going to...?* can imply a ‘request’. More specifically, by comparing the temporal structures of *will* and *be going to*, which are bases for interpreting speech acts, we argue that (i) because the temporal structure of *be going to* (in its volitional use) involves a preliminary stage already ‘ongoing’ at speech time, this form can be construed as implying a ‘request’ when the context where it occurs matches such a temporal structure; (ii) In terms of the temporal structures, *Will you...?* conventionally expresses a request deriving from an intention occurring at speech time, whereas *Are you going to...?* implies a ‘request’ only in contexts where the content of hearers’ behaviors or utterances occurring prior to speech time fits in with the speaker’s desire at speech time.

# On ‘Sadiq and Ameen’ Clause: A Pragmatic Exploration of (un)Truthfulness in Pakistani Culture

Lecture

**Ms. Saima Mubashra**<sup>1</sup>, **Dr. Ghazala Kausar**<sup>2</sup>

*1. National University of Modern Languages, Islamabad, Pakistan, 2. National University of Modern Languages, Islamabad*

Notwithstanding the fact that Truth and Lying appear to be universal constructs, the meaning and nature of (un)truth are culturally contingent. Labels used to denote these concepts have unmistakable cultural imprints that can be uncovered by using semantic and pragmatic explications (Wierzbicka 2002, 2003). The present study aims to explicate meta-pragmatic awareness about the meaning of (un)truthfulness in Pakistani culture with special reference to the political context and present it in culturally neutral terms using the theory of cultural scripts. Apart from the standard semantic analysis of the relevant lexical items, the data for the study comes from the linguistic evidence gleaned from various constitutional petitions filed by invoking Article 62 (1) (f) or the ‘Sadiq and Ameen’ Clause in the Pakistani Constitution: A constitutional provision that makes it obligatory for the public office holder to be truthful and honest. The findings are presented in the form of a set of cultural scripts written by using Natural Semantics of Metalanguage (NSM) which comprises standardized semantic primes found in all the languages of the world. The petitions and the resultant trials provide a rich ground for the hermeneutic process to unearth the cultural meanings of the ‘Sadiq and Ameen’ clause. The court proceedings and the final verdicts try to pass over the constitutional ambiguity by weaving linguistic, religious and legal strands of meaning together. The findings reveal that truthfulness refers more strongly to the sincerity of a person rather than the integrity of the statement. A person’s truthfulness is a stable, all-or-nothing personal attribute likely to be irrevocably impacted by a single or any number of not only mendacious but also inconsistent or contradictory statements.

# Orchestrating children's attentive listening and excitement in teacher-child interactions

---

Lecture

---

***Ms. Emilia Strid<sup>1</sup>***

**1.** *Linköping university*

Children's positive emotional stances constitute a recurrent interactional practice in the everyday activities (especially common in peer play, Strid & Cekaite, forthcoming). However, when studying children's emotional expressions, the focus has predominantly been on negative emotions. Thus far, children's displays of positive emotions (e.g., joy, excitement) and their interactional functions have received scant attention. Using multimodal interaction analysis (Goodwin, 2000) the present study examines how preschool teachers orchestrate and solicit young children's positive emotional responses. More specifically, I examine recurrent teacher practices used to invite children's attentive, temporally extended (and excited) listening and 'excited' responses. Data comprises 30 hours of video-recordings from a regular preschool group for 3-5 y.old (in Sweden). The study focuses on the multimodal organization of teacher's and children's emotional stances (Goodwin & Goodwin, 2000), and the interactional work used to orchestrate extended episodes of emotion sharing between teachers and children as the teachers solicit and sustain children's interest in the institutional activity in a group setting. The study shows how the teachers invite children's alignment and establish a shared understanding of what can be considered interesting. Teachers design embodied turns that i) display their 'excitement' and ii) invite children's aligning responses (displays of their attentive and excited listening). Teachers in a skillful manner make use of embodied resources such as intonation, hand gestures and shift in voice and pitch in various ways scaffolding children's participation. They respond to children's affective displays by ratifying children's embodied emotionally vallenced responses or criticizing and/or correcting their affective character or sequential placement. The analysis suggests the normative character and accountability in how affective displays are interactionally designed and reciprocated.

---

# Particles in lesser-known languages: the case of ‘mm’ in Wa’ikhana

---

Lecture

---

***Dr. Nicholas Williams<sup>1</sup>***

*1. University of Potsdam*

Research in pragmatics continues to focus primarily on a small set of well-documented majority languages, while minority languages remain marginalized and understudied. As part of an effort to re-center pragmatics research on marginalized languages and apparently marginal phenomena, this paper examines a set of non-lexical response particles in face-to-face interaction in Wa’ikhana, an endangered East Tukano language of the Vaupes region in northwest Amazonia. The particles in question appear similar to English particles ‘mm’ and ‘mm-hm’ but exhibit significant differences from the English particles in both form and function. In the course of analyzing these particles, a number of questions have emerged, including how much crosslinguistic variation exists in the domain of response particles and to what extent researchers can understand the nuances of these particles without being full members of the speech community. In the paper, I present prototypical cases of the particles in question, focusing on their prosodic design, sequential position, and role in the unfolding interaction. I then address the larger questions through comparison with existing research on particles in English and other languages. The findings, indicating some unique features of the Wa’ikhana particles, exemplify the power of sequential analysis and interactional linguistic methods, despite the researcher’s ‘outsider’ status. Furthermore, the work demonstrates the need for more research on particles and face-to-face interaction in a much wider range of languages.

# Perspective, grounding and metapragmatic reflexivity in the contextualization of clauses

Lecture

***Dr. Szilárd Tátrai<sup>1</sup>***

***1. Eötvös Loránd University***

The talk has a theoretical orientation, and aims to offer a more elaborate interpretation of contextualization as a classic notion of pragmatics (cf. Auer 2009). It adopts a social cognitive point of view while also entering a discursive relation with syntactic approaches to contextualization (see Imrényi 2017). With its focus on Hungarian, the talk foregrounds the functioning of perspective (cf. Verhagen 2016) for carrying out a micropragmatic study of contextualizing relations within clauses. It presents contextualization as the activation of relevant background knowledge anchored to the discourse participants' vantage points. The talk builds on a model of context-dependent vantage points whereby the referential interpretation of linguistic symbols is crucially informed by the (i) spatio-temporal position, (ii) socio-cultural situatedness and (iii) mental stance of participants in the intersubjective context of discourse. It is argued that contextualizers within the clause that draw on the speaker's mental stance as a vantage point are fundamentally different from contextualizers whose use rests on deictic vantage points (spatio-temporal position as well as socio-cultural situatedness). Whereas the latter constructions supply integral components of the epistemically grounded process (cf. Langacker 2008) profiled by the clause (and occur in a designated clause-initial position in Hungarian), the former are not components thereof, instead expressing a reflexive attitude to it in the form of explicit metapragmatic signals (with more flexible word order behaviour in Hungarian). These signals are similar in this regard to contextualizing clauses (within clause complexes) and suprasentential contextualizing constructions. The talk links up this type of reflexive conceptualization (see Verschueren 2000) with the phenomenon of subjectification, which is in turn interpreted in relation to both objectivization (cf. Langacker 2008) and perspectivization (cf. Sanders-Spooren 1997).

# Policing the language of women (of color) in New York City: competing ideologies of correctness and solidarity

Lecture

***Dr. Cecelia Cutler<sup>1</sup>***

**1.** *City University of New York*

Linguistic policing describes instances in which people make explicit or implicit reference to the markedness, incorrectness, or deficiency of another person's speech. Policing in the domain of language usage, communicative conduct, and bodily hexis is involved in the production of "order"—normatively organised and policed conduct—which is infinitely detailed and regulated by a variety of actors (Blommaert et al. 2009, 203; Muth & DelPercio 2018). Policing can be verbal, written, or multimodal and may occur in face-to-face interaction in almost any conceivable setting as well as in digitally mediated spaces (Androutsopoulos 2009). Lastly, whereas most linguistic policing takes the form of top-down, imposed prescriptive norms of language use, it is quite common for speakers of less prestigious codes or mixed codes to be the targets of both top down and bottom up policing from a multiplicity of local actors.

The present study is based on three independent data sets: (1) interviews from the Corpus of New York City English project (Tortora et al. in progress) (N=50), (2) responses to a survey question about linguistic policing by residents of New York City English features (N=217), and (3) metapragmatic commentary by viewers reacting to videos about the "New York City accent" from YouTube (N=296). Instances of policing were overwhelmingly aimed at women, and particularly women of color. These individuals' experiences with linguistic policing most often took the form of metapragmatic and metadiscursive comments that render certain indexical forms appropriate or inappropriate in particular contexts or when uttered by particular bodies. The comments fall into three basic types: (1) criticism targeting specific speech features (ain't, ax for 'ask', mines for 'mine', etc.); (2) not speaking properly/sounding too "ghetto" or using too much "slang"; or (3) sounding too "proper" or too "white". The analysis explores the language ideologies that undergird each subtype of linguistic policing and the contradictions that women and particularly women of color must navigate between the overarching pressure to conform to normative varieties of English versus the pressure to resist such norms. The tensions between ideologies of prescriptive correctness, expectations about embodied forms of linguistic production (Bucholtz & Hall 2016) and emic pressures to conform to community norms may be explained in part by the fact that women more than men are socially evaluated not on their accomplishments but on their personhood and linguistic self-presentation (Buchholtz 2006, 493). With the aid of a raciolinguistic lens (Rosa & Flores 2017), the paper unpacks the social-historical and ideological factors that make women of color in particular the target of disproportionate levels of top down and bottom up linguistic policing.

---

# Politeness and Cultural Values and Their Effects on Problem Negotiations by native speakers in American and German Cultures

---

Lecture

---

***Dr. Beata Gallaher<sup>1</sup>***

***1. University of Regensburg***

The presentation discusses sociocultural values and politeness strategies emerging from linguistic behavior of American native speakers of English and German native speakers when they negotiated a problem, and when they decided not to do so. Their linguistic choices in problem negotiations were analyzed in terms of linguistic politeness, as defined by Brown & Levinson (1987).

Participants in each language group completed an open-ended discourse completion questionnaire by responding orally to 12 situations featuring problem negotiations and provided written responses to an assessment questionnaire. They also had an option to opt out by providing an explanation of their decision not to react.

The presentation reports on the results obtained from opt-out situations and from the analysis of strategy selection and linguistic choices made by the speakers in various sociocultural contexts. The results indicate significant differences in the speakers' attitude toward friendship, money, social status, and norms as well as differences in strategy selection and politeness/directness levels between these two language groups, which, in turn, reflect sociocultural norms in American and German cultures.

The findings of the study indicate that interlocutors need to be aware of some linguistic and cultural concepts underlying each culture to successfully negotiate a problem or to avoid a communication failure within a culture and particularly across cultures. The results also reveal possible areas for classroom intervention for American L2 learners of German to improve their communicative competence in the target language.

Keywords: German, American English, cross-cultural communication, linguistic politeness, problem negotiation, communication failure, American L2 learners of German

# Politeness as social reason: Melchiorre Gioja's New Galateo (1802-1827) as an antecedent to pragmatic theories of politeness

Lecture

Prof. Andrea Rocci<sup>1</sup>, Mrs. Francesca Saltamacchia<sup>2</sup>

1. Università della Svizzera italiana, Lugano, 2. Università della Svizzera italiana

We analyze Melchiorre Gioja's conception of politeness highlighting how the Italian author's fortunate conduct book, published in the early XIX Century, offers a view of polite behavior as based on *anticipatory inferences* in interaction that are both *strategic*, being aimed at reaching social utility through controlling others' sensation, affect and understanding – and *mechanistic*, being reducible to a sort of calculus. In the light of these features, we discuss how Gioja's ideas anticipate aspects of pragmatic theories of politeness of mid-late XXth Century, starting from Brown and Levinson's (1987) influential universalist model.

The *Nuovo Galateo* by Melchiorre Gioja was published for the first time in post-revolutionary Italy in 1802 is the most popular Italian conduct manual of the Nineteenth Century. The treatise positions itself as a break with the aristocratic tradition and with a code-based, "grammatical" behavioral model based on the respect of the appropriate *ceremonies* according to the situation and social status of participants (cf. Paternoster & Fitzmaurice, 2019). More than proposing a new "code" of conduct, it proposes an inferential view of polite behavior in which *reasonableness* is the only reliable tool to work out correct conduct. His model of *pulitezza* is based on a principle of "social reason" aiming at exercising one's right with the minimum displeasure of other and at multiplying the occasions of "moral pleasure" for them. Under the influence of British philosopher Jeremy Bentham, Gioja provides an utilitarian foundation to social reason, whereby the pursuit of "social happiness" is motivated by individual interest. Interestingly, for Gioja, determining polite behavior is less a matter of convention than of anticipatory inference and requires a case-by case argumentation process to determine what conforms to "social reason" in individual interactions.

Argumentative reconstruction (cf. Rigotti and Greco 2019) provides the methodology for reconstructing how Gioja justifies examples of polite behavior by recourse to anticipatory strategic reasoning that takes into account not only other people's immediate *reactions* of pleasure and displeasure, but also other people's *inferences* about the agent's intentions. Furthermore, particular attention will be given to passages where Gioja proposes a quasi-formal representation (in the shape of an equation) of the calculation of the contribution of a form of behavior to social happiness.

In closing, we compare Gioja's view with classic and more recent theories of politeness revolving on anticipatory inferences (cf. also Watts 2003 and Terkourafi 2003) and we discuss the value of historically situated conceptions for contemporary pragmatic theorists of politeness.

# Pragmatic Aspects of Translation of Distal and Proximal Terms in English and Persian

Lecture

**Dr. Masoumeh Diyanati<sup>1</sup>, Prof. Mohammad Amouzadeh<sup>2</sup>**

**1.** University of Isfahan, **2.** University of Isfahan, Sun Yat-sen University

Deixis, as a universal phenomenon, can be found in all human languages (Huang, 2007). However, the use of deictic terms (indexical categories) ‘vary considerably from language to language and provide extremely fertile ground for contrast’ (Hanks et al., 2009: 6). This is a report of an on-going investigation on deictic shifts in Persian translation of English texts from a discourse-pragmatic perspective. The idea has been developed out of our translation engagement back to two decades ago. English and Persian have rather similar typological characteristics since both are two-term system opposing proximal and distal with the speaker as the deictic origo (Bühler, 1934); however, in translation there is no one-to-one correspondence between English and Persian proximal and distal deictics. That is, English proximal and distal deictics, i.e. *this* and *that*, are not converted in many cases by their Persian corresponding equivalents, i.e. *in* and *ân* respectively:

(1) ST: "What kind of a hand is **that**," he said.

TT: *goft in digeče þur dæstiye*

BT: He said: what kind of a hand is **this**?

(2) ST: Only Arabic was spoken in **this** country.

TT: *dær ân særzæmin hæme ðæræbi sohbæt mi-kærdcend*

BT: In **that** country everyone spoke Arabic.

(3) ST: the Louvre itself had an almost sepulchral aura at **this** hour.

TT: *muze-ye louvr hæm dær ân sâðæt hâl o hævâ-i hozn-ængizi dâšt*

BT: the Louvre, at **that** hour, had a sepulchral aura

Despite the major pragmatic affinity of distal and proximal deixis in Persian and English, how can we explain such discrepancies in translation? In other words, the distal and proximal terms are used to designate entities conceived as close to or away from the speaker both in English and Persian. With this crucial pragmatic similarity of distal and proximal terms of Persian and English, how are their different translations explained in the above examples? Other studies also looked at such a pragmatic phenomenon (e.g., Bosseaux, 2007; Mason & Šerban, 2003). Definitely, further pragmatic parameters are required to account for this discrepancy in translation. We argue that re-contextualization as a pragmatic process is the key notion to explain such a difference in the translation of distal and proximal terms in the two languages. In short, we treat translation as a re-contextualization process in which the deictic terms shifters are reshaped in the new environment forming a new interaction with new referential meanings. In a sense, re-contextualization is defined in terms of a reconstructed interaction.

# Pragmatic aspects of understanding in monolingual and multilingual discourse

Lecture

***Prof. Jochen Rehbein***<sup>1</sup>

**1.** Universität Hamburg

Discourse is the medium in which understanding and misunderstanding emerges. *Hypothesis* of the paper is that understanding in discourse is “percolated” through specific stages which are processed by the listening person and which produce the formation of a hearer’s plan through reconstruction of the received speech actions. The hearer’s plan seems to be a precondition for the hearer’s actively participating at follow-up interactions in the discourse, i.e. for a further reception or production process. The paper focuses - by means of transcripts - the diverse verbal and prosodic expressions hearers employ at the stages of their understanding. Reciprocally, the speaking person not only “monitors” the listener’s fine granulated reception activities being realized in a range of non-verbal, paralinguistic, prosodic and verbal expressions at the stages passed through, but, even, changes her/his verbal constructions in *statu nascendi*: these changes become manifest in breaking-offs, repairs, apokoinus, rephrasings, reformulations etc. (s. Ehlich & Rehbein 1986, Ehlich 1986, Rehbein 1987, Rehbein & Kameyama 2003, Kameyama 2004, Rehbein, J., ten Thije & Verschik 2012, Rehbein, J. & Romaniuk, O. 2014, Rehbein & Çelikkol 2018).

All in all, understanding as it is modelled in the talk encompasses several kinds of *hearer’s (recipient’s) activities* among which are:

- 1) developing a deep network of expectations of what is to be said (by the speaker) based on (common) presuppositions; this guides the stage of assessment of the constellation and the perception of the utterance
- 2) creating reception of propositional and illocutive components by activating knowledge of various linguistic roots
- 3) re-actualizing the speech action/s in its/their various components up to the formation of the hearer’s plan
- 4) taking recourse to reservoirs of knowledge to draw inferences etc.
- 5) checking the appropriateness of her/his understanding over a stretch of discourse.

Moreover, overall information on the objective of speaker’s action, the genre of discourse, discourse pattern, turn taking and keeping, formulaic speech, topic-comment-processing etc. and their commonality in discourse are spooled into the hearer’s activities. Institutional agent-client diversity has to be accounted for, too.

The *data* are taken from multilingual communication (Receptive Multilingualism of various language pairs; ten Thije 2004; Bührig & ten Thije 2006) and monolingual communication (as doctor patient communication, appointments, everyday narratives, homileic discourse, and others). One *result* is, that, in multilingual discourse, hearers’ various types of inferencing procedures at various stages of understanding are more frequently required than in monolingual ones. If time allows for, *competitive approaches* from ethnographic conversational analysis (e.g. Deppermann 2008) and the alignment model of psycholinguistics (e.g. Pickering and Garrod 2004, Bahtina-Jantsikene 2013) will be discussed.

# Pragmatic constituent order variation in modern Northern Mansi – a template approach to newspaper language

Lecture

*Dr. Susanna Virtanen<sup>1</sup>*

*1. Helsinki*

## Pragmatic constituent order variation in modern Northern Mansi – a template approach to newspaper language

Mansi is an urgently endangered indigenous language spoken in Western Siberia, belonging to the Ob-Ugrian branch of the Finno-Ugrian language family. There are still approximately 1,000 living speakers of the Northern dialect. The Eastern, Western and Southern dialects have already died out. Northern Mansi constituent order and its pragmatic variation have not been examined comprehensively until now. My approach fills in this gap with syntactic-pragmatic template analysis (see Good 2016). I use my own model of 9+1 templatic slots, which are filled with syntactic and/or pragmatic functions. My research data is a corpus of 676 clausal entries gathered from *Лўима сэпунок* [Luima (LS), the only up-to-date Mansi newspaper, which is published twice a month. This corpus approach is an attempt to combine both pragmatic/information structural and syntactic levels in the same template analysis: my analysis enables simultaneous observation on both the syntactic and pragmatic levels. The linear order of syntactic categories is analysed, and the results are compared to the results of the pragmatic analysis of the same data. This shows clear correspondences: the numbered slots in the template correlate with both syntactic and pragmatic functions. In my data, the arrangement of constituent order is twofold. First, the basic constituent order is connected to the order of syntactic functions: Mansi is basically a SOV language. Secondly, particular syntactic functions alternate between two or more slots, depending on which pragmatic function they represent. Some slots are always occupied by a particular pragmatic function, which can be represented by several syntactic functions.

Placement of syntactic and pragmatic functions in the 9+1 slot model:

### Slot | PRAGMATIC DEFAULT | Syntactic default

0. | SCENE-SETTER |—
1. | PRIMARY TOPIC | Subject
2. |—| Time
3. |—| Location-1
4. |—| Manner
5. |—| Loc-2/Time-2
6. | NEUTRAL / SECONDARY TOPIC | D<sup>\*)</sup>7. | NEUTRAL | Subject
8. | FOCUS |—
9. |—| Predicate

<sup>\*)</sup>D= DO, IO or Directional adverbial.

My main arguments are:

1. The same template model can be applied to both active and passive clauses.
2. Both syntactic and pragmatic levels are included: the numbered slots are occupied by either syntactic or pragmatic functions.
3. The predicate verb or a nominal predicate occupies the clause-final position, possibly followed only by conjunctions or other particles.
4. Topical arguments tend to occupy sentence-initial positions.

5. The placement of the subject varies between two slots: sentence-initial and two slots before the predicate. Variation is due to pragmatic motivation.
6. DOs, IO and directional adverbials share various common features – both semantic and syntactic – and common slots.
7. Temporal, locational and manner adverbials are placed immediately after the subject, with the temporal component always coming first. However, a scene-setting adverbial is placed before the subject.
8. The most focal element is always placed in Slot 8, immediately before the predicate.

# Pragmatic Enrichment and The Problem of Interpretation in Islamic Jurisprudence

Lecture

***Dr. Niaz Aziz<sup>1</sup>***

***1. Soran University***

There is a heated debate amongst pragmatists concerning unarticulated constituents (UC henceforth), which was originally developed by John Perry (1998). According to UCs, there are context-sensitive expressions that lack truth-evaluativity and are in need to be contextually and pragmatically enriched in order to have a ‘complete’ truth-evaluable proposition (Recanati, 2002, Carston, 2002). The contextual-assignment of UCs has led to the development of different theoretical accounts.

In this paper, I will present one way of signification in Islamic jurisprudence, called “iqtiḍā” (the required meaning), which corresponds to the same phenomenon of UCs (Ali, 2000). Islamic legal theorists have paid significant attention to UCs and have promoted divergent and even contradictory interpretations of them. It follows that their differing interpretations rest upon the recoverable candidate of the UCs. Consequently, the different schools of thought have established a variety of rules that have serious consequences on aspects of Islamic law such as transactions and interpersonal relations (e.g, divorce) based on their interpretations of those UCs.

Drawing on their analyses and given the sensitive nature of the genre, I will argue and show that their study of UCs problematizes and challenges the notion of pragmatic enrichment. Generally speaking, there is a common consensus among the majority of them on the necessity of pragmatic enrichment. They, however, disagreed on two significant problems:

1. Is it the case that there are UCs?
2. If yes, then how an ‘appropriate’ enrichment can be contextually assigned to the proposition?

Unlike modern pragmatics, their copious examples show that sometimes pragmatic enrichment leads to further underspecification. This latter point questions not the necessity of pragmatic enrichment but the extent to which extra-linguistic elements can affect the truth-conditions of an expression.

# Pragmatic Failures of Using Chinese as a Second Language from International Students Majoring in Chinese Language

---

Lecture

---

***Prof. Jie Li<sup>1</sup>***

*1. Jinan University, Guangzhou*

1. This survey investigated the pragmatic (in)competence of International Students' using Chinese as a second language in a native background. As for pragmatic competence, it is defined as communicative ability to express speakers intended information properly and communicate appropriately in various social and cultural contexts. In this study, A questionnaire including proper/improper use of 10 Chinese phrases in different contexts and several open questions was employed to collect data from 36 informants, international students who are majored in Chinese Language and currently studying at a university in China. All of them have passed HSK6 test and are using Chinese as their second language. The results show that four types of pragmatic failure occurred in the data: 1) misuse of linguistic forms, which was observed from the informants' incorrect answers offered to the open questions; 2) failures in pragmatic strategies; 3) failures in pragmatic attitude expression; 4) lack of pragmatic identity; 5) Inconsistency between topics and context. These results can be mainly accounted for in line with the frame of pragmatic failure proposed by Thomas (1983): pragmalinguistic failure and sociopragmatic failure. Inadequate transfer and extending of L1 strategies was the typical one in the type of pragmalinguistic failure: participants have no idea what the proper social norms or rules for the 10 phrases under survey, , and extrapolate them to interaction in Chinese. Moreover, it was found that informants' failure in pragmatic attitude expression is consistent with the work by Padilla Cruz(2014).

# Pragmatic intervention in the realization of some functions of the pragmatic markers ‘you know’ and ‘I mean’ by Brazilian learners of English.

Lecture

***Dr. Aurélia Lyrio<sup>1</sup>***

*1. Universidade Federal do Espírito Santo (UFES)/Brazil*

This study reports the second phase of a research carried out with thirty advanced Brazilian learners of English. It focuses on the realization of some functions of the pragmatic markers *you know*, and *I mean*, after a period of pragmatic instruction. The first phase was in fact a pre-test to determine whether, and in which functions, these students used the markers mentioned. The results revealed that the learners’ use of *you know* exceeded that of the native speakers, in most functions, except in the ones related to politeness, in which the native speakers scored higher. The learners’ use was mostly literal, although there were also other functions in their discourse. Concerning *I mean*, only one function, which was not related to politeness was used by a student. Such findings provided the motivation for pragmatic instruction to this group of learners, in order to make them aware of the pragmatic markers multiple functions, and the importance of using them. After a meticulous study of the functions of the aforementioned markers, I determined those that would be the target of instruction. A week after the end of the two-month pragmatic instruction, the learners were submitted to a post-test, and a month later, to a delayed post-test. The findings show that although four functions of *you know* were taught, only two, occurred in the post-tests, one of them in positive politeness. There was, however, a sharp decline in the literal function of *you know* in the learners’ discourse in both post-tests, which indicates an awareness in relation to specific functions of this marker, possibly due to the pragmatic intervention. This hypothesis can also be validated by the rise in the two post-tests, of one of the functions taught. Regarding *I mean*, from the three functions taught, only one occurred in the post-tests. As in the case of *you know*, other functions appeared in both post-tests. Nevertheless, the research outcomes indicate profits from the pragmatic instruction. My theoretical framework for the functions of these markers is grounded on the research undertaken by Schiffrin (1987), Schourup (1985), Erman (1987, 2001), Östman (1981), Holmes (1986). To analyze the politeness dimension, I took into consideration Brown and Levinson’s (1987) work.

# Pragmatic markers in *The Adventures of Huckleberry Finn*: a conversation analytic approach

---

Lecture

---

**Dr. Fangyuan Dong<sup>1</sup>**

**1.** Shanghai International Studies University

While existing research has examined pragmatic markers in different literary works, little attention has been devoted to their use in Mark Twain's masterpiece, *The Adventures of Huckleberry Finn*. This article investigates pragmatic markers in *The Adventures of Huckleberry Finn* by means of a conversation analytic study, with an attempt to explore their functions in turn management and fiction interpretation. The analysis is based on an 112,056-word archive – the fiction itself, which contains ten most salient pragmatic markers and five combinations of pragmatic markers. The results reveal that similar to earlier investigations, pragmatic markers in *The Adventures of Huckleberry Finn* act as attention-attracting devices, frame markers, face-threat mitigators, hesitation or delay markers, repair markers, markers of insufficiency, markers of contrasting ideas, markers of attitude or emotion and indicators of new information in turn management. The findings also suggest that pragmatic markers in the novel perform such previously unidentified functions as markers of common ground, reminding markers, seekers for confirmation and reassurance, indicators of given information in turn management and are used as markers against racism or slavery, shapers of Huck, shapers of Jim, shapers of other notable characters, markers for localism and colloquialism in fiction interpretation. The study further indicates that the conversation analytic method can provide a new angle to the interpretation of pragmatic markers and the appreciation of *The Adventures of Huckleberry Finn*.

**Keywords:** pragmatic markers; *The Adventures of Huckleberry Finn*; conversation analysis; turn management; fiction interpretation

# Pragmatics of human-robot interaction (HRI): the case of Sophia, the humanoid robot

Lecture

**Dr. Anna Danielewicz-Betz**<sup>1</sup>

1. EU Business School, Munich

The focus of this qualitative study is on the human interlocutor's verbal and non-verbal behaviour during an encounter with Sophia, the social humanoid, as well as on the robot's demonstration of pragmatic competence, which is often contested as Sophia is frequently perceived by viewers not as an autonomous robot but rather an animatronic 'channelling device', relaying scripted communication fed by Hanson Robotics team. Moreover, Sophia's human resemblance when it comes to interaction and expression of emotion and intention is analysed, whereby perceptions of trust, anthropomorphism (Oztop et al., 2005), interaction comfort, and enjoyment are taken into consideration when assessing her social believability (cf., e.g., Müller et al., 2020; Nijssen et al., 2019; Strait et al., 2014) when it comes to giving out pragmatic cues.

The following pragmatic aspects are primarily accounted for when analysing social signals, with the interlocutors (both human and robotic) either conforming to or violating social norms (Guliani et al., 2015): speech acts, the Gricean maxims, Leech's maxims of politeness, humour, as well as robot identity.

All the data are secondary, and the preliminary data set consists of 52 videos of varying length - from 38 sec to 49 minutes - mostly interviews, but also panel discussions (also involving another robot) and monologues, with the total duration amounting to approximately 420 minutes. The corpus was mainly compiled by means of a purposive YouTube search (#SophiaRobot). "Sophia the Robot's" Facebook account, as well as "Sophia the Robot @RealSophiaRobot" Twitter account constituted additional sources of audio, video, and textual data. For the sake of external audience evaluation of HRI, relevant comments below the YouTube videos were extracted. The analysis tools include NVivo (content analysis) and ANVIL (video annotation).

# Pragmatics of referential strategies in Japanese and English narratives: L1, L2, and bilingual narratives

Lecture

***Dr. Keiko Nakamura<sup>1</sup>***

***1. Meikai University***

One important feature of telling a good story involves the selection of effective referential strategies. In the process of telling a story, narrators must be able to introduce new characters, maintain character reference, and re-introduce characters. Different languages have different strategies for doing so, and most narrators learn to do so effortlessly in their own language, using language-appropriate strategies. However, mastery of such referential strategies can be challenging for EFL learners, especially those learning a typologically different language.

This study examines the ability of Japanese EFL learners and Japanese-English bilinguals to achieve discourse cohesion in English through appropriate selection of referential strategies. Written narratives were elicited in both English and Japanese using the wordless picture book, *Frog Where are You?*(Mayer, 1969), from 100 Japanese EFL learners and 30 Japanese-English bilinguals using a method adapted from Berman and Slobin (1994). These narratives were compared to Frog Story narratives collected from Japanese (N=200) and English (N=200) monolinguals in a larger corpus to examine how language-specific aspects of the L1 referential system (Japanese) may influence L2 (English) narratives. Referential strategies used for referent introduction (first mention), referent maintenance (second /subsequent mention) and referent re-introduction of both the main character (i.e., the boy), secondary characters (e.g., the dog, the frog) and subsidiary characters (e.g., the bees, the owl) were examined.

The monolingual data showed the use of language-specific referential strategies in English (e.g., determiners, noun phrases, pronouns, nominal ellipsis) and in Japanese (e.g., NP-ga, NP-wa, null anaphora) respectively. In their English stories, EFL learners were able to use some basic English referential strategies such as pronouns (e.g., *he*, *they*), despite the fact that pronouns are rarely used in Japanese (Clancy, 1980). On the other hand, other strategies were more challenging, such as marking definiteness with articles to indicate givenness (Chafe, 1976) before referent nouns (e.g., *the dog*, *a frog*); narrators would often select the incorrect article or sometimes even use bald nouns. Despite the fact that all of the EFL narrators had 6+ years of studying English, they were not able to function like native writers of English. In contrast, bilingual narrators showed native-like use of referential devices in both languages. This study shows that Japanese EFL learners need more guidance to effectively achieve discourse cohesion in extended discourse.

# Pragmatics of the be + V-ing Form in 18th-century English letters

Lecture

***Prof. Mariko Goto<sup>1</sup>***

***1. Kyushu Institute of Technology***

This study investigates pragmatic features of the *be+V-ing* construction in 18<sup>th</sup>-century English letters. It has generally been viewed that the frequency and range of uses of the construction was very small at the beginning of the century and then remarkably increased in the next 300 years, but that may be because our perspective tends to be limited to written English data such as those in corpora. Since an overwhelming majority of the English language in use would no doubt be spoken English, if we take speech-based materials into consideration, the picture may be different. Although, of course, there is no 18<sup>th</sup> century spoken English text data available, letters written in the century seem to proximate it.

For instance, the frequency and usage patterns of the construction in a collection of letters written by ordinary people to their family members in around 1800, called *The Clift family correspondence 1792-1846*, appears to be quite analogous to that of the one in Present-day English. In this collection, the number of occurrence of the form is 380 per 100,000 words. It is almost the frequency of the form in PDE, which is 393, according to Kranich's (2010: 95) research based on ARCHER -2 corpus. Kranich also mentions that the progressive with an adverb such as *always* as expression of negative speaker attitude is a 20<sup>th</sup> century development (*ibid.*: 217), but a collection of letters written in 1701 contains 8 progressives of the same category; the occurrence rate in that collection and in PDE are about the same. Likewise, the rate of stative progressives in 18<sup>th</sup>-century letters that I have found going through around 7000, 000 words of letters in ECCO (Eighteenth Century Collection Online) page by page and its counterpart in Present-day English pointed out by Rautionaho and Fuchs (2020) on the basis of BNC corpus in its spoken sections are noticeably similar. Though infrequent in either period of time, the periphrastic form in its spontaneity does not seem to resist stative situations. When the communicators' concern is about their acquaintances' whereabouts and episodes, or events they have observed or experienced for example, the progressive is relatively more frequent. On the other hand, when discussing justice, philosophy or the writers' belief and ideas about general truth, it is rare in either time. The frequency of the form in written English seems to have increased in proportion to the literacy rate in the country, too. Analyzing the social, physical and pragmatic environment for 18<sup>th</sup>-century use of the form would demonstrate an intrinsic as well as consistent function of the *be+V-ing* construction, which is to denote an internal phase of the situation described by the *V-ing* form.

# Prepositions in a Cognitive Linguistics Framework: A Cross-Linguistic Comparison of Semantic Networks Between German and English Prepositions

Lecture

**Ms. Michelle Weckermann**<sup>1</sup>

1. University of Augsburg

This paper investigates prepositions in a cognitive linguistics framework, including image schemas and semantic networks to represent their polysemy. There is a wide range of research on this subject, including the polysemy of English prepositions (e.g. Hanazaki, 2005 for *by*; Tyler & Evans, 2003 for *over*), prepositions in different languages (e.g. Luraghi, 2009 for Italian *da*; Meex, 2001 and Bellavia, 1996 for German *über*), as well as cross-linguistic comparative studies (e.g. Taylor, 1988). However, only a small number of papers have constructed semantic networks to illustrate the polysemy of the prepositions, and many have based their analysis on made-up examples (e.g. Tyler & Evans, 2003; Lakoff, 1987).

This paper investigates the polysemy of the two prepositions *about* and *after* (among others, as this paper is part of a larger project looking at a range of prepositions) that have not received much attention in previous research. The aim is to construct semantic networks mirroring the polysemy of the two prepositions. Data on the prepositions' different senses was gathered from a selection of corpora, reflecting how the prepositions are employed in natural language. This included a legal corpus (EuroParl), as well as four novels from different genres (thriller, romance/drama, dystopia/fantasy, and philosophical novels) in order to ensure that the data is extracted from a range of topic areas that mirror as many of the different nuances of meaning manifested in the prepositions' senses as possible.

Furthermore, a cross-linguistic dimension was added to the analysis of the two prepositions. Using the same methodological approach, data was gathered for their translation counterparts in German (*um* and *nach*, respectively). The aim of this was to compare and contrast the semantic networks of the prepositions in English and German, observing how the prepositions behave cross-linguistically. Specifically, the goal was to look at whether prepositions are idiosyncratic in their polysemy or whether cross-linguistic similarities in the prepositions' senses can be spotted.

The analysis revealed that, while there are cross-linguistic similarities in the networks of the prepositions (e.g. *after* and *nach* both mostly have temporal and spatial senses), there are also interesting differences. *About*, for instance, translates as both *über* and *um* in German. Where English thus has one semantic network for *about* covering both its relational and spatial senses, German has two separate networks for these sense groups. The German network for *über* furthermore shows overlap with the English network for *over*.

This paper thus builds on previous research in three main ways: by investigating more and different prepositions (i.e. prepositions that have not been the focus of a lot of research yet), by employing natural and authentic corpus data, and by adding a cross-linguistic dimension to the semantic network-based analysis of the prepositions.

# Presenting self as a parent in a research interview: The immigrants from the post-Soviet states and their stories.

Lecture

***Dr. Aisulu Raspayeva<sup>1</sup>***

**1. CLIC, Rice University**

A research interview is a widely employed method for data collection across multiple disciplines (e.g., Denzin and Lincoln 2004). However, less attention has been devoted to examining a research interview as a dynamic interactional or speech event (e.g., De Fina 2011 2019; Mishler 1986), especially in under-researched cultural groups who may not possess the “shared practices and knowledge” of this speech event. Following the call for the *Pragmatics of Inclusion*, this study brings new insights on the intersection of the language practices and diversity by focusing on the linguistic behavior of the immigrant caregivers from the post-Soviet states residing in the USA during a research interview.

Integrating *narrative positioning analysis* (Bamberg 1997; Schiffrin 1996) and *agency* (Ahearn 2001; Hamilton 1998), I examine how the immigrant mothers construct their personal narratives around an ideology of *parental accountability* (e.g., Elliott 2010; Erikson 2003). Drawing on two personal narratives selected from the data set of 55 interviews, I demonstrate how mother-interviewees employ a reported speech or *constructed dialogue* (Tannen 2007) as a narrative strategy to display their *agentive* (a figure who acts) and *epistemic* (a figure who expresses beliefs/desires) selves (Schiffrin 1996). Thus, they are positioned as an agentive mother who is striving to preserve a native language in their children in the story world (Bamberg 1997) that allows them to present themselves as responsible mothers in the speech event of a research interview.

In the first case, the interviewee as a figure in the story-world confronts the group of husband’s relatives and the children themselves who pressure her to stop speaking Russian at home justifying with a belief in interdependency of a native language and culture. This act is represented via direct reported speech that allows the figure of the mother not only to *describe* what she states to confront the outside pressure but also *demonstrate* how she does it (Hamilton 1998). Thus, she is positioned as a mother agentive or capable (Ahearn 2001) in implementing the “only-native language” policy at home that contributes to her interactional presentation of a responsible parent.

In the second case, the interviewee as a figure in the story-world is positioned as a mother who fails to implement the “only-native language” policy with her children at home. This positioning is accomplished via constructed dialogue as well. Thus, the teller-interview voices a third party, i.e., experienced immigrant parents, who advise her to be agentive in speaking only in her native language with the children. Through the voice of the third party, this belief is emphasized (Labov 1972) as the “correct” language policy or the *standard* (Shiffrin 1996), against which all other actions of the mother (e.g., speaking only in English at home) are evaluated as a failure. Once again, this story-world positioning serves the base for the interactional presentation of a responsible mother. Summing up, this examination extends our understanding of the shared language practices in the immigrant minority group in the context of a research interview contributing to the *Pragmatics of Inclusion*.

# Presupposing indefinite descriptions in Italian political speeches

Lecture

**Dr. Federica Cominetti<sup>1</sup>, Dr. Laura Baranzini<sup>2</sup>, Prof. Edoardo Lombardi Vallauri<sup>1</sup>**

**1.** Roma Tre University; **2.** Osservatorio Linguistico della Svizzera Italiana; Università della Svizzera Italiana

The research question we tackle finds its empirical roots in the development and annotation of *IMPAQTS*: a corpus of transcribed Italian political speeches annotated per implicitation strategies, due by the end of 2022. In its currently available section (400,000 tokens), recurrent examples of NPs introduced by indefinite articles characterized by anaphoric specific reference were retrieved:

1) *Abbiate il coraggio di staccarvi da un monarca presidenziale che ha tradito la Costituzione.*

Be brave enough to break away from *a presidential monarch who betrayed the Constitution*.

Such examples must be interpreted in context as anaphorically referring to a specific referent: being recoverable in the left co-text or from the context and encyclopedic knowledge, such referent is known and identifiable. As such, they allegedly indirectly activate a presupposition of existence of the mentioned entity, thus suggesting that indefinite expressions can trigger existential presupposition similarly to definite descriptions.

In this paper we analyze the characteristics of such alleged “indefinite presuppositional descriptions”, which show a recurrent syntactic structure (i.e. the NP’s head is always modified) and can be classified in three sub-groups according to the semantics of the head noun. In fact, not only can it consist in a proper indefinite noun, e.g. *un monarca presidenziale* “a presidential monarch”, but often consists in a noun normally introduced by a definite article, being characterized by a unique referent, e.g. *un Parlamento* “a Parliament”, or a name, e.g. *un’Europa*, “a Europe”. In the latter two cases, the indefinite NP normally gets the interpretation of “current X” in comparison to past, future and possible ones, as in (2):

2) *Chiediamo a un’Europa che non ha creduto su questo tema un piano straordinario di investimenti.*

We ask to *a Europe which didn’t believe in this theme* an extraordinary plan of investments.

We also discuss, in terms of explicit/implicit meaning articulation and of speaker’s responsibility, the differences that indefinite descriptions show in comparison with definite descriptions – despite the assimilable interpretative result – and the reasons why they are not always interchangeable.

In conclusion, we formulate the hypothesis that the expansions to the indefinite NPs, which as mentioned are always present, add in the discourse fundamental information that constitutes the purpose of the statement, and allow to encode such information - typically critical or negative - in an implicit way (Lombardi Vallauri & Masia 2014, Lombardi Vallauri *et al.* 2020).

From a theoretical perspective, we question the traditional association between definiteness and presupposition triggering, as well as the implications evoked by existential presuppositions at the interface between the semantic and pragmatic levels of interpretation (see a.o. Sbisà 2007, Geurts 2010, Rouchota 1994).

# Proficiency and Internal Modifications in Second Language Mandarin Chinese Refusals

---

Lecture

---

***Mr. Jingxuan Wu<sup>1</sup>, Dr. Carsten Roever<sup>1</sup>***

***1. University of Melbourne***

This paper investigates the development of internal modifications in L2 Mandarin Chinese refusals. Specifically, it investigates the effect of L2 proficiency and the contextual variable Power on internal modifications in L2 Mandarin Chinese refusals. 28 L2 learners at three proficiency levels and 10 Mandarin native speakers participated in this study. The data were elicited through three role plays with different power relations. The results reveal that as L2 proficiency level grows, learners' repertoire of internal modifiers also increases both in the usage frequency and range of internal modifiers at their disposal. Lower intermediate level learners used the least number and commanded a limited range of internal modifiers. They tended to use formulaic and conventionalized linguistic tools to format internal modifiers. Upper intermediate learners employed a broader range of internal modifiers, including sentence-initial particles as downtoners, repetition of verbs, postponing markers, and cajolers, though some divergence to native speakers' norms are noticeable. Both lower intermediate and upper intermediate level learners usually placed the internal modifiers in the turn-initial or final position. Advanced level learners used the highest number of internal modifiers and they had a similar range of internal modifiers as Chinese native speakers. They also frequently inserted the internal modifiers at sentence internally, which converged with the native speakers' practice. While the linguistic formats of internal modifiers show greater diversification for advanced learners than lower level learners, even advanced level learners still lagged far behind native speakers, who employed more diversified linguistic expressions as downtoners, intensifiers, cajolers, hedges, and understaters, which were absent in L2 learners' data. They also used far more internal modifiers than all L2 groups. For the influence of the contextual variable Power on internal modification, all the three proficiency groups showed little evidence of development in sociopragmatic knowledge, as both the usage frequency and preferred type of internal modifiers in different contexts among L2 learners diverged from the native speakers' practice. We attribute our findings to different level of L2 knowledge, cognitive processing constraints, and the importance of noticing in acquiring pragmatic knowledge.

# Pursuing a response: how families employ alternative-offering questions in family consultations in Dutch neonatal intensive care

Lecture

**Dr. Joyce Lamerichs<sup>1</sup>, Dr. Mirjam De Vos<sup>2</sup>, Prof. Ellen Smets<sup>2</sup>, Ms. Aranka Akkermans<sup>2</sup>**

*<sup>1</sup>. VU Amsterdam, <sup>2</sup>. AmsterdamUMC*

This paper uses a conversation analytic (CA) approach to study formal family consultations in Dutch neonatal intensive care. Clinical practice in intensive care is increasingly moving towards implementing models of shared decision making (SDM) that incorporate contingencies and identify pragmatic strategies (Walther et al, 2018; Weiss et al, 2019). In neonatal critical care, family-centred care (FCC) is gradually embraced as an important communicative framework for care practices (see Wreesmann et al., 2020). At the same time, studies report that a lack of practical guidance, implementation gaps and unmet communicative needs identified by parents, still remain (Lorié et al., 2021).

So far, only a limited number of CA studies have conducted finegrained empirical analyses of formal family consultations in neonatal intensive care, as they occur *in situ*. The only study we know of, conducted in two neonatal care units in the UK, has examined the divergent ways in which treatment options are being presented to families (Shaw et al., 2016; Shaw et al., 2020). Depending on who initiated so-called ‘decision talk’, it was shown that doctors present treatment options differently (e.g. listing multiple options or recommending a single-option when initiated by parents or doctors, respectively).

Our study offers a contribution to CA studies in neonatal critical care by reporting on 17 hours of audiotaped data of formal family consultations, involving different doctors talking to seven families in consecutive meetings. In all consultations, acute concerns about the baby’s medical condition are presented to the families. We demonstrate how doctors present these concerns with elaborate informings that include largely implicit ways of addressing the possibilities and limitations of continuing life-sustaining treatment. We present a collection of 83 instances in which families, in response to these informings, pose alternative-offering questions (AOQs), formatted to include two ‘model’ answer options (Pomerantz, 1986). We present detailed evidence of what these questions index and how they are subsequently dealt with.

Our findings illustrate the interactional difficulties physicians experience in responding to AOQs. We demonstrate three types of findings: (1) doctors do not deal with the candidate answer options embedded in the parent’s questions in their subsequent turn, and produce claims to no knowledge or uncertainty; (2) doctors treat the AOQ as topicalising an ‘untimely’ subject (i.e. the child’s demise) which results in closing the topic rather than to elicit further topical talk on families’ underlying concerns, (3) physicians responses may address only one of the embedded options in the question, which we show to be the cause of further troubles in the ensuing talk. We conclude that the sequential placement of AOQs and how they are being treated, indexes the dilemma of how and when to adequately elicit families underlying concerns and worries. Our study highlights the interactional efforts parents have to undertake to voice their concerns as explicit, candidate options, in response to doctors’ elaborate accounts. We also showed how appreciation of communication frameworks such as SDM or FCC need to be more firmly grounded in interactional analyses, and what such a fine-grained approach might offer.

---

# Raising both eyebrows in interaction

---

Lecture

---

***Dr. Carolin Dix<sup>1</sup>, Dr. Alexandra Groß<sup>1</sup>***

***1. University of Bayreuth***

Facial movements are an essential interactional resource for the constitution of the multimodal gestalt of actions. Formerly being almost exclusively viewed as a human way of expressing emotions (e.g. Ekman 1979), their interactional impact as *facial gestures* has been discovered by researchers working in the tradition of communication theory (e.g. Bavelas & Chovil 2018) as well as conversation analysis and multimodal interaction analysis (e.g. Kaukomaa, et al. 2014). However, it still remains a desideratum to systematically approach the human repertoire of facial gestures occurring in natural f2f interaction in order to specify their contribution to action formation, to the organization of talk and interaction as well as to displaying participation (Alt 2020). In our paper we want to contribute one little puzzle piece to this tremendous task by shedding light on formal, distributional and functional aspects of one specific category of facial movements in interaction: *raising both eyebrows simultaneously* (RBE). Goodwin & Goodwin (1986) describe RBE as one possible cue of the *thinking face* during word searches; it has further been classified as *visual prosody* (Ambrazaitis & House 2017) and as part of offering-sequences (Kärkkäinen & Keisanen 2012). Other researchers mention the *eyebrow flash* as part of greetings (e.g. Ekman 1979).

By means of videotaped data of naturally occurring german conversations (i.a. dinner conversation, conversations while driving a car) we will show how formal manifestations of RBE (especially the eyebrow flash & wagging) and temporal variations (short flash vs. long flash) in co-occurrence with verbal, vocal and other bodily resources reflect functional specificities, e.g. operating as change-of-state-token and contributing to the embodiment of offers, evaluations and repair initiations.

# Recollection as a social practice

---

## Lecture

---

***Dr. Alan Zemel<sup>1</sup>, Ms. Shengqin Jin<sup>1</sup>, Ms. Olivia Mata<sup>1</sup>, Ms. Bryanna Hebenstreit<sup>1</sup>***

***1. University at Albany SUNY***

We analyze and explicate recollecting work and the recollections such work produces using Conversation Analysis. Actors routinely recognize and distinguish recollecting from other kinds of activities. We consider how interlocutors accountably produce and respond to utterances as recognizable recollections, and the interactional work such recollections do. Our data consist of four corpora of recordings of naturally occurring, institutional interactions.

Analysis suggests that recollecting is a social practice in which actors report on events or outcomes that are no longer experientially accessible to interactants. Recollecting treats reported events as actors' *prior* experiences in a manner designed to make those experiences available to others. Recollecting often uses storytelling formats (Mandelbaum, 2013) where the storyteller is both the speaker in the moment and an actor in the 'story'. This allows a speaker to assume a testimonial relationship to recipients and display an experiential (Heritage, 2011) relation to reported events.

The following excerpt from a psychotherapy session displays a recognizable recollection in which P uses a first-person report, addressed to the therapist, to formulate an event as his prior experience:

- 1 P: I could hear my mom screamin (.) one day and I don- pff (.)
- 2 I don't know what I heard (.) that triggered it cuz usually
- 3 it's triggered by something-

The 'screaming' was reportedly heard by P but not the therapist. It is not experientially available to either P or the therapist during P's telling. P and the therapist relies solely on P's formulation and their "mastery of natural language" (Garfinkel & Sacks, 1970) to make the recollected occurrence mutually available.

In our investigation, we observe that recollecting may be *self-initiated*, as when a speaker 'volunteers' a recollection, or *other-initiated*, as when a speaker responds to an inquiry about a prior occurrence. It may be *individually or conjointly achieved*. Also, recollections can be challenged and *called to account*, as occasionally occurred in the House Intelligence Committee's Impeachment Inquiry Hearings (2019). Recollecting is a practice that interlocutors use to *accomplish various actions*, including informing, eliciting affiliation and solidarity, identifying issues, instructing, demonstrating, etc.

When members recollect, they utilize interactional resources in the moment to 'contextualize' their current (inter)actions in terms of past occurrences. Furthermore, recollecting constitutes and affirms current relationships among actors engaged in recollecting work in terms of the actions currently performed and the shared and shareable 'histories' that recollecting makes relevant in the current interaction.

# Recollection as a visible and progressive embodied realization in interaction

---

Lecture

---

***Dr. Hideyuki Sugiura<sup>1</sup>***

***1. Doshisha University***

Previous conversation analytic studies uncovered that recollection is made intelligible as a social phenomenon in interactions, rather than as a mental process in an individual's mind. Most of these studies focused on turn-initial or turn-final particles in different languages that participants employ to claim remembrance in various ways (e.g., Betz and Golato, 2008; Hayashi, 2012; Heritage 1984; Koivisto, 2013). Although these studies examined the use of particles as an integral part of an act of recollection, they have not investigated in depth the use of other, particularly nonverbal, resources mobilized by participants to accomplish an act of recollection. From the conversation-analytic perspective of multimodal interaction, this study investigates how each moment of an act of recollection is systematically realized using both verbal and nonverbal resources in a temporally unfolding interaction. The data used in this study comprise 10 video recordings of everyday Japanese conversations. The study particularly focuses on cases where multiple parties work together to recollect a certain temporally forgotten word. The data exhibit that an act of recollection is best understood as a visible and progressive realization that is made possible by the coordination of multiple resources mobilized by participants. In one of the cases examined in this study, at the onset of recollection, one of the participants (X) first recollects a certain word, begins to build a turn at talk with a change of state token a ('Oh') while temporarily withdrawing his gaze from a co-participant (Y). Subsequently, X claps his hands once, and immediately turns his gaze back to Y. As noted by Goodwin (1981, 1987), by turning his gaze to Y, X appears to direct his action in progress toward Y. X then points towards Y's body. At the point of establishment of X's pointing, he utters the recollected word and claims remembrance. The delivery of the recollected word assumes a peculiar shape. That is, the recollected word is delivered twice in a row at a noticeable pitch. X maintains his pointing and eye-gaze toward Y even after producing the recollected word. After hearing the recollected word, Y, who now recollects the word after X does, turns his gaze toward X and begins to produce the recollected word before X completes his turn. Subsequently, Y quickly begins to point to X's body following the onset of the recollected word. Further, similar to X, Y produces the recollected word twice in a row, followed by multiple sayings of *soo* ('right'), which strongly confirm that the recollected word spoken by X is the right one. In summary, the act of recollection is not merely performed by a turn at talk but is actualized moment by moment as a public display of progressive and visible realization through the temporally coordinated use of multiple resources.

# Recycling and replacing repairs as self-repair strategies in Hungarian and in Hungarian as a foreign language conversations

Lecture

**Dr. Anett Arvay<sup>1</sup>, Dr. Zsuzsanna Németh<sup>2</sup>**

*1. University of Szeged, 2. Department of General Linguistics, University of Szeged, MTA-DE-SZTE Research Group for Theoretical Linguistics*

Recycling and replacing repairs as self-initiated same-turn self-repair strategies have been thoroughly examined in the conversation analytic literature. Fox et al. (2009) investigated the site of repair initiation and the length and syntactic class of words in which the repair is initiated in seven areally and typologically diverse languages: Bikol, Sochiapam Chinantec, Finnish, Indonesian, English, Japanese, and Mandarin. They found that there is an underlying universal tendency to initiate recycling after and replacing before recognisable completion, but this pattern is sometimes masked by language-specific features (Fox et al. 2009: 80). That is to say, the morpho-syntactic structure of the particular language always plays a role in the use of the repair operation. Literature suggests that in languages which have function words preceding content words, speakers tend to recycle back to function words rather than content words (Fox et al. 2010: 2504). Németh (2012) explored the same factors in Hungarian. She found that Hungarian fits the patterns suggested as universal.

All the studies so far have analysed native speakers' encounters, however, no research has been examined whether the universal tendency is also present in interlanguage i.e. when speakers use a foreign language during communication. The aim of this paper is to explore the same variables in Hungarian as a foreign language (HFL) conversations with regards to recycling and replacing repairs. The data collection was designed to create a parallel corpus with Németh's (2012) research on Hungarian native speakers' self-repair strategies. Ten three-participant dialogues will be recorded in which the participants have different native languages and speak Hungarian as a foreign language at a B2-C1 level.

During the analysis, we explore (1) the frequency of recycling and replacing repairs in the corpus, (2) the syntactic category and length of the target word in all recycling and replacing instances, and (3) the location where speakers initiate repair in the target word in all recycling and replacing repairs in the corpus. In order to see the relationship between the variables listed above, we will use 2x2 and 2x3 Pearson's chi-square statistics. Since research studies show that the morpho-syntactic structure of the language of the conversation has an effect on repair strategies, it is hypothesised that the HFL participants employ the same repair strategies as the Hungarian native speakers.

Key words: interlanguage, repair strategies, Hungarian as a foreign language

# Referring to COVID-19 in Estonian emergency calls

Lecture

**Dr. Tiit Hennoste<sup>1</sup>, Dr. Andriela Rääbis<sup>1</sup>, Dr. Andra Rumm<sup>1</sup>, Ms. Piret Kuusk<sup>1</sup>, Ms. Andra Annuka<sup>1</sup>,  
Dr. Kirsi Laanesoo<sup>1</sup>**

*1. University of Tartu*

The topic of our lecture is referring to COVID-19 (in Estonian *koroona/koroonaviirus* 'corona/coronavirus') in the phone calls to the Estonian Emergency Response Centre.

Our research question is how callers refer to COVID-19 when they mention it at the first time and how they create their role and position in relation to the COVID-19 through it.

Our data come from the corpus of emergency calls at the University of Tartu. Method used is Conversation Analysis.

The preliminary results reveal that callers who use the word *koroona* 'corona' can be divided into three.

Callers who use the word *koroona* 'corona' without any problems. Those callers often distance themselves from COVID-19, e.g. saying that they are calling for another person (Example 1).

(1)

C: tere mul on seoke mure et mu naisel on kahtlus et tal on võibola koroonaviirus. tal on astma ta- tal on ingamisraskused

'hello I have such a problem that my wife has a suspicion that she maybe has the coronavirus. she has asthma she she has problems with breathing'

Callers who refer to *koroona/koroonaviirus* 'corona/coronavirus' as known/old information, e.g. by using marker of definiteness *see* 'this, the' (Example 2: *selle koroonavirusega* 'with this coronavirus').

(2)

C: tere ee mul on selle koroonaviirusega üks siuke: juhtum millest ma taaks teile rääkida

'hello uhm I have such a case with this coronavirus that I want to tell you'

Callers who initiate word searches (hesitation markers, placeholders etc) before the word *koroona/koroonaviirus* 'corona/coronavirus' (Example 3: placeholder *selle* and hesitation pause). The search can be an indication of the trouble but also device for delaying the negative information.

(3)

C: ma tahtsin küsida selle kohta selle (.) kuradi koroonaviiruse kohta

'I wanted to ask about it about this (.) damned corona virus'

Another group of callers refer COVID-19 indirectly. They avoid the word *koroona* 'corona' and use words like *viirus* 'virus', *haigus* 'disease', list of some symptoms (like cough), or only mention that they want to take a 'test' (i.e. COVID-19 test) (Example 4).

(4)

C: sooviks teha (.) sooviks teha testi. .hhhh

'I would like to take (.) would like to take a test. .hhhh'

In our presentation we describe different referring variants and compare them with the variants that the speakers use when they are talking about other diseases in the calls to the Emergency Response Centre.

# Relational work in intercultural business communication: A multimodal interaction analysis of an Austrian-Russian joint venture

---

Lecture

---

***Ms. Anna Golovko<sup>1</sup>***

*1. Vienna University of Economics and Business*

Interpersonal relationships are crucial for business partnerships. Yet, building an interpersonal relationship in a business context is far from easy, especially between business partners with different language repertoires and cultural backgrounds. In order to investigate these complex relations, the present study aims to examine interpreter-mediated communication between business partners from Austria and Russian-speaking countries by focusing on how their relationships are built through communication.

What challenges do the business partners who seek to found a joint venture in renewable energy face when it comes to their communication? What communicative means do the interactants use to overcome these challenges, to establish rapport, and to shape their interpersonal relationship? In order to answer these questions, a multimodal interaction analysis of video-recorded interactions between business partners is carried out. To this moment, 7,5 hours of video-recordings of interactions between business partners who have been working together on a wind park for 5 months are collected, which allows to identify recurring patterns of interaction and to observe the process of building rapport over time.

The present study is a part of a PhD-thesis in progress, which aims to contribute to the body of research on cross-cultural business communication and to fill an important research gap by providing an analysis based on authentic video-recorded interaction data. This, in turn, will help to develop recommendations which could be used in cultural awareness trainings. These trainings are meant to prepare Austrian companies for establishing business contacts and conducting successful interactions with enterprises from Russian-speaking countries.

# Relational Work in Online Child Sexual Groomers' Manipulative Discourse – New Insights from Spanish-language Data

Lecture

***Dr. Sergio Maruenda-Bataller<sup>1</sup>, Prof. Nuria Lorenzo-Dus<sup>2</sup>, Dr. Carmen Pérez-Sabater<sup>3</sup>***

*1. IULMA/Universitat de València, 2. Swansea University, 3. Universitat Politècnica de València*

Online child sexual abuse/exploitation, within which online child sexual grooming (henceforth OCSG) is embedded, is a growing social challenge globally. This may account for an also growing body of academic scholarship into OCSG over the past decade or so, primarily within the disciplines of Criminology and Psychology (see, e.g., Burton et al. 2016; Craven, Brown & Gilchrist 2006; Kloess, Beech & Harkins 2014; Patrick et al, 2016; Smith, Thompson & Davidson 2014; Webster et al. 2012; Whittle et al. 2013). Comparatively, Linguistics scholarship into OCSG is still 'in its infancy' (Chiang and Grant, 2018, p. 2). This is somewhat ironic given that OCSG is 'an internet-enabled, *communicative* process of entrapment in which an adult uses language and other semiotic modes (e.g. images) to lure a minor into taking part in sexual activities online and, at times, also offline (Lorenzo-Dus et al 2020: 15-16). A number of recent Discourse Analysis/Pragmatics studies have begun to fill this gap in contexts in which OCSG happens through the medium of the English language. Their findings regarding offenders' discourse strategies (Lorenzo-Dus et al 2016; Chiang and Grant 2018; Lorenzo-Dus and Izura 2017; Lorenzo-Dus and Kinzel 2020, forthcoming; Grant and Macleod 2020) and children's perception of offenders' communicative behaviour (Lorenzo-Dus and Mullineux 2020) provide a strong foundation for examining OCSG discourse in other languages.

In this presentation, we report and discuss the findings of the first analysis of OCSG discourse in Spanish, with a novel focus on offenders' strategic use of 'relational work' (Watts and Locher 2005, 2008) therein. Our data comprise all the case files about OCSG available within the Spanish *Centre of Judiciary Documentation of the General Council of the Judiciary* (CENDOJ) for the 2018-20 period (164 cases, involving 85 convicted offenders and 154 child victims). Within each case file, all the conversational fragments containing a verbatim reproduction of the online interactions between the offenders and their victims were selected for analysis. Our results highlight offenders' use of face-maintaining strategies, typically oriented to the victim's positive face needs (e.g. compliments), alongside face-threatening behaviours that are primarily oriented towards the victim's equity rights (e.g. threats and commands). We also find offenders' strategic use of both vague language and sexual explicitness aligned to a number of goals, ranging from getting their victim to trust them through to seeking to isolate her/him physically and affectively from meaningful others. Overall, our analysis reveals the complex, and clearly manipulative, relational work that offenders perform during OCSG. Importantly, and from an applied research perspective, our findings inform ongoing development of targeted interventions for professionals with child-safeguarding roles, such as police officers, social workers and educators.

# Relational work in tourist offices in Flanders, the Netherlands, France and Wallonia. A corpus based analysis of opening and closing rituals from a cross-cultural perspective.

Lecture

***Prof. Els Tobback<sup>1</sup>***

**1. University of Antwerp**

This paper sets out to draw the interactional profile of opening and closing sections in tourist offices in four geographically close regions, with the aim to reflect on the way interactants in this specific setting perform ‘relational work’ and construe their interpersonal relationship. It offers a quantitative analysis of speech acts and their concrete linguistic realisations in 400 intralingual interactions in 13 tourist offices spread over Flanders, Wallonia, (the southern part of) the Netherlands and (the north-eastern part of) France.

The results show, first of all, that the interactional profiles appear to be different in the four regions, though also between the main interactants in each of the regions. However, French-language interactions overall show to have a great deal of characteristics in common, while at the same time differing “en bloc” from the Dutch-speaking regions. The differences hint at a distinction between two types of involvement (Scollon & Scollon 1995/2012, see also Márquez-Reiter & Placencia 2004, Félix-Brasdefer 2015). Whereas the French-language interactants mainly show involvement by being very interactive (voluble), in the Dutch-language interactions, involvement appears to be more fairly associated with higher levels of informality, expressivity and complicity. This being said, in contrast with the French-language interactions (limited differences), Dutch and Flemish interactions appear to be rather different, the former displaying a higher degree of interactivity, informality and expressivity than the latter.

Although our data only concern an extremely tiny part of all possible interactional situations, the results offer food for thought with regard to the question of how Belgium’s main language communities relate to the two neighbouring regions with whom they respectively share the language. In socio-psychological studies, Belgium has often been analysed as a monolithic cultural bloc, close to the French and far away from the Dutch cultural profile (e.g. Hofstede 2001), although, more recently, Minkov and Hofstede (2014) showed Flanders to be fairly different from both French and Walloon cultural values. While taking every possible precaution, and only admitting at a very abstract level that general cultural values somehow percolate to communicative patterns, our results seem to confirm that, conversationally speaking, Flemish interactants behave differently both from the Dutch and from the Walloon interactants.

# Repair in child–robot interaction

---

Lecture

---

***Prof. Marjut Johansson<sup>1</sup>***

*1. University of Turku*

In this study, my aim to explore child–robot interaction (CRI) in the context of a foreign language learning (FL). In their recent paper, Guzman and Lewis (2020) proposed that human–machine communication (HMC) should be considered as *communicatively oriented* research, and this perspective is adopted here. In addition, following the proposition of Gunkel (2020), research on artificial intelligence (AI) should target how we, as humans, *are related* to AI-based systems and how *we respond* to them in social situations. I will study FL learning conversations that children have with a robot as verbal interactions, especially from the perspective of repair.

As regards CRI, the role of robots has been studied, especially as tutors for learning (Belpaeme et al. 2018). Research on robot-assisted language learning focuses on word learning, reading, and motivation, among other aspects (Berghe et al. (2018)). However, the communicative perspective has yet to be adopted in studies on CRI and HMC. Recent attempts integrate robot developers know-how and linguists and interactional knowledge (e.g., Fischer et al. 2020). Some novel studies propose conversation analysis as an analytical perspective (e.g., Pitsch 2020; Rollet & Clavel 2020).

In this study, the interactional relationship between children and robots is asymmetrical even though the robot is introduced in the language classroom. My research questions focus on what kind of trouble arises in these interactional sequences between a child (or children) and a robot and what type of repair children implement in these situations. I focus on the repairs carried out by one child as well as those negotiated by the children among themselves. The theoretical and methodological approach draws on conversation analysis as well as interactional and digital discourse analysis.

Social robots have recently been adopted in a few Finnish primary schools as part of their pioneering L2 language learning projects. The robot Nao has been used in FL learning situations with pre-programmed learning material. The data are videotaped interactions (altogether 42 recordings) with children (7–12 years) who are learning English. The children, interacting in dyads or groups with the robot, strive to have discussions on familiar topics with the robot.

# Reported Speech and Its Evaluative Meaning in Chinese Criminal Trial Discourse

Lecture

***Mrs. ZeJun Ma<sup>1</sup>, Ms. Yaqian Guo<sup>1</sup>***

***1. Dalian University of Technology***

The court trial is the most important judicial activity, for the judgment and ruling in court is closely related to the property and even the life of people involved. Therefore, all participants in court trials attach great importance to the use of language and choice of strategies to achieve their communicative purposes. Reported speech is one of the important strategies commonly employed by court participants. Both the identification and confirmation of legal facts and the presentation of relevant laws in court trials are inseparable from the use of reported speech.

This paper aims to compare and analyze the linguistic features and the evaluative meaning of reported speech employed by the prosecution party and the defense party at both the lexical and the phonological levels through quantitative and qualitative analysis of reported speech taken from 40 criminal cases from *Trial on the Scene* (A CCTV-12 Programme) and the Website <http://tingshen.court.gov.cn/> (the website that broadcasts trials in Chinese courts). In 40 cases collected, 1860 examples of reported speech are labeled and collected as data. The appraisal resources utilized by different participants when reported speech is used are analyzed and the visible contours are drawn with the help of the software *praat* reveal the evaluative meaning of reported speech.

It is found that the participants in court use reported speech as a strategy to achieve their communicative intentions and the use of reported speech and its evaluative meaning are influenced by the speaker's identity. Here are the main findings. Firstly, in court trial, the prosecutors use the reported speech most frequently to provide legal support and to construct the legal fact. Among these, most speeches are from the specified others and written documents. In contrast, the defense attorneys and the defendants usually reproduce utterances of fact from self and specified others to reconstruct the scene when the crime was happening. Secondly, in the process of reporting, the speakers directly express their stance and attitude by adding evaluation. The prosecutors often use positive judgment about themselves to confirm the reliability of the evidence, but they usually report utterances showing negative evaluation towards the defendants to expose their cruel behaviors and their evil motivation. The defense party tends to shirk the responsibility through negative judgment on the behaviors of the victims or the plaintiffs and negative judgments are usually used by the defense party with the intention to deny the crime or to achieve the goal of mitigating the degree of penalty. Thirdly, through the analysis of prosodic features such as pitch, intensity and duration in the employment of reported speech by the prosecution party and the defense party with the aid of software Praat, it is found that speakers can express evaluation indirectly. Prosecutors can express querying, reminding, or condemning by increasing intonation and intensity; whereas the defense party conveys his cooperation or refutation through increasing the pitch or lengthening the duration, or just emphasizing the important information in their utterances.

# Reported thought's functions in an Angolan civil war survival autobiographical narrative

Lecture

***Dr. Mercia Flannery<sup>1</sup>***

*1. The University of Pennsylvania*

Within narrative discourse, reported speech or constructed dialogue is a linguistic resource that allows for the mimetic presentation of characters and their actions and whose main documented functions are to signpost evaluation and instantiate identity (Schiffrin, 2000; Clark and Gerrig, 1990; Tannen, 1989; Labov, 1972). Relatively less attention has been given to reported thought, or “inner speech” (Tannen, 1989: 114; Haakana, 2007) which, although not uttered in the story world, may reveal the narrator’s and the characters’ perceived stance in the represented interactional order (Goffman, 1974). This paper investigates the use of reported thought in excerpts of the oral life history of an Angolan civil war survivor, exemplifying its functions in this type of narrative discourse, in Portuguese. According to Bakhtin (1997: 174), in autobiographic narratives a narrator may perform two roles, as 1) author and 2) as character, or “hero”. Such narratives feature the author-as-character in the development of a sequence of actions, over an extended period, “in relationships with others in certain places at certain times” (Horsdal, 2016: 267). Coherence is attained in these texts both by their orientation to a larger social context and to a defined historic period (Bakhtin, 1997; Horsdal, 2016). In the specific case of the autobiography analyzed in this paper, the narrator presents himself in the context of the long and violent Angola’s civil war (1975-2002), showing the impact that this defining historical event had on his personal life, and to the development of his moral self (Stets and Carter, 2011). This is an autobiography of transformation whose most significant narrated events are 1) the death of the narrator’s mother, 2) his encounters with law enforcement and the military representatives, and 3) his religious conversion during the war. While presenting these episodes in narrative discourse, “from the contextually situated point of view of here and now” (Horsdal, 2016: 267), the narrator employs several instances of reported thought, animating his relationships with others. These uses of reported thought 1) represent the reactions of those with whom the narrator interacts in the story-world, leading to complex formulations of identity (Spronck and Nikitina, 2019) for self-vis-à-vis others, 2) build prototypical roles in a narrative of conflict, i.e., survivor or hero, victim, perpetrator, bystander (Bakhtin, 1997; Schiffrin, 2000), and 3) are not syntactically expressed with typical epistemic verbs in Portuguese, such as “pensar”, “achar”, i.e., to think, or verbs of saying, such as “dizer”, “falar”, i.e., to say, to speak. This paper contributes to the body of work on reported speech, presenting an analysis of reported thought’s functions in excerpts of the oral life history of an Angolan civil war survivor, in Portuguese.

# Research on Irony in English vs non-English languages: a review and meta-commentary

Lecture

**Dr. Ewa Dryll<sup>1</sup>, Mr. Piotr Kałowski<sup>1</sup>, Ms. Katarzyna Branowska<sup>1</sup>, Dr. Natalia Banasik-Jemielniak<sup>2</sup>**

***1. University of Warsaw, Faculty of Psychology, 2. The Maria Grzegorzewska University***

Research on verbal irony covers a broad array of topics, both theoretical and practical. A debate concerning the very definition of the term - what is "irony"? (Kreuz, 2020) - is far from over.

Notably, this debate has largely been advanced in the English language, using English examples and data from English-speaking participants. We argue that focusing one language may have significant consequences for irony research - both the conclusions drawn from the empirical data as well as the trends in published research. This is because language use is known to be influenced by numerous factors, including cultural ones. A comprehensive framework by Hofstede (2001) includes such dimensions as masculinity/femininity, tolerance of uncertainty, or power distance (i.e., emphasis on hierarchical relations). It seems pertinent to assume that since these factors impact language use, they impact the use and understanding of irony as well. Furthermore, a more complex relationship is also possible in which cultural factors mediate/moderate individual factors in the context of irony use or vice versa. Generalizing research findings from one language (usually English) to another, especially in the case of more sophisticated phenomena as irony, may result in inaccurate conclusions and significant information loss. Therefore, we advocate for a (cross-)cultural view on irony and paying more attention to research and publications in less popular languages.

To this end, we will present the results of an ongoing review of scientific literature on verbal irony in languages other than English, including Arabic, Chinese, Croatian, Czech, French, German, Hebrew, Italian, Polish, Russian, Slovak, Spanish, and Turkish. With the help of professional translators, we have identified and selected 400 articles. By way of inductive content analysis (Braun & Clarke, 2006), we will present how the construct of verbal irony is presented in these publications in order to identify the patterns of cross-cultural differences and similarities in research. Do researchers tend to agree on the definition of irony across languages? Is it a concept that is easily translated into different languages? How is English-language literature on irony used by non-English-speaking authors? What areas of research on irony are undertaken by scientists from non-Western cultural spheres?

The synthetic overview of the literature which we propose will be of interest both for researchers of verbal irony as well as for linguists in general, serving as meta-commentary on the state of the science.

# Resolving troubles in automatic registration: Customers calibrating their responses during facial recognition

Lecture

***Ms. Xinzhi Xu<sup>1</sup>, Prof. Christian Greiffenhagen<sup>1</sup>***

***1. The Chinese University of Hong Kong***

Facial recognition has been widely used in many self-registration settings. To achieve a wide coverage of facial recognition in those settings, people need to follow a series of pre-programmed machine instructions (e.g. “close your eyes”, “open your eyes”, “shake head”) given by the system. However, what happens if this process did not smoothly succeed? For instance, in many settings, the system does not identify a source of error, but simply repeats the instructions several times. People have to figure out “*what might be wrong*” by themselves during the on-going interaction by calibrating the way they respond to the instructions. Drawing on the approach of ethnomethodology and conversation analysis (EMCA), this paper investigates the calibration of people’s response to the recurrent facial recognition instructions through video recording of automatic self-registration in two robotic hotels in Mainland China.

Researchers have defined “directives” as utterances which are “designed to get someone to do something” (Goodwin 1990:65) and “need to be complied with” (Craven & Potter 2010:426). Therefore, previous directive/response sequences studies mainly talked about how directors re-design their turn, upgrade the directive-words, or adding physical instruction into directives given the un-achievement of their purposes during the interaction (e.g. Craven & Potter 2010; Goodwin & Cekaite 2013; Takada 2013). It was the *directive-giver* who calibrated their directives all the time. On the contrary, directives in this paper have nothing to change the whole time. It is the *responding party* who calibrates their response in the light of the un-achievement of interaction. Thus, this paper makes a novel contribution to studies on directive/response sequences via including the analysis on the calibration of responses in practice.

This study focuses on analysing the calibration of people’s response to the *exact same instructions* at the second and later cycles. This paper has two major findings: (a) people did respond differently under the same directives at the subsequent cycles (e.g. they change the frequency of head-shaking from less to more and keep their eyes closed longer and more firmly). (b) knowing the whole sequence of the instruction helps people formulate a comprehensive understanding of the directives of the facial recognition system during the human-computer directive-response interaction.

# Russian immigrants in Cyprus: Request strategies and (im)politeness of on-line communication

Lecture

***Dr. Sviatlana Karpava<sup>1</sup>***

**1. Univ**

Request speech acts and mitigating strategies in L1 and L2 have been widely and thoroughly studied across languages and cultures revealing cross-linguistic differences (Blum-Kulka and Olshtain, 1984; Economidou-Kogetidis, 2008, 2009, 2012, 2013; Ruiz de Zarobe and Ruiz de Zarobe, 2012; Webman Shafran, 2019). Appropriate use of the request form in a social context depends on such factors as L1, culture, age and gender of the interlocutors, social distance and power relations as well as the degree of imposition. Native speakers acquire pragmatic competence subconsciously through exposure to native language from birth, which is not the case with L2 learners who need to put a conscious effort in order to learn pragmatic rules in L2 (Blum-Kulka, 1982; Bardovi-Harlig and Hartford, 1990; Nelson et al., 2002; Webman Shafran, 2019).

This study investigated (in)directness, internal and external modification and hearer/speaker perspective of request strategies (Blum-Kulka et al., 1989; Tannen, 1993; Economidou-Kogetidis, 2008; Ogiermann and Bella, 2020) in L1 Russian, L2 English and L3 Greek and (im)politeness of on-line communication by Russian immigrants residing in Cyprus. The focus is on their pragmatic behaviour and on-line interactional practices depending on the topic of the discussion/chat, group post, interlocutor characteristics. We have analysed 500 posts (Russian, English and Greek) and relevant comments on various topics such as job, career, entertainment, services, leisure time, food, family, children, school, travelling, COVID 19, health care, politics (open-access FB group).

Overall, it was found that the participants tend to have a preference towards direct request strategies and bold on record politeness in L1 Russian posts and comments, while conventionally indirect requests were implemented mostly in L2 English and L3 Greek. This is in line with the previous research that showed that conventionally indirect requests are the most preferred strategies universally even though there are some variations across languages and cultures (Blum-Kulka et al., 1989; Stavans and Webman Shafran, 2017; Webman Shafran, 2019).

The analysis of the data showed that such factors as the language and the topic of on-line interaction as well as social distance, hearer dominance, power, familiarity and imposition affect the degree of (in)directness, request perspective, internal and external modification. The requests in L1 Russian were mainly speaker-oriented, while the ones in L2 English or L3 Greek were hearer-oriented or impersonal. There was also correlation between the level of directness and the request perspective as direct requests (imperative) have the hearer perspective; indirect requests can have speaker, hearer, inclusive or impersonal perspectives, which is in agreement with the previous finding by Ogiermann and Bella (2020). It is interesting to note that the participants of on-line communication code-switch and code-mix a lot, especially when they would like to emphasize the information or talk about specific (cultural) issues of Cyprus. The participants of our study implemented more external than internal modification in their requests posted in a FB group as they might opt for the explicit realization of politeness (Faerch and Kasper, 1989) or find this way of modification to be easier than the lexical one (Hassall, 2001, 2012).

# Secondary Procedural Schema Transfer in an L2 into an L3 Translation: An Exploratory Qualitative Study

---

Lecture

---

***Prof. Mariko Boku<sup>1</sup>***

**1.** Ritsumeikan University, Japan

Sperber and Wilson (1986, 1995) proposed a theory of relevance, which claimed that the human brain has innate domain-specific modules for comprehending utterances that are encapsulated and are not associated with other modules or systems. Relevance theory assumes that individuals evaluate their own schemas (including encyclopedic entries) and choose the one that requires the least amount of effort for disambiguation, reference assignment, and enrichment. Based on this theory, we might ask: Will an individual always find the schema embedded within a particular language module to be available at the time of translation? Which schema does a trilingual speaker choose when translating a second language (L2) into a third language (L3)? It might be difficult to answer these questions based on this theory because it is not yet known how an individual can evaluate a schema in an encapsulated domain-specific module without associating it with other (including memory) modules (systems). Then how should we deal with the schema? The purpose of this study is to explore and generate hypotheses regarding trilingual learners' cognitive processing as they comprehend and translate an L2 (Japanese) into an L3 (English). This paper will review previous studies, discuss the theoretical background, and then explain the methods used. The participants studied were Chinese students who were learning Japanese as an L2 and had lived in Japan for more than 3 years. They were enrolled in an elective Japanese-English translation class via movie clips. They practiced translating from Japanese into English, their L3. The movie clips included subject omissions, slang, and higher-order meanings. First, they were asked to interpret the meanings of the language of the scenes. Next, they were asked to submit a translation from Japanese into English and their narrative comments, reflecting on how they processed the translation, what they found difficult about it, and why. This paper will conclude by discussing the secondary procedural schema transfer hypothesis based on the results of the study.

# Sevastopol: Discursive constructions of local identity in the time of crisis

Lecture

***Dr. Veronika Borshcheva<sup>1</sup>, Dr. Natalia Knoblock<sup>2</sup>, Dr. Tatyana Vakulova<sup>3</sup>***

**1.** Oriental Studies Institute Russian Academy of Sciences, **2.** Saginaw Valley State University, **3.** Sevastopol State University

The presentation investigates prominent topoi in the discussions of the Crimean referendum of 2014. It asked the population of the Crimean Peninsula to choose between joining Russia or remaining in Ukraine with greater autonomy (BBC, 2014) and played a prominent role in the events resulting in the Russian annexation of the territory. While not recognized by Ukraine and the international community, the referendum carries symbolic value to the people living with the consequences of their decision. Even four years after the event, citizens of the Crimean Peninsula reported vivid memories of it, with several themes recurring in their narratives and connecting the referendum to a larger frame of reference. Many respondents invoked issues of local history, citizenship, ethnic and cultural identity, political affiliation, and more in their descriptions of the events.

The data was collected in the summer of 2018 in semi-structured interviews in Sevastopol, the largest city and a major port in Crimea. Out of 15 interviews, 10 were chosen as representative of the three types of people willing to share their memories of the referendum: three voters, four precinct volunteers, and three members of a paramilitary “self-defense” group. In line with studies reporting Crimeans emphasizing their regional identity above ethnic or national (Knott, 2015; Zeveleva & Bludova, 2019), one of the recurring themes in the interviews was the salience of local identity, and the unique features setting the city of Sevastopol apart not only from other locales in Ukraine but even from the rest of Crimea.

Informed by the Bourdieu's (1977) concept of the ‘sense of place’ and Antonsich’s (2010) ‘place-belongingness’, the presentation will focus on the respondents’ discussion of the city’s unique character. It will catalog prominent topoi (KhosraviNik et al., 2012) present in the descriptions of Sevastopol, and it and will analyze respondents’ discursive strategies of narrating their attachment to the city and the links they drew between their views and actions and the city’s salient features. The analysis of the data contributes to the study of discursive explications of the sense of belonging and place-attachment by people undergoing traumatic events that lead to radical transformation of their lives.

# Shifting Notions of Otherness: Identity Construction of German-Turkish Descendants in Germany

---

Lecture

---

**Ms. Yesim Kakalic<sup>1</sup>**

**1. University of Warwick**

The German media landscape is characterised by discourses of ethnic tension, migration, integration and assimilation in relation to German-Turks (Schneider, 2001; Mueller, 2006; Ramm, 2009, 2010) and has led to a stereotypical and negative public image of this very group (Mora, 2009). Such discourses typically construct and portray German-Turks as the *other*, ultimately intensifying discrimination (Bonfadelli, 2007) and feelings of alienation. This paper aims to understand how mainstream discourses of German-Turks contribute to this *othering* and how they influence the self-perceptions and identity constructions of German-Turks, who often find themselves torn between positioning themselves as Germans, Turks or German-Turks. This paper thus aims to answer the following Research Question: How do German-Turkish descendants construct their identities as Germans, Turks and/or German-Turks in and through the processes of *othering*?

Drawing on over 13 hours of audio- and video-recorded focus group discussions with German-Turkish descendants, this paper utilises the framework from Bucholtz & Hall (2005) to approach identity from a sociocultural linguistic perspective and analyses and discusses narratives of discrimination which emerged as one of the main themes during the coding process. More specifically, it explores the discursive and pragmatic processes through which German-Turks construct and negotiate their own (and others') multiple identities by *othering* either "the Germans" or "the Turks", and positioning themselves in relation to these larger groups – sometimes embracing and sometimes rejecting membership in them.

Findings illustrate that what is considered to be "the other" by participants is constantly shifting throughout these processes of identity construction and negotiation. This highly dynamic nature of *otherness* is closely intertwined with issues of social integration and discrimination, which participants experience on a daily basis. Through analysing the pragmatic and discursive processes of this *othering*, this paper provides important insights of how mainstream and stereotypical discourses of German-Turks affect the identity construction of members of this group, and provides empirical evidence about the (discursive) processes through which social integration takes place.

# Signals of metapragmatic awareness in internet-mediated discourse

Lecture

***Dr. Krisztina Laczkó<sup>1</sup>***

***1. ELTE University***

In this talk I will investigate linguistic signals of metapragmatic awareness in the framework of functional (social) cognitive pragmatics, on the basis of a model of joint attentional scenes and intersubjective context (Verschueren 1999, 2004; Croft 2009; Tátrai 2017) in internet-mediated discourse. In this framework, metapragmatic awareness means that discourse participants are able to relate reflexively to various linguistic constructions and to associated cognitive processes and sociocultural expectations. By using diverse metapragmatic signals, speakers can reflect on their own activity and on that of the addressee(s) or other (third) parties both in production and in perception (referring to the joint attentional scene), as well as on the organisation of the discourse (referring to the referential scene). The extent and degree of elaboration of metapragmatic signals and the level of metapragmatic awareness are interrelated in an iconic way: the more extensive and the more semantically elaborated the metapragmatic signals, the higher the level of metapragmatic awareness.

The talk focuses on linguistic implementations of reflexive adjustment to attention direction and attention management. The empirical material is based on two genres of computer-mediated discourse in Hungarian: a thematically unbounded and a thematically bounded topic. I manually annotated and analysed linguistic implementations of reference to the production and reception of utterances in two continuous samples of 500 contributions each. The analyses concentrate on their qualitative properties.

The research questions are: 1. What are the extent and degree of elaboration of metapragmatic signals referring to the joint attentional scene? 2. What patterns are metapragmatic signals organised into in the given discourse? 3. What common and distinct properties are shown by the two samples representing two different subtypes of the given genre and what genre-specific properties can be established on that basis?

According to my preliminary hypothesis, the presence of metapragmatic signals can be considered to be a strong genre-specific property in both samples, albeit with characteristic differences in elaboration and patterning. In spontaneous colloquial discourse, they occur in a more desemantised manner, in accordance with the spontaneity of discourse and by following spoken language norms, especially in the initial portions of utterances, e.g. to signal turn taking within the discourse. In pre-planned utterances, we find implementations that are linguistically more elaborated, in a characteristic arrangement, at the beginnings and ends of utterances, but also during referential scenes, as part of being continuously aware of the direction of attention.

This case study offers a contribution to the consistent description and understanding of the genre-specific properties of internet-mediated discourse with respect to metapragmatic awareness.

# Social distancing and linguistic solidarity: Hungarian emailing practices during the coronavirus epidemic

Lecture

***Dr. Zsófia Ludányi<sup>1</sup>, Dr. Ágnes Domonkos<sup>2</sup>***

***1. Eszterházy Károly University & Hungarian Research Centre for Linguistics, 2. Eszterházy Károly University***

With its outbreak and quick spread in early 2020, the COVID-19 epidemic brought rapid and sweeping changes in its wake in all walks of life. As measures were being imposed to contain the spread of the virus, emailing practices, including patterns of polite behaviour, were re-evaluated (cf. Dürscheid & Frehner 2013). Based on a corpus of emails comprising more than 250 texts, collected by various methods and showcasing personal, official and business correspondence alike, our paper presents linguistic features of emailing practices characterizing the first two and a half months of the global epidemic. Our pragmatic analysis uses the criteria of politeness theories (Brown & Levinson 1987, Culpeper 2011, Kádár & Haugh 2013) to explore and classify novel emailing formulas indexically referring to the speech situation, and to interpret the functions of particular linguistic devices.

In the letters included in the database, we assigned codes to elements referring to the epidemic, descriptions of the resulting situation, acts of cancellation and rejection, apologies, openings and closings, and good wishes highlighting the importance of preserving health and safety. Based on the empirical material, the paper presents the strategies at work in the expression of these speech acts, including the issues of how they are combined and what patterns they exhibit in relation to various types of references to the ongoing epidemic.

The results point to the existence of a social distance-reducing strategy underlying varied patterns of construal (Svennevig 1999). Social distance is offset, as it were, by linguistic means, distance being restricted to the spatial domain and solidarity taking centre stage in language activity.

# Student-initiated storytelling: demonstrating knowledge in classroom interaction

---

Lecture

---

***Dr. Elham Monfaredi<sup>1</sup>***

***1. University of Hawaii at Manoa***

Students' agency and initiatives have gained recognition for creating learning opportunities in L2 learning. Although the significance of learner initiatives has long been recognised in the second language acquisition (SLA) research tradition (Ellis 1998; Goodwin 2007; Kumaravadivelu 1993; Sert 2017; Van Lier 1988; 2008; Walsh 2002; 2011), different ways such initiatives manifest themselves are yet under-researched. The most prevalent student-initiated actions documented are questions, clarification and confirmation requests, comprehension checks, and other-initiations of repair (Fagan 2012; Jacknick 2011; Kääntä 2014; Merke 2016; Waring 2009; 2011; Watanabe 2017). Using conversation analysis, this study continues this line of research by specifying how students manage their participation and make contribution to the pedagogical goals of the classroom with self-initiated storytelling.

The data originates from 38 hours of video-recorded interaction in intermediate and advanced Persian language classes at two North American Universities during which the students recounted 13 stories. The study draws on multimodal conversation analysis (Mondada, 2014) in combination with membership categorization analysis (Fitzgerald & Housely, 2015; Hester & Eglin, 1997) to detail the sequential structure as well as identity and category works of students' self-initiated storytelling.

This study uses both Jacknick (2009) and Waring (2011) conceptualization of student-initiated participation to examine occasioned stories that students self-initiate into (unsolicited) or emerge as replies to teacher prompts (solicited). The analysis has shown that students' initiation of stories makes relevant their categorical and discourse identities to demonstrate their knowledge affordances. The analysis has also shown that students' storytelling brings different social and participation roles to the interaction and thus creates layers in the classroom participation framework. The storytellers' participation framework, the way they construct and reshape their interactional roles as the interaction unfolds, is one of the resources through which they bring their epistemic knowledge to class. The current study contributes to work on storytelling in classroom interaction and feeds into the growing body of research on student agency in institutional settings.

# Syntax-in-Sight: Finger Counting as Teacher Resource for Repair

---

Lecture

---

***Ms. Carol Lo***<sup>1</sup>

**1.** Teachers College, Columbia University

Treating learner grammatical errors is one of the core pedagogic tasks in the second language classroom. In particular, the teacher's broad repertoire of bodily resources has been shown to play an important role in repair initiation in L2 pedagogic settings (e.g., Mortensen, 2016; Seo, 2011; Seo & Koshik, 2010). In this paper, I show how finger counting—which has received scant attention in existing research on embodied conduct in social interaction—can serve as an important tool for repair of grammatical errors. Data come from 28 hours of video-recordings collected from an elementary and intermediate level ESL class in the East coast of the United States. The data were transcribed using conversation analytic notations (Hepburn & Bolden, 2017; Jefferson, 2004), and Mondada's (2016) multimodal transcription conventions were followed for descriptions of embodied conduct.

The focal practice of this paper, which I have glossed as *finger counting*, involves both verbal and gestural components. Gesturally, it is a two-handed gesture in which the teacher first holds the left palm vertically, displaying all five fingers. Counting then begins with the right index finger tapping or touching the fingertips of the left hand, starting with the pinkie or the thumb. Verbally, each word or syntactic element of a target structure is assigned to one digit. The essence of finger counting, in short, is to represent a fixed sequence of syntactic components—the word order—by a fixed, linear sequence of finger movements. In so doing, the one-to-one correspondence between syntactic components and fingers, as well as the final finger configuration after counting is complete, provide learners a verbal and embodied illustration of a syntactic structure.

The analysis, based on 32 cases of finger counting, shows that finger counting can (1) specify and locate the trouble source both visually and verbally to facilitate learner self-repair and (2) make the correction(s) more salient and the entire repair turn accessible for learners given the wide array of modalities involved (i.e., the audio, the visual, and the tactile). Since repair initiations can be arrayed on a continuum based on their strength in locating and delimiting the trouble source (Schegloff, Jefferson, & Sacks, 1977), finger counting constitutes a strong repair initiation as it mobilizes both verbal and embodied resources to scaffold learners understanding of an error. The action of counting, along with other features of turn design, help learners analyze their errors by informing them the location of the error, the method of repair, and in some cases, the nature of the error. This paper advances our understanding of gesture and practices of next-turn repair initiation in the context of language classroom.

# Talk and Embodied Conduct in Word Searches in Multilingual Interaction

---

Lecture

---

***Ms. Budimka Uskokovic<sup>1</sup>, Prof. Carmen Taleghani-Nikazm<sup>1</sup>***

***1. The Ohio State University***

This paper concerns repair practices of word search (Goodwin, 1986) in multilingual conversations in a digital environment. Using analytical frameworks of conversation analysis and multimodality, it investigates talk and embodied practices utilized by speakers during word searches in videoconferencing conversations. Previous research has shown that speakers utilize a variety of talk and embodied practices to initiate word searches. They also note that speakers employ resources to discourage the co-participation of the other and to resolve the repair on their own (preference for self-repair) (Jefferson et al., 1977), or to invite the other to collaborate in resolving the word search in favor of progressivity in interaction (Goodwin, 1986; Streeck, 1995; Schegloff, 2007). In addition, studies have found that embodied practices play an important role in word searches (Goodwin, 1986; Hayashi, 2003; Streeck, 1995). It has been noted that in the course of a word search the speaker's gaze movement invites or does not invite the other's co-participation (Goodwin, 1986; Hayashi, 2003) and that speakers use gestures to reach a collaborative solution throughout the search (Streeck, 1995).

Studies on word searches in multilingual interactions have similarly found that second language speakers (L2) deploy embodied resources in the course of searching for a word. For instance, L2 speakers use a sharp head turn or head tilt to the side with continued gaze toward the recipient or a head poke forward to initiate repair (Koshik & Seo, 2010). These studies, however, have only examined talk and embodied conduct in word searches in face-to-face physical talk-in-interaction.

Analyzing word searches in semi-pedagogical conversations via video-conferencing, our paper demonstrates that when engaged in word searches, L2 speakers use their index fingers in addition to other vocal and embodied resources to signal engagement in word searches. Contrary to the existing findings that state L2 speakers appeal to the recipient as an expert in the precise domain of issue (cf. Meredith & Stokoe, 2013), we show that L2 speakers utilize electronic dictionaries (Barrow, 2010; Hauser, 2014) and that they point the extended finger upwards at the onset of the word search to index gesturally that the progressivity of talk-in-interaction will be temporarily put on hold (Mondada, 2007; Streeck, 2009). That is, L2 speaker of trouble source uses the pointing gesture to direct the co-participant's attention to their action of looking up a word, thereby discouraging their co-participant's involvement in their current action and securing the possibility of self-repair. In such cases, the gesture is accompanied by a pre-sequence announcing (Greer, 2016), and thereby has a pragmatic function – it functions as a floor-keeping strategy. We demonstrate that L2 speakers, due to digital environment affordances and immediate access to Internet and online dictionaries, opt for using an outside source to look up the word rather than invite their L1 (expert) coparticipant to collaborate in the search and provide the outcome. The organization of embodied conduct and talk in the cases of word searches that we analyzed is not idiosyncratic and is used by multiple L2 speakers in the data.

# Talker effect on phonetic accommodation in second-language interaction among learners of English

Lecture

***Mr. Dongyue Xie<sup>1</sup>, Dr. Bin Li<sup>2</sup>, Prof. Hua Chen<sup>3</sup>***

***1. City University of Hong Kong and Nanjing University, 2. City University of Hong Kong, 3. Nanjing University***

People may align their linguistic behaviors with those of other talkers in interaction. The converging tendency has been referred to as accommodation or interactive alignment. Being Common in speech communication in native languages and beneficial to second language (L2) acquisition, phonetic accommodation by L2 learners has remained under-researched. L2 learners do not have strong sensitivity to identify correlates to adjust or the sufficient competence to realize accommodation as they may do in their native languages. Thus, an investigation is worthy on learners' attempt of phonetic adjustments and its outcome in L2 interaction.

This study adopted an interactive task where advanced L2 learners of English worked in pairs to negotiate for missing information in order to complete maps. We examined their production of vowels before and after the tasks. Vowel duration and their formant frequencies were compared across learners, which showed variations in phonetic adjustment among participants with different proficiency levels in English. We also observed correlation between learners' tendency of selective accommodation and their interlocutors' English proficiency levels. Post-task interviews further revealed that both conscious and automatic processes were engaged phonetic accommodation during in-task interaction.

---

# Talking to a wall? A telemarketer's conversation with a bot.

---

Lecture

---

***Dr. Heidi Vepsäläinen<sup>1</sup>***

***1. University of Helsinki***

In this paper, I will present a case study on one telemarketer's interaction with a Jolly Roger bot and investigate the participant roles in the conversation. Jolly Roger Telephone is a service that provides pre-recorded telephone bots called pirates for private people. Pirates are designed to interact with telemarketers and telescammers to waste their time. The bots react to the caller's speech by playing a pre-recorded and pre-ordered set of lines, which are usually not responsive to what has been said previously in the conversation. In a way, they could be described as a type of a social bot, which is, by definition, software that control their own social media accounts, perform activities in them, and are able to pass as human beings (Boshmaf et al. 2011, Gehl & Bakardjieva 2016), even though they do not function in social media or act as active participants in a discussion.

This study concentrates on a peculiar interaction between a pirate and a telemarketer, who recognizes their interlocutor as a bot. According to Sahin et al. (2017), 5 % of the callers talking to a similar bot recognize that they are talking to a bot, which leaves them with no reason to continue talking, but for some reason in this case the telemarketer continues the discussion. Throughout the conversation they construct different kinds of participatory roles for their interlocutor, fluctuating between the different roles: client, a woman, a bot, and the person behind the recording. I will utilize Goffman's (1981) participatory framework as well as Conversation Analysis and Membership Categorization Analysis to analyze how the different roles are built, and whom is the telemarketer talking to.

# Textbook dialogues as deontic authority: students' orientations during pair work activity in JFL classroom

Lecture

***Ms. Koyuki Mitani<sup>1</sup>***

*1. University of Hawaii at Manoa*

Tasks are ubiquitous and indispensable activities in second and foreign language classrooms. Understanding how tasks function and facilitate students' learning is crucial for their effective employment in classroom teaching. Following Breen (1987)'s pioneering work which conceptualized task outcomes as emergent products of the dynamic relationship among task-as-workplan, students' contributions, and context of task implementation, previous studies investigated how task-as-workplan, a blueprint of potential learning events, was transformed by students in the particulars of the context of task implementation (e.g., Coughlan & Duff, 1994; Hellermann & Doepler, 2010; Kunitz, 2018; Mori, 2002; Seedhouse, 2005, 2019). As students collaboratively work through instructionally assigned tasks with peers, mere learning plans of teacher designed tasks are realized in the specific contingencies of the on-going interaction, which generates the ecology for the situated use of various interactional resources and provides opportunities to discover learnables. Due to the contingent nature of interaction, pedagogical activities that a teacher intended for a specific task may result in different student experiences (Mori, 2002; Kunitz, 2015; Seedhouse, 2019). To further understand the transformation of task-as-workplan by students, this study adopts the methodological framework of multimodal conversation analysis to examine students' implementations of tasks in a Japanese classroom at an American university. The data comes from 65 instances of video recordings of students' performances during pair work activities. Detailed analysis of the interactions of three student pairs who conducted the same conversational task shows the distinctive activities they engaged in through the task. As a result of their orientations to the different aspects of the task instruction, observations are made of their competence in and opportunities for learning different kinds of target language abilities. Moreover, multimodal analysis of the interactions reveals the students' orientations to the textbook dialogues as a model for the formats of their interactional turns as well as the sequential organizations of the task interactions. Specifically, it was observed that a student issued an other-initiated repair to reformulate the linguistic format of his co-participant's question even though the original format of the question was syntactically adequate and prosodically recognizable to perform the action required by the task prompt. Here, the student's other-initiated repair was produced as an exposed other-correction (Jefferson, 1984; Hauser, 2010) in a declarative format, suggesting his strong epistemic stance toward the proposed alternative format for the question. The analysis of the textbook dialogues, linguistic forms proposed by the repair, students' embodiments and task prompt reveal that the reformulation of the question is attributed to the students' orientation to the linguistic forms that appeared in the textbook dialogues as relevant, if not legitimate, resources to accomplish the task in hand. However, the ways the students utilize the dialogues in achieving the task are observably different for each pair, indicating the different degrees of the deontic force of the dialogues manifested by the students and revealing their divergent understandings about the goal of the activity. Drawing on the findings of the study, this paper discusses pedagogical implications on task design and task instruction.

# The approximative component in spanish adverbs “aún” and “todavía” (eng. “still”)

Panel contribution

***Ms. Amparo Martínez<sup>1</sup>***

**1.** University of Valencia

The aim of this communication is to analyse the Spanish adverbs *aún* and *todavía*(*still - A/T*) as *approximatives*. This category is defined as the blend of two components: *proximity* and *polarity*(Pons and Schwenter, 2011). *Proximity* expresses the closeness to complete an event and *polarity* has to do with the relationship between states-of-affairs, *p* or  $\sim p$ . The prototypical members of this category are: *casi*(*almost*) and *apenas* (*barely*). *A/T* are described as grammatical temporal adverbs with aspectual meanings. Semantically, *A/T* formalize a past tense operator (Garrido Medina, 1988) which presupposes a *transition point*in the event they have scope over. Lastly, *A/T*convey a temporal implicature from a *change expectation*(Garrido Medina, 1992; Amaral y Del Prete, 2010). There are concepts such as *change expectation*or *transition point* which are the basis for considering *A/T* adverbs with a *proximity component*.

This modular description helps us with three features of *approximativity*: the grammatical, the semantic and the pragmatic approaches. Thanks to this, it will be possible to compare how *A/T* are related with *approximatives* such as *casi*or *apenas*and why *A/T* can contribute to increase the list of *approximative adverbs*.

In conclusion, the field of *approximatives*is not restricted to the *almost-barely* pair; this pair, whose main meaning is the *polar component*,must be related to other *approximatives*,whose main meaning is the *proximal component*. The analysis of *A/T*lets us to argue in favour of a new species of *temporal approximatives*,which increase the general theory of *approximatives*.

# The Bite of the Roaring Crowd: Obstructing Opponent Actions Using Collective Cheering

Lecture

***Dr. Adrian Kerrison<sup>1</sup>***

***1. Ulster University***

Part of a sports team's "home advantage" (Barsky & Schwartz, 1977) is the expectation that supportive home fans can benefit their team's play, but in-stadium practices of support have rarely been investigated as accomplishments of interaction. This paper will address this gap in knowledge by using Conversation Analysis to examine practices of interaction that crowds use to attempt specific strategic maneuvers during a game. These are practices designed to distract opponents or disrupt their ability to communicate during pivotal moments. Even if they are not always successful, these attempts at supportive disruption provide a view into the shared knowledge of supporters based on how they target their interventions for particular in-game contexts.

Kerrison (2018) introduces the concept of "batch participation," the idea that sports crowds and other non-individual social actors can be constructed to do interaction work that is beyond the expressive capability of any of the individual participants alone. For instance, a person in the back row of a stadium may participate in cheering that will be heard by an on-field player, and thus will have achieved some accountable interaction with that player thanks to their participation in the entity of "the crowd" that has engaged with that player. They may then say, "we cheered them and they waved at us" even if the fan, individually, was not directly heard nor seen. While studies of non-individual interaction like choral co-production (Lerner, 2002) and joint speech (Cummins, 2018) often focus on the production of shared turns-at-talk as a project unto themselves, this paper seeks to shift focus into how individuals use batch participation to accomplish new and unique work through collective interactions with other parties.

This paper uses publicly-available audio/video recordings of supporters viewing active competition to examine their collective attempts at obstructing opponents. These include american football crowds producing a heightened noise level to limit their opponents' ability to communicate as they discuss an upcoming play, baseball crowds chanting about an opponent's error-in-play to attempt to distract and disrupt their play, and a group of political activists attempting to block passage of a bill by cheering and chanting from the gallery to disrupt the parliamentary procedure. The final example was chosen to show how these skills of batch participation extend beyond the relatively inconsequential fun of sporting events. In a new age of mass protest, the interactional powers of crowds are being relied upon and confronted in new ways. This paper intends to add to a practical understanding of these interactions, revealing more about practical advantages of mass participation, how it is performed, and what it can achieve.

# The case of MIND YOU as an intersubjective rectification marker

Lecture

***Ms. Vassiliki Geka<sup>1</sup>, Prof. Sophia Marmaridou<sup>1</sup>***

***1. National and Kapodistrian University of Athens***

Integrating insights from research on *Other*-orientation (Bakhtin 1975/1981) and dialogic perspectivisation (Traugott 2008; Linell 2009), attested both in dialogical and monological (con)texts (Schwenter 2000), we focus on meaning rectification in corpus-retrieved data. Adopting a Construction Grammar approach, we specifically aim to show that, in accordance with the above, MIND YOU, in (1) below, is an intersubjective rectification marker (cf. Bell 2009; Ranger 2015).

(1): “Matty says to himself and then strikes himself in the temple with the heel of his hand to make himself stop thinking and then smacks himself again and pretends to knock himself stupid – not into a coma, ***mind you***, not even unconscious, just a pretend concussion...”

COCA (MAG-Field & Stream, 2003)

Our hypothesis is that MIND YOU is used by the Speaker to call attention to an upcoming rectification of a proposition */p/* for the benefit of the Addressee's understanding. The rectification may concern either the content of a proposition globally or its accuracy of linguistic glossing, thereby readily associating the construction with metalinguistic operations in discourse. The research questions to be addressed are: (1) What are the semantics and pragmatics of MIND YOU that license its intersubjective function? (2) How does its intersubjective function affect the Speaker's meaning-making process? (3) What is its role in discourse structure? Responding to the above, we argue that by inheriting features of the dispositional mental state verb '*mind*', and the directive speech act force of the Imperative, MIND YOU marks a proposition */p/* as in need of rectification due to unwelcome, inferentially-augmented interpretations. The latter urge the Speaker to summon the (assumed) Addressee's attention so that fallacious assumptions are obviated. Finally, as shown in the example, the construction exhibits contextual dependencies involving an antecedent part in need of revision (*p*), the '*rectification-signalling*' construction (*r-s*), and a follow-up part involving the specifics of the '*rectification-clarification*' (*r-c*). In foregrounding these, we ultimately argue that, by analogy with discourse markers, MIND YOU can effectively delimit discourse units.

**Key Words:** Construction Grammar, dialogicity, proposition rectification marker, discourse unit delimitation

# The commodification of dialects in the Finnish vlogosphere

---

Lecture

---

***Ms. Anna Sundqvist<sup>1</sup>***

**1. University of Helsinki**

On YouTube, a platform largely built on user-created content, perceived authenticity plays a central role (Burgess & Green 2018:40–41). This, and the fact that language is rarely outwardly regulated, makes YouTube a favourable media platform for non-standard language varieties. Linguistic means of commodifying identity (see e.g. Heller 2010) include speaking in dialect, which is often associated with the speaker's authenticity (e.g. Mielikäinen & Palander 2014:84, Johnstone 2009:160). In this paper, I will examine how four Finnish YouTubers employ regional dialects in their content creation and brand building, and the kinds of interactional and commercial functions dialectal variation serves in the videos. The YouTubers in my data come from four different dialect areas.

I will show that the YouTubers use regional variation to distinguish between characters or speaker roles, or to perform local authenticity. Salient dialectal features and feature clusters (even those not belonging to the vlogger's own dialect) are used to evoke a humoristic or playful mode. The functions of variation are typically similar to those determined in previous research (on code-switching in Finnish see e.g. Lappalainen 2004) but I will argue that, in the vlogosphere, these functions are intertwined with distinct commercial purposes.

The employment of dialect appears in several modes. While the focus of my analysis will be on the vloggers' speech I will also briefly discuss the language in the thumbnails, video descriptions and comments. The comment section serves as a window to the audience's language perceptions and ideologies: sometimes even a subtle departure from the YouTuber's typical way of talking can spark a concerned comment.

I will conclude by discussing the role that dialect use plays in captivating audience on YouTube. The localisation achieved by their respective home dialects may allow the YouTubers to detach themselves from the stereotype of a Helsinki-based vlogger, as well as provide distinctive, dialect-related content. In addition, variation within the YouTuber's speech contributes to the tone of the video, allowing the YouTuber to regulate the stance their viewers will adopt. In short, the results of my analysis implicate that speaking in dialect adds likability, perceived authenticity, and conspicuity to the YouTubers' brands.

# The connective ‘infatti’ in Italian talk-in-interaction: from justification to agreement sequences

Lecture

***Mrs. Elena Battaglia***<sup>1</sup>

1. Università della Svizzera italiana, Lugano

Research has shown that connectives may come to serve pragmatic purposes in interaction (Mulder/Thompson 2008; Barth-Weingarten/Couper-Kuhlen 2011) and enter non-prototypical constructions (Cuenca 2020), but this process has received little attention in Italian (see however Bazzanella/Miecznikowski 2009).

In this study, I examine the polyfunctional marker *infatti* in spoken Italian as a case study, on the basis of the annotation of 300 occurrences from the LIP and Kiparla corpora. Insights from a large-scale corpus study in diachrony are also taken into account.

As a connective, *infatti* establishes a justification relation, introducing an argument *p* for the speaker’s standpoint (1). Crucially, conversational data show that *infatti* moves from clause-combining to the construction of responsive turns doing agreement and stance alignment. Two types of sedimented routines are identified in the analysis. The conventional fragment *infatti p* may be recruited to introduce an independently possessed information that is compatible with the interlocutor’s standpoint (2). The marker may also autonomously realise an affiliative turn from a K+ position (Heritage 2012), pointing to previous knowledge displayed in context (3).

(1) *qui andiam bene infatti non avete più fatto correzioni*

“we’re fine here, in fact [infatti] you’ve made no more corrections”

(2) A: *in Svizzera sta lui*

“he’s in Switzerland”

B: *ahinfattime l’ha detto Gino che è in Svizzera*

“oh indeed [infatti] Gino told me he was in Switzerland”

(3) A: *non c’era ancora mi sembra*

“he wasn’t there yet I think”

B: *ah non c’era ancora*

“oh he wasn’t there yet”

A: ***infatti***

“exactly”

In order to explain the functional and structural relations between the uses of *infatti*, I discuss the hypothesis that (2) and (3) respectively arise out of (1) and (2) in interaction. On one hand, I argue that *infatti* serves as an indicator of the speaker’s epistemic independence and of his/her possession of evidence in favour of a standpoint, and that this invariant favours the shift from justification to agreement sequences. On the other, I show that this shift takes place within recurrent, locally emergent patterns that are best described as transformations of the more sedimented ones, on the basis of semantic-pragmatic, prosodic and sequential parameters. These include the presence/absence of turn continuation after *infatti*, its intonation contour, and the cooccurrence with other pragmatic markers.

This study overall contributes to the understanding of interactional functions emerging from discourse connectivity strategies and provides empirical evidence for their interplay within forms of sequential organization.

# The Graded Co-Salience Hypothesis for Polysemous Ambiguity

---

Lecture

---

***Mr. Thomas Williamson<sup>1</sup>***

**1.** University of Cambridge

When one says, ‘I went to the bank on Wednesday’, knowledge of the speaker’s financial difficulties or their profession in potamology might point a hearer to take one of two salient interpretations. However, without this background knowledge (or sufficient linguistic context, for example) the hearer might be excused for drawing a blank as to the intended meaning of the utterance. This phenomenon, polysemous ambiguity, has been seemingly cast aside as less interesting in the study of polysemy, in favour of approaches that look to map its structure in the mental lexicon (see Jastrzembski 1981; Williams 1992), or profile its features from a usage-based perspective (see Gries 2006). The aim of the present study is shed light on what causes ambiguities to arise out of the use of polysemous words.

To this end, this study hypothesises that the Graded Salience Hypothesis (Giora 1997, 2003) can be used outside of the original scope of its application to determine precisely why polysemes in context can be ambiguous. Just as Giora proposes that lexical access is ordered as a function of senses’ salience, it is so hypothesised that polysemous ambiguity results from the competition of similarly salient senses within a polysemy network (see Weinreich, 1964). Using data from the ARCHER 3.2 corpus to analyse frequency as an input factor to linguistic structure (see Bybee 2006, 2010), 2,761 token instances of 9 polysemes (*hand, head, door, once, book, run, cut, stop, and court*) are manually tagged in a semantic decision task, adapted from Glynn (2016), as being either of a particular sense or ambiguous based on the priming effects of their linguistic context. It is found that significant incidences of polysemous ambiguity can be explained as a function of the plurality of salient senses per lexical item. This paper suggests that polysemous ambiguity can be explained as the result of the co-activation of co-salient senses: The Graded Co-Salience Hypothesis.

# The Grammaticalization of Rhetorical Questions

---

Lecture

---

**Mrs. Ruti Bardenstein**<sup>1</sup>

1. Tel-Aviv University

Questions are used for multiple discourse purposes, beyond just seeking for information-bearing answers. Questions of a specific kind that are associated with a specific discourse pattern (Ariel, 2008) might serve as a fertile ground for rhetoric interpretations via contextual deduction (questions cannot serve as a discourse pattern on their own right) and even for various grammaticalization processes (e.g. Herring 1991 for rhetorical questions in Tamil, Koshik 2005 for rhetorical questions in English). Like any other linguistic phrase that is consistently associated with a certain discourse pattern, questions might gradually lose their original function (in this case: questioning) and turn into linguistic constructions that bear an altogether different meaning than the compositional meaning of their parts. This type of grammaticalization process is the focus of this paper. It is a two-stage process whereby questions lose their original questioning function. Initially, they are recruited to convey the strong and emotional speaker's stance (usually his/her resentment) towards a salient discourse assumption or claim. Then, this interpretation becomes a salient discourse profile of the specific questions, it fixates so that these questions become Goldbergian constructions (Goldberg, 1995), which I call Constructional Rhetorical Questions (CRQ, see Bardenstein, in press). These constructions pair a certain form with a certain meaning un-compositionally (their meaning is not composed of the meanings of their parts). In other words, the relevant questions: (a) are never interpreted as 'real' (information-seeking) questions and (b) there is no way of predicting their meanings based on the meaning of their parts or based on other related constructions. Thus, we witness a linguistic historical-change process of question forms whose linguistic recruitment and pragmatic usage eventually becomes semantic (to the point where the question is not even perceived as a question any longer). In this paper I focus on four types on RQCs in Hebrew, based on several corpora, but demonstrate a cross linguistic phenomenon.

# The Ideational Functions of the Coronavirus-related Hashtags Used during the Covid-19 Pandemic Restrictions

---

Lecture

---

***Dr. Joy Aworo-Okoroh<sup>1</sup>, Dr. Chuka Ononye<sup>2</sup>***

***1. Adamawa State University, 2. University of Nigeria***

The emergence of COVID-19 has in many ways affected people's lives and triggered a multilingual kind of response, resulting in its own specialised discourse. This discourse has provided a source of data for studies with macro- and micro-linguistic perspectives (Tan et al, 2020). The studies have however focused more on the former, analysing ways – presidential speeches, parliamentary proceedings, and official announcements on COVID-19 – through which government bodies respond to the outbreak of the disease and communicate with the public. At the micro level, the lexical, semantic and discourse elements through which personal posts of short narratives and photos are communicated to capture people's experience of the pandemic have also been documented. However, little is known about how people from different part of the world represented activities going on during the pandemic restrictions with a particular form of social tagging, the hashtag. This paper explores how social media users, constrained by their understanding of prior epidemics and related knowledge and emergent actual experience of the coronavirus crisis, use hashtags to enact such communicative functions as supporting the health sector, encouraging compliance to the stipulated covid-19 protocols, raising concerns over certain unusual realities around the world, encouraging other users on survival mechanisms, and expressing fear/frustration over the effect of the pandemic. The data comprise a 60-thousand-word corpus, which includes hashtags related to the Covid-19 pandemic and the attendant restriction experiences, gathered from three popular social media platforms – Facebook, Twitter and Instagram – between March and August, 2020, when virtually all parts of every country were locked down. These were subjected to a mixed-method content analysis with insights drawn from Halliday's linguistic metafunctions and Kecske's socio-cognitive approach to pragmatics. This corpus-based discourse analysis of hashtags is expected to reveal a range of complex meanings in the social media texts, which are able to explain how the communicative functions are achieved through sociocultural constraints on meaning construction and comprehension. Generally, the study provides a linguistic contribution to the pool of studies on the impact of the coronavirus pandemic and its associated restrictions to human activity.

# The Identity of a “Reasonable Woman” Constructed through Epistemic Stance Control

Lecture

***Prof. Kyoko Satoh***<sup>1</sup>

1. Yokohama City University

Drawing on the life story narrative of a Japanese actress (pseudonym, Emi) in her sixties, this paper examines the manner in which she constructs her identity. Emi has established her own theatrical company. She is married and has two children. Emi is well known for her performance as a prostitute. Her musings reveal the difficulties she faced in balancing her professional and private life. This paper focuses on the linguistic resources manipulated by her to control epistemic domains. The study reveals that her attempt to achieve epistemic congruence resonates with her constructed identity as a struggling member of a society where the discourses of women as “natural caregivers” and “domestic workers” (Charlebois 2014) prevailed.

The Japanese language has linguistic resources that mark epistemic domains. Sentence-final particles and sentence-final modal expressions are among them. For example, *yo* is used to mark non-shared information—a marker to claim epistemic primacy by a speaker (Hayano 2011). Since Emi’s story is about her own life, it is presumed that she claims her epistemic primacy throughout the story. Accordingly, as her story progresses, she assumes epistemic primacy with the use of the linguistic device *yo*. However, she sometimes shares primacy with the interviewer by using other expressions such as *ne*, a sentence-final particle marking the shared information between a speaker and recipients, and *janaidesuka*, a sentence-final modal expression which invites shared confirmation from interlocutors.

A close investigation of the data reveals that her withdrawal from epistemic primacy is related to her fight against prevalent gendered discourses. Her story contrasts the two gender categories of women and men. In particular, men are portrayed as hostile to her. For example, she depicts the men who meet her on business as people who objectify and humiliate her, and her husband as someone who believed in the hegemonic gendered discourse that a woman is a natural caregiver at home. In these portrayals, she switches sentence final expressions to achieve epistemic congruence.

Japanese society has a long history of women being confined to the domestic domain. Under such circumstances, women whose behavior deviates from the dominant gendered discourse are undoubtedly marginalized. Thus, she seeks epistemic congruence in the story as one of her methods to construct her identity as a rational woman who behaves reasonably.

Thus, this paper suggests that the manipulation of the epistemic stance of a speaker in a life story narrative reveals the author’s technique of identity construction. It also shows that the pursuit of epistemic congruence in utterances, where it is unnecessary, is closely related to dominant discourses or norms prevailing in the society.

# The importance of place in digital communication

---

Lecture

---

***Prof. Alejandro Parini<sup>1</sup>, Dr. Francisco Yus Ramos<sup>2</sup>***

***1. University of Belgrano, 2. UNIVERSITY OF ALICANTE***

This presentation is meant as an introduction and a prelude to the panel entitled *The online-offline interface. The importance of place in digital communication*. In this introduction to the panel we aim to characterise place as it is discursively entextualised (decontextualised and recontextualised) both individually and collectively in digital interaction. We argue that this entextualisation is performed in terms of three different layers of context: 1) sociocultural context through which place is seen as liberating and at the same time constraining, ie. tethering and untethering people to and from the physicality of a particular location (Yus (submitted); Frith 2014, de Souza 2013; de Souza and Frith 2010). This is done against the background of the premium put on mobility and liquidity (Bauman 2010) as crucial components of the relationship between the Internet and the culture of freedom and sharing that characterises contemporary society today; 2) sociomental context in which place is seen as evoking a feeling of togetherness and never-ending connectivity through the sharing of experiences both physicalised and virtualised with known and/or unknown others; and 3) situational context in which place is discursively and interactionally conceptualised along four dimensions: a) temporal dimension through which place is experienced and constructed or co-constructed in synchronous or asynchronous forms of communication, with (a)synchronicity seen not only as an inherent property of a particular medium of communication but also seen in terms of how users perceive, interpret and assess temporality and their current physical location (as opposed to the virtual realm where interactions unfold) in a particularised instance of communication where a particular medium is used; b) functional dimension through which place is framed as a free-standing, one-off event or as a prelude or follow-up event connecting different social practices taking place in hybridised physical-virtual scenarios; c) multimedia dimension through which place is co-constructed either unimodally or multimodally using different semiotic resources, depending on the affordances exhibited by the interfaces chosen for these interactions; and d) Interpersonal dimension through which place is collectively constructed in the form of a cultural mosaic or wikispace.

# The inter-corporeality of language acquisition: A multi-modal analysis of blind Japanese English language learner interactions

---

Lecture

---

***Mr. James Carpenter<sup>1</sup>***

***1. Rikkyo University***

In this micro-ethnography, I investigate how non-visual cues in the enkinesthetic field contribute to the interactional accomplishment of L2 learnables involving blind English as a foreign language learners and their blind teacher. Since the social turn, applied linguistics researchers have increasingly focused on studying language acquisition as an experience that emerges from the relationship between thinking, feeling, and consciousness (e.g., Douglas Fir Group, 2016), or an enkinesthetic field (Stuart, 2017); this requires an analysis of how other senses, beyond the visual, shape second or foreign language (L2) classroom interactions. Through this study, I hope to draw greater attention to the role that multi-modal sense information plays in the social accomplishment of second language acquisition (SLA).

First, I will explain how the relationship between the contextual configuration of the classroom and the unlike semiotic resources attended to by the participants made the L2 grammar they were studying using tactile images salient: The teacher's directives invoked a ready-at-hand semiotic field into the evolving contextual configuration of the classroom. The students' developing L2 system, their understanding of the teacher's directives, and the felt-sensations of space depicted on the tactile images prospectively overlapped to form a kind of virtual space in which the L2 grammar became, in a sense, visible to them.

Next, I will explain the role that the felt-sensation of the tactile image of a watch dial played in organizing an IRE sequence focused around grammar for telling the time. Both the students and the teacher were able to feel the time on their watch dials with considerable precision. However, confirming that the students' could correctly use the L2 grammar for telling the time required the teacher to embed what she felt on her watch dial into an IRE sequence; the purpose of this sequence was to confirm that the students were feeling the same time on their own watch dials. Without vision, felt sensations in the enkinesthetic field need to be mutually confirmed before becoming an object of joint attention.

Finally, I will conclude this presentation by highlighting how the participants were often not attending to the same semiotic fields at the same time. As a result, the process of language learning for the blind seems to involve drawing on a diverse range of non-visual semiotic fields (tactile images, intonation, body position, etc.) that mutually elaborate one another. The overlap between the unfolding contextual configuration of the classroom and the non-visual semiotic fields available to the participants formed the socio-cognitive scaffolding over which the L2 grammar they were learning became intelligible.

---

# The Interactional Achievement of Assessing Food Nutrition in Everyday Life

---

Lecture

---

***Ms. Kaicheng Zhan<sup>1</sup>***

**1.** Rutgers University

Food assessment (Mondada, 2009; Wiggins, 2004) is one way that eating becomes relevant for participants in interaction. Prior research on food assessment has mainly dealt with assessing taste in food talk while other aspects of food, such as texture, smell, or nutritious quality, can be assessed. This paper uses Conversation Analysis to examine the deployment of a specific type of food assessment I call *nutrition assessment* (e.g., “This is good for you” “It has a lot of protein”) through which participants (family and friends) evaluate the nutritional qualities of certain food items, drinks, diets etc. The paper first discusses three features of nutrition assessments: grounds, stance, and taste-health dichotomy and shows that interactants employ nutrition assessments to engage in two broad activities: persuading another to eat (or not) certain foods and defending one’s criticized food choice. With a focus on the latter, this paper illustrates the ways in which participants employ both commonsense and specialized knowledge about nutrition and healthy eating to account for and thus defend their food choice when it is challenged by others. The analysis suggests that while participants orient to nutrition assessments as persuasive defense against food choice criticism, recipients may show skepticism by challenging the defense. Implications for interpersonal relationships and family roles are discussed. Data are in American-English.

# The material landscape of kitchens: Coordinating tools, implements, and objects

Lecture

***Ms. Jessica La<sup>1</sup>***

**1. King's College London**

The recent burgeoning of research on materiality and embodiment within interactional studies has led to growing interest in how tools and technologies feature in work and collaboration (Nevile et al., 2014; Heath & Luff, 2000; Goodwin, 1994; Heath, 2012). The embedding of tools, objects, and the like, within the performance of tasks enables a shared orientation to the world, accomplishing a 'professional vision' that is critical for collaborative work (Goodwin, 1994). Focusing on the achievement of finer, more delicate forms of collaboration, studies have shown how tools and implements figure in precise moments of exchange and coordination (e.g. such as in the passing of tools in surgery discussed by Heath et al., 2017). A critical area requiring further examination is understanding how engagements with objects can project and anticipate future action, facilitating finely coordinated activity. For instance, the assembly and arrangement of objects and tools such as on a surgical mayo stand (Heath et al., 2017) or a cooking benchtop (Mondada, 2014) can project and enable a future trajectory of coordinated action. Developing this work, I examine how objects and the like enable the fine coordination of work in professional kitchens, a setting known for a richness of materiality which chefs and cooks rely upon to do their work. Drawing upon ethnomethodology and conversation analysis, I analyse video recordings of visual and material collaborative activities between cooks. I will explore how the systematic use of objects to perform tasks informs the coordination of work beyond the here and now. I examine the routine use of objects that shape and are shaped by the local interactional organisation, focusing on how this can project upcoming action further into the future and enable coordination of future trajectories of action. Of particular interest, is the management of dockets and how they constitute a collaborative artefact which organises work in a way that is sensitive to the contingencies of the local context. This paper contributes novel ideas about the interactional organisation of tools, equipment, and objects in collaborative activity and more broadly, speaks to discussions about projection in embodied interaction (e.g., Depperman & Günthner, 2015).

# The meta-pragmatic role of discourse markers, the case of „hiszen”

Lecture

*Dr. Ildiko Vasko*<sup>1</sup>

1. ELTE University of Budapest

This paper focuses on the meta-pragmatic functions pragmatic markers play in discourse interpretation, how these procedural elements in a language can provide us clues as far as contextual effects and background knowledge is concerned. Their role is essential in communication as human language is constrained both socially and culturally. “Hiszen” offers a good example for that.

The ample literature on various pragmatic markers has already revealed many aspects of their procedural role in the meta-pragmatic awareness of language users, and a series of meta-pragmatic functions. However, less attention has been paid to the function pragmatic markers have in managing discourse segments with regard to common ground (cf. Repp 2013: 232).

The function of the Hungarian epistemic stance device “hiszen” is strongly connected to its original verbal form, 1<sup>st</sup> p.s. “hiszem, hogy...” (I believe that...) The pragmatic marker is a phonological reduction of the original verb that has been grammaticalized, it has assorted functions and its use has become more general compared to the meaning of the verb, although it has retained certain features: since the word has an epistemic meaning, it refers to the speaker’s knowledge and opinion

- A: Nem tetszik. B:**Hiszen** nem ismered!
- I don’t like him. (**But**)you don’t even know him!
- Ülj le, **hiszen** teljesen kimerültél.
- Sit down, (**because**) you are totally exhausted.
- Ne sírj, **hiszen** itt vagyunk.
- Don’t cry, (**you know**), we are here.

It will be argued that “hiszen” functions as a procedural guideline in utterance interpretation marking common ground when it occurs as an epistemic expression of a causal relationship (1), offers an argument towards a possible conclusion (2), serves the goal of highlighting a stronger reason or simply appeals to the hearer’s opinion (3). “Hiszen” foregrounds certain features of the situation, making the relevant part of common ground salient for the hearer.

# The need for caution in trusting folk intuitions about perjury

---

Lecture

---

***Dr. Izabela Skoczen<sup>1</sup>***

***1. Jagiellonian University***

Purpose statement: I investigate: (i) to what extent do folk ascriptions of lying differ between casual and courtroom contexts? (ii) to what extent does motive (reason) to lie influence ascriptions of trust, mental states, and lying judgments? (iii) to what extent are lying judgments consistent with previous ascriptions of communicated content?

Research problem: Do laypeople think that we communicate different contents with the same utterance in casual and courtroom contexts? If yes, what impact does this have on perjury ascriptions? Juries should assess what is a lie in a courtroom setting rather than a casual context.

State of the art: Marmor claims that, roughly, implicatures are not inferred in courtroom contexts. By contrast, Bianchi claims they are inferred but disbelieved. The Supreme Court in the Bronston judgment claims that implicatures are not inferred, yet juries mistakenly treat these not inferred implicatures as lies. Who is right? I perform an empirical investigation.

Hypotheses: Following the Supreme Court's Bronston judgment, I expect: (i) averaged lying judgments to be similar in casual and courtroom contexts; (ii) motive to lie to influence levels of trust, mental states ascriptions, and patterns of lying judgments; (iii) retrospective judgments of lying, after being presented with the state of the world, to be inconsistent with previous judgments of communicated content: participants hold the protagonist responsible for content she did not communicate.

Description of the methods and tools: I performed a survey experiment on the Qualtrics platform. Participants were recruited through Amazon Mechanical Turk ( $N = 630$ ). I employed standard Likert scales and forced-choice questions.

Results: I found that: (i) average lying judgments are similar in casual and courtroom contexts; (ii) motive to lie decreases trust ascription and increases lying judgment; (iii) judgments of lying are inconsistent with previous judgments of communicated content: participants hold the protagonist responsible for content they did not communicate (effect size of the difference  $d = .694$ ).

Conclusions: Perjury ascriptions are inconsistent. The Supreme Court's worries expressed in the Bronston judgment are well founded.

# The open class repair initiator “anteeks(i) mitä” (‘sorry what’) in Finnish Twitter interaction

Lecture

***Ms. Helena Nurmikari***<sup>1</sup>

**1.** University of Helsinki

Twitter is a popular social media networking service. Twitter’s most significant feature is the hashtag, which may be used for categorizing discussions, metacommenting and even emotive usage (Wikström 2014). In this paper, I focus on the use of the Finnish expression “anteeks(i) mitä” ‘sorry what’, which consists of the question word *mitä* and an expression of apology. *Anteeks(i) mitä* does not appear to be very frequent in spoken interaction, but it has conventionalized as a hashtag on Twitter.

In spoken interaction, “*anteeks mitä*” functions as an open class repair initiator (Drew 1997), displaying problems in hearing, understanding or acceptance (Haakana 2011; Carlson 2014). Regardless of the verbal expression of apology “*anteeks(i)*”, this repair initiator is not used for executing any apologies in spoken interaction. In that regard, it differs from apologetic repair initiators consisting of only an apology in English (Robinson 2006) and German (Egbert 1996).

The data consist of 391 tweets with “*anteeks(i) mitä*” either as a hashtag or without the hash. I will argue that, in Twitter interaction, instead of initiating repair, *anteeks(i) mitä* displays a problem in accepting some conduct by a person or institution that is either cited in the same tweet or presented in the previous tweet by another writer. Typically, *anteeks(i) mitä* is not followed by a correction by the recipient on Twitter, coming out more clearly as an affective cue instead of a repair initiator. Prior research on spoken interaction contains mentionings of affective usage of repair-initiators (e.g. Haakana & Visapää 2005: 456–457; Selting 1996). Through empirical analysis of the local placement and larger contexts of use of the repair-initiator *anteeks(i) mitä* in written, internet based Twitter interaction will be shown to differ from the typical use of open class repair initiators in spoken interaction. The placements and usages of *anteeks(i) mitä* and hashtag #*anteeks(i)mitä* will be discussed in relation to the kinds of possibilities and restrictions that internet based written interaction more generally provides.

# The Other's Other: A comparative discursive pragmatic approach to third person referential forms in digital Korean and Japanese Comfort Women discourses

Lecture

**Ms. Kerry Sluchinski<sup>1</sup>**

**1.** University of Alberta

The growing body of literature in social/discursive psychology on membership categorization (e.g. Gordon, 2015) and indexicality (e.g. Ochs, 1993), alongside frameworks of stance (e.g. Du Bois, 2007), has shown how identities are co-constructed in interactions and through discourse. However, identities are very much based on outsiders' stereotypical perceptions and not how one communicates those identities themselves, resulting in the process of othering.

By examining the discursive choices of online Japanese and Korean communities regarding Comfort Women, in target and source text contexts, this comparative discursive study investigates the role that third person referential forms and their "degrees of vulgarity" play in the construction of (distorted) identities by the Other for the "Other". It is through reference to others that language users reveal their attitudes and ideologies towards those others, i.e. stance, as well as construct self and other identities (e.g. Ochs, 1993).

The corpus consists of 77 Japanese source-language posts, either human or machine translations of Korean source-language news articles (n= 81) and an arbitrary selection of their comments, and their Japanese source-language comments (n = 39,283). The Japanese data was collected during January 2020 from blogging site *Kaikai-hanno*, a translation blog dedicated to reacting to Korea, using the 慰安婦 *ianfu* 'Comfort Women' tag offered by the blog. The data consists of all articles to which said tag was bound ( 3 in 2017, 31 in 2018, and 43 in 2019; no posts with said tag were made in 2020 at the time of collection). The corresponding Korean data was also collected during January 2020 and is included in the corpus, bringing the total texts to 158 (i.e. 77 Japanese and 81 Korean).

Adopting an inductive, discourse analytical approach, this study focusses on the Attitude aspect of Martin and White's (2005) Appraisal and Evaluation framework, viewing the construction of identities as a by-product of the speaker's appraisal process. Attitude is composed of affect (emotion), judgement (ethics), and appreciation (aesthetics) mechanisms. The study specifically focuses on the aspect of attitude because attitudinal meanings are direct reflections of a speaker's/writer's stance (Martin and White, 2005:43). Stance is one way that people position themselves in relation to the Other and can be further extrapolated based on the Stance Triangle (Du Bois, 2007). Thus, the study is concerned with the link between third person referential forms and how said forms are manipulated (or not) in the context of translation as a potential site of verbal aggression and discriminatory discourse that others Comfort Women.

# The Parisian or al-Barisi: The politics of language use in a Palestinian novel

Lecture

***Prof. Helge Daniëls<sup>1</sup>***

**1. KU Leuven**

In this paper I will present a linguistic analysis of *The Parisian or al-Barisi*, a novel written by the Palestinian author Isabella Hammad. As I will demonstrate, language (variability) is at the core of the literary aesthetics of this novel. In the narrative and especially in the dialogues, English, French and (Palestinian) Arabic are interwoven in a highly sophisticated way. This interaction between languages and language varieties can be approached in many ways, one of them being code-switching, but I will argue that the language use in this novel defies straightforward classification. The use of French and Arabic is not limited to toponyms, titles, realia and cultural specific concepts, neither does it just give a French or Arabic ‘flavor’ or ‘couleur local’ to the English text. Moreover, in some parts of the novel the English is influenced by French and Arabic in such a way that these paragraphs read as ‘translated French’ or ‘translated Arabic’. These techniques are reminiscent of a ‘resistant’ or ‘foreignizing’ translation, in which the translator deliberately deviates from the conventions of the target language in order make the reader aware of the ‘foreignness’ of the text and the fact that (s)he is reading a translated text.<sup>[1]</sup> Therefore, the incorporation of Arabic and French elements cannot be considered as simple ‘intrusions’ on the English text; the three languages are combined in such a way that they can be seen as one multilayered literary idiom. This means that the ‘Englishness’, ‘Frenchness’ and ‘Arabicness’ of these elements cannot be taken at face value and that the languages cannot be seen as completely separate English, French and Arabic entities.<sup>[2]</sup>

Apart from identifying the ways in which this is achieved in the text, I will mainly focus on the symbolic dimensions of this multilayered interplay between the languages and varieties, which is at moments deeply political. The novel is set in the turbulent years of WWI and the interbellum, when the maps of the Middle East were drastically redrawn by the Sykes-Picot agreement (1916) and the Balfour Declaration (1917). The main character is Midhat Kamal, a young Palestinian from Nablus who studies in France during the war years and returns afterwards to Nablus. His struggle and play with his identity and alterity (the ‘oriental’ in France and ‘al-Barisi’ in Nablus), as well as his search for independence, are intertwined with Palestine’s political struggle. I will argue that by permeating the English narrative and dialogues with French and Arabic and by creating a dynamic interaction between them, Hammad not only establishes polyphony and polyglossia in a Bakhtinian sense,<sup>[3]</sup> but also appropriates the (post)colonial languages of Sykes and Picot to comments on Orientalism, as well as colonial, gender and class relations.

# The perception of empathy

---

Lecture

---

***Ms. Carme Sanahuges<sup>1</sup>, Dr. Hortènsia Curell<sup>1</sup>***

*1. Universitat Autònoma de Barcelona*

Closely linked with emotions, empathy is an important ability and part of our emotional and social intelligence (Neubauer and Freudenthaler 2005; Bar-On 2006; Mayer et al. 2008; Joseph and Newman 2010; Mayer et al. 2016). Acting and responding empathically not only conveys the idea that we understand the other person's thoughts and feelings, helping us improve our social performance in most of our everyday interactions (Redmond 1985; Preckel et al. 2018), but it also helps us establish or reinforce social bonds (Gallese 2003; Galinsky et al. 2005).

This paper addresses a specific aspect of the speech act of empathy-giving: the participants' perceptions of their own interactions. This is part of a study that was conducted with 26 L1 speakers of Catalan and 26 L1 speakers of English who were asked to role play and discuss different adverse situations whose preferred response was empathic. Each of those interactions (102 in total) was judged by the participants by means of a post-role play questionnaire that aimed to get their first and fresh impression of the conversation they had just had. The different variables, 5 for the empathy receiver or story teller (level of satisfaction, changes in mood, changes in the perspective of the situation, feeling understood by the other person and feeling judged by the other person) and 5 for the empathy provider or story recipient (level of satisfaction, level of responsibility of the other person, help the other person to cope with the situation, identification with the other person and level of worry about the other person) were intercorrelated and also correlated with the number of strategies in each conversation (Sanahuges & Curell 2020) offering a more personal perspective of the effect of each interaction on the teller and on the recipient. The results, presented for each individual language group and for the two language groups together, show a significant correlation between the number of strategies and the level of satisfaction of the empathy receiver ( $p<0.05$ ) and the level of concern of the empathy provider ( $p<0.01$ ). The rest of variables, when intercorrelated, yield 62.2% of significant results underscoring the complexities involved in the assessment of those interactions.

By examining how these conversations are perceived by the participants we aim to connect our internal interpretation and external display of empathy. A better understanding of how supposedly emphatic interactions are assessed would facilitate If we can better understand how supposedly empathic interactions are assessed, this can facilitate the comprehension and production of this speech act and also enrich and complement existing research on empathy, leading to a more effective, practical applicability in our social behaviour and particularly in fields where empathy is central (mediation, healthcare, negotiations, etc.).

# The pragmatic functions of the Japanese predicate phrase *to omou* '(I) think that' in letters to the editor in a newspaper

Lecture

***Ms. Jun Kanazawa***<sup>1</sup>

1. The University of Tokyo

Using supportive evidence from a corpus spanning two years of letters to the editor, a prototypical argumentative discourse, published in the Japanese newspaper *Yomiuri Shimbun*, this study focuses on the Japanese predicate phrase *to omou* '(I) think that.' It is used at the end of a sentence and can be omitted without affecting the sentence's meaning. The phrase performs two pragmatic functions, namely **highlighting I or you function**.

## (1) Highlighting *I* function

*Anata wa hantai suru ka mo shirenai ga, anrakushi wa yoonin sareru beki da to omou.*

'You may disagree, but **(I) think that**euthanasia should be accepted.'

The Japanese equivalent of the English expression *I think* is *to omou*, which comprises the quotative particle *to*, the verb *omou* 'think,' and the non-past tense formative *-u*. In Japanese, the subject of a sentence is often not mentioned. Therefore, when *to omou* is used, its subject is usually omitted as well.

However, even if the subject of *to omou* is not explicitly mentioned, the reader can understand its subject is *watashi* 'I,' because *to omou* has the unique feature that only a singular first-person pronoun can be its subject when it is used in the non-past tense. Therefore, in (1), *to omou* evokes the presence of *I* as the writer. This is the highlighting *I* function. In (1), by evoking the presence of *I*, *to omou* ensures that the content of the quoted clause is only the writer's opinion and the reader does not have to unconditionally agree with it. Therefore, it can attenuate the illocutionary force of the assertion. This hedging function is parallel to that of the English phrase *I think*.

## (2) Highlighting *you* function

*Kotoshi wa benkyoo o takusan {shiyoo/shitai} to omou.*

Lit. '**(I) think that** (I) {shall/want to} study a lot this year.'

'I {shall/want to} study a lot this year.'

In contrast, in (2), interestingly, *to omou* evokes the presence of *you* as the reader, even if a second-person pronoun is not mentioned in the sentence. This is the highlighting *you* function. As in (2), the quotative clause of *to omou* can include the volitional suffix *-yoo* or desiderative suffix *-tai* 'want.' In (2), without *to omou*, the sentence can be interpreted as a soliloquy. However, when *to omou* is attached, it is understood as part of a dialog and the entire sentence declares to the reader the writer's prospective action or determination. Therefore, this use of *to omou* can invite the reader into the discourse by indicating the writer's awareness of their presence. In this sense, *to omou* functions akin to the expression *I tell you*.

So far, many researchers have claimed that *to omou* can imply *I*. However, to my knowledge, its function to evoke the presence of *you* has never been reported. This study sheds light on a new aspect of *to omou*, and indicates that, depending on the content of its quotative clause, *to omou* performs drastically distinct functions: highlighting *I* or *you*.

# The presentation of personalities in the mother tongue and in the foreign language

Lecture

***Dr. Angela Weisshaar<sup>1</sup>***

***1. University of Goettingen***

The telling of one and the same matter by one and the same person in L1 and L2 has up to now only been explored to a very limited extent. When late bilinguals tell the same event in L1 and L2, there are usually differences in version. These differences are subtle or obvious and may also concern the representation of persons. Late bilinguals often mention different images of themselves and others. For example, a person may appear more friendly or problematic in one of the versions (s. Weisshaar 2009).

How can this happen?

Do bilinguals perhaps have two personalities, as some people suggest? Or does our memory work differently in the two languages? Ervin-Tripp (1954) explains this phenomenon with the respective socialization in each language.

A selection of German-Italian, German-French, German-Spanish and German-Portuguese spoken and written examples (out of more than 100 collected texts) will be used to illustrate such differences. We will try to find an explanation.

# The raised index finger in Hebrew talk-in-interaction

## Lecture

***Dr. Anna Inbar***<sup>1</sup>, ***Prof. Alan Cienki***<sup>2</sup>

**1.** University of Haifa, **2.** Vrije Universiteit Amsterdam

The raised index finger gesture (RIF) has previously been described as a gesture that singles out one component of the utterance and draws the interlocutor's attention to this component (e.g., Kendon 2004). Kendon (2004) suggested that the gesture alerts the addressee in some way to the frame in terms of which the utterance is to be interpreted.

The aim of the present study is to examine the roles that the RIF plays in Hebrew talk-in-interaction. The corpus for the study was drawn from the issue-oriented Israeli television show *Butterfly Effect*, in which two interviewers host one scholar, always an expert in his or her field, and discuss interesting and controversial topics. The total length of the corpus is around 560 minutes, spanning 14 programs that aired between 2012 and 2013. One hundred instances of the RIF were extracted from the corpus and the contexts of their use were analyzed. A corpus-driven discourse analysis reveals that the RIF may occur in various contexts (that are not usually studied together), such as opposition, rectification, concession, epistemic certainty, discourse shifts, and discourse suspension. However, an examination of these contexts shows that they share the feature of "unexpectedness" (Zimmermann 2008); that is, the speaker presents a message or a speech act that they expect will violate the hearer's expectations (based on general knowledge or prior discourse). Thus, by using the RIF, speakers may set up a frame in terms of which the indicated component of the utterance is to be interpreted as unexpected on the part of the hearer.

The following example illustrates the context of epistemic certainty. This epistemic stance is conveyed explicitly in Hebrew by the discourse marker *be'etsem* "in fact" (Gvura & Manor 2013), whereby the speakers emphasize their strong commitment to the truth value of their propositions. The example was taken from an interview with a professor of psychology who was discussing the influence of the listener during conversations.

- 1 mi-bxina te'oretit,  
from-examination.SG.F theoretical.SG.F
- 'theoretically,'
- 2 xokrot amerikaiyot ta'anu tə'ana 'axat she-scholar.PL.F American.PL.F claim.PST.3PL claim.F one.F that
- 'American scholars have made one claim that'
- 3 be'etsem #ha-makshiv# kove'a 'et ha-sixa.  
in\_fact DEF-listener.M determine.PRS.SG.M OBJ DEF-conversation.F
- 'in fact, the listener leads the conversation.'
- #RIF————>#
- 4 ze m- ha-makshiv, 'ata 'amarta, pasivi,  
this.M m- DEF.listener.M, you.SG.M say.PST.2SG.M, passive.SG.M,
- 'this l- the listener, you said, is passive,'
- 5 ha-makshiv ze ha-menahel shel ha-sixa...  
DEF-listener.M this.M DEF-manager of DEF- conversation
- 'the listener is a leader of the conversation,'

The opinion presented here, that the listener is the one who leads the conversation (lines 3, 5), is contrary to interviewer's opinion that the listener is passive (line 4). Following the discourse marker *be'etsem*, the RIF

appears before (and is maintained throughout) the phrase *ha-makshiv* “the listener”, drawing the addressees’ attention to the upcoming message that is evaluated as unexpected for the hearer. We suggest that by this gesture, the speaker provides clues about the affective character of the message, thus providing the basis for a swifter update of the common ground (Clark 1996).

# The relation between compounding and conceptual modulation

Lecture

***Prof. Anne Bezuidenhout***<sup>1</sup>

**1.** University of South Carolina

According to Relevance Theory, linguistic expressions that encode conceptual (as opposed to procedural) meanings are semantically underspecified. Hence, when used in verbal communication, interpreters must pragmatically modulate the encoded meanings of these expressions, in order to arrive at the meanings that speakers intended to communicate by using those expressions in context. Such pragmatic modulation results in *ad hoc* concepts – ones derived from the encoded meanings of expressions together with contextually available assumptions. (Sperber & Wilson, 1995; Carston, 2002).

In the case of the interpretation of a novel noun-noun compound expression, such as ‘sugar line’, the relation between the meanings of the two nouns is semantically underspecified and that relation must be pragmatically modulated in order to arrive at a contextually appropriate meaning. Such compounds require ‘enriched’ composition, since the intended meaning goes beyond the encoded meanings of the two nouns and the syntactic structure of the compound expression. (Jackendoff, 2010).

In this paper, I compare *ad hoc* concept construction, in which the encoded meaning of a single expression is pragmatically modulated (e.g., narrowed), to the process of deriving the meaning of a novel noun-noun compound expression. My central claim is that it is fruitful to posit a similarity between the process of modulating the underspecified meaning of a single expression on the one hand and the process of modulating the underspecified meaning of a relation between the meanings of two expressions on the other.

I argue that there are two benefits to making this comparison. Firstly, it brings two sets of literature together that tend not to be in dialogue with each other (the RT literature on *ad hoc* concept construction and the morphological literature on compounding). Secondly, when one looks at these two sorts of processes together, one sees that they are intertwined in interesting ways. Deriving meanings of compounds often involves pragmatic modulation (e.g., narrowing) of one or both of the component meanings, while simultaneously modulating (e.g., narrowing) the semantic relation between the component meanings. Thus, these processes are ripe to be treated in some overarching, unifying framework. I illustrate this process in some detail and sketch the main elements of an overarching framework of pragmatic modulation. Finally, I address one important apparent difference between *ad hoc* concepts and novel noun-noun compounds, namely that the former do not persist outside their contexts of creation, whereas compounds, once created, can be reused. Some existing experimental evidence can be helpful in adjudicating this issue. (Gerrig and Murphy, 1992; Raffray et al., 2007).

# The relative clause construction **ze (copula) N(P) she-RC** in spoken Hebrew discourse as a multimodal package for stance-taking

Lecture

***Mr. Nikolaus Wildner***<sup>1</sup>

1. University of Haifa

In an action-based view on language use, stance-taking is a ubiquitous practice in interpersonal communication. Used as an overarching term according to Du Bois (2007), stance-taking involves three basic components: a stance-taker, an object of stance, and an evaluation of the latter by the former.

Employing the analytic methodology of Interactional Linguistics (Couper-Kuhlen & Selting 2018), I present a multimodal analysis of a particular syntactic format involving a relative clause (RC) in spoken Hebrew discourse that is regularly, but not exclusively, used for the action of stance-taking in discourse.

By viewing cases of this format as “multimodal packages for the production of action” (Hayashi 2005), I investigate the distinct yet interconnected modalities involved in their production - prosody, gaze conduct, gestures, and bodily behaviour, and I argue that speakers apply specific patterns of non-verbal modes of expression for each distinct action - stance-taking and others - that they perform through the same syntactic format.

The discussed format involves a deictic subject pronoun *ze* (“this”) followed by a noun phrase (NP) and a predicative RC introduced by the subordinator *she-*, i.e. **ze (copula) N(P) she-RC**:

1 Naomi: *nagid      'ani yexola      lehitxaber*  
say.fut.1pl I can.prss.f.sg connect.inf  
like I can really connect

*mamash le-'anashim she-hem,*  
really to-person.pl that-they  
to people who are,  
2      '*e,*  
uh  
uh,  
3      *me'od ptuxim ve-yeshirim,*  
very open.pl and-straightforward.pl  
very open and straightforward,  
4      *ki      nagid,*  
because say.fut.1pl  
because like,  
5      ***l-i      ze      mashehu***  
to-1sg this.m.sg something  
for me that's something

#***she-kashe la'asot 'ot-o,***#  
that-difficult do.inf acc-3m.sg

which is difficult to do,

**#lifts hand from chest to an open hand gesture towards herself#**

- 6      *ve-'ani ma'arixa                  'ot-o,*  
       and-I appreciate.prs.f.sg acc-3m.sg  
       and I appreciate it,

In this interaction of two friends, Naomi relates to her interlocutor the qualities she would look for in a partner. The pronoun *mashehu* “something” represents the aforementioned qualities of openness and straightforwardness as the object of stance, whereas the content of the RC evaluates these personal attributes as difficult to act upon by herself. The subjective character of the target construction is multimodally performed: After pointing towards her chest at the beginning of line 5, Naomi lifts her hand at the onset of the RC to an open hand gesture that she directs towards herself during her evaluative statement.

This contrasts with the same format used deictically with reference to objects in the interlocutors’ shared space, rather than intratextually to items within a discourse:

- 1 Naomi: *xelek ze              haya              xiburim*  
       part this.m.sg be.pst.3m.sg combination.pl  
       some of them were combinations

she-lamadnu,  
 that-learn.pst.1pl  
 that we learned,

- 2      *nagid      #ze              xibur              she-lamadnu?,#*  
       say.fut.1pl this.m.sg combination that-learn.pst.1pl  
       for instance this is a combination that we learned?,  
       **#places her hand on a piece of fabric#**

Here, Naomi uses the target construction to point - physically and linguistically - at a concrete item, a piece of fabric, and to characterise it. This deictic usage is also performed through Naomi’s bodily behaviour: She places her hand on the piece of fabric she wants to elaborate on, synchronously with uttering the target construction.

# The role of metaphors in investigating evaluative prosody – a corpus-driven approach

Lecture

***Dr. Gábor Simon<sup>1</sup>***

**1. Eötvös Loránd University**

Corpus-assisted methods have a long tradition in the examination of evaluative prosody (EP, see Stubbs 2002, Hunston 2011, Rühlemann 2019). Collocation and concordance analyses, however, can only test the (professional) intuition about the evaluative character of an expression. Thus, these methods cannot be used for extracting a large sample of words with evaluative function from a corpus.

Recent findings (Morley–Partington 2009, Partington 2015, but see also Stubbs 2002), however, support the role of metaphorization in establishing EP: metaphorical meaning extension can serve as a vantage point for the emergence of pejoration or amelioration.

The paper aims to answer the following questions. (i) In what proportions does metaphorization co-occur with EP? (ii) How can we carry out a corpus-driven analysis of EP relying on the identification and annotation of metaphors?

To propose answers to these questions, my study combines quantitative and qualitative methods of corpus analysis. In the first part of the talk, I introduce a “morpheme-sensitive” version of the MIPVU method (Steen et al. 2011) which is a reliable process of metaphor annotation in Hungarian texts (Simon et al 2020). This method has been used for annotating metaphors in a test corpus (appr. 6000 tokens), which gives us essential information about the distribution of metaphorization in the corpus.

After the quantitative exploration of metaphors, the evaluative function of the identified metaphorical expressions is analysed on a case by case basis. This qualitative phase of the research explores the patterns of metaphorical evaluation in the corpus.

The main advantage of this approach is that it makes the relationship between metaphor and EP measurable, providing a complex corpus-driven methodology for extracting EP-data through metaphor identification.

# The role of prosody and silence in communicating insinuations. An experimental approach.

Lecture

***Dr. Jonathan Caballero<sup>1</sup>, Ms. Meri Arushanyan<sup>1</sup>, Dr. Marc Pell<sup>1</sup>***

***1. McGill University***

Insinuations constitute indirect speech acts where the speaker intends to communicate a veiled meaning besides the utterance's literal meaning. One strategy that speakers can use to achieve this is to prosodically signal their communicative intention. For listeners to correctly interpret the insinuation, they first need to accurately perceive the underlying intention to communicate an indirect meaning, and then to accurately infer it by considering contextual cues, shared knowledge, and plausible alternative meanings. The cognitively demanding nature of communicating insinuations makes them challenging to encode and decode and opens the risk for miscommunication, particularly in intercultural communication settings and when using an L2.

We present two stages of an ongoing study. In the first stage, we recorded ~700 minimal pairs of literal vs. insinuation utterances from native English speakers and highly proficient English as a Foreign Language (EFL) speakers. The minimal pairs differ only in terms of their prosodic characteristics, which we analyzed acoustically. We found variability in the prosodic strategies that speakers use to encode insinuations. Literal and insinuation recordings differed in mean and standard deviation measures of pitch (fundamental frequency or  $f_0$ ), amplitude, and vocal quality measures (Harmonics-to-noise ratio), but the acoustic profiles varied idiosyncratically across speakers. The only reliable acoustic cue across native and EFL speakers was an increased duration of the insinuation recordings. This was due to increased use of *silence and pauses*, often occurring at strategic points of the utterance, in addition to local lengthening of some words.

In a second stage, we presented these recordings to an independent group of native English speakers using a forced-choice methodology to obtain data of perceptual accuracy for detecting literal and insinuation meanings. The literal recordings produced by native and EFL speakers were correctly recognized at very high levels (>80%). The insinuation recordings of native speakers were better recognized (>80%) than those produced by EFL speakers (>60% on average), which were nevertheless recognized at above-chance levels, and some of them almost as well as those from native speakers (~80%).

Lastly, we describe a novel social interaction methodology based on a behavioral economics approach to study social decision-making. The methodology is designed to capture the essential characteristics of communicative situations while ensuring experimental control. We present the results of a pilot experiment using a subset of the literal and insinuation recordings with the highest recognition rates in the last phase (~80%). We demonstrate how the methodology can be used to capture the joint contribution of prosodic contrasts *and* the linguistic background of prospective listeners (native or EFL) in guiding the speakers' decisions to use indirect meanings in communication. We highlight the opportunities that this approach offers for addressing the main interest of pragmatics - the role of language in social contexts - in an experimentally controlled but highly natural context.

# The scalar implicature view of presupposition: new evidence from an experimental study

Lecture

**Dr. Tamara Melo de Oliveira<sup>1</sup>, Dr. Marcos Goldnadel<sup>2</sup>**

**1. Instituto Federal de Santa Catarina, 2. Universidade Federal do Rio Grande do Sul**

The past twenty years have witnessed a significant shift in theoretical models designed to deal with the triggering problem of presuppositions. The generalized tendency to consider presupposition as a conventional pragmatic phenomenon, subject to conversational interference, gave way to a different view, according to which presupposition would be a conversational phenomenon. Among these approaches, one that has received attention in experimental studies is the one proposed by the Italian linguist Jacopo Romoli. According to Romoli (2015), inferences produced by soft triggers in negative, disjunctive or conditional utterances are obligatory scalar implicatures. We conducted an experiment in portuguese, similar to those reported in Bill, Romoli and Schwarz (2018), in order to assess whether participants react differently to utterances with presuppositional triggers and utterances with traditional scalar expressions. In our experiment the participants ( $n = 101$ ) were asked to judge whether images matched stimulus utterances. This experiment corrects some problems found in the previous ones, the main one being the possible confound introduced by the processing asymmetry between utterances with *stop* as a presuppositional trigger and utterances with traditional scalar items, considering the view that presuppositions are scalar implicatures. This view compels us to consider that the processing of negative utterances with traditional scalar expressions involves three negations, whereas the processing of negative presuppositional utterances with *stop* as a trigger involves four. The processing of negative presuppositional utterances with *continue* (*continuar*, in portuguese) as a trigger, on the other hand, involves three negations. This makes this trigger more suitable for this comparison. That is the reason why we built an experiment in portuguese with *continuar* (*continue*) as a trigger instead of *parar*(*stop*). Due to the changes made in our experiment, the results reported here present an important difference in relation to those of Bill, Romoli and Schwarz (2018). Specifically, we found a more significant difference in reaction times between cases in which participants rejected a violation of the pragmatic inference and cases in which participants rejected a violation of the literal content in presuppositional utterances, an outcome that is similar to that found for implicatures. This result favors Romoli's hypothesis. However, unlike the original study (based on results obtained in separate experiments), which does not directly compare acceptance rates and reaction times between different phenomena, being limited to the comparison of reaction time patterns, the study presented here is based on a single experiment, and makes direct comparisons between these indicators. In these comparisons, two results are unfavorable to the hypothesis that presuppositions of utterances with soft triggers are scalar implicatures. We found different acceptance rates between utterances with presuppositional triggers and utterances with scalar expressions in cases of violation of the pragmatic inference. We also found different reaction times between the same two types of utterances when the violation of the inference is rejected. These differences, therefore, present evidence contrary to Romoli's hypothesis.

# The Shameless Normalization of Impoliteness in Berlusconi's and Trump's Press Conferences

Lecture

***Prof. Jonathan Culpeper<sup>1</sup>, Prof. Ruth Wodak<sup>1</sup>, Prof. Elena Semino<sup>1</sup>***

***1. Lancaster University***

This paper, to be presented by Jonathan Culpeper, examines political press conferences in two different cultural contexts, North America and Italy, and specifically impoliteness behaviours performed by senior politicians which traditionally would be considered impolite and attract negative evaluations but here are positively evaluated by notable numbers of the audience. This is not a context where impoliteness by politicians is institutionally licensed (e.g. the “reasonable hostility” of some political discourses; Tracy 2008) or where it might be considered banter (i.e. mock impoliteness; Leech 1983). Instead, the violation of the traditional moral order sustaining politeness seems to be part of a right-wing populist agenda of shameless normalization.

We apply the notions of *impoliteness*, notably Culpeper (2011), and *shameless normalization* (Wodak 2018, 2021) to potentially impolite behaviours produced by Donald Trump and Silvio Berlusconi in official press conferences. Press conferences, as an activity type, involve relatively clear expectations and norms, so that impolite behaviours theoretically constitute particularly salient violations. We present two case studies involving racist and misogynist insults on the part of Berlusconi and Trump, respectively. We describe the kinds of impoliteness that each politician employs, without any apology, and then examine comments posted in response to YouTube videos of each incident. These comments show evidence of polarized responses, but with substantial proportions expressing positive evaluations. As also noted by other researchers (e.g. Blitvich 2009; Montgomery 2017), we observe that impoliteness affords the possibility of presenting authentic and hyper-masculine identities. We conclude by briefly reflecting on implications for definitions of (im)politeness, change from politeness to impoliteness (and vice versa), and also the political and cultural landscape.

# The speech act of apologising in Japanese online communication: a corpus assisted study of apologetic expressions in written, computer-mediated discourse.

Lecture

***Ms. Eugenia Diegoli<sup>1</sup>***

*1. University of Bologna*

The aim of this study is to investigate the use of three Japanese expressions commonly signalled as apologetic, namely *gomen* ‘sorry (NON POLITE)’, *sumimasen* ‘sorry (POLITE)’ and *mōshiwake arimasen* ‘sorry (SUPER POLITE)’, in written, online platforms in Japanese. Combining a discursive approach with corpus linguistic tools for the collection and analysis of spontaneous data, the study addresses the following research questions: (1) What are the main pragmatic functions these Japanese expressions - usually considered as apologies (here defined as expressions “directed towards some action [...] considered to be negative and unwanted for the recipient of the apology” [Coulmas, 1981, p. 71]) - have in online settings? (2) How is the act of apologising performed in the specific setting of online communication? (3) What motivates an apology in the collected data? The various pragmatic functions *gomen*, *sumimasen*, and *mōshiwake arimasen* serve in a corpus of spontaneous conversations collected from the Q&A forum Yahoo! Chiebukuro are investigated and the findings are compared. A close reading of the collected texts has shown that their real communicative intent can be something different from an apology, or indeed can be apologising plus other intentions. In fact, they are polyfunctional words which, in the data set, performed twelve actions: apologise, reject a request or an offer, demand an apology, reject an apology, make first order considerations, leave-taking, mitigation of impolite expressions, in idiomatic expression, thank, request, as attention getters and, finally, as opening formulae. Though results have confirmed that a number of pragmatic functions present a strong preference for one lexeme, all three expressions *gomen*, *sumimasen*, and *mōshiwake arimasen* are commonly used in the corpus to express speaker’s regret for an offence (in 55.6%, 42.86% and 72.49% of occurrences respectively). When the lexemes are intended as an apology, the study also shows the different patterns of speech act realization. The findings indicate that expression of responsibility is the most common apologetic strategy in the data set, used in 62.81% of apologetic utterances, followed by apologies constituted by the lexeme alone and self-humbling, used in 17.76% and 10.72% of cases respectively. Finally, the apology strategies are investigated in relation to the type of offence they are aimed at remedying and preliminary results support Brown and Levinson’s ([1978]1987) assumption that weighty offences involve more complex apologies. These arguments are developed by analysing multiple linguistic, paralinguistic and contextual variables that frequently co-occur with apologetic devices and play a role in the realization of their pragmatic functions. Since computer-mediated discourse is fundamentally multimodal, multimodal features of speech acts such as emoji and non-standard script choices are also taken into consideration. Such features are used in 77 out of the 596 (12.9%) apologetic utterances identified in the corpus and a close reading of the co-text indicates that they seem to positively affect the interpretation of the interlocutor.

# The successful viva as a joint accomplishment: Exploring good interactional practices in viva examinations

Lecture

***Dr. Linda Walz<sup>1</sup>, Dr. Bogdana Huma<sup>2</sup>, Ms. Holly Dobrzycki<sup>2</sup>***

***1. Leeds Trinity University, 2. York St John University***

In UK Higher Education, the final step for obtaining a master's by research or doctoral degree is to complete an oral examination or *viva voce* (henceforth: *viva*). This thesis defence is conducted closed from the public between the candidate and examiners who are not the project supervisors. Research on vivas is scarce. Studies exploring candidates' experiences of this interactional setting, as remembered and recounted in interviews (Davis and Engward 2018), have revealed a variety of experiences ranging from enjoyable to horrific (Sikes 2017).

Participants' experiences of vivas and anecdotal evidence of 'what works' in a *viva* constitute the main input for *viva* training provided to candidates. While they are often advised to demonstrate independent critical ability and having made an original contribution to knowledge (Tinkler and Jackson 2000), candidates are not told what demonstrating these abilities looks like in practice. Guidance on this, if provided at all, is scarce, and no study has explored the *viva* as an interactional event, potentially due to the challenges that obtaining such data presents (Davis and Engward 2018).

Importantly, retrospective accounts of highly emotional events are often inaccurate, incomplete, and attuned to the circumstances in which they are elicited. Furthermore, individuals are not able to identify nor articulate what works well, especially in high-stakes situations (Stokoe 2013). Thus, to fully understand what occasions a diversity of outcomes and experiences in vivas and to provide comprehensive training for candidates, we need to 'open the black box' of *viva* examinations to scrutinise its constituent activities empirically.

The present research took on this challenge by exploring recordings of vivas, which are regularly produced at several universities in the UK. Using conversation analysis, we investigate how participants accomplish the authentication of their work, present themselves as knowledgeable and demonstrate criticality. The analysis reveals that these actions are jointly constructed and accomplished rather than achieved individually, contrary to the established expectation on the candidate to 'defend' their work. Furthermore, our analysis outlines an interactional trajectory of vivas, wherein certain actions are strategically placed at particular points in the examination. For instance, a candidate may highlight problematic aspects in their thesis towards the end of the *viva* to demonstrate criticality in a 'safe' moment in the interaction. This research thus sheds light on an underexplored educational setting and provides the foundation for practice-based training and advice that is grounded in direct evidence from real-life interactions.

# The Temporal Meaning of Kana Alnaqisa (was): A Pragmatic Reading

Lecture

***Prof. Manal Najjar<sup>1</sup>***

***1. university of Tabuk***

Arab Grammarians stood at variance with regard to the definition of kana (was). Kana was considered as a verb, a particle, a quasi-verb or a linking verb by different scholars; others saw it as an auxiliary verb; while some other scholars categorized kana as (Afa'al naqisa), based on two different claims. First, a considerable group of grammarians saw kana as fie'l naqis since it carries the temporal function, but not the event or the verb meaning. Second, kana dose not take subject only, but also takes Alkhabar (the predicate).

Excluding kana from being fie'l naqis, this study aims to examine the verb kana from a completely different contextual and pragmatic perspectives. Moreover, this study seeks to analyze and interpret the temporal meaning of kana in different grammatical constructs, focusing on the effect of context to monitor and determine the meaning intended. Syntactically, kana "was" is a unique kind of verbs that requires an argument to complete its meaning. However, on the semantic level, it is considered a strong verb, carrying various shades of meaning in various contexts in the sense that it is open to equate itself with all possible events, images, and meaning. Such uniqueness of the verb simultaneously serves a variety of pragmatics functions.

The study further argues that this verb in the morphological past form kana ݂ܲܶ (derived from the root of ݂ܹܶ which means the Universe) is considered unique and the most comprehensive verb as the mother of all verbs, encompassing all tenses of the past, present, and future within the dimensions of continuity and eternity. This distinctive temporal variation and its indications of the verb is recurrently utilized in the Holy Quran and Hadith of Prophet Mohammad, in addition to the heritage of the Arabic language. Such different uses and temporal meanings of kana are closely related to the context of the communicative situation. In other words, the verb kana, in spite of its past form, acquires different tenses and temporal meanings when used in different contexts and communicative environments.

The study hence concludes that categorizing the verb kana as fie'l naqis is inaccurate and confusing with regard to its temporal meaning. Moreover, the Arabs' recurrent interpretation of kana as to express the past tense only is based on morphological consideration rather than functional, not paying considerable attention to the verb's holistic nature in expressing meaning and tenses.

The study, therefore, calls for coining a different term for the verb kana. For instance, kana could be the verb that requires khabar (predicate), as Saibawi did or that necessities khabar as named by Alfarisi (377 H); or the verb that takes a mansoub (accusative) mutbadaa' (subject/topic) and marfou' (nominative) khabar, as referred to by Ibn Malik (672 H), Abu Hiyan (745 H), Almuradi (749 H), Ibn Hashim (761 H), and Aldmamini (763 H). Other scholars like Ibn Asfour (669 H) chose to call kana as the verb that takes both mutbadaa' and khabar, whereas Alazhari (905 H) named it the verb which takes mutbadaa'.

# The turn-by-turn unfolding of “dialogue”: Examining participants’ orientations to moments of transformative engagement

Lecture

***Ms. Lotte van Burgsteden<sup>1</sup>, Prof. Hedwig te Molder<sup>1</sup>, Prof. Geoffrey Raymond<sup>2</sup>***

*1. Vrije Universiteit Amsterdam, 2. University of California*

The emergence of heightened polarization and complex tensions pose special challenges for democratic governments addressing controversial policy decisions. In some contexts, governments have sought to address such issues by organizing public meetings to interact with citizens and increase their engagement in the matter. Nevertheless, the capacity for such meetings to engender a profound, transformative kind of contact of the sort described in philosophy and communication studies as “dialogic moments” has been questioned. Moreover, in contemporary democratic societies in which it has become common practice to call for “dialogue”, there is a growing need to broaden our conceptualizations of how “dialogue” gets established in actual interactions. Drawing upon a corpus of 10 (video-)recorded (contentious) public meetings (duration: approximately 18 hours) where officials, experts and citizens discuss the (health) effects of livestock farming in the Netherlands, the current study uses conversation analysis to address these questions. We thereby answer the question: “How do moments oriented to as transformative get accomplished in situated, actual interactions?”

We focus on situations in public meetings where some trouble has been alluded to or indicated by citizens but either not yet raised explicitly or resolved by prior talk. For persons conducting these meetings, the surfacing of such partially submerged troubles poses a choice between moving on or inviting their elaboration. We show how orientations to transformative engagements may emerge when organizers pose a query designed to invite discussion of the recipient’s apparent trouble. To explicate how these moments emerge and come to be resolved, we examine how the parties elaborate the issue or problem and the forms of acknowledgement and alignment that are associated with subsequent displays of understanding that convey transformation. By subsequently mutually ratifying the topic’s closure, participants treat the project of “hearing” and “being heard” as resolved. We thus demonstrate dialogicity as a provisional template, where each of these components is consequential for how the trouble is solicited:

1. Organizers’ opening up retro-sequence (Schegloff, 2007)
2. Citizens’ explication of the surfaced trouble
3. Organizers’ acknowledgement/alignment
4. Citizens’ displays that their issues are addressed satisfactorily
5. Organizers’ displays of understanding
6. Citizens’ displays that their issues have been addressed satisfactorily
7. Mutually ratified transition to new topic or activity

All these actions pertain to what is in the accountable conduct of the setting. Organizers demonstrate that what has been said has been consequential for what they do or say next, and display a new understanding of citizens’ perspectives. On their part, citizens orient to their concern being registered and heard by the civic organization, leading to a transformation in their engagement. Our study explicates this template by showing its moment-by-moment unfolding within characteristic examples from our data. Our study thus addresses the possibility for democratic deliberation around social problems, identifying some of the participations forms which participants themselves orient to as transformative.

# The Use of Hedges in Academic Research Articles Written in English and Japanese

Lecture

***Dr. Kayo Fujimura-Wilson<sup>1</sup>***

**1.** Yamaguchi University

Writing papers constitutes an aspect of interactions between authors and readers. An author making a claim in a research article tends to use hedges for self-protection, as they soften the strength of the statement. Further, hedges present the article as stating an opinion rather than explicitly introducing facts. Authors' use of hedges may lead readers to interpret their statements in various ways. In research articles, authors tend to use hedges to indicate their unwillingness to explicitly and completely commit to the truthfulness of their claims (Hyland, 1998). The use of hedges emphasises the subjectivity of the authors' positions by allowing the findings of their studies to be presented as opinions rather than facts, thereby opening these positions to negotiation in discussion (Hyland, 2005).

The use of hedges may vary according to the type of academic discipline of an article. Additionally, the use of hedges by authors generally reflects their own writing styles. Articles in hard disciplines often use statistical analysis with explicit numbers to present their findings. Meanwhile, authors of articles in soft disciplines generally need to interpret and explain the results of their studies, as explicit numerical data are not commonly used in these articles. Thus, it is often stated that articles in soft disciplines tend to use more hedges than in hard disciplines. Differences have also been observed in the use of hedges between articles in different languages. Generally, native English authors of articles in soft disciplines tend to use more hedges than non-native English authors.

Therefore, in this study, academic research articles written in English by native English writers as well as Japanese writers, and research articles written in Japanese by native Japanese writers were compared and analysed. A total of 60 research articles were investigated in this study. These articles belonged to both hard and soft disciplines to identify differences in the use of hedges in different languages and between native and non-native English writers. The acquisition of hedges used in articles written in English by Japanese writers was also examined in this study.

The results showed similarities and differences between English and Japanese writers, between the English and Japanese languages, and between English and Japanese articles written by Japanese writers. This study focuses on the use of hedges by Japanese writers, and in particular, the differences in the use of hedges in English by Japanese writers in hard and soft disciplines and in Japanese articles. In doing so, it aims to determine whether there are differences in the use of hedges in these two languages in different disciplines. For instance, the numbers of hedges used by Japanese writers in English and Japanese articles in hard disciplines are similar, unlike those used in soft disciplines. More similarities are observed in the use of hedges in hard disciplines than in soft disciplines. Conversely, a greater variety of hedges is used in articles in soft disciplines by native English writers than by Japanese writers.

# The ‘Other’ Side of Recruitment: Methods of Assistance in Social Interaction

Lecture

***Dr. Kobin Kendrick<sup>1</sup>***

*1. University of York*

The recruitment of assistance is ubiquitous in our everyday lives and is central to the management of social cohesion and solidarity in social interaction (Kendrick & Drew, 2016). Rather than beginning with vernacular actions such as offers or requests and examining their implementation, research on the recruitment of assistance begins with a social organizational problem: how do participants in interaction recognize and resolve troubles that emerge in practical courses of action (Kendrick & Drew, 2016, p. 2)? Studies of recruitment have investigated various ways in which participants in social interaction solicit, elicit, and provide assistance (Kendrick & Drew, 2016; Floyd, Rossi, & Enfield, 2020). Although the concept of recruitment embraces the provision of assistance as well as its solicitation (Kendrick & Drew, 2016, p. 2), because it emerged out of research on requesting in social interaction (Drew & Couper-Kuhlen, 2014), studies of recruitment have thus far focused on methods employed by Self, the one who experiences the trouble, that recruit the assistance of an Other (e.g., embodied displays of need or requests for assistance). The methods employed by Other – the diverse ways in which one person comes to help another – have yet to be fully examined.

In this paper, I extend the analysis of recruitment developed by Kendrick and Drew (2016) to include the methods of assistance employed by Other, that is, linguistic and embodied practices that attend and respond to Self’s trouble, enact Other’s participation in its remediation, and embody their recruitment into Self’s course of action. Based on a collection of over 500 cases drawn from video-recorded interactions among family, friends, and colleagues in the U.S. and U.K., a continuum of methods is identified. The methods of assistance span from visible displays of attention and availability and methods that index or formulate Self’s trouble (alerts and reports), to those that articulate possible solutions (advice and offers) and intervene directly into Self’s course of action to manage or resolve the trouble. After I describe and systematically compare the methods of assistance, I argue that together with the methods of recruitment they form a coherent social organization of alternative methods employed by Self and Other for the management of troubles, difficulties, and needs in the progressive realization of practical courses of action. I then conclude with reflections on this mode of analysis, which is rooted in classic conversation analytic research on the organization of interaction, and on the conceptualization of social action employed in it.

A significant part of everyday verbal communication consists of nonliteral language, including irony. People vary in the extent to which they use it to communicate with others. This may be related to both cultural and individual factors. Irony has been found to be used in about 8% of all conversational turns among friends by US English (Gibbs, 2000). Although there is substantial evidence showing that people use it more often in conversations with people they know well, we do not quite understand if this preference for using irony is related to one's social milieu. Also, we do know that internet - based communication tends to generate more ironic and aggressive verbal behaviors, and we would like to expand our understanding of this factor.

We wanted to test the hypothesis that the extent to which verbal irony is used is related to social factors such as time spent with friends, both face-to-face and online, and the reported number of friends. In particular, since most of the data on irony use come from English-speaking samples, we wanted to analyze non-English speaking populations. To this end, we analyzed the responses of 315 participants in Poland (249 female, age 18-79, M = 28.11, SD = 9.65) and 329 in Turkey (250 female, age:18-70, M = 36.98, SD = 12.32) on the Sarcasm Self-Report Scale (SSS, Ivanko et al., 2004), a quantitative questionnaire, and the information they provided in a questionnaire on social interactions. We then ran a correlation and a regression using SPSS ver. 25.

We found that in the Turkish sample, the declared use of irony correlates significantly with the time spent with friends face-to-face ( $r = .22$ ,  $p < 0.001$ ) and with time spent online ( $r = .13$ ,  $p < 0.005$ ). There is also a negative correlation between the declared use of irony and age ( $r = -.29$ ,  $p < 0.001$ ). Although the correlations are rather weak, they may indicate a potentially important factor in sarcasm use. The regression model explains 17% of the variance in SSS, but only time spent with friends f2f and age are important factors, while the number of close friends, time spent on social media and sojourning experience are not significant factors.

In the Polish sample, where the Sarcasm Self-Report Scale scores range between 16 and 112, with M = 66.60 and SD = 17.80 (Turkish sample: 16-102, M = 48.20, SD = 19.11), no correlation between irony use and any of the variables: time spent with friends f2f, time spent online or number of close friends was found to be significant. This result points to the importance of assuming that social factors may have a different importance for irony across different cultural groups. We will discuss possible interpretations of this finding and propose further investigations.

We conclude that more intercultural research on irony is needed.

# Topicalizing understanding in French and German

## Lecture

***Dr. Andrea Golato<sup>1</sup>, Dr. Peter Golato<sup>1</sup>, Dr. Emma Betz<sup>2</sup>***

*1. Texas State University, 2. University of Waterloo*

Accomplishing joint action relies on shared understanding, the infrastructure for which is sequential organization (Mondada 2011; Heritage 1984): Doing the next relevant action allows participants to show understanding. Sacks (1992) distinguishes *claiming* from *demonstrating* understanding. The latter involves giving proof or evidence (Schegloff 2007); the former may be done with repetitions, nodding, or response particles (Gardner 2002). We focus on explicit claims of understanding involving the verb ‘understand’ in responsive position in French and German. Data include telephone and face-to-face interactions taken from publicly-available and private corpora. We show that the type of understanding indexed by *versteh ich-* and *j’comprends*-turns is tied to specific sequential and turn positions (cf. Sidnell 2014; Deppermann 2015) resulting in a range of actions which can be carried out by explicit topicalizations of understanding (Deppermann 2008, 2011).

Preliminary findings suggest a spectrum of uses. One the one end are the more literal meanings (foregrounding the grasping of propositional meaning, including allusions; intention) found in contexts in which understanding (e.g., of rules in a card game) is explicitly being negotiated. Here, understanding claims propose sequence closings, thereby enabling a move to next matters. This can be seen in excerpt 1, taken from a business call in which Ap12 has learned that the intended party is unavailable. Ap12 subsequently asks to leave a message and provides information about the nature of the call (lines 1-4), which is receipted with a confirmation token. When Ap12 provides further detail, AS uses an understanding claim in line 9 to close the sequence and preempt further (projected) expansion.

Extract: CLAPI\_Tel\_Assureurs\_Conv.12\_00:24:27-00:25:49\_assureurs

01 Ap12: voilà bah vous laissez un message qu’ je

*right well can you leave a message that I*

02 le rappellerai pa’ce que j’aurais une mission un petit peu

*will call him back ‘cause I’ve got kind of a special project*

03 spéciale qui est plutôt: je dirais de l’information à

*which is rather: I would say some information to*

04 recevoir de: renseignements d’affaire

*get some: business information*

05 AS: oui

*yes*

06 Ap12: pour compléter je dirais les éléments que nous avons

*in addition I would provide the components that we have*

07 et les vérifier surtout de manière à avoir

*and verify them so as to have*

08 une information pré[cise euh ]

*precise information uh*

09 AS: [oui je com]prends

[ yes Iun]derstand

10 Ap12: voilà hein vous voyez de quoi nous parlons hein

*alright then you see what we’re talking about right*

On the other end of the spectrum are pragmatic meanings of “understand” such as foregrounding the acceptance of views, position, and actions. Here, “understand” is used to resolve competing action trajectories.

Overall, we compare uses of explicit understanding claims in French and German and contrast them with alternative practices for claiming understanding (e.g., *jaja*, Golato and Fagyal 2007; *okay*, Betz & Deppermann 2021). In addition to contributing to the literature on “understanding”, we also contribute to the research on the negotiation of intersubjectivity and speaker alignment.

---

# Toward Linguistic Certainty in High-Stakes Communications

---

Lecture

---

***Dr. Timothy Habick<sup>1</sup>***

*1. Reasoning, Inc.*

The pragmatics of standardized examinations is rarely discussed, yet the multilevel features of these high-stakes communicative events combine to have decisive effects on people's lives. Test candidates' careers depend on their success in understanding descriptions of complicated professional scenarios and in responding appropriately to questions and directives expressed in a standard (but perhaps unusual) register of language.

As part of the tacit communicative contract between test maker and test taker, each textual unit *shall* point directly, efficiently, and uniquely to an intended meaning, without irrelevance, garden pathing, and unresolved implicatures. The impersonal speech act of standardized examinations typically precludes any interactional negotiation of unclear meanings, so candidates legitimately expect test materials to fully comply with Grice's maxims. Test writers, for their part, legitimately expect candidates to be good-faith students of the language-dialect-register-jargon used in the relevant profession, and to be cooperative in their interpretations too. Cooperative in this regard means drawing register-appropriate inferences, not interpretations justifiable in irrelevant pragmatic contexts. Ideally, the professional register is modeled in textbooks, authoritative guidance, and approved practice materials. Many high-stakes professional examinations effectively assess professional language comprehension as well as mastery of professional content. This appears inevitable since the goal is to assess professional competence, and for most fields, conceptual content cannot be mastered without corresponding mastery over the linguistic structures conventionally used to express it.

Communications for high-stakes purposes thus must be designed to convey exactly one meaning to large numbers of readers, who are assumed to represent diverse international backgrounds. Can linguists say, with reasonable certainty, that for any given sentence in context there is an identifiable set of meanings that *can*, *must*, or *cannot* be legitimately interpreted from it? The answer surely is yes: by identifying violations of linguistic, logical, and pragmatic conventions of the relevant language-dialect-register. An interpretation that does not violate any rule is by definition a legitimate interpretation, regardless of the writer's intended meaning or the most popular interpretation. Certain grammatical and pragmatic structures, however, can be technically flawless yet predictably confuse a few readers. Reference to a taxonomy of such structures based on candidates' post-test feedback helps to ensure efficient processing.

Regarding pragmatic errors, how do ethnically diverse candidates actually respond to test materials? Differential Item Functioning (DIF) is a statistical procedure designed to identify discrepancies in performance on a test question by different self-identified (ethnic/gender) groups as a function of each group's performance on the test as a whole. For example, if Asian candidates, otherwise performing well on a test, tend to answer a particular question incorrectly, cultural interference could be the reason. DIF investigations shed light on the cultural assumptions that guide individuals to draw unintended inferences, even from highly manicured text. DIF insights of this type diminish as principles deduced from earlier DIF studies are implemented. DIF-flags drop precipitously as testing programs pay closer attention to the evocative potential and pragmatics of their communications. DIF analyses and the removal of pragmatic garden pathing can help ensure pragmatic certainty in the interpretation of textual materials.

# Tracing effects of digital tools on L2 opinions: A pragmatic analysis of ‘said’ and ‘unsaid’

Lecture

***Dr. Aisha Siddiqua<sup>1</sup>, Prof. Patrick Studer<sup>1</sup>***

***1. ZHAW School of Applied Linguistics***

This paper explores L2 opinions on internationalization of the curriculum by program heads in Swiss higher education institutions (HEIs). The analysis focuses on a) ‘what is said’ by looking at contextualization cue (Gumpers, 1976; Garfinkel 1967), implicatures (Grice, 1975; Levinson, 1983) and presuppositions (Stalnaker, 1973, 1974, 1998) in utterances and b) attempts to reconstruct ‘what is unsaid’ by examining silences and the lack of comments on certain issues raised during the focus-group discussions. It is anticipated that an in-depth analysis of focus group discussions will enable us to bridge the gap between what is said and what is understood. Since data is the essence of any pragmatic research, finding a suitable data collection method that matches the research questions and the analytical framework can be quite challenging (see for an overview, Schneider, 2018; Jucker, 2018; Takahashi, 2010; Golato & Golato, 2019). Considering the current global events and reduced mobility (due to Covid-19), this study uses two forms of digital data: primary data include computer-mediated semi-structured focus-group discussions (FGDs) which are similar to in-person spoken data as they are temporally synchronous (Jucker, 2018). FGDs are considered a useful tool for untapping socially shared knowledge and learning participants’ heterogenous opinions in group dynamics (Marková et al., 2007). FGDs are complemented by an electronically delivered survey. This paper, thus, not only shows how pragmatic analysis can contribute to the understanding of numerous interdisciplinary linguistic issues but also examines the dynamics of data collected through computer-mediated methods, identifying its successes and failures.

The study forms part of a larger project *internationalization of the curriculum* in Switzerland. Participants in FGDs included 11 program heads from numerous Swiss HEIs whereas more than 200 program heads, course coordinators and teachers from different Swiss HEIs took part in the survey. Participants were presented with broadly the same themes in FGDs as well as the survey. Oral data is transcribed using Jeffersonian transcription notation (1984) and analyzed using reconstructive interview analysis technique based on conversational analysis. Preliminary findings indicate that there is a huge gap in the conceptualization of the internationalization of the curriculum in scholarly circles and the pedagogical practice. The same terminology (e.g., internationalization) may imply different things for representatives from diverse disciplines and are implemented differently as well. In terms of methodology, digital FGDs served as an effective way to have an insight of participants’ beliefs, opinions, ideologies and experiences. However, several differences were found in the way opinions were expressed in FGDs and the survey which will be highlighted in detail in the paper.

# Tracking the longitudinal effectiveness of pre-study abroad pragmatics instruction for Chinese second language learners

Lecture

***Dr. Nicola Halenka<sup>1</sup>, Dr. Jiayi Wang<sup>1</sup>***

*<sup>1</sup>. University of Central Lancashire*

This study directly addresses the conference theme of inclusion and diversity by focusing on the less commonly taught language of Chinese. With the continued popularity of study abroad (SA) for language learners, this longitudinal investigation aimed to better prepare students of Chinese as a second language for a SA stay. Drawing on language socialisation theory (Schieffelin & Ochs, 1986), the pre-SA instruction focused on developing the production of formulaic expressions in L2 Chinese (pragmalinguistic focus) and L2 cultural knowledge (socio-pragmatic focus). The effectiveness of the instruction was then tracked over one academic year during the learners' SA stay in China, capturing data sets at the pre, during and post SA stages. The research questions framing the investigation were i) To what extent can explicit instruction of L2 Chinese formulaic language enhance situationally-appropriate output? ii) To what extent do learners perceive the instruction to be beneficial for a SA experience? While scholars have recently begun to investigate L2 Chinese pragmatic development during SA (Ren, 2019), pre-departure pragmatics instruction has yet to be explored. This study aims to fill this gap and is also unique in its longitudinal focus of one academic year, collection of multiple data sets, and its focus on British students in the Higher Education context.

Employing an underexplored group of British university students ( $N=18$ ) studying Chinese as a second language, this mixed-methods study comprised six hours of explicit pre-SA pragmatics instruction. An innovative computerised oral test was administered three times with an instructed experimental group ( $n=9$ ) and a control group ( $n=9$ ) providing baseline data, before and after the pre-departure instruction, as well as on their return to the UK. In addition, the experimental group provided qualitative data during these three phases to add to the rich data set.

Quantitative data analyses were based on rater evaluations of the situational appropriateness of the formulaic expressions across the time periods. Qualitative data analyses drew on participants' retrospective verbal reports, critical incident reports and individual semi-structured interviews during the three phases. Findings show that the instruction had a statistically significant impact on the experimental group's abilities to reproduce pragmatically appropriate formulaic expressions in Chinese in a range of academic and social situations, as well as increasing their confidence to interact in the L2. These post-instructional improvements were generally sustained after returning to the UK. In comparison, whilst the year abroad appeared to have somewhat of a positive impact on the control group, their performance levels on the oral test failed to reach those of their instructed counterparts after the year abroad on either pragmalinguistic or sociopragmatic measures. This study suggests pedagogical implications for teaching Chinese as an L2 and champions the use of a formulaic teaching approach for SA purposes.

# Translanguaging in Conflict-Ridden Educational Contexts: The Case of EFL Classrooms for Arabic Speakers in Israel

Lecture

**Dr. Muzna Awayed-Bishara<sup>1</sup>, Dr. Hadar Netz<sup>2</sup>, Prof. Adam Lefstein<sup>3</sup>, Prof. Tommaso Milani<sup>4</sup>**

**1.** The Hebrew University of Jerusalem, **2.** Tel-Aviv University, **3.** Ben Gurion University of the Negev, **4.** University of Gothenburg

This paper examines the pedagogical functions of translanguaging in English as a Foreign Language (EFL) classrooms in conflict-ridden educational contexts, which are also characterized by asymmetrical relations of power between languages. A growing body of work illustrate that translanguaging – broadly defined as bi/multilinguals' flexible uses of their linguistic resources (García, 2009) – is a natural and characteristic practice of bi/multilinguals. According to García and Leiva (2014), by challenging existing linguistic hierarchies and rejecting notions of language purity, translanguaging may advance social justice and liberate the voices of marginalized language learners. While the translanguaging literature is mainly celebratory, recent scholarly voices have been calling to reexamine the functions and implications of translanguaging across different contexts. Despite existing awareness of the educational significance of discussing controversial issues (Hess, 2002), research indicates that EFL teachers generally embrace discourse that aligns with an imposed hegemonic EFL policy aimed at the institutionalization of difference (Awayed-Bishara, 2020). Against this backdrop, this paper examines the intersection between minority teachers' and students' movement between languages and their negotiation of politically charged issues in the EFL classroom.

Towards this end, we draw on a corpus of approximately 13 hours of recorded and fully transcribed EFL lessons for Arabic speakers in 13 high schools in Northern Israel. Israel offers a unique case study since the educational system is almost entirely separate for the Jewish (Hebrew-speaking) majority and the Palestinian (Arabic-speaking) minority. To speakers of Arabic, English might be considered a fourth language after Spoken Arabic, Modern Standard Arabic, and Hebrew. In July 2018, Israel legislated the Nation State Law which not only reinforced the second class citizenship of its largest Arab minority but also cancelled Arabic's until then status as an official language (Awayed-Bishara, 2020). In light of this linguistic and socio-political complexity, the paper untangles the way translanguaging practices, specifically the use of English and Arabic, are employed. As we will show, translanguaging in our context has similar impact to that described elsewhere (e.g. clarifying meaning, dealing with classroom management, etc.). However, our findings suggest that while translanguaging has the potential to advance culturally-relevant pedagogies, it also functions as a policing pedagogical practice, problematizing, thus, the liberating notion and framework of voice that the literature offers. We argue that more research is required in similar conflict-ridden educational contexts (e.g. Charalambous and colleagues' work in Cyprus) in order to gain a more nuanced understanding of the diversified manifestations of translanguaging in these and other conflictual contexts.

# Troubles talk in mother-adolescent daughter interaction: Social bond building or social bond blocking?

---

Lecture

---

***Dr. Domenica DelPrete<sup>1</sup>***

***1. Teachers College, Columbia University***

Beginning with Jefferson's (1980, 1988) ground breaking work, troubles talk has sparked the interest of discourse analysts across disciplines (e.g., Coates, 1996; Ekström, Lindström, & Karlsson, 2013; Park, 2016; Pudlinski, 2005; Tannen 2001, 2006, 2017). Known also as a type of "rapport-talk" (Tannen, 1990, 2001, 2006, 2017), troubles talk enhances connection, invites identification, and builds social bonds. Despite its success in female friendship groups, there is a dearth of discourse studies exploring troubles talk among female family members, particularly mothers and adolescent daughters. This study delves into the intricate nature of this conversational ritual by providing a discursive analysis of how a mother engages in troubles talk with her adolescent daughter in order to build social bonds. It also unearths the interactional consequences of the mother's troubles talk with her adolescent daughter, and the linguistic means by which these accomplishments are discursively constructed. The data consisted of seven and a half hours of videotaped and transcribed naturally-occurring interaction between a mother and her adolescent daughter in the family home. The following questions guided this research: 1) Why does the mother engage in troubles talk with her adolescent daughter, and 2) How does the mother discursively accomplish troubles-talk in conversations with her adolescent daughter, and 3) What linguistic strategies signal the daughter's desire to disengage from the mother's troubles-talk? Findings reveal that the mother employs two discursive strategies to accomplish her troubles talk and build social bonds: (1) *persistent engagement* and (2) *treating the daughter's responses as inadequate*. The adolescent daughter, however, repeatedly blocks the mother's attempts at social bond building using five linguistic strategies: (1) *bald-on-record usage*; (2) *minimal response*; (3) *unmitigated dispreferred response*; (4) *lack of interactive questioning*; and (5) *solution-giving stance*.

Findings also extend Wolfson's (1986) bulge theory by arguing that the mother and daughter are operating under different conversational expectations, which align with their perspectives on relationship status and social distance. The study also provides practical implications for the mother-adolescent daughter relationship. It proposes what I call a *discursive consciousness raising*, or the prompting of individuals to become more aware of their verbal (and non-verbal) behavior; this includes how this behavior is received by other interlocutors. Specifically, the aim is to enhance communication between mothers and adolescent daughters, providing them with the discursive tools to navigate through occasions of troubles talk and other conversational activity where each person has conflicting interactional goals.

---

# Turn-final creaky voice across the lifespan in Tyneside English

---

Lecture

---

***Dr. Mirjam Eiswirth<sup>1</sup>, Dr. James Grama<sup>1</sup>, Prof. Isabelle Buchstaller<sup>1</sup>***

***1. Universität Duisburg-Essen***

In English, creaky voice has been identified as serving a social and stylistic role (see, e.g., Podesva (2013)). Phonetic investigations have chiefly considered its acoustic correlates across languages, while variationist-style studies on English have largely focused on the speech of young female speakers from urban, college-educated backgrounds (Dallaston & Docherty, 2020). A handful of studies of creak in UK Englishes show a correlation between creaky voice and sex, socioeconomic status, and age in Glasgow (Stuart-Smith, 1999), Edinburgh (Esling, 1978), and Leeds/York (Henton & Bladon, 1988). Interactionally, creak frequently occurs turn-finally in English (Henton & Bladon, 1988; Podesva, 2013) and serves as a turn-yielding signal, for example in Finnish (Ogden, 2001). While creak can play an important role in interaction, comparatively little is known about the ways in which speakers do life-stage specific identity work with creak.

This paper adds a dynamic perspective to the interactional functions of creak. We report on a panel data-set which consists of six participants from the North East of England recorded at two time points: in the 1970s when they were in their early twenties, and in 2014 when they were in their mid-sixties. Three participants were also re-recorded in 2019 in their early seventies. In order to control for interactional and stylistic factors, we restrict the variable context to turn-final position where creak has been shown to be more likely (cf. Henton and Bladon, 1988). We also trace how the proportion of creaky voice at the ends of turns changes for these individual speakers over the course of their lifespan. The definition of a turn, and in particular the end of a turn, draws on the next-turn proof procedure. Creaky voice is coded auditorily, though additional insights as to the changing nature of a speaker's creak are drawn from phonetic analysis.

This study makes contributions to pragmatics and sociolinguistics. It adds to our understanding of how speakers make use of creaky voice in interaction. It connects interactional and linguistic factors by focusing on the specific context of turn-final phonation. Finally, it contributes to an understanding of how the role of phonation changes over a speaker's life across three time points from 1974-2019.

# Twitter and the Real Academia Española: Perspectives on impoliteness

Lecture

***Mr. Victor Garre Leon<sup>1</sup>, Dr. Dale A. Koike<sup>1</sup>***

***1. University of Texas at Austin***

This study presents a first- and second-order approach to impoliteness as found in Twitter feeds on the website of the Real Academia Española (RAE), the official Spanish-language institution of the Hispanic world. Our goal is to argue that impoliteness must be studied from the perspective of the individual, reflecting their background experiences and knowledge, while also acknowledging their communities' norms. Based on the impoliteness framework of Bousfield (2008), we address the following research questions:

- How do impoliteness readings vary among the viewers of negative tweets on the RAE website who represent diverse backgrounds?
- How do the differences and similarities in the viewers' opinions of the tweets reveal their expectations and frames of impoliteness?
- Do the results support Bousfield's impoliteness categories and a frame-based notion of impoliteness?

We collected 56 reactive tweets in threads among different users, generating a dialogue of different opinions of (dis)agreement. Next, fourteen participant-viewers rated each user's tweet and provided judgments and comments on the perceived impoliteness on a 5-point scale. This approach to analysis approximates the concept of first- and second-order distinctions in politeness research (Haugh & Kádár 2013) in which, on one level, the tweeters evaluate what they and others are saying to the RAE on the website, while on another level, the viewers of this study evaluate those tweets externally.

Our results indicate some commonalities among subgroups in terms of politeness norms, but they also show individual differences in terms of expectations. The results suggest the limitations of previous impoliteness frameworks, which apply mostly to face-to-face interactions. Our research calls for the need to develop a framework of impoliteness to account for the complexity of the interactions in social media and consider an analysis at individual and community levels.

# Types and pragmatic functions of *hogy*- 'that' insubordinations in Hungarian

Lecture

***Mrs. Csilla Ilona Dér***<sup>1</sup>

1. Karoli Gaspar University of the Reformed Church

Insubordination – the independent use of constructions showing characteristics of subordinate clauses – is a well-studied phenomenon in many languages (Evans & Watanabe 2016), but there are only a few analyses of insubordinate clauses (ISCs) in Hungarian (Kas 2005, Brdar-Szabó 2009, Dér 2019 a, b).

The paper focuses on the four types of *hogy*- 'that' ISCs in Hungarian language:

(1) (rhetorical) questions: *Hogy miért van ez így?* Why is this so?

(2) negative wishes (curses): *Hogy pusztulnál el!* I wish you died!

(3) expression of positive/negative emotions: *Hogy milyen szörnyű!* How terrible!; *Hogy milyen szép vagy!* 'How beautiful you are!'

(4) metapragmatic expressions (~discourse markers): *Hogy összegezzem:... To sum up:... Hogy megvilágít-sam... To shed light on...*

Types (1)–(3) have a non-insubordinate independent version without the conjunction *hogy*: *Miért van ez így? Pusztulnál el! Milyen szörnyű!*

Our main goal is to answer the following questions:

- What are the main functional differences between the insubordinate and non-insubordinate constructions based on the judgement of informants? What are the exact interpersonal and metatextual roles that they serve? Are there genre-related usages?
- Why are non-insubordinate versions of type (4) missing in this language?
- Which types of *that*-ISCs evolved through ellipsis of the main sentence (Evans & Watanabe 2016) and which through other mechanisms like cooptation (Heine – Kaltenböck – Kuteva 2016)?

Our methodology contains detailed analysis of synchronic and diachronic databases (TMK, MTSz, MNSz2) and questionnaire research among native speakers of Hungarian.

# Understanding above Ages (What are the differences in the Speech of various generations)

Lecture

***Dr. Elena Borisova<sup>1</sup>***

**1. Moscow City University**

The difference in languages of various social groups (sociolects) was investigated by sociolinguists, mostly concerning gender and territory. The specifics of language variants that differ according to the age of speech partners was also noticed. The focus in these researches was made first of all on youth slang. As for the specifics of common language there were some investigations on changes in pronunciation and some other entities. Still the difference in languages of 3-4 generations that communicate in the same layer of time is worth describing from different points of view including pragmatic approach.

The research under description concerns the points of misunderstanding in using lexis in informal communication. The following methods were used: revealing evaluative capacity of lexis by interviews, understanding of neologisms and archaisms revealed by interview, analyzing cases of misunderstanding gathered by the author and mentioned in blogs and other media.

Summing up the results of these investigations, one may proclaim:

1. The changes in the lexis are more or less evident for generations with the difference in age about 40 (2 consequent changes of generations). The amount of lexis that is common for the old generation and unknown (or understood in another way) by the young one, is about 1% (it can vary according to the degree of acquaintance with classic literature up to 3%). So it is not great still it causes some difficulties in communication.
2. The semantic changes concern the lexis that seem to be still common for 2 generations (Rus. *roumyany* – ‘red-checkboned’ is known to young persons but is mostly understood as ‘healthy’).
3. The evaluative capacity in Russian was changed after the Transition (1991) mostly in the political sphere, where some abstract lexis has also changed its semantics ^ egoist ‘egoist – negative for old generation, neutral or positive for the young persons.

# Va a ser que nadie es perfecto. The evolution of Spanish ‘va a ser que’

Lecture

***Prof. María Sol Sansiñena<sup>1</sup>, Prof. Mar Garachana<sup>2</sup>***

***1. KU Leuven, 2. University of Barcelona***

The Spanish periphrastic future construction (PF) *<ir a + inf>* (lit. go to + INF) has recently evolved new uses expressing different types of modal, evidential and attitudinal meanings (Ledgeway & Maiden 2016; Marín Arrese 2017, a.o.). Several of these non-temporal uses are still un(der)described, and there is thus a great need for comprehensive studies that have explanatory potential for directions of change.

This study seeks to use corpus evidence (CREA, CORDE, CORPES, Twitter) to gain a better insight into the origin and expansion of the construction *<va a ser que + sí/no>* (lit. goes to be that + YES/NO) in Peninsular Spanish. This construction is documented since the beginning of the 21st century with assertive and refutative values (1). As can be observed in (1) the use of *va a ser que* is clearly dialogic. The construction appears at the beginning of an interactional turn that refutes what the interlocutor has expressed in the preceding turn. In this way, *va a ser que* works as a discourse strategy with an intersubjective value.

(1) “*Que lo hagan ellos si son tan listos*”, venía a decir [...] el recurso de la magistrada. Y el Supremo le respondió: “***Va a ser que no***”.

“Let them do it if they are so clever”, more or less said [...] the magistrate’s appeal. And the Supreme replied: “**Obviously not.**” (CORDE, 2015)

The refutative character of the construction is consistent with a specific discourse pattern and discourse position. By appearing in reactive interventions, *va a ser que* is always situated in turn-initial position, and it never appears in a first turn in an adjacency pair.

We argue that this construction derives from the use of the periphrastic future construction *<ir a ‘go to’ + inf>* in a pseudo-cleft sentence whose subject is either a deictic element or an element that conveys the speaker’s attitudinal assessment of the propositional content expressed in the attribute, a complement *que*-clause (2).

(2) *Lo mejor va a ser que tú mismo vayas a buscarlos*.

‘The best thing will be that you go looking for them yourself.’ (CORPES, 2005)

The etymological structure evolves through a process that formally implies the suppression of the explicit subject and the fusion of the components *va a ser que* leading to the conventionalization of refutative and assertive values.

The hypothesis is that we are witnessing the constructionalization of a discourse device specialized in putting the focus on the information that follows —a type of argumentative reinforcement strategy—, stemming from the PF used in identifying copula sentences X *va a ser que*Y. To demonstrate this directionality, we examine recent stages of change and develop syntactic and semantic-pragmatic arguments grounded in a data-based approach.

# Verbal and Bodily Origo Construction in Social VR Tandem Interactions

Lecture

***Dr. Timo Ahlers<sup>1</sup>, Dr. Karsten Senkbeil<sup>2</sup>***

***1. University of Potsdam, 2. University of Hildesheim***

In this paper, we will report on ongoing research from the project “The Humanities in Virtual Reality (HumanivR)”, which develops methodology and applications of Virtual Reality (VR) for linguistic and anthropological research. In pilot studies, we have explored the application of Social VR in language learning contexts. Our studies so far have shown that activity-oriented, collaborative VR communication in language tandems helps learners acquire and reflect on referential practices and polysemic deictic constructions in a much more immersive and holistic way than traditional language classes have been able to (Ahlers, Senkbeil et al. 2020). Our results show that ‘digital-game-based language learning’ (DGBLL, ibid.) in VR facilitates learners’ progress in the semantics of space and body, i.e. (local and personal) deixis, motion-related verbs, and the prepositional system of the target language, which we will demonstrate on a few examples.

Moreover, our empirical work with this data has drawn attention to the fact that classic conversation analytical tools have blind spots when dealing with digital communication, particularly in VR. In particular, we will argue in this contribution that solely relying on the observer perspective in video-based conversation analyses produces a linguistic observer bias, which can be overcome by using ego-perspective video data in analogue and virtual settings. By adding eye-gaze data from mobile eye tracking, we demonstrate how linguistic methods can profit from a more comprehensive data basis, resulting in more precise speaker/hearer-centered interpretations and even new analytic categories regarding processes of joint attention and action.

Our work with (eye-gaze augmented) ego-perspective video data from tandem learning interactions in a) physical space and b) in virtual reality shows that VR users adapt quickly to the extension of the body in the virtual dimension, where the autopoietic (real-life) body (Zlatev 2013) and the augmenting allopoietic body (the avatar) are simultaneously active. Among other things, ‘origo extension’ occurs when VR users switch between communication in analogous space and tandem partners in virtual space. Our analysis focuses on the verbal and bodily reference to i) the virtual origo and ii) the communicative display of switching between analogous (deixis in classic face-to-face interaction) and virtual addressees (avatar-to-avatar interactions) and includes joint attention/action processes in both domains. As a result, we propose an extended model of origo, from the analogous (Bühler [1934] 2011) to the virtual domain, which implies new directions for both (linguistic) theory and (empirical) practice in the future.

# Verbo-Visual argumentation in advertisements and its inferential reconstruction: a multi-theoretical perspective.

---

Lecture

---

***Dr. Rosalice Pinto Pinto<sup>1</sup>, Dr. Fabrizio Macagno<sup>1</sup>***

*1. Universidade Nova de Lisboa*

The term verbo-visual argumentation or “multimodal argumentation” describe a specific characteristic of a text combining more than one semiotic resource. This specific type of argumentation characterizes many printed advertisements, becoming a crucial and problematic area of research. Despite of the importance of this kind of argumentation that integrates verbal and non verbal (images, pictorial) messages, the methods used for interpreting and reconstructing the structure of arguments expressed through verbal and visual strategies capture only isolated dimensions of this complex phenomenon. Due to this peculiarity, this paper aims at proposing and illustrating a methodology for the reconstruction and analysis of “double- mode” arguments in advertisements, combining the instruments developed in social semiotics, pragmatics, and argumentation theory. The method for the reconstruction of this multimodal argumentation is processed through a five-step path. The analysis of its context, text genre, and images leads to a first representation of the messages that encode both pictorially and verbally (step 1). These first semantic representations are further enriched by including their polyphonic articulations and presuppositions (step 2), their explicatures (step 3), and their dialogical functions and illocutionary forces (step 4). These pragmatic steps retrieve the commitment structure of the ad, which allows a further argument analysis conducted through argumentation schemes (step 5). In order to illustrate this method, combining instruments from different approaches, we analyze an advertisement from a Portuguese Airline Company (TAP) produced in 2008. Despite this method was used for the analysis of a single text, our hypothesis is that it can be adapted to other texts combining different semiotic resources.

# Warri no dey carry last: a pragmatic study of ethnic stereotyping in Nigerian stand-up comedy

Lecture

***Dr. Akinbiyi Adetunji<sup>1</sup>***

***1. Emmanuel Alayande College of Education***

Despite the fairly recent upsurge in research interest in Nigerian humour, no documented study has investigated the socio-cognitive content of its production and consumption. This study is, thus, a cognitive-pragmatic investigation of the humorous representation of Warri and its indigenes (colloquially called, “Wafferians”) in jokes made by Nigerian stand-up comedians. Theoretically anchored in Relevance Theory, as complemented with aspects of stereotype and ethnic humour, all the series of the popular Nigerian stand-up comedy road show, *Night of a Thousand Laughs* as well as *Youtube* editions of *Made in Warri* and *Warri on Fire* (specifically-relevant Nigerian stand-up comedy shows) were purposively sampled for jokes which targeted the Wafferian. The study intended to identify the assumptions of Wafferian type(s) made mutually manifest in the jokes and how the typifications were implicitly and explicitly constructed and communicated by the comedians. Findings revealed a Wafferian-as-deviant stereotype, as illustrated with six major typifications: criminality, cunningness, confidence, violence, sincerity and smartness. As such, comedians’ monologues teased out a transmission of both positively-valued and negatively-valued stereotypes, realised in reinforcements or modifications of assumptions held in audience’s private and mutual cognitive environments regarding the Wafferian’s identity (traits, attributes and behavioural tendencies). Audiences’ uptake of the comedians’ predictions, revealed in mainly affiliative responses, indicated a similarity in the private and mental representations of members of the audience about the Wafferian. Additionally, the Wafferian-as-deviant stereotype instantiates epistemic vigilance, since all but one of the jokes sampled were performed by Wafferian-comedians (ethnic and cultural insiders), who should be considered authentic and reliable communicators of their in-group’s characteristics. Ultimately, the comedians sought to project Wafferians as different and distinct from other Nigerians, both for the purposes of self-deprecation and group pride. This study, thus, adds the Wafferian to the list of documented targets of ethnic humour, in the global spread.

# We-sense Building in Natural Conversational Narratives in Chinese

---

Lecture

---

***Dr. Yurong Zhao<sup>1</sup>***

*1. Northeastern University at Qinhuangdao*

Storytelling has been taken as one of the basic strategies for emotional involvement and intimacy building (Tannen, 2007). Just as Bochner (1997) argued, the sharing of personal stories is an important inclusion device and may naturally lead to the establishment of we-sense. In the process of story sharing, the teller's feeling, emotion and affect are also shared, and the affective empathy and resonance between them functions as essential means of relationship building (Collins, 2004; Couper-Kuhlen, 2012; Maynard & Freese, 2012).

Following the studies of storytelling both from the social psychology and interactional linguistics, the paper probes into natural conversational narratives in Chinese, a much less cultivated field compared with natural narratives in other languages, attempting at some interesting findings of affective and interactional we-sense building devices. A small corpus of 24-hour storytelling in Chinese in a university campus community serves as the empirical base.

Global analysis of empathy and resonance effects is made, and it is found that hearer-oriented personal and social deixis in the narrative layer, character dialogue in the story layer and the performance telling style in the discourse layer are helpful devices for we-sense building in the affective dimension. Meanwhile, local analyses of coordination effects in the process of telling suggest that discourse repair, alignment and affiliation devices naturally lead to the inter-subjectivity and interpersonal bond building between the interlocutors, and hence, we-sense building.

Enlightened with socio-psychological studies on interpersonal attraction, we can further interpret the we-sense building mechanism through story sharing as "I-sharing" effects (Pinel et al., 2016). That is, the rich employment of affective and interactional devices in the process of personal storytelling could easily encourage the individuals to cross the border between Self and Other and put oneself in the other's shoe, feeling co-presence, sympathy and empathy, and hence, affiliation to an ingroup.

# What a “discursive system of gender discrimination” is and how inclusive language can defeat it

Lecture

***Prof. Béatrice Fracchiolla<sup>1</sup>***

**1. Université de Lorraine**

My work on the linguistic and verbal expression of gender, in particular in writing and in terms of speech acts and linguistic performativity led me to highlight and define what I have called a “discursive system of gender discrimination”. This system is based on the way language is organized on a daily basis in unconscious historically built and structured discourses which, in a pragmatic way, exclude and discriminate each gender from the other – often in very implicit ways. The object of this communication is 1 / to show how it is possible to make these invisible speeches apparent and 2 / to show how this discriminating systematization is violent and represents a discursive phenomenon that we find at work not only in terms of gender, but also in all the other types of discrimination, all organized into a system also based on the very same semiotics and cognitive operations of categorization than those related to gender. The presentation will be based on French language and facts, so that examples will be taken from several corpora collected in France, in particular regarding the use of “Miss” and “Madam”, the feminization of profession name. This will lead me to explain why a form of social violence exists in the ways women are being named and talked about in diverse situations in society. I will thus illustrate the use of feminine gender inclusive language in France, how it is related to political ideologies, and what its real stakes are today after several centuries of repression and denial. The main theoretical framework is the theory of speech acts.

# What makes children laugh? Neural correlates of the development of humour

Lecture

**Dr. Mirella Manfredi<sup>1</sup>, Dr. Luca Bischetti<sup>2</sup>, Prof. Valentina Bambini<sup>2</sup>, Prof. Moritz Daum<sup>3</sup>**

**1.** Department of Psychology, University of Zurich, **2.** University School for Advanced Studies IUSS Pavia, Pavia, Italy, **3.**

Department of Psychology, University of Zurich; V. Bambini and M. Daum equally contributed as co-senior authors

This project aims at investigating how children's cognitive development affects their brain responses to different types of verbal humour. The Cognitive-Stage theory (McGhee, 1979) states that the type and complexity of humour a child can produce and understand mainly depends on the acquired cognitive functioning. Thus, each new cognitive acquisition leads to a qualitatively different form of humour. Following this account, we will study how and when children become sensitive to different types of verbal humour, across two developmental stages. We designed our experiment assuming that the understanding of humour starts from simpler phonological aspects, first as sensitivity to error or verbal slapstick (as represented by a rhyming nonword, which recalls the target) and, only at later stages evolves into the appreciation of deliberate instances of phonological humour, that is, the humour based on play with sounds that makes a word sound like another word (Hempelmann & Miller, 2017).

To this aim, we will compare the processing of humour elicited by phonological and nonsense jokes in two children groups (3 years and 5 years). Brain activity will be measured via ERPs: a context image (constant across conditions) will be presented, followed by auditory utterances created by manipulating the final word of a straightforward sentence into: i) the *Base Condition*, which creates a non-humorous sentence containing the baseline target word (e.g., I eat the beef); ii) the *Phonological-humorous condition*, which contains an unexpected word, phonologically close to the target word and rhyming with it, thus triggering a paradoxical and humorous effect (e.g., "I eat the thief"); iii) the *Slapstick-rhyme condition*, which includes a non-word phonologically close to the target word and rhyming with it (e.g., "I eat the sleep"); iv) the *Slapstick-nonsense condition*, which contains a non-word with the same root as the target word (e.g., "I eat the baur").

We hypothesize that, if humour processing changes across development, humour reaction will be indexed by different ERP responses (as reflected in greater N400 and/or P600 amplitude) to the *Slapstick-rhyme* condition compared to the other conditions in the 3-year-olds. Following McGhee (1979), we expect that the critical non-word of this condition, recalling the target word with the rhyme, could be interpreted as a *slip of the tongue*. The brain response to this condition in 3-year-olds would reflect the appreciation of the semantic incongruity, along with phonological similarity. Conversely, we expect a greater response (modulation of N400 and/or P600) to the *Phonological-humorous* condition, compared to the others, in the 5-year olds: in addition to rhyming, this condition would create a paradoxical semantic effect that, following our hypothesis, should be appreciated more by 5-year-olds.

Finally, the *Slapstick-nonsense condition* would represent a control condition, useful to confirm (or not) the pivotal role of the rhyme in triggering the humorous reaction in younger children.

The results of this study could confirm the results of previous investigations (Honig 1988, McGhee, 1979; Manfredi et al., 2014; Canal et al., 2019; Bischetti et al., 2019), and offer first insights into the neural correlates of humour processing in preschool children.

---

# Why German has more IAW structures than French

---

Lecture

---

***Dr. Steven Schoonjans<sup>1</sup>***

*1. Alpen-Adria-Universität Klagenfurt & KU Leuven*

The name “WhIAW construction” has been introduced by Stefanowitsch (2011) to refer to the intensification of wh-questions by means of elements such as *in aller Welt* ‘in all world’ (1) that express “incomprehension from the side of the speaker with regard to the sentence’s proposition” (p.190, my translation). As Stefanowitsch himself already indicated, other elements can occur in this intensifier slot as well, including *zum Teufel* ‘the devil’ (2), *um Himmels willen* ‘for heaven’s sake’, and *in drei Teufels Namen* ‘in three devils’s names’ (typical English examples would be *the fuck*, *the heck*, and *the hell*, among others). Based upon Stefanowitsch’s terminology, these elements are referred to as IAW structures.

(1) *Was in aller Welt will Frau Merkel erreichen?* (Stefanowitsch 2011:190)

‘What in all world does Merkel want to achieve?’

(2) *Was zum Teufel machst du da oben?* (COSMAS-II)

‘What the devil are you doing up there?’

The diversity is considerably bigger, however, than Stefanowitsch’s description suggests: An internet search yielded over 600 different IAW structures for German, including creative examples such as *beim Barte des Schneeleoparden* ‘by the snow leopard’s beard’, *zum fliegenden Fischstäbchen* ‘the flying fish stick’ and *zu Merlins langen Unterhosen* ‘by Merlin’s long underpants’. In French, the diversity is clearly not as big, yet still about 100 different structures could be found already, including *diable* (‘the devil’) and *pour l’amour de Dieu* (‘for God’s love’).

This talk offers a typological and topological comparison of the German and French IAW structures. The topological comparison is based upon the results of searches in different corpora (COSMAS-II, Wikipedia, Frantext, Orfeo) and shows that despite differences in sentence structure, the IAW structures occur in similar positions in the sentence in both languages. For the typological comparison, the corpus results are combined with the internet search results to get a better view of the ad-hoc creativity that is not necessarily apparent in the corpora. It is shown that the diversity in German is considerably bigger, although the same principles of creative variation are at play in both languages. I will discuss, among other things, loans from English, creative adaptation to the actual context, and the typical language use of certain communities (including in Harry Potter fanfictions and Spongepedia), indicating how they might explain the greater diversity in German.

# Women's prison literature as discourses of the margins: a literary pragmatic analysis of EL Sadawi's Memoirs From Women's Prisons

---

Lecture

---

***Prof. Fatima Inuwa<sup>1</sup>***

**1.** Gombe State University

There are different studies that centre on the nexus between pragmatics and literature (see Sell 1991, Mey, 1994, Pettersson, 2005, Yan, 2017), however, within the African context, the language used by prisoners who write about their penitentiary experiences have not been adequately explored in pragmatics. Even in the literary domain where studies exist, the attention is largely focused on the works of male prison writers in Africa such as Dennis Brutus, Breyten Breytenbach, Jack Mapanje, Wole Soyinka, Ahmed Ngim and Ken Saro Wiwa among others with very little attention given to women's prison writings. Women such as Nawal EL Sadawi, who have been incarcerated are silenced and doubly marginalized as prisoners and as female authors because there are less scholarly attention on their works. This paper therefore addresses this lacuna by using textual analysis to examine EL Sadawi's *Memoirs from Women's Prison* especially how language is used to capture the experience of torture, pain, death row, sexual deprivations and suicidal urges. Adopting an interdisciplinary approach using (Mey (1994), Foucault (1995) and Lazar (2014), this paper examines pragmatic views of the text production and consumption in EL Sadawi's work that include cooperative principle, particularly specific linguistic choices EL Sadawi explores to capture her readers in achieving collaborative recreation of textual meaning; multivocality, namely the various textual voices in the text. Based on the analysis, the paper found out that El Sadawi in *Memoirs from Women's Prison* maximizes the use of language through the minimum use of words, time and space. She also employs a conversational style that brings the author and the reader in a dialogue contributing in a communicative process of the text that is peculiar to the prison experience of women. Thus, the paper concludes that EL Sadawi through her pragmatic choice of words reveals women's resolve to resist oppression and her work offers a rare insight into the unforgettable experience of women who have been imprisoned.

***Dr. Elisabeth Zima<sup>1</sup>, Prof. Peter Auer<sup>2</sup>***

***1. University of Freiburg, Department of German Linguistics, 2. Universität Freiburg, Section of German Linguistics***

In one of the pioneering works on the multimodal analysis of verbal interaction entitled “Gesture and coparticipation in the activity of searching for a word”, Charles and Marjorie Goodwin (1986) formulated fundamental insights into the relationship between gaze and co-participation in word search activities:

- During word searches, speakers typically gaze away from their recipients. If they have been looking toward the recipient “*they will actively withdraw their gaze as the search begins*” (1986: 57, our emphasis). Gaze aversion in word searches may be seen as indicative of the preference for self-repair.
- In contrast, gaze shifts towards a recipient during word searches actively engage the recipient in the process of finding the missing word: “*the recipient’s active coparticipation in the search is now not only appropriate but sought by the speaker.*“ (70-71, our emphasis).

The function of gaze to invite or ward off coparticipation in word search activities has been confirmed by a number of subsequent studies (e.g. Hayashi 2003, Bolden 2003, Jehoul 2019, Dressel 2020), but usually on the basis of only a few cases. In this paper, we test the validity of the claims made on a larger data-set. Drawing on a corpus of 177 word search activities from German dyadic and triadic interactions, we show that only the first observation ((1) above) is confirmed by our data: gaze withdrawal is significantly more often followed by same-speaker completion than by cooperation in the word search. The second observation (2) is not corroborated: cooperation is not more frequent when the speaker’s gaze is turned to the recipient during the hesitation. Most notably, speakers often gaze at a coparticipant but still resolve a word search themselves. What is more, although recipient’s coparticipation in a word search occurs less frequently during speaker’s gaze aversion, in a number of examples candidate lexemes are offered, and these offers are not always treated as unwelcome by the word searching speaker.

Based on these findings, we investigate whether a more refined model on the relationship between gaze behavior and coparticipation in word search can be developed. In order to do so, we examine a number of contextual features and explore their influence on this relationship. These include the number of participants and their spatial arrangement, the epistemic structure of the exchange, the length of the hesitation phase, and metapragmatic search markers such as ‘I can’t think of the right word’.

# World of Irony: Overview of Verbal Irony Research in a Cross-Cultural Context

Lecture

***Mr. Piotr Kałowski<sup>1</sup>, Dr. Natalia Banasiak-Jemielniak<sup>2</sup>, Ms. Katarzyna Branowska<sup>1</sup>, Ms. Aleksandra Siemieniuk<sup>3</sup>, Ms. Anna Mitrowska<sup>4</sup>***

***1. University of Warsaw, Faculty of Psychology, 2. The Maria Grzegorzewska University, 3. University of Warsaw, Faculty of Polish Philology, 4. Independent researcher***

Linguistic/psycholinguistic verbal irony research has a dynamic history. From Paul Grice's account of irony as "saying the opposite of what you mean" proposed in the 1970s, the understanding of irony has advanced considerably (see Garmendia, 2018). Theories move from formal linguistic descriptions and pragmatic analyses to cognitive models of perception and interpretation processes (Gibbs & Samermit, 2017). These are accompanied by a broad range of empirical studies, which have recently begun to incorporate neuroimaging in order to locate the neural underpinnings of irony.

However, equal attention has been paid to the interpersonal aspects and contexts of irony. A notable area of focus involves the influence of individual differences between the speakers. For example, men and women have been shown to significantly differ in their attitudes towards and use of irony (see, e.g., Colston & Lee, 2004; Milanowicz, Bokus, & Tarnowski, 2017). The developmental trajectory of irony use/understanding is also being mapped, showing that it engages complex social-cognitive processes (see, e.g., Banasiak-Jemielniak et al., 2020; Pexman, 2008). On the basis of this data, scientists have recently begun to develop machine learning algorithms to detect written irony and sarcasm online (see Bamman & Smith, 2015; Maynard & Greenwood, 2014). Yet despite the increasing refinement of theory and methodology, a decisive majority of data concerns the English language and native speakers of English. Overlooking the study of irony in different languages and cultures in favor of deepening the analyses of English data represents a significant imbalance.

Thus, answering the researchers' call to make irony research more interdisciplinary (Athanasidou & Colston, 2017), the following presentation will draw attention to the influence of cultural factors in irony use and interpretation as well as the significance of cross-cultural comparative studies.

Drawing from data on the factors influencing irony use and understanding, including recent studies on the impact of bilingualism (Tiv et al., 2019; Tiv et al., 2020), we will outline how culturally-mediated aspects of communication, conceptualized through Hofstede's (2001) five-dimension model, can influence irony use/understanding, and thus should be included in future studies.

We will argue that such factors as cultural individualism vs. collectivism, uncertainty avoidance, or power distance might also find expression in irony/sarcasm, and thus, that including them in research is necessary to accurately study this phenomenon. We will also discuss how factors established as significant in irony use/understanding (e.g., self-esteem, self-presentation style) are simultaneously culturally-mediated, further legitimizing the cross-cultural perspective in irony research. Attention will also be paid to select cross-cultural differences in the social-cognitive constructions of irony (e.g., Japanese *hiniku*). Finally, potential benefits of considering cultural factors and carrying out cross-cultural studies on irony will be discussed: These include not only a deeper, more nuanced understanding of verbal irony as a linguistic and social-cognitive phenomenon, but also a more balanced and inclusive research perspective, taking into account non-English/Western languages and cultural circles.

As is becoming increasingly evident in many areas of life and science, so in irony research the way forward seems to involve integration rather than isolation.

# £ Making a joke £ or having a £ trouble £: Use of smile voice in humorous and problematic situations

Lecture

***Ms. Andra Annuka<sup>1</sup>, Dr. Tiit Hennoste<sup>1</sup>, Dr. Andriela Rääbis<sup>1</sup>***

***1. University of Tartu***

The topic of our presentation is the use of smile voice in humorous and problematic situations in Estonian institutional interaction.

In the studies of laughter, smile voice is often overlooked or analyzed together with laughter. Previous mentions say that smile voice is pseudo-laughter (Lavin, Maynard 2001) or a possibly-laughter relevant phenomenon (Jefferson 2010; Ford, Fox 2010). Haakana (2010) has studied smiling and has said, that smile voice is a (partly) audible smile. We analyze smile voice as an independent phenomenon and define it as an audible voice quality that resembles laughter but does not include any laugh particles.

Our research question is: what are the differences of using smile voice in humorous and problematic situations? The data consist of institutional interactions from the Corpus of Spoken Estonian of the University of Tartu and from two Estonian TV talk shows. The collection consists of 348 turns that are partly or wholly said with smile voice and the analysis draws on Conversation Analysis.

The preliminary results show that smile voice is used differently in problematic and humorous situations and the use of smile voice in turns vary in them.

In problematic situations there was only one smile voice position in our data: some words in the turn are pronounced with smile voice. The analysis shows that those words are somehow problematic for the speaker or the speaker uses smile voice on certain words to mitigate a possibly problematic situation.

In humorous situations smile voice can also mark only some words. Here the use is different than in problematic situations: smile voice is used to mark the part of the turn as non-serious. In humorous situations smile voice can also take up the whole turn. In that case the speakers are telling jokes or personal stories. However, in humorous situations smile voice can also flood out into the beginning of the same speaker's next turn, that starts a new and non-humorous topic.

In our presentation we are going to discuss the usage of smile voice and how the recipient responds to prior speakers smile voice. The main goal is to analyze in which conditions does smile voice flood out to the same speakers next turn.

# 'I know I'm rude but': The discourse markers for strategically acknowledging rudeness in Korean

Lecture

*Prof. Seongha Rhee<sup>1</sup>*

*1. Hankuk University of Foreign Studies*

Korean has one peculiar type of mitigating discourse markers that involve the lexeme mak 'coarse, coarsely', i.e., makilay '(X) rashly says like this' and makmallo 'with crude words', as exemplified in (1) (TOP: topic; END: sentence-ender; NOM: nominative; COMP: complementizer; FUT: future; Q: question):

(1) a. na-n nemwu chakha-y chensa-kath-ay makilay

I-TOP very be.good-END angel-like-END DM

'I am a good (girl). (I'm) like an angel. DM (= '(X) rashly says like this')

(2018.05.03, Instagram post)

b. makmallo nwu-ka ne-hanthey keseyha-la-myen ha-kyess-ni?

DM someone-NOM you-to castrate-COMP-if do-FUT-Q

'DM (= 'With crude words') if someone tells you to, would you castrate yourself?'

(1998 Drama Kecismal Episode #5)

The DM makilay in (1a) literally means 'X rashly says like this', but now functions as a DM to present a negative comment on her own statement, thus signaling that the speaker is aware of inappropriateness of her self-praise. Interestingly, this DM is a quotation in form and the imagined speaker is a third party, thus the utterance in (1a) is 'polyphonic': "I am a good girl. I'm like an angel. "O, she impudently says something like this!'" In other words, an imaginary third-party's negative evaluation is quoted as a juxtaposed utterance. This self-derogating strategy borrowing an imaginary speaker's mouth is to preempt the addressee's criticism for her self-praise. By using this DM, the speaker is conveying the message: 'I know what I just said is not appropriate, so don't be harsh on me.'

The DM makmallo in (1b) means 'put it bluntly' (literally 'with crude words') signaling that what is to follow is not a refined expression. The speaker, suffering from the uterus cancer, is protesting to her husband who urges her to have her uterus removed. In order to stress her natural agony over the prospective loss of her femininity, she analogically uses the term 'castration' to highlight the unlikelihood of her husband willingly agreeing to be castrated simply because someone recommends it. The strategy of this DM is to preempt the criticism from the addressee who would most likely find the question too extreme. With this DM the speaker is conveying the message: 'I know my word choice in the following is crude, so don't criticize me.'

The development of these DMs reveals intriguing cognitive and discursive strategies. The developments involve: (i) meta-discursive strategies in that the speaker is monitoring the self's utterances, (ii) shifted perspectivization in that an imaginary third-party's evaluative viewpoint is adopted, (iii) rhetorical strategies of presenting assertions or questions that are extreme to the point of inordinateness but thus more forceful and persuasive, and (iv) elaborate intersubjectification in that the speaker is attenuating the self's talk by protecting the face of the addressee as well as the speaker's in a potentially face-threatening act, by way of self-deprecation.

Drawing upon contemporary and historical corpus data, this paper presents the developmental paths of the DMs makilay and makmallo and discusses the cognitive and discursive strategies focusing on theoretical issues, e.g. (inter)subjectification, hypothetical discourse and rhetorical strategy in grammaticalization.

# “A friendly, neighborhood hijabi”: A multimodal discourse analysis of Huda Fahmy’s webcomic ‘Yes, I’m Hot in This’

Lecture

***Ms. Samantha Creel<sup>1</sup>***

**1. University of Florida**

Since 2017, Egyptian-American artist Huda Fahmy has captivated the Instagram world with her humorous webcomic titled ‘Yes, I’m Hot in This’, with a following of over 300,000 users as of 2020. Born in the Arab diaspora hub of Dearborn, Michigan, Fahmy is a Muslim-American woman whose webcomics wittily tackle stereotypes and taboo topics surrounding Islam and life as a hijabi in the United States. Fahmy’s ability to address prejudices faced by Muslim women through humorous webcomics has attracted a diverse audience. Indeed, her humorous approach seems to be an effective teaching tool that makes learning about Islam and the Muslim woman’s experience more accessible in a society in which division and misunderstanding is currently widespread. Previous research has shown that comics can wield ideological power and are often used to reinforce or resist a political view or aspect of the status quo (Barker, 1989; DiPaolo, 2011; Høigilt, 2017; McAllister et al., 2011; Veloso & Bateman, 2013). To understand how Fahmy uses the multimodal genre of webcomic to represent the Muslim-American experience and engage a large, culturally and ideologically complex audience, the present study employs Multimodal Critical Discourse Analysis (MCDA) (Machin & Mayr, 2012), drawing on social semiotics (Kress & Hodge, 1988; Kress & van Leeuwen, 1996) in a close analysis of 50 of Fahmy’s webcomics spanning 2017-2020. Multimodal analysis considers both semiotic and linguistic content to be important in the meaning-making of discourse and is used here to identify discursive strategies and themes in her content that connect her to her audience. Specifically, the analysis focuses on the social context of Fahmy’s identity, the topics she chooses to address, animation style, character actions and positions, as well as features of the language she uses. Preliminary results show that Fahmy uses a variety of visual and linguistic strategies to contest the traditional ‘othering’ of the Muslim woman in Western society and make her life relatable to the average American. The results of this study have far-reaching implications for the use of humor in education and mutual cultural understanding.

# “Get in here with Mom”: Family cooking as multimodal socialization and sociability on a documentary-style reality TV show

Lecture

***Dr. Cynthia Gordon<sup>1</sup>, Ms. Alexus Wells<sup>1</sup>***

*<sup>1</sup> Georgetown University*

Existing research at the intersection of food and family discourse identifies mealtimes as key sites for parent-child socialization. At mealtimes, adult family members socialize children into culturally appropriate mealtime behaviors, linguistic and otherwise (Blum-Kulka 1997); narrative activities reinforce the family's hierarchical structure (Ochs, Smith, and Taylor 1992); and family members socialize one another into taste preferences (Ochs, Pontecorvo, and Fasulo 1996). Simultaneously through mealtime talk, family members enact sociability and create connection (e.g., Blum-Kulka 1997; Tannen 2001).

In this study, we explore another food-focused context for parent-child socialization and family sociability – cooking together. Specifically, we consider how meal preparation unfolds (and is displayed) in the kitchens of two families featured on *Real Food Real Kitchens*, a documentary-style American reality TV series that spotlights everyday people preparing and talking about treasured family recipes. In one episode, a mother and her grade-school age daughter cook together; in the other a grandmother, two aunts, and two teenage nieces do. Shaped by our interest in cooperation in the kitchen and uses of hands in particular, we focus on three extracts wherein multiple family members put their hands into one bowl simultaneously or in quick succession as they prepare a dish (cornbread dressing, ambrosia salad, or meatloaf). Adopting a multimodal analytic approach that is grounded in interactional sociolinguistics and draws on insights from conversation analysis, we show how in such moments younger family members are simultaneously socialized into food preparation as a sociable family practice and into the family hierarchy. Specifically, sequences of “recruitment” (e.g., Clayman and Heritage 2014), coordinated action, and metacommentary facilitate older family members’ socialization of younger family members not only into appropriate uses of hands in the kitchen (e.g., to measure, taste, and shape) but also into family relationships as structured by both power and solidarity, as Tannen (1994) discusses these terms (e.g., adults involve children, but mediate their access to ingredients).

Our analysis highlights how through their verbal participation – such as by producing directives and assessments, lexical repetition, pronouns, and laughter, as well as nonverbal participation – including body positioning, gaze, the handing of ingredients, and uses of hands to engage with food, family members multimodally accomplish family meal preparation, pass down knowledge, and build (and display) solidarity.

By focusing on family cooking, this study contributes to existing research that highlights how, in food-related interactions, family socialization and intergenerational sociability are accomplished (e.g., Blum-Kulka 1997, Paugh and Izquierdo 2009). It also contributes to studies of the multimodality of everyday family discourse (e.g., Erickson 1982, M.H. Goodwin 2006), and specifically the importance of hands in such discourse (e.g., C. Goodwin 2017; Scollon 2001). Finally, it contributes to research on how family interactions are portrayed in food-centric reality and infotainment television (e.g., Gordon 2015; Matwick and Matwick 2017).

# “If an astronaut were on the moon...” Eliciting metapragmatic data from young L2 learners

Lecture

**Mr. Anders Myrset<sup>1</sup>, Dr. Milica Savić<sup>1</sup>**

**1. University of Stavanger**

The aim of this paper is two-fold: firstly, to provide an overview of the methods used to elicit metapragmatic data in research with young language learners through a systematic review; and secondly, to present three data collection techniques designed and used in two research projects conducted by the authors, and examine their affordances for eliciting metapragmatic data.

The systematic review incorporated empirical peer-reviewed studies published in English between the years 2000 and 2019. Out of the initial 864 publications, after the screening process, only 15 articles focusing on 5-to-13-year-old children’s metapragmatic awareness were selected for the review. While they employed different stimuli and modalities for data elicitation as well as various response types, the individual interview set-up and the expected response types closely reflected those widely employed in research with adults (Culpeper, Mackey & Taguchi, 2018).

Against this backdrop, the paper presents three elicitation techniques, and examples of the data generated, from two studies conducted by the authors. Based on the literature on the methodological considerations for conducting research with children (e.g. O’Kane, 2008; Pinter, 2014; Punch, 2002), the following three techniques were developed: the Emoticon task, the Ranking circle, and Readers Theatre. These were employed in two research projects investigating young Norwegian EFL learners’ metapragmatic awareness, defined as “the ability to verbalize reflections on the linguistic form of requests, the contextual features influencing requestive behaviour, or their interplay, with or without employing L1 as a frame of reference” (Savić & Myrset, forthcoming). After describing the techniques and exemplifying the metapragmatic discussions elicited through them, the presentation will argue for the inclusion of innovative, child-friendly methods in interlanguage pragmatics research focusing on children’s metapragmatic awareness.

# “Il peut avoir mal” : A New Perspective on the French Epistemic Modal Marker “peut” in Clinical Contexts

Lecture

***Prof. Michel de Fornel<sup>1</sup>***

***1. EHESS***

We consider the relevance of the epistemic marker in the diagnostic claims of pain in consultations for non-verbal and poly-disabled children. From an internalist point of view of pain, given the context of strong epistemic uncertainty prevalent in these consultations, one should expect that the epistemic modal verb *peut* in diagnostic claims is used to display a certain cautiousness. However, a close analysis of its pragmatic functioning reveals that it appears in constructions that mark the diagnostic statement as belonging to an experiential knowledge (the knowledge of the close relationship between pain and the expressive patterns of the child). This knowledge leads, on clinical examination, to a kind of “direct” perception of the expression of pain, which might be missed by an undiscerning observer. Therefore, it leads also to the diagnostic formulation relying on a strong epistemic certainty (the strong probability is that the child is in pain).

We will demonstrate that the use of the epistemic modality in diagnostic contexts presupposes a double dimension, both indexical (the perceptual premises originating from the physical examination) and general (the background knowledge that includes a knowledge of the child's habitual expressive modalities). Even if the clinician seeks to collectivize her diagnosis, her personal conviction of the reliability of the signs and the indications acquired during the physical examination, takes precedence over any shared knowledge: the objective dimension, linked to her personal knowledge, seems more salient than the intersubjective dimension.

# “In England, if you talk to a minor, you go to jail”: Negotiation of age and its legal requirements across borders on online spaces

Lecture

***Dr. Seyed Hadi Mirvahedi<sup>1</sup>***

*1. University of Os*

The study fills a critical gap in studies of online culture in the context of Iran by investigating how a specific religious system of governance formed in Iran after the Islamic Revolution in February 1979, and accordingly the expected individual and social behavior (Abrahamian, 1982), is maintained, negotiated, or contested by people in the online world. Despite the government's attempts to resist 'cultural invasion', i.e. exposing the citizens to Western thoughts and values', and safeguarding Iranian-Islamic identity in the society over the last 40 years (Hayati & Mashhadi, 2010), the widespread access to internet and smart phones in the country - with 88 million active SIM cards and 53 million mobile internet users, 62,702,731 (76%) of Iranians use Internet (Internet World Stats, 2018) – is said to have undermined the endeavor in achieving an 'ideal' society. Working within a new and rapidly-evolving field of the sociolinguistic study of online culture (e.g. Zidjaly, 2019) through digital ethnography (Varis, 2015), the study applies multimodal conversational analysis to video-recordings of live video chats by Iranians living in Iran and overseas.. This paper focuses on the data from a 22-minute live video chat between a girl in Iran, and two Iranian boys living in Europe. As the conversation unfolds, they engage in negotiating the girl's age (because she looks younger than 18), and with that, various sociocultural norms in Iran and Europe are discussed. The analysis sheds light on how live chat users form "micro populations" (Maly & Varis, 2016) to "interactionally", "locally", and "endogenously" (Garfinkel, 1988) discuss, negotiate, contest and (re)produce a new social order. The project illustrates how human agents with their idiosyncratic ideas and concepts, concerns and fantasies shape micro hegemonies, specifically afforded by online infrastructure in today's world, which may come in contact and clash with existing dominant official societal hegemonies in certain societies (Blommaert, 2005, 2018).

# “It’s a surface definition, it’s not about the quality aspect”—reviewing speech act classifications for annotating pragmatic functions in ELF communication

Lecture

***Ms. Stefanie Riegler<sup>1</sup>***

***1. University of Vienna***

English as a lingua franca (ELF) contexts have been interesting sites to study pragmatic phenomena. The *Vienna-Oxford International Corpus of English* (VOICE) (VOICE 2013) facilitates research into the pragmatic processes at work in ELF interactions by providing rich contextual information and detailed conversation analytic mark-up. Although VOICE transcripts include pragmatically-useful information (e.g. mark-up for non-English speech) (see Pitzl 2021: 100–101), more extensive annotation of pragmatic functions in VOICE would clearly help advance research on ELF communication. Current systems for pragmatic annotation of L1 corpora (see e.g. Kallen & Kirk 2012; Weisser 2015) mainly build on Searle’s (1969) categorization of speech acts. Based as it is on invented examples, Searle’s taxonomy, however, contributes only little to the description of language functions in data of spoken language-in-use and likewise fails to account for much of the discursive work speakers are involved in during communication (Adolphs 2008: 45–47). This raises the question how useful existing speech act classifications are for the annotation of pragmatic functions in spoken ELF data, where we cannot necessarily rely on fairly stable correlations between linguistic forms and communicative functions as in L1 usage (Seidlhofer 2009: 41). This paper proposes a pragmatic annotation for VOICE based on a functional orientation to ELF use which reflects the heterogeneity of communicative practices in the linguistically and culturally diverse settings captured in VOICE and one which is also more readily accessible for language pedagogy. For this purpose, this paper discusses different approaches to pragmatic annotation and how these relate to speech act theories. It provides examples of how mapping speech act classifications onto VOICE data gives only a superficial account of the communicative processes that ELF speakers are involved in and indicates the need for a bottom-up annotation of pragmatic functions informed by existing ELF data. Therefore, this paper considers how current speech act annotation systems can be combined with studies of pragmatic practices in ELF interactions, conversation analytic principles and research into communication strategies to establish a conceptual basis for a taxonomy of pragmatic functions in VOICE.

# “Let’s start with this one”: The German modal particle *mal* in bridal consultants’ exercise of deontic authority

---

Lecture

---

***Ms. Jessica Marsh<sup>1</sup>***

**1.** University of Surrey

In this paper I examine some of the interpersonal functions of the German modal particle *mal*. The data are taken from the German reality television show *Zwischen Tüll und Tränen* (*Between Tulle and Tears*), which features brides shopping for wedding dresses. Using a general discourse analytic approach drawing on conversation analysis and (im)politeness theory, the analysis focuses on the bridal consultants’ use of *mal* when initiating a transition from one stage of the appointment to the next. The results suggest that *mal* is used in these contexts because participants orient to these interactional moments as particularly delicate (cf. Márquez Reiter et al 2016).

The analysis focuses on the brides’ and consultants’ differing claims to deontic authority and the potential face threats associated with the exercise of this form of authority (e.g., Stevanovic 2017; Stevanovic & Peräkylä 2012, 2014). On one hand, participants clearly share an understanding that the consultants have the authority to manage the pace of the interaction and to determine how the appointment should proceed. At the same time, however, the brides have the ultimate authority to decide whether to purchase a dress. There is thus an expectation of deference to the customer that makes an overt display of deontic authority from the consultants potentially face threatening. Building on prior research identifying *mal* as a downtoner in requests (cf. Kotovova, 2015; Bardovi-Harlig & Griffin, 2005; Möllering, 2001; Hentschel, 1991), I suggest that the use of *mal* in these contexts serves an interpersonal function oriented to participants’ face needs.

# “Like Sister, Like Brother?”: Discursive Construction of Religious Identities in the Propaganda Messages Used by Boko Haram and Islamic Movement of Nigeria

Lecture

***Dr. Chuka Ononye<sup>1</sup>, Mr. Ja’afar Wakili<sup>2</sup>***

*1. University of Nigeria, Nsukka, 2. Federal University Kashere, Gombe*

Having a particular religious identity involves being like other members in a group, and making efforts to keep to the group's radical views (Alubo, 2009). The Boko Haram (BH) and the recently-banned Islamic Movement in Nigeria (IMN) utilize many linguistic strategies to sell specific identities to individuals thereby drawing them to their groups. The manipulative strategies used by terrorist organisations in Nigeria have been well documented. Particularly, those of BH have been studied from pragmatic and discourse analytical perspectives, but only very little linguistic attention has been paid to texts produced by the IMN. In this study, we examine the identity(ies) constructed by the IMN, and relate them to the more recognizable socio-cultural identity of BH in order to determine whether they can be seen as indices of same salafist goal. The data comprise 60 full-length audio and print manuscripts of speeches and interviews delivered in Hausa/Arabic by the groups. For the IMN, the sermons, speeches and interviews of Sheikh Ibraheem Zakzaky and other group leaders, published in IMN official newspaper, *AlMizan* print and online (<http://www.almizan.info/>), are gathered. Others released on YouTube and INM official website (<https://www.islamicmovement.org/>) are selected from 2013 (when the group took a confrontational posture) to date. For BH, 24 manuscripts released on YouTube by the leaders, Muhammad Yusuf and Abubakar Shekau, between 2009 (when the group went confrontational) and 2020 (when the group was last heard from) are sampled. The data set are translated from Hausa/Arabic to English (for uniformity and wider consumption) and transposed to writing in Word document (for ease in coding). They are subjected to qualitative content analysis drawing insights from the broader framework of social constructionist discourse analysis, including Bucholtz and Hall's Socio-cultural Linguistic approach to identity construction and Goffman's Participation Theory, which follow the line of research that focuses on situated analysis of identities. The emergence, partialness, positionality, relationality, and indexicality principles of identity construction are identified in the texts. The emergence and partialness principles respectively emphasise the dynamism and intentionality of the social actions conveyed in the texts; positionality is indexed by the temporal and interactional stances and participant roles raised; relationality is associated with the identities raised in order to demonstrate the divine authorisation and adequation of the groups' activities and positions, while indexicality includes such linguistic strategies as labelling and categorisation used by the groups to evaluate different participants in the discourse. With these findings based on a content analysis of the texts from the two groups, this paper is expected to move existing literature on religious radicalism a step forward, especially in comparing the linguistic strategies used in identity construction by both groups. Thus, the findings will shed additional light on the linguistic triggers of insurgency and provide a new interdisciplinary path to the discourse analysis of terrorist propaganda.

# “Shut up! Don’t say that! You’ve got to say ḥashākem!” The Pragmatics of ḥashāk and its Variants in Colloquial Algerian Arabic

Lecture

***Dr. Boudjema Dendenne<sup>1</sup>***

1. École Normale Supérieure - Messaoud Zeghar, Sétif, Algeria

This contribution attempts to unravel the pragmatic functions served by *ḥāshāk* and its variants (e.g., *ḥāsha*, *ḥāshākem*, *ḥāshāh/ḥāshāha/ḥāshāhem*, *māḥashākesh*, the verb *ḥāsha/ḥāshi*) in Colloquial Algerian Arabic (CAA). *Hashākliterally means “I exempt/exalt/distance you from X.” To the best of our knowledge, this is the first study on the pragmatics of *ḥāshāk* and its variants in colloquial (Algerian) Arabic. To this end, two complementary data sets have been collected: data from a survey (administered online to a sample of indigenous speakers,  $N = 263$ ) and naturally occurring examples ( $N = 159$ , gained by the notebook technique mainly). The examples are categorised based on the pragmatic functions fulfilled by *ḥāshāk* and its variants into eight groups and compared to the survey participants’ metapragmatic judgements on the use/perception of these pragmatic markers. Our findings indicate that the core semantic import (exaltative/excepting/exempting/distancing meaning) is retained in CAA and further extended to perform other pragmatic functions: apologetic, requestive, appreciative, concessive, defensive, sarcastic, and critical, in an array of highly conventionalised contexts. We would argue that these intertwined functions should be looked at as a continuum, rather than as clear-cut categories. For example, it is noted that when *ḥāshāk* (addressed to one interlocutor) serves as an expression of apology, it remains a concomitant exaltative/distancing marker. Therefore, when people speak about ill-mannered/corrupt people, saying “they’re real dogs *ḥāshāk*”, they are apologising for the mentioning of the disturbing word ‘dogs’/unpleasant people and – at the same time – they except/exempt/distance their interlocutors from being like those ‘bad people’. It is observed that Algerian parents socialise their children to modify any inappropriate words/acts uttered/Performed in front of other people with *ḥāshāk* or one of its variants (the words quoted in the title are addressed from a mother to her three year-old female child). Moreover, native speakers of CAA find *ḥāshāk* and its variants irreplaceable/untranslatable even when they speak in a foreign language (French mainly). These findings are discussed from an eclectic perspective: conversational maxims (Grice, 1975), politeness (Brown & Levinson, 1987), rapport management (Spencer-Oatey, 2008), pragmatic/discourse markers (e.g., Aijmer, Foolen, & Simon-Vandenbergen, 2006), and pragmatic reversal (e.g., Mazzon, 2017). The present contribution is concluded by inviting pragmaticists and sociolinguists to indulge in the many research avenues highlighted by the researcher.*

# “What we may conclude” – The demise of a hedging construction in 20th-century English

Lecture

***Prof. Svenja Kranich<sup>1</sup>, Ms. Anna-Katharina Scholz<sup>1</sup>***

***1. University of Bonn***

Modal markers, such as the modal verb *may*, often function as a means of expressing reader-oriented caution, i.e. they signal that the speaker does not want to impinge on the reader's freedom to hold a different opinion (cf. Hyland 1996: 436f.). The way they are used in texts and which specific modal constructions are preferred in hedging expressions is, however, based on genre-specific communicative conventions and subject to change. The English modals as a class have been declining in recent times, but this trend has not been affecting all modals equally (cf. e.g. Leech 2009) – some remain stable at fairly high frequencies, such as *can*, while others have been experiencing a sharp drop in frequency over the last century, e.g. *may* (Mair 2006: 100). Previously, the demise of the hedging construction *we + may + SAY* (i.e. a verb of saying, thinking, or reasoning) has been identified as partly responsible for the modal *may*'s decline in recent decades (cf. Kranich forthc.). In this paper, we will take a broader look at this type of construction, investigating the usage of *we + modal (may, might, can, could) + 49 common communicative and mental verbs (e.g. say, argue, (dis)agree)* in the time span 1900-2009 on the basis of the Corpus of Historical American English (COHA). Our quantitative results are striking and show a clear trend of decline. Overall, from 1900 to 2009, the construction *we + modal + SAY* exhibits a decline of - 63 %. However, this trend does not affect all four modals in the same way: mostly, the usage with *may* and *might* decreases, while *can* and *could* remain relatively stable.

We will take a closer look at the reasons behind these differences, supplementing the first quantitative findings with a qualitative analysis to uncover specific textual functions. Already, we can say that there seem to be functional differences depending on the modal used, reflecting their different semantics (e.g. *we can say* seems to have more of an ability reading than *we may say*, where instead authors seem to give themselves permission). A possible explanation for the differences may thus be that permission-oriented hedging is falling out of use due to a general trend towards more democratization in language (cf. Mair 2006: 1-11), which goes hand in hand with an avoidance of linguistic means associated with traditional power hierarchies.

# “Where We Can’t Get a Direct Answer from the Nominee”: Linguistic Strategies to Avoid Answering Questions in the Judge Barrett Confirmation Hearing

Lecture

**Prof. Mercedes Nino-Murcia**<sup>1</sup>, **Prof. Maria Lenardon**<sup>2</sup>, **Prof. Susana de Los Heros**<sup>3</sup>

<sup>1</sup>. University of Iowa, <sup>2</sup>. Villanova University, <sup>3</sup>. University of Rhode Island

Institutional discourse is goal-oriented, and participants develop topics around issues to achieve specific goals (Wang 2006). Therefore, pre-established regulations and protocols guide a confirmation hearing. As there were contrasting perspectives between Republican and Democrats, senators questioned the nominee to accomplish a specific political agenda. In this setting, questions play a central role as they elicit information or confirm implied statements. In this presentation, we examine questions and answers in Judge Barrett’s Senate confirmation hearing for a US Supreme Court position (October 2020).

Using CDA, we examine how Judge Barrett responds to both parties focusing on the different answers she provides on key political issues. Additionally, we describe how she employs several strategies to avoid aligning with a particular position (Wodak et al. 2011). Our data come from the public transcript of the hearing when Judge Barrett speaks (C-Span 2020). We analyze longer stretches of discourse as question-answer exchanges can take more than one turn. As meaning-making depends on the implicatures drawn from the footing of actors, that is, if they are Democratic or Republican senators, we consider the presumed inferences that seem to arise in the interaction.

Our results show that Judge Barrett responds: (a) unequivocally to the Republican senators who enhance her qualifications as a candidate and (b) ambiguously to Democrat Senators who oppose her confirmation. In the example below, Democratic Senator Amy Klobuchar asks Judge Barrett a yes/no question about Roe v. Wade, a ruling on abortion. As shown below, Judge Barrett requests clarification instead of answering. In contrast, Senator Klobuchar reminds Judge Barrett that she is the interviewee and needs to respond to the question (day 2).

**Amy Klobuchar:** (04:09:55)

*...Well, you also separately acknowledged that in a Planned Parenthood V Casey, the Supreme Court’s controlling opinion talked about the reliance interests on Roe V Wade, which it treated in that case, as super precedent. Is Roe a super precedent?*

**Judge Amy Coney Barrett:** (04:10:13)

*How would you define super precedent? \*\*\*\*\**

**Amy Klobuchar:**(04:10:17)

*Actually, I thought someday I’d be sitting in that chair. I’m not. I’m up here. So I’m asking you.*

We also observed that friction, negativity, and rebuffs evidence the fact that power in language contributes to the mutual construction of social, political selves. Lastly, our data supports labeling yes/no questions as “verification questions” because these can be answered in different ways and even without including yes or no in the answer (Mahmood 2014).

# “You are the best!” Relational practices in emails in English at a Norwegian university

Lecture

***Dr. Milica Savić<sup>1</sup>***

***1. University of Stavanger***

This study investigates relational practices in developing email conversations at a Norwegian university, between interactants performing various institutional roles, including faculty members, administrative staff, PhD fellows and MA students. The overarching aim is to reveal how interactant relationships are negotiated as email conversations unfold and whether the interactants' institutional roles and social distance affect relational practices. In line with a broadly discursive perspective, interpersonal relationships are regarded as dynamic, arising from and shaped in situated institutional interactions through the email medium. At the same time, it is recognized that “interactants draw on complex and multifaceted representations of the self developed in previous interactions, which they negotiate and renegotiate in emergent interaction” (Locher 2013: 147).

The influence of three variables on relational practices was examined: conversational progression, institutional roles, and social distance. The corpus included 101 email conversations (441 emails), which varied in length from 3 to 16 exchanges. All the emails were classified in terms of the opening sequences, closing sequences, and other relational moves in the body of the email. To analyze the influence of conversational progression and social distance on opening and closing sequences, and simultaneously examine the openings and closings employed in email conversations between interactants with different institutional roles, regression analysis was used. To examine the differences in the frequency of occurrence of the other relational moves depending on conversational progression and social distance, the Chi square test was employed.

Conversational progression was found to exert an influence on increasing familiarity in closing sequences, but not in the openings. This contrasts sharply with the findings of previous studies, which have consistently found conversational progression to have an effect on opening sequences (Bou-Franch 2011; McKeown and Zhang 2015). With regard to institutional roles, the openings and closings in the conversations between faculty members tended to orient to familiarity to a greater extent than in most other institutional role dyads, while the widest variety and the highest frequency of the other relational moves were identified in conversations between faculty and PhD fellows. Finally, social distance was identified as a driver of deference in both openings and closings in line with previous research (McKeown and Zhang 2015; Savić 2019; Waldvogel 2007), while its influence on the frequency of occurrence of other relational moves was limited.

# “You’re so not nice”: Mother-As-Martyr in Mother-Daughter Interaction

Lecture

***Dr. Catherine Box<sup>1</sup>, Dr. Domenica DelPrete<sup>2</sup>***

***1. University of Pennsylvania, 2. Teachers College, Columbia University***

From biblical images, to feminist writings on the family (e.g. Chodorow, 1978; Ochs & Taylor, 2001; Thorne, 1992), to explorations of perceived (in)competence during childbirth and childrearing (Fansaghari, Kordi, & Asgharipour, 2019; Mercer, 2004), to myriad books marketed to the general public (e.g. Farris, 2015; Tannen, 2006), the maternal figure has been analysed, polarised, and problematised in both academic research and texts with wider appeal. While a substantial body of work in discourse analysis delves into the nature of mother-daughter talk (e.g. Spitz, 2005; Zakaria & Jarin, 2020), there is relatively less attention to analyzing naturally-occurring, multimodal exchanges specifying how the maternal role emerges *in situ*. Moreover, analyzing interaction sequences between mothers and adolescent daughters remains relatively rare, and yet it is a rich space for exploring a particularly connective, albeit oftentimes disharmonious, phase of the mother-daughter relationship (DelPrete, 2015).

Our case study contains approximately 20 hours of videotaped interaction between a mother and her 15-year old daughter, located in the Northeastern United States. Most interactions take place in the kitchen or the TV room, the sites of many mundane family activities such as eating, gathering materials, and discussing schoolwork or extracurricular activities. Data were transcribed utilizing Jefferson’s Transcription, and themes emerged when conducting line-by-line analyses of sequences of talk and gesture. When considering the mother’s discursive practices as demonstrated in the data, our analysis was guided by insights from interactional sociolinguistics, proven fruitful when investigating identity in family talk (e.g. Gordon, 2009; Johnson, 2018; Tannen, 2006).

We determined one prominent role indexed throughout the data to be what we have termed *mother-as-martyr*. In these sequences, the mother invokes her sacrificial actions or tolerance of painful emotions. She does so either implicitly (by not disclosing the truth about disconcerting feelings) or explicitly (by professing her good-natured and altruistic self).

The following questions guide our research: 1) what discursive conditions prompt the mother to evoke, either openly or not, the role of martyr when engaging with her daughter; 2) what are the discursive practices when indexing such a role; and (3) what are the interactional accomplishments of mother-as-martyr? While findings broadly echo those of prominent health professionals, who discourage mothers from engaging in martyrdom (e.g., Northrup, 2006), our work offers a fine-grained treatment of different kinds of martyrdom and the outcomes that emerge. Thus, this study provides a more nuanced understanding of the mother-as-martyr role in particular and mother-daughter interaction more generally.

# Posters

# A Comparative Content Analysis of English Subtitles in Japanese and Korean Movies

Poster

***Prof. Makoto Imura<sup>1</sup>, Prof. William Figoni<sup>2</sup>***

***1. Osaka Institute of Technology, 2. Kindai University***

The Japanese film *Shoplifters* (Koreeda, 2018) and the Korean film *Parasite* (Bong, 2019) both earned international awards and have been viewed across the world. Poverty and wealth inequality are common themes of both movies. However, there are some striking differences in the way family struggles are portrayed. While *Shoplifters* is about the meaning of family and bonds of love, *Parasite* is more a protest against social injustices. Another area of contrast is related to sociocultural factors. In *Shoplifters*, the family members are not blood-related but due to past, often painful, experiences a quasi-family is formed. They live from hand to mouth, resigned to reality. On the other hand, the family in *Parasite* are blood-related. They are all street-smart and carefully craft strategies to enhance their lives to transform the future. This study investigates how these different messages are conveyed through the language used by the characters; more specifically, how subtle differences and nuances in meaning are revealed through the use of specific lexical items. Though the study is still in progress, this poster presentation will show the following results based on the corpus analysis of English subtitles of the two movies by:

- comparing and contrasting lexical items that belong to one film but not the other
- extracting key (unique) lexical items from each film
- mapping a co-occurrence network of words
- showing and comparing the clusters of words in each film
- plotting the relations of extracted words (correspondence analysis)
- providing a coding analysis of key concepts

As instruments for analysis, the authors have used AntConc 3.5.8 (Anthony, 2019), Range32 (Nation, 2005), and KH Coder 3 (Higuchi, 2020). We hope this type of analysis will shed new light on explorations in language usage across cultures.

# A Contrastive Analysis of Sentence-final Forms: Chinese “-ma (嘛)” and Japanese “-jan(aika)”

Poster

**Ms. Qiong Wang<sup>1</sup>**

*1. The University of Tokyo*

This paper is an attempt to characterize the roughly corresponding Japanese and Chinese sentence-final particle constructions “-jan(aika)” and “-ma(嘛)” by comparing them in terms of information structure, based on data collected from some corpora.

According to the theory of territory of information, there is a one-dimensional psychological distance between a given piece of information and the speaker/addressee. Table 1 shows how the examples of “-jan(aika)” and “-ma (嘛)” (76 and 209 in total, respectively) collected from the corpora are classified according to this criterion.

Table 1

No.	distance	-jan(aika)	嘛ma
1-1	close/close	33%	41%
1-2	close/far	39%	29%
1-3	far/close	11%	24%
1-4	far/far	17%	6%

Kimura and Moriyama (1997) point out that Chinese grammar is not sensitive to the territory of information, arguing instead that declarative and interrogative sentences, both in Japanese and in Chinese, can be systematically classified in terms of (i) whether or not the speaker knows the relevant information and (ii) whether or not the addressee is expected to know the information that the speaker requests. Based on their idea, the examples collected are classified according to whether or not the information conveyed or requested is known to the speaker/addressee, as shown in Table 2.

Table 2

No.	state of knowledge	-jan(aika)	嘛ma
2-1	known/known	34%	45%
2-2	known/unknown	57%	54%
2-3	unknown/known	4%	1%
2-4	unknown/unknown	5%	0%

Information is also characterized as either old or new depending on whether it can or cannot be recovered from the previous context.

Table 3

No.	old or new information	-jan(aika)	嘛ma
3-1	old	18%	43%
3-2	new	82%	57%

Table 3 indicates a remarkable difference between “-jan(aika)” and 嘛: while the former has a strong tendency to mark new information, the latter is not biased in favor of either old or new information. Thus, while it is natural to use “年轻人嘛 (youngster-ma)” in response to someone who says, “Young people nowadays are incompetent” as a comment on a young colleague, it sounds odd to say “Wakamono-janaika (youngster-janaika)” in the same situation.

Another interesting contrast between the two constructions is that, as Tables 1 and 2 show, “-jan(aika)” is used preferentially when the speaker is informationally superior to the addressee, while 嘛 is most likely to occur with old information, irrespective of the addressee’s state of knowledge. Thus, while “明天有考试嘛 (We

have an exam tomorrow-*ma*)” can be used felicitously in response either to someone who says, “Let’s go to the movies this evening,” forgetting all about tomorrow’s exam or to someone who says, “We have an exam tomorrow, so we’ll have to get up early”, the use of its Japanese counterpart with “-jan(aika)” is appropriate only in the former situation.

Some other characteristics of these constructions (e.g. “-jan(aika)” and 麻 respectively have an affinity for proximal demonstratives and kind-denoting nouns) may also be accounted for in terms of the contrastive analysis presented in this paper.

# A corpus-based analysis of the usage of Chinese fanyu: Based on the cognitive control theory of irony

Poster

***Dr. Mian Huang***<sup>1</sup>

**1.** Chongqing Technology and Business University

This study aims to clarify the nature of *fanyu* (a quasi-equivalent of irony in the Chinese language). First, after reviewing traditions of irony, I will propose the concept of “cognitive control” : efforts at self-control of mental states. Then I will present a framework explicating the communication of irony: an ironic remark is generated by the attempts to control the mind resulting from the interplay of an intentional operating process which is a conscious, effortful search for mental contents to produce a desired state of mind and an ironic monitoring process being an unconscious, automatic search for mental contents that indicate a failure to produce the desired state of mind. Because the operating process costs more cognitive capacity and normally has greater cognitive effects than the monitoring process, under contexts that decrease cognitive capacity, however, the monitoring process may supersede the operating process and so enhance the speaker’s sensitivity to mental contents that are the ironic opposite of those that are intended. After that, I will analyze the use of *fanyu* based on examples from a self-constructed corpus which is formed by Chinese *fanyu* messages collected from Sina Weibo, a Twitter-like microblog social network. These examples are divided into 2 broad categories: positive affect *fanyu* and negative affect *fanyu*. Although the examples of *fanyu* are various in verbal and non-verbal features, most of them can be shown to be consistent with the above-mentioned theory. Finally, *fanyu* will be compared with English irony. On the account of cognitive control, their similarities and differences can be brought out. Both involve cognitive control which produces ironic effects, but in Chinese *fanyu*, the control is for either positive affect or negative affect; in English irony, it is primarily for negative affect. Consequently unlike English irony which intrinsically expresses the speaker’s attitudes and carries a reversed evaluation of the referent and generates conversational implicature invariably carrying negative evaluation, Chinese *fanyu* conveys positive attitudes in some instances (Huang, 2017: 96).

# A Study of Intensifiers used in Apologies Between English Speakers in Japan and how this Affects Japanese English Learners' Pragmatic Development

Poster

***Mr. Timothy Wilson<sup>1</sup>***

**1.** Hiroshima Shudo University

Making an apology is an important speech act for language learners to acquire as it avoids any misunderstanding or miscommunication by repairing a situation effectively. Apologies are important for English language learning, as speech acts such as this should be incorporated into the classroom to help learners develop pragmatic competence in the L2 target language. Moreover, when apologizing, linguistic devices known as *intensifiers* are often used to modify or intensify another word. Common examples such as *very*, *really* and *extremely* contribute to maximizing an apology's effect and therefore enable successful communication without causing harm or distress.

Earlier studies on intensifiers have determined that there are notable differences between native British and American use of intensifiers, however, a previous study by this author revealed that there was no significant difference in their overall amount of use, but that the British use certain intensifiers, such as 'terribly' and 'deeply' more frequently than Americans do, and as such, are considered to have a wider repertoire than Americans. The purpose of this study, therefore, is to determine whether learning English from either a native English speaker or a native Japanese teacher of English has an effect on the acquisition of this grammatical and pragmatic feature by Japanese English language learners, and thus seeks to determine the proportion and extent of their knowledge and use of intensifiers when they need to make an apology. A Discourse Completion Task (DCT) containing ten hypothetical but potential scenarios in which an apology can be made, and interviews were conducted among native British, American, and Japanese teachers of English, as well as among Japanese learners of English.

# Aesthetics in practice: the interactional organisation of 'looking together'

Poster

***Ms. Lucy Meechan<sup>1</sup>***

**1. Kings College London**

The process of art perception; how we look at objects and artworks, has formed the analytic foundations of work in both the humanities and social sciences. However, it remains underpinned by an individualistic conception of how we look, positioning meaning as an epiphenomenal product of the subjective and cognitive encounter, and in turn neglecting the emergent nature of perception, that is, the situated and practical circumstances in which it is accomplished. Despite the burgeoning corpus of video-based studies concerned with 'multimodal' interaction, particularly the ways in which objects, tools and technologies feature in conduct and communication, there is little academic research concerned with how textual and digital resources feature in visitor's interactions in museums and galleries.

Methodologically situated within the framework of Ethnomethodology and Conversation Analysis and drawing upon the growing corpus of research concerned with multimodal interaction, this study addresses these issues pertaining to aesthetic perception through novel analytic resources. Employing a substantial corpus of video data concerned with the 'naturally- occurring' interactions of museum and gallery visitors, it conducts a fine-grained, sequential analysis of participants talk, embodied, conduct, gesture and gaze to reveal the tacit 'seen but unnoticed' practices through which visitors establish a commonality of perception. Therefore, whilst resonating with existing research which has addressed how gaze, along with embodied pointing and deictics establish joint attention in naturally-occurring social interaction, it reveals how the very sense and significance of objects is reflexively constituted through the conduct and collaboration of visitors, and in particular their use of material resources.

# American Female Identity Maintenance in a Japanese as a Second Language Context

---

Poster

***Dr. Christopher Hale<sup>1</sup>***

***1. Akita International University***

The purpose of this ongoing study is to analyze the idiosyncratic use of “like” in Japanese conversations by American adolescent, English first-language speakers. While this transfer from the student’s first language (L1) would normally indicate an error in their interlanguage requiring repair (Selinker, 1972; Wong & Waring, 2010), the use of this word, particularly by adolescent American girls, has been shown to have distinct psychological underpinnings and to be bound to the speaker’s socio-cultural identity (Laserna, Seih & Pennebaker, 2014; Saxena, 2009; Eckert, 1990). Employing conversation analysis (CA) methodology, the data to be presented was taken from an advanced-level Japanese language class at a Japanese woman’s university where the two Americans were exchange students. Cultural, contextual and pragmatic elements are explored in order to identify the function of the young girls’ usage of “like” in Japanese conversation.

# Are change of state and factive nominals presupposition triggers?

Poster

**Ms. Giulia Giunta<sup>1</sup>, Dr. Federica Cominetti<sup>1</sup>**

**1.** Roma Tre University

Presupposition is triggered by many linguistic items (Levinson 1983), including change of state (Sellars 1954; Karttunen 1973) and factive predicates (Kiparsky & Kiparsky 1970; Karttunen 1971). Precisely, change of state predicates presuppose that a state or process prior to that asserted by the predicate itself is, or has been, the case, while factives presuppose the truth of their complement clauses. In the framework of a project which aims to build IMPAQTS, a large *corpus* of Italian political speeches, and pragmatically annotate it per implicit contents (including presuppositions), we empirically observed that nominal forms derived from change of state and factive verbs, as well as nominals which are bases for change of state and factive verbs, seem to be presupposition triggers not differently from the verbal forms they are related to. For example, in (1), the noun *crollo* ('collapse') seems to presuppose that the traditional parties still have many electors, while, in (2), the noun *consapevolezza* ('awareness') seems to presuppose that Europe will be saved if it changes.

(1) [Le elezioni] segneranno il *crollo* dei partiti tradizionali.

'[The elections] will mark the *collapse* of traditional parties.'

(2) La lista unitaria per l'Europa parte dalla *consapevolezza* che l'Europa si salva se cambia.

'The unitarian list for Europe starts from the *awareness* that Europe will be saved if it changes.'

In the light of this observation, we formulated the hypothesis that these nominals *are* presupposition triggers. This is also theoretically coherent with research on nominalization, which has shown that nominalized forms keep many verbal properties, e.g. argument structure (Grimshaw 1990).

We substantiated our hypothesis collecting many examples of these hypothesized-to-be nominal presupposition triggers from the *corpus* we are building and annotating, and carrying out the tests the literature has identified to be effective at verifying whether a sentence contains a presupposition (3-4) (cf. Sbisà 2007).

(3) Le elezioni segneranno il *crollo* dei partiti tradizionali?

'Will the elections mark the *collapse* of traditional parties?'

(4) La lista unitaria per l'Europa non parte dalla *consapevolezza* che l'Europa si salva se cambia.

'The unitarian list for Europe does not start from the *awareness* that Europe will be saved if it changes.'

As (3-4) show, the presuppositions are still in place. Therefore, it is possible to state that the hypothesized-to-be nominal presupposition triggers are actual presupposition triggers.

# Audience design and frame of reference in adolescents' referential production

Poster

***Ms. Caroline Arvidsson<sup>1</sup>, Mr. David Pagmar<sup>1</sup>, Dr. Julia Uddén<sup>1</sup>***

***1. Department of Linguistics, Stockholm University***

When participating in dialogue, speakers design their utterances to accommodate the individual needs of listeners (Bentz, et al., in prep). This feature is known as audience design (Clark & Murphy, 1982). Although audience design is central to conventional conversation, it is not known at which age speakers begin taking into account the world knowledge/frame of reference of their interlocutors. Indications from recent studies suggest that albeit preschool and first grade children engage in basic forms of perspective taking (Nadig & Sedivy, 2002), they fail to adapt their utterances in accordance with listener-specific needs in reference production (Pagmar, et al., in prep). Adult participants do however adapt their utterances, and individual differences in the adult population were not dependent on cognitive control function (Bentz, et al., in prep). The dependence on cognitive control function, e.g. switching, may be hypothesized to be greater in children. The current study aims to test the referential production of two age groups; early and mid adolescents (11;0-12;11 and 15;0-16;11), with the purpose of tracing the development of the ability to use information regarding listener-perspective during on-line referential production, and test its relation to cognitive control. The paradigm builds further on the well-established Director's task but does not require the participants to take the visual perspective of the listener. Instead, participants are presented with a set of pictures portraying referents well-known to them, e.g. popular cartoon characters, hosts of children's tv-shows, etc. Knowledge of the referents are controlled through post-test surveys. Furthermore, they are asked to direct listeners of two distinct groups, small children and elders, into choosing the target referent. Participants who take the frame of reference of addressees into consideration are expected to adopt different strategies when addressing the different groups, i.e., increase informativeness when denoting referents assumed to be unknown to the listener vs using less informative referential expressions (such as proper names) when denoting referents judged to be known to the listener. Cognitive control/executive function is assessed using the Wisconsin card sorting task. Results are discussed in terms of cognitive costs of switching strategies and the Gricean maxim of quantity.

***Prof. Kristine Munoz***<sup>1</sup>

*1. University of Iowa*

## Calibrating discursive force in sickness and in health

One of the most fundamental questions an ethnographer faces when trying to formulate the norms of a culture under study is the consequences, whether positive or negative, faced by community members whose actions are relevant to those norms. Gerry Philipsen's (1997) original formulation of speech codes theory proposed the discursive force position as a way of understanding the connection between elements of a cultural code and the actions of persons who orient to the code. The discursive force position suggests that knowing a cultural code allows people - both analysts and community members - to predict and explain discourse about actions relevant to the code.

This essay will examine how persons calibrate the discursive force of norms, premises and symbolic terms in matters of health and illness. In 2020, communal discourse about those matters was more heated, divided and central to public awareness than ever before. The meaning, and indeed the relevance of scientific facts to cultural ways of speaking, both mediated and interpersonal, seemed to be in constant flux. The global coronavirus pandemic and the social dramas that sprung up around the globe suggested that conceptual tools to understand cultural norms had become more important than ever. I will discuss cultural elements of contradictory coronavirus discourses to show the explanatory power of speech code theory (SCT) in these matters.

I begin by defining what it means to calibrate, rather than define or measure, discursive force, left as largely unexplored territory since Philipsen's original formulation. Then I apply this theoretical expansion to the most hotly disputed discourse of the pandemic in the US: wearing face masks. Once human beings in their interconnected, yet still insulated and often antagonistic speech communities tried to make sense of contradictory information about the efficacy of face masks, COVID became as much a cultural phenomenon as a medical one. Antagonistic discourses developed around competing ideologies of individualism versus community, focused around the issue of whether wearing a face mask should be mandatory or a personal choice. Beliefs about whether they were the most effective means of controlling the virus or a plot to control freedom-loving citizens attracted adamant, even violent, support. These discourses pervaded both private and public relational interaction in the US well into 2021. I conclude by arguing that in times of division, uncertainty and heightened tension, a theoretical apparatus to calibrate the discursive force of communicative norms may become more analytically and pragmatically important than ever.

# Compound-coinages as sources of attitudinal meaning

Poster

Ms. Qi Yu<sup>1</sup>

1. University of Konstanz

**Overview.** Intended but masked meanings of speakers (S) are crucial in studying political discourses (Beaver & Stanley 2019). Our study investigates how German *compound-coinages* (CC) consisting only of sentimentally neutral constituents make speakers' non-neutral attitude visible for hearers (H) in political discourses.

(1-2a) below show examples of CC. (1-2b) elaborate their attitudinal meanings. These are not explicitly conveyed by S, but still understood by H. (1-2c) are alternatives of (1-2a) with equal semantic extensions, but without the attendant attitudinal meanings:

(1) a. *Merkel-Land* 'Merkel-land': *Refugees avoid Austria and prefer Merkel-Land because they can bring families there.* (Source: Facebook)

b. S accuses Merkel of causing German refugee crisis.

c. *Deutschland* 'Germany'

(2) a. *Kopftuch-Praktikantin* 'hijab-intern': *New position for hijab-intern* (Source: *Bild*, 2016-08-26)

b. S regards the intern as a religious alien who is possibly difficult to integrate into German society.

c. *die palästinensische/syrische/indonesische...* *Praktikantin* 'The Palestinian/Syrian/Indonesian... intern'

We aim to analyze how attitudinal meanings such as (1-2b) arise.

**Earlier studies.** A commonly shared assumption in studies on compound meaning is that there is some covert, meaning-decisive semantic relation *R* between the constituents of a compound (in particular, see Levi 1978 and Meyer 1993):

(3) Let  $C_1C_2$  be a compound where  $[[C_1]]=m_1$  and  $[[C_2]]=m_2$ . Then  $[[C_1C_2]]=m_1Rm_2$ .

Nevertheless, this is insufficient to capture CC's attitudinal meanings: They can neither arise from the semantics of the "harmless" neutral constituents, nor do they constitute *semantic relations* between constituents.

**Analysis.** We propose that H interprets CC like (1-2a) by *identifying S's intended operation on common ground* (CG; Stalnaker 2002). In contrast to (1-2c), (1-2a) make following properties of the *objects under discussion* (OUD, here *Germany* and *intern*) salient by explicitly using constituents *Merkel* and *Kopftuch*:

(4) a. Merkel is the person in power in Germany.

b. The intern wears a hijab.

These highlighted properties in turn invoke attitudinal beliefs which S intends to add to CG<sub>S,H</sub>:

(5) a. German refugee crisis is Merkel's fault.

b. Muslims are cultural-religious outcomers and problematic subjects for integration.

H's understanding of such a compound-coinage  $C_1C_2\dots C_n$  can thus be generalized as (6):

(6) a. Property-highlighting with surface form: Component  $C_i$  ( $1 \leq i \leq n$ ) emphasizes property *r* of the OUD.

b. Activation of attitudinal belief: *r* activates attitudinal belief(s) *A* with which S intends to update CG<sub>S,H</sub>.

c. Hearer's recognition of S's intended operation on CG: H identifies that S intends to update CG<sub>S,H</sub> with *A*.

d. Hearer's Interpretation: H interprets  $C_1C_2\dots C_n$  as implicitly conveying *A*.

Through (6), *A* becomes approachable for H without being explicitly said.

**Outlook.** It may seem tempting to categorize such attitudinal meanings as non-at-issue content. However, we see critical issues, cf. Carrus 2017 on problems using at-issueness to analyze the linguistic status of derogative meanings of slurs like *faggot*. Details and discussions will be shown in the poster.

# Conflicting frames and argumentation in controversies over fashion sustainability

Poster

***Ms. Chiara Mercuri***<sup>1</sup>

**1.** Università della Svizzera italiana, Lugano

This research explores the connection between argumentation and conflicting frames in fashion sustainability controversies as types of argumentative *polylogue*, i.e. a discussion that involves a plurality of parties, positions and places (Lewiński & Aakhus, 2014). These controversies display elements of conflict and polarization. Parties in a controversy make sense of communicative messages according to different frames, that is, structures that guide an individual's interpretation of reality (Fillmore, 1976). As frames offer a simplified vision of reality, the discussion often results in a polarization of positions that might exacerbate the conflict (Shmueli et al., 2006). From this perspective, a reconstruction of the different parties' conflicting frames is crucial to understand the interests at issue within controversies (Shmueli et al., 2006; Greco 2020).

These premises show the importance of investigating the connection between linguistic frames, as elicited by the use of frame-activating words, and the reasons why frames of conflicting parties may result 'conflicting'. To understand this, it is necessary to examine how different frames are related to underlying implicit premises in the parties' argumentation. This research adopts Pragma-Dialectics as theoretical framework, which defines argumentation as the discussion that "arises in response to, or in anticipation of, a difference of opinion" (van Eemeren 2010, p. 1). Although scholars have acknowledged a connection between framing and argumentation at the level of implicit premises (van Eemeren 2010; Greco Morasso 2012), this connection remains yet to be systematically explored.

At the empirical level, I select a composite corpus consisting of different texts, in order to gain an overview of the argumentative *polylogue* and the actors that participate in it. The corpus collection, which is currently in process, includes sustainability reports by fashion brands, official documents released by the European Union, as well as social media posts published around specific events relevant to the fashion industry, e.g. Fashion Weeks.

After retrieving the frame-activating words present in the corpus and performing a semantic analysis (Fillmore, 1976), I will identify the different conflicting frames and their underlying argumentative premises. Following these steps, I plan to carry out an argumentative analysis of the *polylogue*, focusing on the implicit premises present in the controversy. At the theoretical level, this research brings forward the reflection on the relationship between the linguistic interpretation of frames, their connection to implicit premises in argumentation and their potential to analyse public controversies.

# Cultural Inclusiveness of Measures for Assessing Pragmatic Skills in Clinical Settings

Poster

**Prof. Stefano Rezzonico<sup>1</sup>, Ms. Marylène Dionne<sup>1</sup>, Ms. Farha Hussain<sup>1</sup>, Prof. Natacha Trudeau<sup>1</sup>**

**1. Université de Montréal**

*Introduction:* Assessing pragmatics is a particularly relevant yet complicated task for Speech-Language Pathologists. Given the time constraints they face, reliable and clinically meaningful tools that are quick to use are necessary to support clinicians in assessing children's pragmatic abilities. Possible methods include parental reports and direct-observation tools, such as observation scales. Previous studies in cross-cultural pragmatics and pragmatic development indicated both general trends and specific variations across and within languages and cultures (Trosborg, 2010). Furthermore, a recent report on the impacts of systemic racism in Speech-Language and audiological services in Quebec, Canada (GAAROA, 2020), indicated that Black, Indigenous and Racialized People might not always receive appropriate SLP services. Using culturally appropriate instruments is key for offering effective Speech-Language Services to the population (Hyter and Salas-Provance, 2019). This includes the use of assessment tools that are inclusive and not solely based on dominant group(s) within the population (Hyter, 2017).

*Methods:* Existing published tools and available experimental measures in French and English were analyzed for their potential cultural biases. First, for all the measures, the possible influence of the clinician' personal judgment and biases on performance was examined. Secondly, for the normed-based instruments, the sample composition was analyzed. Lastly, for criterion-based instruments, the sample composition of supporting literature used to establish the criteria was analyzed.

*Results:* Preliminary analyses indicate that most instruments might suffer from cultural biases. Many instruments contained judgment items asking the clinician to indicate a behavior as appropriate or inappropriate. Although some measures included descriptive observational scales, some of the measures do not exclude subjective judgment that might lead to unconscious cultural biases. Norms were often based on monolingual participants and criterion-based instruments tended to be based on a body of literature that focused on samples from monolingual and monocultural (e.g. white middle class) backgrounds.

*Perspectives:* Considering the unlikelihood to apply detailed analyses and thorough transcriptions (as found in research) to clinical contexts, several instruments were developed to support clinicians in assessing children's pragmatic development. These tools might allow unconscious biases to influence the assessment process of patients from minority groups. While norms should be used carefully when assessing children from cultural minorities, descriptive observational scale seem to have the potential of being inclusive measures. However, consistent support (e.g., workshop, self-teaching sessions, etc.) appears necessary to train clinicians in the use of these measures. In addition, and regardless of the type of measures used, clinicians should be made aware of their own potential bias and develop strategies to minimize their impact on the clinical processes.

# Developing an elicited imitation test to assess EFL learners' knowledge of pragmatic routines

Poster

***Ms. Nanaho Oki<sup>1</sup>, Mr. Shinya Ozawa<sup>2</sup>, Mr. Daisuke Nakanishi<sup>2</sup>, Ms. Lisa Mizushima<sup>3</sup>, Mr. Hiroya Tanaka<sup>4</sup>, Mr. James Ronald<sup>2</sup>***

**1.** Hokkaido Musashi Women's Junior College, **2.** Hiroshima Shudo University, **3.** Sapporo Gakuin University, **4.** Hokkai-Gakuen University

This study attempts to assess L2 learners', Japanese learners of English as a foreign language in our case, pragmalinguistic knowledge using an online elicited imitation test (hereafter, EIT) which focuses on assessing receptive pragmatic routine knowledge. Pragmatic routines are multi-word strings conventionally used to convey specific meanings and functions in a speech community (e.g., Bardovi-Harlig, 2008, 2012). They are said to be critically important for L2, especially low-level, learners because "they provide low-level learners with a quick repertoire of target language resources, allowing them to outperform their competence" (Roever, Wang, & Brophy, 2014, p. 382). However, acquiring sufficient knowledge of pragmatic routines is a challenge for many L2 learners because even proficient L2 learners tend to use certain types of pragmatic routines repeatedly, reducing the opportunity to gain a wide range of pragmatic knowledge (Bardovi-Harlig, 2009). Therefore, it remains an essential task for language instructors to help learners gain extensive knowledge of pragmatic routines not only by teaching but also by assessing such knowledge. Although some types of L2 learners' pragmatic routine knowledge assessments have developed in previous research (e.g., Bardovi-Harlig, 2009; Roever, 2012), they tend to assess explicit pragmatic knowledge. Therefore, it is still important to develop a test that can assess various aspects of pragmatic routine knowledge including implicit knowledge. To contribute to solving this issue in research and practice, we developed an online EIT for pragmatic routine knowledge, Pragmatic Routine Elicited Imitation Test (hereafter, PREIT). The targeted pragmatic routines include four speech acts; disagreement, refusal, request, and suggestion. Although EIT was originally developed for measuring implicit grammatical knowledge and L2 oral proficiency (Yan, Maeda, Lv, & Ginther, 2015), it is also claimed that it can be applied to assessing L2 learners' implicit pragmatic knowledge (Ellis & Roever, 2018). We also implemented a preliminary study using PREIT with Japanese university EFL learners. In this poster presentation, we will introduce how PREIT can be delivered online, discuss the significance of using PREIT to assess L2 learners' pragmatic routine knowledge, and show the results of the preliminary study. This presentation will be of interest to researchers of L2 pragmatics and to language instructors.

# Discourse genres and situations in teaching materials for Italian as a second language used in Italian-speaking Switzerland

Poster

***Ms. Annalisa Carlevaro<sup>1</sup>***

*1. Università della Svizzera italiana, Lugano*

Language competence is a basic competence and tool for social and professional inclusion. In situations of immigration, the teaching of the host society's language should meet the needs of immigrants and promote their learning by proposing communicative resources that are tailored to the linguistic, social, cultural, economic and institutional properties of the environment. In recent decades, there has been constant immigration into the Italian-speaking part of Switzerland and Italian is widely being taught as a second language (ISL) to adults. In a linguistic perspective, the specificities of the Swiss context have been investigated by several recent studies. While Italian, for long, has not been considered to be a pluricentric language (Ammon 1989, Clyne 2004), recent research underlines the presence of specific lexical and morpho-syntactic features of the standard language in Italian speaking Switzerland and relates these to sociolinguistic, political and administrative aspects of the Swiss society (Pandolfi 2009, 2011; Berruto 2011). Teaching resources for ISL should take into account these aspects. Specific teaching materials for ISL in the Swiss context are rare, however, and research on such materials is lacking.

This poster analyzes a corpus of 30 ISL manuals for adults in an inclusion perspective, taking into account the lexical, cultural and social specificities that immigrant learners in Italian-speaking Switzerland (Ticino and Grisons) are likely to face. The analysis focuses on the texts and discourse situations included in the manuals. The analyzed texts represent about 100 different discourse genres and have been described in the attempt to answer the following research questions: are the situations of language use and the vocabulary in the available ISL materials appropriate for the Italian-speaking part of Switzerland? Do authors take into account some of the peculiarities of Italian as a pluricentric language? The study is completed by a series of semi-guided problem-centered expert interviews with directors of schools in Italian-speaking Switzerland, which show how key actors in the field of ISL teaching assess the available teaching materials and their adequacy to the Swiss context.

# Disfluency and taking the floor in Japanese-language conversation

Poster

***Dr. Toshiyuki Sadanobu<sup>1</sup>***

*1. Kyoto University*

This presentation will discuss how disfluency of utterances in Japanese-language conversation is related to taking the floor.

We will employ as data about 300 talks (totaling approximately 20 hours) by native speakers from entries to the Funny Talk contest, held annually since 2010. Generally, funny talks by native Japanese speakers take the form of recounting personal experiences, rather than a joke setup. All of these entries consist of the speakers narrating personal experiences, and as a result it is very easy to differentiate between the floor taker who advances the story and other participants in the conversation.

Comparison of the utterances of the floor taker recounting a personal experience, which make up the core of the conversation, and those of other participants in the conversation—non-floor takers—who occasionally interject their reactions or questions, shows a major difference in disfluency. That is, the utterances of the floor taker were much more likely to become disfluent, while those of the non-floor taker generally were fluent. This presentation will demonstrate this specifically by focusing on two points: fillers and utterance units.

With regard to fillers, the rate of occurrence of fillers in the utterances of the floor taker was higher than in the utterances of the non-floor taker. This is consistent with a previous study (Sadanobu 2016, Sadanobu 2020) that shows that while anybody may think, only three types of speakers may utter fillers such as “umm” while doing so: (i) the speaker of an utterance currently being made, (ii) a speaker starting to speak after having taken the right of utterance from the speaker, and (iii) a person identified by the speaker but who has no intention of speaking him or herself.

With regard to utterance units, it has been pointed out that while natural English conversation often is spoken in units of clauses (subject + predicate) (Chafe 1980; 1987, Iwasaki and Tao 1993), natural Japanese conversation often is uttered in units of “bunsetsu” (Clancy 1982, Maynard 1989, Iwasaki 1993, Iwasaki and Tao 1993). While a “bunsetsu” in Japanese is a structural element of a sentence such as noun + case particle, it even more closely resembles a sentence than does an English prepositional phrase (Iwasaki 1993, Sadanobu 2006). In addition, the rate at which the floor taker utters consecutive phrases in units of “bunsetsu” is higher than that of the non-floor taker.

Of course, to some degree this tendency can be understood as reflecting the fact that the utterance by the floor taker tends to be long, while that of the non-floor taker short. But this cannot be considered a full explanation of this phenomenon. This presentation will attempt to examine this tendency as an issue of the status of a participant in the conversation: that is, whether or not he or she is the floor taker.

# Don't interrupt while I am speaking: A multidisciplinary approach to interruption in everyday Chinese talk-in-interaction

Poster

**Ms. Yingnian Tao<sup>1</sup>**

**1.** Lancaster University

Interruption happens in everyday and institutional settings where an interlocutor interrupts at various stages of the ongoing speech. The recipient of interruption may respond affiliatively or disaffiliatively. This study adopts a combined pragmatic and conversation analytic approach to study interruption in talk-in-interaction. It aims to statistically derive an **interruption model** by exploring the relationship between **intrusiveness** of interruption utterances and their **linguistic dimensions**. It aims to answer 1) how intrusiveness of interruption utterances can be measured? 2) what linguistic dimensions are represented in interruption utterances? 3) what are the relationships between intrusiveness and the four linguistic dimensions? It collected 20 naturally occurring telephone conversations spoken by native Chinese speakers in the CALLHOME Mandarin corpus. The four linguistic dimensions and two parameters of intrusiveness were annotated on a data-driven basis. R functions (e.g., linear regression) were employed to measure the correlations between each dimension and levels of intrusiveness as well as the interactions across these dimensions.

The **four linguistic dimensions** of interruption utterances are *interruption timing*, *interruption markers*, *turn size*, and *illocutionary forces*. *Interruption timing* is determined by measuring a topic-comment segment of the interruptee's utterance. *Interruption markers* focus on what tokens are used by an interrupter to preface interruption utterances. *Turn size* draws on the concept of turn-constructional units (TCUs) to classify interruption utterances into single-unit turns (single TCU at or below sentence level) and multi-unit turns (multiple TCUs with each at sentence level). *Illocutionary forces* indicate what actions (directives, interrogatives, evaluations, assertions) are conveyed in interruption utterances.

The **intrusiveness** of interruption utterances measures the magnitude of disruptiveness of interruptions. It is measured by two parameters: information flow and affiliation. The former explores the impact of certain interruption utterances on the current flow of conversation that is initiated by the interruptee. An interrupter may boost the flow via asking questions and expanding on the topic; an interrupter may hinder the flow via stopping the interruptee from completing utterances and shifting topics. The latter explores the interrupter's (dis)alignment with the interruptee. The interrupter may show positive (e.g., agreement, praise) or negative attitudes (disagreement, teasing) towards the interruptee and the topic being discussed. Acknowledging tokens such as small size interjections 嘴/en/huh maintain the conversational flow and register neutral affiliation.

The preliminary findings show that interruption timing and turn size have a strong correlation with intrusiveness in telephone conversations. Non-backchannel utterances that are inserted before the interruptee has produced the comment (as opposed to topic) are more disruptive than inserted at a later stage. Single-unit turns and multi-unit turns do not show statistical differences in terms of intrusiveness, which means that jumping into other speaker's speaking and producing more than one turn units receives much the same level of intrusiveness as injecting with merely one turn unit in everyday conversation, at least in telephone exchanges.

This study innovates with a quantitative analysis of the phenomenon of interruption. This interruption model, although designed for the Chinese language, is expected to inspire interruption model design in other languages.

# Empirical Approaches to Verbal Violence against Migrants in German Institutions

Poster

***Prof. Silke Jansen<sup>1</sup>, Mrs. Lucía Romero<sup>1</sup>***

***1. Friedrich-Alexander Universität Erlangen-Nürnberg***

Although verbal violence against migrants seems to be a common phenomenon in German institutions, it is clearly understudied in Applied Linguistics. Problems with data collection and the fact that verbal aggressions are generally realized by indirect means (and thus not immediately recognizable) may have contributed to the lack of research in this field. The VIOLIN project, from which the present contribution emerges, aims at filling this gap, by developing novel forms of data collection and analysis.

Building qualitative analysis of narratives of so-called “critical incidents” reported by Spanish-speaking migrants in Germany, we developed analytical tools based on Speech Act Theory and Narrative Analysis that allow for a better understanding of how the perception of aggression and violence emerges in interactions. Special emphasis is laid on how migrants interpret pragmatic cues, make significant attributions about the motivations of their interlocutor, and organize their experiences within memory reconstruction processes.

In the poster proposed here, we will present an analytical apparatus for the study of verbal aggression and violence that combines approaches from Psychology and Political Sciences under an Applied Linguistics framework. Relying on a corpus of critical incidents taken from the interviews, we demonstrate how recurrent structures on the macro-level can be detected through micro-analysis of the migrant’s narratives. This allows a deeper understanding of why, how and where verbal aggression and violence against migrants emerges, which can be translated into recommendations for language use in German institutions.

# Experimental Pragmatics goes on Twitter. Evidence from the online processing of presuppositions in political tweets

Poster

***Dr. Davide Garassino<sup>1</sup>, Dr. Nicola Brocca<sup>2</sup>, Dr. Viviana Masia<sup>3</sup>***

***1. University of Zurich and Zurich University of Applied Sciences, 2. University of Innsbruck, 3. Roma Tre University***

Implicit communication is pervasive in political communication on social networks (Brocca et al. 2016; Garassino et al. 2019). In particular, the fast rate at which contents are negotiated on Twitter and their brevity make the use of implicit devices a widespread strategy, which can also be potentially dangerous regarding the impact these messages may have on the formation of beliefs and ideologies in the receiver's mind.

Relying on ecologically valid stimuli, a set of (minimally adapted) Italian political tweets, this study discusses a behavioural *online* experiment, carried out on the LimeSurvey platform. The experiment intends to contribute to the literature on the cognitive status of presuppositions (among others, Tiemann et al. 2011; Schwarz 2015; Masia et al. 2017; Domaneschi et al. 2018), by highlighting the mechanisms behind the processing of two presupposition triggers (definite descriptions and change-of-state verbs) as compared to their assertive presentation.

In this experiment, which involves a population mostly made out of students (age range: 19-30), native speakers are asked to read tweets and then decide whether a certain information 'X' was present or not in the text. Importantly, 'X' may represent content conveyed by a presupposition or an assertion. It can also contain fillers.

The set of stimuli (28 in total, 7 tweets x 2 triggers x 2 conditions, presupposition and assertion; 14 fillers) is arranged in a Latin Square design and presented in random order so that participants do not read the same piece of information in both presupposition and assertion packaging. After reading the tweet, participants can no longer move back to the text. They are then asked to choose one out of five answers, ranging from "yes, information X is certainly present in the text" to "no, the information X is certainly not present in the text". Accuracy and levels of certainty are tracked.

# Formulations in Group Psychotherapy for Cancer Survivors

Poster

***Prof. Yoshifumi Mizukawa<sup>1</sup>, Prof. Akane Kamozawa<sup>1</sup>, Dr. Sumiko Oshima<sup>1</sup>***

***1. Hokusei Gakuen University***

This study examined the practice of formulations in group psychotherapy, using ethnomethodology/conversation analysis. Although Sacks (1966, 1992) set out conversation analysis from the research of group therapy and Perakyra et al. (2008) established conversation analysis as an area of psychotherapy, group psychotherapy has not been focused on, with a few exceptions. In this study, we scrutinize group psychotherapy and develop some concepts of formulations in psychotherapy, which has been the subject of conversation analysis since Davis (1986).

We invited persons from cancer-survivor organizations to participate in a group experience using the “functional subgrouping” of the method of group psychotherapy known as systems-centered therapy (SCT). Before the experience, the seven research participants were briefed by a co-researcher, a clinical psychologist, on the group experience and the study. Their consent to participate in the study was obtained and their suitability for participation in the group experience was determined. The group experience was conducted in two sets, A and B, for a total of 4 days and 10 sessions, and participants were required to participate in all sessions (each session was around 45 minutes).

The SCT group experience prompted the group to structure their talk in unique ways. First, “similarities” to the previous speaker were found. Next, the participants were asked to go through the following steps: (1) Reflect on what the speaker has said using a statement such as “I heard you said ...”; (2) Based on that similarity and resonance, say what you feel in your own way, and (3) Ask the group, “Anyone else?” These were done in one turn of the participant; each speaker followed a similar speech structure. Step 2 was to be felt on the spot and was not to be an explanation of the experience.

This structure constitutes a “functional subgrouping,” in which similarities to earlier utterances are explored and connected, and different ones are gradually recognized and integrated. This process is instructed by the leader (the clinical psychologist) who encourage participants to change course and speak in this way if any utterances/compositions other than those described above occur. This unique speech component is, in conversation analysis, formulations, (1) and the first-pair part of an adjacency pair, a question, (3). We observed that these unique speech constructions are carried out by the participants in succession; in other words, it is the unique structure of sequential interaction that constitutes SCT.

The formulations in group psychotherapy are examined in its interactional practices, in contrast to the conversation analysis of psychotherapy (see Perakylra, 2019). In this group psychotherapy, the participants/clients formulated each other continuously, which enhanced the solidarity of “resonance of experience” rather than “interpretation of experience” through “functional subgrouping.” By focusing on turn-taking in conversation and mutual formulations, this study identified various properties of group psychotherapy for cancer survivors in SCT.

# From grammar to pragmatics: a necessary change in the perspective of aviation English teaching

Poster

***Dr. Malila Prado<sup>1</sup>, Dr. Adriana Porcellato<sup>2</sup>***

***1. Fujian University of Technology, 2. Universidade de São Paulo***

Aeronautical Phraseology, a specialized language used by pilots and air traffic controllers on the radio, is a set of phrases defined for each moment of the flight. When abnormal situations happen and Aeronautical Phraseology is no longer enough, both professionals must resort to plain aviation English (Bieswanger, 2016), a more spontaneous subset of aeronautical English that needs to follow the same principles as the documented phraseology, that is, be concise, objective and clear. In order to be granted a license to operate internationally, pilots and controllers must undergo and pass a language proficiency exam that tests their ability to use plain aviation English (ICAO, 2010). The parameters that all governments are required to use to assess these professionals' language proficiency are described in the Manual of Implementation of the Language Proficiency Requirements, or Doc 9835, and listed under language areas such as pronunciation, structure, vocabulary, fluency, comprehension and interaction, on a scale from 1 to 6, with 4 being the minimum level required for international operations. Previous studies (Prado, 2015) found discrepancies between real communications and the descriptor of structure in Doc 9835, concluding that the grammar structures pilots and controllers use in real life are simpler than those prescribed as basic. This paper aims to compare the complex grammar structures listed in Doc 9835 (as pre-requisite for level 5 and above) against a corpus of radiotelephony communications held in abnormal situations. The corpus, containing 110,737 words transcribed from 130 audio files, was tagged by part-of-speech through SketchEngine, which allowed us, among others, to search for constructions such as adverb + verb when looking for adverbial clauses. The data revealed that almost 90% of the grammatically categorized structures found in Doc 9835 present clear pragmatic functions when seen in context (c.f., Aijmer & Rühlmann, 2015). We then grouped the findings according to their pragmatic function. To illustrate, the search for 'conditionals', one of the items listed in Doc 9835, brought out the cluster 'if you can', which is more commonly used to make requests ('if you can notify the company / I'd appreciate') than to express hypotheses. The results suggest that a switch from grammar categorizations to pragmatic attributes would bring the neglected aspects of communicative competence to the fore, thus assisting Aeronautical English teachers and learners (Davies, 2004). To conclude, this paper suggests practical applications of the finding to Aviation English teaching.

# Function of sign language interpreting and speech-to-text in university teaching

Poster

***Ms. Larysa Zavgorodnia<sup>1</sup>***

**1. ZHAW**

Nowadays, there are no doubts that languages and communication modes play a decisive role in educational careers and have an impact on professional choices. However, language and communication barriers are the most common reason why deaf and hearing-impaired people in Switzerland (Hohenstein et al. 2018; Rodríguez et al. 2018) and other countries around the world (Napier/Leeson 2016 p. 225–228; Lang 2002; Powell/Hyde/Punch 2013; Richardson et al. 2010) are not able to make the transition to tertiary education or to appropriate academic subjects. Accessibility and inclusion for the target group is still in a process of development.

For persons with hearing impairments, an inclusive approach requiring participation and involvement of all discourse actors is associated with the availability of appropriate communication modes. These include (1) sign language and (2) written (academic) language: written notes, subtitles, speech-to-text translation (Hohenstein/Zavgorodnia 2019).

Up to now, the function of sign language in tertiary education has only been studied selectively, and that of speech-to-text translation in academic contexts has not been studied at all. Therefore, the present project aims to close this gap by examining how knowledge transfer and the systematic build-up of knowledge can be ensured by means of sign language and text-to-speech translation in face-to-face and distanced university courses. A question to be tackled is as to what extent sign language, i.e. translation between two languages in different modalities (oral-auditive and gestural-visual) and speech-to-text translation, i.e. intralingual modal translation in German which often serves as a second language for deaf students, allow for different forms of knowledge-building and development of academic registers.

The empirical material is collected in authentic university courses (lectures and seminars) in digital and in-person modes which are taking place in German-speaking environments of Switzerland. Courses are most often attended by only one student with a hearing impairment making use of interpreting from German into either sign language (Swiss German Sign Language) or via speech-to-text translation into a written form of German. The data consist of (i) video recordings, (ii) eye-tracking data and (iii) follow-up questionnaires and will be analyzed according to a mixed methods design.

The analysis is based on a theoretical approach of functional-pragmatic speech and communication analysis (Ehlich 1986, Rehbein 1977, Redder 1990, 2008). Thus, the investigation of multimodal and interpreted communication is made possible as well as the perspective of the listener (here: viewer) can be reconstructed.

This PhD project is co-supervised by Prof. Dr. Christiane Hohenstein (Zurich University of Applied Sciences) and Prof. Dr. Klaus Schubert (University of Hildesheim). It is located in the context of the larger project “Digital opportunities promoting inclusion in Academia” (project leader Prof. Dr. Christiane Hohenstein) which is funded by Digitalization Initiative of the Zurich Higher Education Institutions and conducted at the Zurich University of Applied Sciences.

# How and When Do Listeners Respond in Conversations? : A Comparative Study of Backchannels in Japanese and English

Poster

***Ms. Kaori Kobayashi<sup>1</sup>***

**1.** Japan Women's University

In dyadic face-to-face interactions, while the main speakers talk, the other participants listen to them. When the participants play the role of listeners, they are not just quiet; rather, they react in ways to what they hear by using backchannels such as ‘yeah’ and ‘un (yeah)’ in English and Japanese respectively and nodding. The listeners have three choices of reaction: 1) nonverbal backchannels alone, 2) verbal backchannels alone, and 3) co-occurrence of nonverbal and verbal backchannels. As Maynard (1986, 1993), Clancy et al. (1996), and other studies show, Japanese speakers employ more backchannels than English speakers. However, the mechanism of co-occurrence of nonverbal and verbal backchannels has not been revealed in previous studies. Therefore, this study examines which types of backchannels listeners choose and what the cues are in Japanese and English conversations.

This study employs conversational data, where the participants talk in pairs about the topic “What were you most surprised at?” Ten pairs of conversations between female native speakers of Japanese and American English are examined. The participants are all students who are familiar with one another. Each conversation takes approximately five minutes, and the total of all the conversations is roughly a hundred minutes.

In the analysis, backchannels are classified into three types: 1) nonverbal alone, 2) verbal alone, and 3) co-occurrence of nonverbal and verbal. Then, the contexts of the conversation in which the listeners use backchannels are categorized, such as grammatical and syntactic elements, pause, and the other’s backchannels. Finally, the frequency of backchannel is examined.

The results of analysis demonstrate different usage of backchannels in both languages. In the Japanese data, the listeners use co-occurrence of nonverbal and verbal backchannels in any context. As for the contexts, all the three types of backchannels emerge most often after particles uttered by the speakers. On the other hand, in the English data, the listeners use three types of backchannels according to the context: nonverbal backchannels in the middle of utterance or phrase, and verbal backchannels with or without nonverbal ones at the end of utterance. From these results, it can be said that in Japanese and English conversations, the cues for backchannels are different and that the ways in which interactants participate in conversation diverge.

# How Do Deafblind People Represent Their Attitudes?: “Shaking-Fingers” in Finger Braille Conversations

Poster

***Mr. Kanato Ochiai<sup>1</sup>, Prof. Mayumi Bono<sup>2</sup>***

***1. University of Tsukuba/National Institute of Informatics, 2. National Institute of Informatics***

This study discusses the interactional practices the deafblind people communicate with other deafblind people by analyzing data from a conversation between two deafblind people who use finger braille. Deafblindness is a condition that combines vision and hearing impairment (Mesch, 2001). Finger Braille is a communication method used in the Japanese deafblind community, in which the speaker taps the interlocuter's six fingers, index, middle, and ring fingers of both hands, such as the keys of a Braille typewriter, in the mora-by-mora manner (Fukushima, 2011).

Previous studies of language usage and communication by deafblind people have focused on people who first lost their hearing ability and transformed visual sign language into tactile sign language (Mesch, 2001; Raanes & Berge, 2017). In contrast, few analyses have focused on people who first lost sight and used other communication methods in their daily lives. Therefore, we recorded a conversation between two deafblind people who first lost sight and use finger braille for their daily communication. Then, we explore how they talk about the past events they experienced together and how they exchange their feelings and attitudes through the conversation.

This paper focuses on the “shaking-fingers” action one deafblind person used and analyzes its characteristics based on quantitative and qualitative observations of its use in the conversation.

In the quantitative analysis, we found out that the “shaking-fingers” has three characteristics: 1) it is used with the symbol “—,” which indicates prolongation of the vowel (9/13 cases); 2) it is used when the sender is laughing (all cases), and 3) after it is used, the sender offers the turn to the receiver (all cases). Also, we pointed out that this action expresses the affective attitude of showing that the speaker thinks something they said is funny.

In the qualitative analysis, we found out there were (1) cases in which the action was used as a way to express that the affective attitude of the speaker and the receiver is the same and (2) cases in which it was used as a way to express that the speaker’s memory/perception is funny. We analyzed the examples of both cases and found out that the use of “shaking-fingers” is a practice that indeed shows the affiliation to the affective attitude of the other person and enables the sharing of high interest.

# How to keep a distance between patient and nurse in psychiatric situation: Expert nurse recognize "self" from patients and other patients.

Poster

***Prof. Namiko Kawamura<sup>1</sup>, Prof. Kayoko Machida<sup>2</sup>***

***1. Shiga University of Medical Science, 2. Sapporo City University***

Purpose: The issue of keeping appropriate psychological distance between nurses and patients has been one of the crucial topics of psychiatric situation, because when dealing with the needs of patients with unstable ego status (Abo; 1994 [Japanese]), simply responding to the patient's wishes leads to the over-involvement in relationships (Morse; 1991). In many cases, nurses learn how to keep a psychological distance through experiences in psychiatric practices, from communication with patients. The purpose of this study is to examine exactly how expert nurses approach, understand and align with patients, and at the same time avoid getting overinvolved in them. The result should contribute to instructing novice nurses and nursing students about an appropriate way of patient-nurse communication in psychiatric nursing.

Method: Four female expert psychiatric nurses participated in this qualitative study. Data were collected from February to March 2018, through individual 40-60 minute-interviews.

The director of the nursing department recommended a person who is suitable for the conditions of the participants. Upon receiving the recommendation, the researcher directly requested the participation in this research. If consent was obtained, 40-60-minute interview was conducted individually, and the content was recorded with consent. Interview data were transcribed and analyzed utilizing text mining software (Japanese); KHCoder.Ver.3.0. quantitatively and qualitatively. The study was conducted with the approval of the ethical review nursing research subcommittee at the institution to which the researcher belongs.

Result: All nurses have experience of clinical instruction for student nurses and rookie nurses. From the analysis of text mining software, the word "self" was often found in every nurse.

First, a nurse approaches and understands the patient focusing on getting closer to the patient while observing the patient in detail, grasping the patient's pace and timing, and then tell the patient what the nurse has observed and noticed about the patient, as a person and as a care provider. Second, the nurse adjusts their relationship toward recovery prioritizing the patient's medical and psychological condition, at the same time the nurse always tries to control themselves calm and stable by being conscious of his/her own self.

Discussion: The result reveals that nurses have two types of viewpoints, dealing with patients and being aware of how they are viewed by other patients.

It is also thought that recognition of "self" as an expert nurse is formed not only from the perspective of dealing with patients as a professional but also from the perspective of the patients who project the nurse's self as a care-taker.

# Language Learning Partnerships: Negotiating Needs, Strategies, and Purposes in an Intercultural Setting

Poster

***Dr. Paula Schreiber***<sup>1</sup>

**1.** University of Trento Department of Humanities

In the context of the overall project “Tandem Language Learning Trento” (<https://international.unitn.it/incoming/tandem-language-learning>), this sub-project focuses on different pragmatic aspects of interaction strategies between Native-Speakers and L2-Learners. The program is mainly addressed to students and exchange students. The combined languages of the *Language Learning Partnerships* are Italian and the native language offered by the international participant. The tandem partners arrange jointly an exchange of 20 hours. The scheduled online talks last 90-120 minutes.

Various disciplines have deepened the approach of *Tandem Language Learning*, since Brammert's definition of *Tandem* as a language partnership based on the key principles of autonomy and reciprocity (Brammerts, 2003, 29). The complexity of this approach is currently shaped by (1) Studies in Second Language Acquisition, (2) Intercultural Studies, and (3) Psycholinguistics (e.g. the ongoing discussion on Learning and Using in Tandem, (Hilton, 2020)).

Interaction is a constitutive part of *Tandem Language Learning*, but till now the analyses of pragmatic layers were principally focused on the functions of reformulation activities, and the guided use of linguistic constructions. Likewise, the conversational analysis was mainly focused on discourse analytic aspects, for example, implementing cultural knowledge via narrative sequences (Apfelbaum, 1993) or via associograms (Bechtel, 2003). In a new perspective, this proposal points out the following research question: *How needs, strategies, and purposes were negotiated in an intercultural setting created by two tandem partners?*

For this purpose, several meetings will be registered, transcribed, and then annotated to allow the analysis of the following aspects:

- What strategies are used to create a participation framework?
- How are pre- and post-sequences distributed?
- Which preferences can be defined regarding the organization of discourse patterns?
- Which methods are set for longer stretches of conversation?
- Is it possible to outline a correlation between turn-taking and code-switching?

# Latvian discourse particle *tikai* ‘only’: opposite scalarity

Poster

***Mrs. Evelīna Zilgalve***<sup>1</sup>

1. University of Latvia

Pragmatic markers *only* and *even* have been a topical issue in a number of papers in pragmatics and semantics throughout several decades (see e.g. Horn 1969, Karttunen and Peters 1975, Kay 1990, Roberts 2006, Ippolito 2008, Charnavel 2015; König 1991 etc.). Latvian discourse particle *tikai* is very similar to English *only* and similar focus particles in other languages in terms of its meaning in sentence. As it is usually stated, these operators convey meaning ‘that something is limited to not more than, or is not anything other than, the people, things, amount, or activity stated’ (Cambridge Dictionary). Latvian *tikai* can be used as a restrictor (1):

(1) *Tikai Jānis gāja uz teātri.*

only Jānis 3sg-go-pst to-prep theatre-sg-acc

‘Only Jānis went to the theatre.’

*Tikai* also can express opposition as in (2):

(2) *Jānis ir gudrs, tikai kautrīgs.*

Jānis 3sg-be-prs smart-adj, only shy-adj

‘Jānis is smart, only shy.’

However, it is evident that *tikai* does not link two elements which have completely opposite meanings. For example, in (2), a strong contradiction between being smart and being shy does not arise, although *tikai* is generally described as a conjunction of contrast in similar sentences.

Common semantic features of *tikai* in non-identical contexts can be traced after collecting data from The Balanced Corpus of Modern Latvian. These features change in affirmative or negative sentences, and they also differ in terms of scalarity. The analysis focuses on the pragmatics of *tikai* using data from the Latvian corpora.

# Linguistic Prediction and Pragmatics: How constraining is the context?

Poster

***Mr. Maxime Corbeil<sup>1</sup>***

**1.** Université du Québec à Montréal

During a cloze task (Taylor, 1953), participants complete a sentence using the most appropriate word. The predictability value of a word corresponds to its frequency of use compared to all the other responses given for this specific sentence.

The Cloze task and the predictability value have been used extensively in the literature in linguistics, even though we still know almost nothing about how this task is performed (Smith & Levy, 2011).

(1) I went to the bakery for a loaf of...(bread)

(2) The old man plays...(?)

For example, in (1), we can easily predict a specific word using the fact that in English, we usually have an adjective or a noun phrase after a preposition (syntactic constraint), or by associating the lexical meaning of 'loaf' with 'bread' (semantic constraint). As for (2), we do not have enough linguistic clues to narrow down the possibilities. However, adding a context (3) makes it much easier to predict the upcoming word.

(3) [At a chess tournament] The old man plays...(chess)

The crucial disambiguating role of the context has already been argued for by Gibson et al. (2019), and in this poster, I am interested in describing the role of the context when performing a Cloze task.

I present an activation-based model of the Cloze Task where the best continuation is selected among possible upcoming words represented as a conceptual space of possibility. This conceptual space is computed from the syntactic and semantic information expressed by the sentence itself. I also introduce a multilayered representational model in which the contextual representations are derived from the information contained at the sentence level.

These contextual representations then act as a top-down influence that modifies the structure of this conceptual space. For example, semantic features and words related to the context, e.g., 'a chess tournament', could be activated even though they are not linguistically linked with the sentence itself.

I use word vectors derived from distributional approaches (Landauer & Dumais, 1997) to represent this conceptual space in terms of a similarity space, and I model this contextual influence using probabilistic inference. This approach allows us to better explain how the non-literal meaning of a word could be triggered in a specific context (Werning & Cosentino, 2017).

# Longitudinal emergence of intersubjective meaning: Identifying practices with cross-sequential scope in psychotherapy

Poster

**Mx. Elisabeth W. Apicella<sup>1</sup>**

**1.** Mannheim University

In my PhD research project I aim to explore the practices people use to co-construct meaning in interaction. Several such practices have already been identified in publications within the fields of Interactional Linguistics and Conversation Analysis (IL/CA). Their focus, however, has been on the deployment of these practices for conversational activities within the sequential context, such as the negotiation of meaning for a locally relevant referent (Deppermann 2020) or the formulation of inferences within the sequence (Deppermann & Helmer 2013). My aim is instead to find out how these practices contribute to the longitudinal emergence of meaning, and which practices can be observed in cross-sequential analyses that have not yet been identified by sequence analysis alone.

The term ‘sequence analysis’ refers to the analysis of an “orderly stretch of talk and other conduct in which some course of action gets initiated, worked through, and brought to closure” (Schegloff 2007: 3) while ‘cross-sequential analyses’ are analyses of several such stretches of talk in relation to each other.

Methodologically, the research project relies on Conversation Analysis and Interactional Linguistics. The examined data is drawn from a corpus of 80 hours of video recordings of naturally occurring interaction from psychotherapy sessions held in German (psychodynamic focal therapy, five different patient-therapist dyads). This interaction type was chosen because in psychotherapy the co-construction of meaning is a central part of the interactional agenda and thus very likely to surface in talk. Additionally, working with data from psychotherapy sessions allows the researcher to access the complete interaction history of a dyad, starting with the first session after informed consent for the recordings was obtained.

In my poster I intend to present some of the most salient interactional phenomena that were observed in preliminary data analyses and that point to participant orientation towards the cross-sequential nature of interactionally emergent meanings. The poster will include a brief analysis of the formal, functional and contextual aspects of turns-at-talk in sequences that appear to represent the first sequence in a topically linked series during which meaning is co-constructed by participants. Supported by extracts from later sessions, I will demonstrate that these sequences are indeed treated by the participants as first sequences (in a series), and how the corresponding cross-sequential reference points are established interactionally.

Based on all preliminary findings, the poster will list the hypotheses and questions that inform the next stage of my PhD project. This will, hopefully, lead to fruitful discussions with researchers of all career stages who are invested in the investigation of interactional semantics.

# Macroprojects in gaming: An analysis of the overall structural organization of interaction in World of Warcraft raids

Poster

***Ms. Jessica Lindström<sup>1</sup>***

***1. University of Helsinki***

This paper examines the overall structural organization of interaction in multi-party gaming events called raids in the game World of Warcraft. It focuses on the following questions: How is interaction organized on a larger scale in the data? What kind of units of interaction can be observed, and what kind of interactional goals do they serve? Additionally, what kind of transcription layout best represents the complex audio-visual data being analysed? The paper draws upon a thesis on the same subject (Lindström 2020).

The research data consists of two two-and-a-half-hour video recordings, which include the spatial dimension of the game, an in-game chat window and voice communication. In the transcripts, each of these dimensions is represented through a separate column (for a similar layout see Recktenwald 2017). There are 20 players present in both recordings. The language of the game is English, whereas the language of the players' interaction in the game is Finnish.

The research method combines conversation analysis and an ethnographic approach. While the analysis itself is based on data excerpts, the thesis also showcases and discusses the interactional environment and contextual factors of the gaming events. This facilitates the reader's understanding of the data and makes known the researcher's interpretations. In other words, the in-depth introduction of the game and the discussion of contextual factors provides grounds for the researcher's inferences of "what is happening" interactionally in the data excerpts. The thesis also explores the methodology involved in investigating multi-channel and massively multi-party audio-visual data. This is shown through an overview of the transcription layout.

The results suggest that interaction in raids is organized into macro-structures of different levels: the entire gaming event as a whole makes up a *macroproject*; macroprojects are comprised of chained-together *subprojects*, attempts at defeating the challenge i.e. "killing the boss"; and each subproject consists of three normatively ordered activities, *preparation*, *performance*, and *debriefing*. The subprojects make up the majority of the macroproject, and while the interaction during the subprojects is *goal-oriented*, the rest of the time is *non-goal-oriented* or leisurely. This leisurely time consists mostly of breaks and less-demanding game content, and a change in interactional constraints on the participants is observed.

The results of the research are not only empirical, but also methodological and theoretical. Questions regarding both how to analyse and how to conceptualise the observations are answered in an outline of a transcription method and in an expansion and detailed definition of the conversation analytic term *project* (see Robinson 2003).

# Map Related Problems in Estonian Emergency Calls

Poster

**Ms. Piret Kuusk<sup>1</sup>, Dr. Tiit Hennoste<sup>1</sup>, Dr. Andra Rumm<sup>1</sup>**

***1. University of Tartu***

This presentation will look at the interactional problems that map applications cause in Estonian emergency calls. The location of the incident is one of the essential pieces of information in emergency calls: it is impossible to dispatch help without knowing where exactly it is needed. My aim is to determine the problem aspects of the map application in use. What causes location problems when the tools used are seemingly adequate? I argue that the map application can cause problems despite its apparent quality and the amount of its additional details. The data used in this presentation is derived from the Corpus of Spoken Estonian of the University of Tartu that has a subcorpus dedicated to Estonian emergency calls. My analysis draws on conversation analysis.

Map related problems in calls to emergency services have been previously noted in studies concerning underdeveloped countries where the map application used by the emergency services does not always correspond to the real circumstances. It has been suggested that a computerized system, where map information is combined with local knowledge and landmarks, may alleviate locational problems. (Nattrass et al., 2017) This computerized system would be similar to the one used by Estonian Emergency Services.

My analysis shows that a considerable part of location problems may not be solved by the system described. In Estonian emergency calls, over 41% of all responses given by the callers about location turn out to be problematic (Kuusk, 2020). A significant part of locational problems is related to the map used by Estonian Emergency Services. In this presentation I will analyse in more detail why location problems still arise.

Preliminary results show that one of the causes could be the caller's and call-taker's different perspective to the location: one sees the site first-hand, the other has a bird-eye view from the map. A substantial part of Estonian emergency calls come from public places. As such, many problems seem to stem from the lack of widely known fixed markings for public places, e.g. roads. In this case, the caller may know where they are but be unable to communicate the location sufficiently. In addition, in calls from public places the callers use obsolete or colloquial names for places, which are not marked on the map application.

# Moments of Negotiation in the Joint Construction of Reference: A Quantitative Study of ehm and hmm

Poster

***Dr. Kyoko Sugisaki<sup>1</sup>, Dr. Iris Hübscher<sup>2</sup>, Mr. Yshai Kalmanovitch<sup>1</sup>, Dr. Klaus Kesselheim<sup>1</sup>***

*<sup>1</sup> University of Zurich, <sup>2</sup> URPP Langue and Space; University of Zurich*

In our poster, we present the results of a quantitative study on the joint construction of reference in interaction. Our study is based on the *Zurich Tangram Corpus* (Kalmanovitch 2016). This corpus contains data from a series of laboratory experiments with 29 German-speaking *instructor-receiver* dyads, which have been recorded (+40 hours of audio and video data) and transcribed, resulting in an XML corpus of 306'542 tokens.

The recorded experiment is inspired by Clark and Wilkes-Gibbs' study (1986). In each experimental task, the instructor receives a table with 6 x 4 tangram figures. The instructor describes these figures to the receiver, who tries to identify the described figures in a pile of memory-like cards in order to reconstruct the original order. In each session, the roles of instructor and receiver changes 4 times, the session being repeated two times in weekly intervals.

Since tangram figures are combined polygons, they offer a broad range of subjective interpretations. Therefore we find long and intensive negotiations about what is the ‘correct’ reference form in the course of the interactions. In our study, we trace the grounding procedure (Clark 1996) from the introduction of a reference form through the subsequent negotiations to a jointly agreed referential term, trying to quantify moments of negotiations in the focused dyad interaction.

More specifically, we focus on the role of two non-lexical items – *ehm* and *hmm* – when they are uttered by the *receiver*. Our goal is to use quantitative methods to describe and distinguish the pragmatic functions these two items perform in the process of negotiating reference.

To this end, we quantify the *third turn proof procedure* in conversation analysis (Hoey & Kendrick, 2017; Sacks et.al, 1974). We consider the receiver’s utterance containing the non-lexical items *ehm* or *hmm* as the “second responding turn”, and calculate contrasts between the instructor’s “first turn” (before *ehm/hmm*) and “third turn” (after *ehm/hmm*) with respect to the (non-)lexical chain of references (i.e. pronominalisation, definiteness, use of repetitions, semantic similarity of reference forms, etc.) through computer-linguistic and corpus-linguistic methodologies. The contrasts between first and third turn are analysed not only *locally*, but also *globally*, identifying characteristic patterns over the course of the three weekly experimental sessions.

With our study, we not only reconstruct how participants use *ehm/hmm* to organize their negotiation of common ground in interaction (drawing special attention to the important role of the *receiver*), but advance a quantified account for the construction of joint reference in interaction on the classical “toolbox” of conversation analysis.

# No entry without a face mask: the pragmatics of multilingual “pandemic discourse” in Slovakia’s tourist linguistic landscapes.

Poster

***Prof. Milan Ferencik<sup>1</sup>, Ms. Denisa Bariová<sup>1</sup>***

***1. University of Presov***

Since March 2020, the pandemic crisis has altered linguistic landscapes of tourist areas across the world by adding a layer of “pandemic regulatory discourse” through which special regimes of access, movement and behaviour are imposed by service providers in an effort to contain the spread of the Covid 19 virus. In the poster, we survey this layer of the semioscape of a popular Slovakian tourist area focusing on the multimodal and plurilingual regulatory practices through which producers display their authority to impose regulations, legitimize them and anticipate recipients’ (non-)compliance. Our diachronic perspective of this discourse highlights its gradual evolution, from the relative scarcity of the regulatory signage, its monolingualism and the use of ad hoc resources in the early stages of the crisis towards its conventionalisation, iconicisation, and emblematisation. The study is grounded in sociolinguistics of globalization (Blommaert 2010), ethnographic linguistic landscape studies (Blommaert, 2013), geosemiotics (Scollon and Scollon, 2003), interpersonal pragmatics (Kádár and Haugh, 2013) and language management theory (Nekvapil, 2016).

# Other-initiated Repair with the Appendor Wh-Question

Poster

***Ms. Sally Jones<sup>1</sup>***

**1.** Nagoya University

This paper will examine how interactants do other-initiated repair with the appendor wh-question in English conversation. The “appendor wh-question” is a term I created to refer to a linguistic format consisting of only a preposition or a present participle plus a wh-question (these are not themselves repeats). For instance, *for what, doing what, since when*, etc. This research expands upon prior research that has examined the appendor wh-question in terms of repair (Egbert, Golato, & Robinson, 2009; Weber, 1993). Furthermore, I will discuss two kinds of appendor wh-questions doing repair: minimal other-initiated repair (simply consisting of a trouble source, repair initiator and repair solution) and non-minimal other-initiated repair (the repair solution becomes the new trouble source, resulting in a longer sequence).

The data was collected from 135 hours of naturally-occurring interaction in English, including telephone calls and video-recorded face-to-face interaction. Employing the methodology of conversation analysis, 83 instances of appendor wh-questions were analysed with ten found to be doing minimal other-initiated repair, while five were found in non-minimal other-initiated repair sequences.

In line with Egbert, Golato, & Robinson (2009) and their research on *for what*, it was found that the appendor wh-question assumes that there is a referent that can resolve the problem of understanding. Furthermore, it was found that appendor wh-question can occur in sequential environments whereby the source of the trouble is sequentially disjoint from prior talk. The appendor wh-question shows that the interactant initiating repair was able to grasp what was said, but not what it is in relation to.

The appendor wh-question was also found in non-minimal other-initiated repair. The initial trouble turn is initially responded to with a weaker repair initiator in terms of locating the trouble (e.g., “what”), but then the appendor wh-question is the second (and final) repair initiator used in the repair sequence. This shows the progression of how the trouble source has been grasped, with the interactant being able to more closely pinpoint what information they need to resolve their understanding problem.

With the progression of interaction occurring in real time, a conversational analytic approach to the study of appendor wh-questions enables us to identify how we understand that the participants do repair, as well as how these appendor wh-questions have been designed and understood by the interactants themselves.

# Parody of anti-immigrant netspeak as a form of political discourse on the internet

Poster

***Ms. Outi Pajukallio<sup>1</sup>***

**1. University of Helsinki**

Internet and social media have increased the amount of free-form writing, and provided a platform for public discussion on political topics such as immigration. In an electronic citizen survey by the Finnish Ministry of the Interior (Sisäministeriö 2017:70–71), the responses showed up a perception of a deep polarisation of attitudes with two political extremes concerning immigrants in the Finnish society. This division is visible on the internet, where both sides dispute and show disagreement with each other for example by seizing on the language proficiency of others (Lahti 2019:217).

In this paper, I will discuss ways in which the supporters of one view make use of the perceived language proficiency of the opposite side to express their political views under the guise of humour. I will examine the posts of a humorous Facebook group whose members have a positive stance on immigration. I will show ways in which the posts parody people with anti-immigrant views. All the posts are written in a specific parodic style of writing. A core practice is to present the people with anti-immigrant views as incompetent or otherwise flawed (online) writers.

I will analyse the linguistic means used in the parody and the language attitudes behind the humour. The focus of the analysis is on the typography, orthography, imitation of speech and affective expressions used in constructing the parodic meaning. I will analyse how the language used in the online parody differs from typical online writing and I will examine why the features are used in the parody. Through the analyses, I will show the kinds of features of netspeak that are treated as substandard. In the conclusion, the analytic findings will be discussed more generally from the point of view of their implications for norms of netspeak.

# Personal pronouns and Covid-speech: an analysis of Italian Premier Conte's video messages

Poster

***Dr. Chiara Meluzzi<sup>1</sup>***

**1.** University of Milan

## Pragmatics

This work deals with the use of personal pronouns (PPs) in the public speeches of former Italian premier Giuseppe Conte during Covid-19 pandemic. Since the end of February, the Italian premier Giuseppe Conte has appeared on the national TV on a weekly schedule.

PPs have been largely studied for their deictic and anaphoric function, but in the last decades scholars have emphasized how PPs could cover a broader range of functions, commonly described as non-prototypical (De Cock & Kluge 2016). In this work, we will consider PPs as part of a discursive approach for the analysis of political speech (e.g., Proctor et al. 2011). In line mainly with Bravo's (1998) notions of *autonomía* (autonomy) and *afiliación* (affiliation), it will be analyzed how the Premier Conte varies the use of PPs in the different messages in order to remark his own political personality vs. the creation and identification of a collectivity of participants (see also Harwood 2006 among others).

For this work, five March and five September/October videos involving premier Conte in a similar recording setting (that is, in front of the camera and/or the press) have been freely accessed through the YouTube channel of *Palazzo Chigi - Presidenza del consiglio dei ministri* (<https://www.youtube.com/user/governo.it>). Each video has been downloaded, transcribed and annotated on ELAN 5.1 (Slotjes & Wittenburg 2008), and PPs were manually annotated on a separated tier.

The analysis has shown how the use of PPs varies among the four analyzed speeches, in particular by alternating the use of 1<sup>st</sup> person singular pronouns, 1<sup>st</sup> person plural pronouns, and 3<sup>rd</sup> person pronouns, either singular or plural, are here considered together as an impersonal strategy (Fetzer & Bull 2008). It has been noted how the Premier switches between PPs, in particular by using plural pronouns to evoke comity and for an in-group making pragmatic strategy in the last sections of the speech, when he evokes a sense of unity of the nation also by using slogans (e.g. *Insieme ce la faremo!* 'We'll get through this together!').

# Pragmatic and social skills of French-speaking preschoolers: is there a relationship?

Poster

***Ms. Marylène Dionne<sup>1</sup>, Prof. Stefano Rezzonico<sup>1</sup>***

***1. Université de Montréal***

**Introduction:** Pragmatic skills are crucial for social participation. For example, young children have to participate in conversations with an adult or their peers, request toys they want to play with, participate in group activities in their daycare tell or tell a story or a personal experience to someone (Airenti, 2017). Preschoolers with a language disorder are at risk of experiencing social exclusion and challenges in their social participation at home or in their daycare (Conti-Ramsden & al., 2019; McCabe, 2005; Norbury & al., 2016). However, the relationship between language, pragmatic and social skills deserve further research to better understand what role each of these skills play in everyday social participation (Durkin & Conti-Ramsden, 2007).

**Methods:** This research project aims to study the links between language, pragmatic and social skills of French-speaking preschoolers. In total, 23 children aged 3-5 participated in the study. Seven children, assessed by a speech-language pathologist, were considered having a language disorder. Children participated in two pragmatic skills assessment tasks: a personal narrative task (Dionne & Rezzonico, 2019) and a structured symbolic play task (adapted from Sylvestre, Di Sante & Morissette, 2018). Children were also administered two vocabulary assessment tasks (EVIP, Dunn, Dunn & Thériault-Whalen, 1983; CELF-CDN-Fr Vocabulaire Expressif, Wigg & al., 2009). Children's parents completed the Language Use Inventory – French (LUI-Fr, Pesco & O'Neil, 2018), a questionnaire that reports language and pragmatic skills from the parents' point of view. Childcare educators completed the French version of the Social Competence and Behavior Evaluation (SCBE, Dumas, Lafrenière, Capuano & Durning, 1997), a questionnaire that describes preschoolers' social skills, adaptation and functioning within their daycares.

**Results and perspectives:** Preliminary results tend to indicate that children with language disorders obtained lower scores on both language and pragmatic tasks than the typically developing children. These children also tend to be more adult-dependent during social interactions than their peers. Ongoing analysis will help to better understand the role played by language and pragmatic skills on social participation at daycare. These results will lay the foundations for a better understanding of difficulties that are expected in a preschooler from those who fit more in a profile of language development disorder. This could help better identify children at risk of experiencing impacts in their everyday life, such as social exclusion, and ensure early intervention.

# Pragmatic strategies in study abroad, with a focus on I think

Poster

**Dr. Eiko Gyogi<sup>1</sup>, Dr. Mika Kizu<sup>2</sup>, Dr. Patrick Dougherty<sup>1</sup>**

***1. Akita International University, 2. Notre Dame Seishin University***

This study investigates the development of pragmatic strategies in study abroad (SA) experiences among a group of upper-intermediate to advanced L2 learners. In particular, this study focuses on *I think*, one of the common stance-taking devices with multiple and overlapping pragmatic functions, including empathetic, evaluative, mitigating, tentative, and discursive functions (Zhang, 2014). Previous studies have reported that the use of *I think* differs between individuals who use English-as-a-lingua-franca (ELF) and those using native-language (L1) (Baumgarten and House, 2010; Zhang and Sabet, 2016). This paper examines (1) how L2 learners' use of *I think* changed before and after their SA experiences from a longitudinal perspective, and (2) how these learners deployed such markers to manage social interactions.

The study participants included 11 upper-intermediate to advanced English language learners, studying in an English-medium university in Japan, an ELF setting where the majority of students were non-native speakers of English. They visited an English-speaking country for a year during their second or third years to study in an undergraduate program where participants were required to adjust their English for versatile uses in different academic, social, and personal settings. The data was mainly collected through 15–20-minute semi-structured interviews conducted before, during, immediately, and six months after the SA experiences. In addition to these interviews, a questionnaire asking for the level of use of and exposure to English as well as an English speaking test (i.e. Versant® Speaking Test) were administered at each data collection point.

Our quantitative results show a considerable inter-speaker variation in the use of *I think*, with two learners reaching the highest ratio of *I think* before their SA experiences while other learners used *I think* the most either during or after their SA experiences. The ratio of *I think* was neither correlated with students' proficiency levels assessed through the English-speaking test nor the hours of self-reported exposure to English at each data collection point. In terms of sentential positions, approximately 85% of their total use was sentence-initial, with the remaining 15% in the comment clause. *I think* in the comment clause is frequently used as a marker for mitigation and tentativeness (Sato, 2017), and is less observed in ELF communication compared to L1 communication (Baumgarten and House, 2010). While the research instrument in this study (i.e. 15-20-minute interviews) was limited as they did not cover the full repertoire that each learner could use, an advanced learner did not use *I think* in the comment clause before and six months after SA despite using *I think* during and immediately after his SA experience, suggesting his possible adjustment to different communication styles depending on the context he was in (i.e. ELF contexts or SA context). Our qualitative analysis demonstrates focused learners' strategic use of *I think* to fulfil a range of interactional demands when needed, including mitigating possible offenses and maintaining relations with the interlocutor. The pedagogical implications of this study were additionally examined from an ELF perspective.

# Processing standard and non-standard projective implications

Poster

***Ms. Maja Kasjanowicz<sup>1</sup>, Mr. Mateusz Włodarczyk<sup>1</sup>***

***1. University of Szczecin***

Levinson (1983), based on Grice's analysis of A-cases and C-cases, introduced the distinction between standard and non-standard conversational implicatures; the former arise when the speaker is observing the conversational maxims, while the latter arise in the case of maxim exploitation. Kasjanowicz (2021) proposes that the same distinction can be applied to the class of projective contents: since the rules governing the use of projective content triggers can be either observed or violated, one can distinguish between standard and non-standard projective implications.

This assumption gives rise to certain predictions about the processing of utterances having standard and non-standard projective implications. It is predicted that in some cases the projective content of an utterance can give rise to conversational implicatures (Guerts 2019, Kasjanowicz 2021). In the case of standard projective implications, the projective content arises when the rules of appropriateness for this content are observed by the speaker or, in other words, when the projective content is not-at-issue relevant to the current question under discussion. Therefore, the hearer does not have to accommodate it in order to compute i) the propositional content of an utterance and ii) the conversational implicatures that arise from it. In the case of non-standard projective implications, by contrast, the projective content of an utterance plays a key role in calculating its conversational implicature; in short, the implicature in question involves exploitation of the rules of appropriateness. Therefore, it is probable that we can observe a difference between the processing of standard and non-standard projective implications.

In the context of experimental research, on-line projective implication processing is frequently studied by the self-paced reading task (Tiemann et al. 2011, Domaneschi 2016). In our study we will use this method to measure the differences between the on-line processing of standard and non-standard projective implications.

The aim of our study is to measure the differences in the reading time between triggering words and their neutral counterparts. Experimental research on presuppositions shows that the reading time of triggering words is longer than the reading time of the neutral words occurring in the same position. We suggest that both in the case of standard and non-standard projective implications the reading time of the triggering words will be longer than the reading time of neutral words. However, in the case of critical words — i.e., words that allow the hearers to establish the content of projective implications — their reading times will be longer in cases of non-standard projective implications, because these contents play a key role in the speakers' communicative plans.

The preparation of this work is supported by the National Science Centre, Poland, through research grant No.2015/19/B/HS1/03306.

The inferential content of narratives – such as explanations and attribution of mental states – find greater expression when children first participate in conversations focused on the causes of the events (.for a review, see for ex., Nelson & Khan, 2019). The present contribution reports results of two studies. In Study 1, 84 French-speaking children between 5;6 and 8;8 years of age, narrated the *Stone story* (a wordless five-picture story whose plot is based on a misunderstanding between two characters) before and after a Short Conversational Interaction (SCI) focused on the causes of the events, as well as one week later, when the children also narrated a new story. Thirty additional age-matched children served as the Control group: instead of the SCI they played a Memory game with a set of cards that included the pictures of the *Stone story*. In the SCI group, the narratives children produced after the SCI contained significantly more inferential content compared to the narratives produced at the outset (before the SCI). These immediate improvements were still present a week later for the same story, and were also visible in the narratives of the new story. Narratives produced after the SCI were also longer and contained more markers of causality. The effect was stronger in first (M=6;10 yrs) and second graders (M=7;10 yrs) than in kindergarten (M=5;10 yrs) children. By contrast, in the children of the Control group, no significant improvements were found in the narratives produced after the *Memorygame*, comared to the narrative produced at the outset, on any of the inferential content and linguistic measures.

Study 2 built upon these results. Noting that in Study 1 not all children of the SCI group improved their narratives after the SCI, Study 2 aimed to focus on individual differences in the effectiveness of the SCI and to investigate whether these were related to variation in children's executive function skills such as cognitive inhibition and flexibility. Eighty 6- to 8-year-old French-speaking children went through the same procedure as the SCI group in Study 1 and also participated in executive function tasks. Cognitive inhibition was assessed by the Animal Stroop test; cognitive flexibility, by a three-criterion classification task and a local/global figure-matching task. Study 2 confirmed the positive results obtained by the SCI group of Study 1, and showed the presence of wide individual variation in the effectiveness of the SCI in promoting the expression of inferential content. It also indicated that this individual variation is significantly related to children's higher inhibitory control. Contrary to an earlier pilot study, no significant relation was found with measures of cognitive flexibility, probably due to the low discriminating power of the tasks used in this study. These results suggest that narrative-promoting interventions should also closely address individual differences and focus on the different skills needed to tell high quality narratives, including executive function skills.

# Small talks in Indonesian Academic Whatsapp Groups

Poster

***Dr. Dian Ekawati<sup>1</sup>, Dr. Lusi Lian Piantari<sup>2</sup>, Dr. Maria Teodora Ping<sup>3</sup>***

***1. Universitas Padjadjaran, 2. Universitas Al Azhar, 3. Universitas Mulawarman***

The development of communication through digital media, especially during a pandemic situation, is getting more intense so that many platforms, including WhatsApp Groups (WAGs), have been created to facilitate communication and provide information. In Indonesia, WAG have particularly become a common form of communication. These groups are created for the contexts of both institutional and private communication. Furthermore, Indonesia's geographic and demographic conditions also make WAG highly active. Through these groups, information is spread, communication is formed, and relationships are established. Taking this current phenomenon into account, this preliminary research entitled "Small-talks in Indonesian Academic WhatsApp Group" was conducted with the aim of collecting, classifying, and analyzing small talks occurring in the context of academic and institutional situations in WAG. The theories of small talk mediated interaction from Androutopoulos (2006, 2014), Mirivel / Tracy (2005), pragmatics of computer mediated discourse from Herring, Stein, Virtanen (2013), the method of pragmatics in computer mediated communication and language variations in Whatsapp (Sabater, 2015 ), pragmatic uses in WhatsApp status (Moya & Moya, 2015), mobile instant messaging behavior (Church and Oliveira, 2013) and text messaging (Thurlow & Poff, 2011) were used to analyze 100 sampled data of conversation screenshots from various WAGs in the academic context collected between March - September 2020 during the obligatory physical and social distancing in Indonesia. Furthermore, the approach used to analyze the data was discourse and conversation analysis in order to yield results presented in the forms of a structured pattern of the beginning and the ending of small talks in the conversation, the topics discussed in small talks, the inclusion of informal topics into formal meeting situations, as well as the changes of registers from formal to informal. Overall, based on the results of the analysis conducted in this research, the small talks in the digital academic discourse on WAGs were reactions towards announcements and news as well as topics brought up for further discussions. From the cultural perspective, these small talks and WAGs could be considered to be the most appropriate combination of communal interaction and oral tradition in Indonesia. Moreover, the reactions were in the forms of a verbal thank you in Indonesian or in the local languages as well as a non-verbal one by sending a sticker with a word or a sentence expressing gratitude. Consequently, reactions to those stickers, emojis, or thank you notes became a turn transition point to enter more informal topics so that the small talk continued until the official or formal topics returned. Furthermore, the interaction settings and participants in the group also determined how small talks started. WAGs with faculty members tend to be more formal because group members came from different study programs with a larger, more strict hierarchy. Meanwhile, WAGs of study programs tend to be more informal because of the personal closeness and more homogeneous backgrounds. Eventually, small talks were also characterized by instances of local language use, informal language registers, and colloquial diction.

# Smartphone Moves as Adjustments of Face-to-Face Engagement

Poster

***Mr. Eerik Mantere<sup>1</sup>***

***1. Université de Bordeaux & Tampere University***

This poster presents the embodied practices of people simultaneously interacting with their smartphones and each other in casual settings. It uses 10 clear photo-cartoons to show how changing one's bodily configurations with a smartphone also adjusts the face-to-face conversational engagement and participation framework of the situation.

The poster presents new concepts and methodology for understanding collocated sociability in the world of ubiquitous mobile digital devices. It is based on an ongoing work on collection based conversation analytic study of spontaneous smartphone use and face-to-face interaction with over 50 hours of videotaped everyday encounters and three major findings so far.

First, participants orient to user-device configurations constituting of 1) device-location in relation to user's body, 2) device's relation to user's hands, 3) device's screen-direction in relation to user's head. Second, these configurations are oriented to as manifestations of degrees of user-device involvement. Third, smartphone moves from one configuration to another carry sequential relevance through adjusting the level of face-to-face engagement. Increased smartphone engagement is seen as decreased conversational engagement and vice versa.

Engagement is conceptualized, not as either-or, but as the 'making available of a set of interactive resources in the service of one rather than another agency-affording situated relation'—be with a person or another material or immaterial entity. Even if increasing engagement with one's phone routinely manifests as a mutually comprehended event of disengagement from the conversational co-participant, it also indexically derives its significance through the shared social project of the moment. The crux of the co-operatively constructed engagements of the situation are the relations that each modalities of the physical orientation and re-orientation have with the spatial loci of the advancing of the jointly understood shared social project of the moment.

# Sociopragmatic Competence in Home Care for Elders in Hawai'i

Poster

**Ms. Kendi Ho**<sup>1</sup>

1. University of H

The COVID-19 pandemic highlights the vulnerability of elders in institutional care and the essential plurilingual paraprofessionals caregivers. Currently, the U.S. does not have standardized competencies for care worker training. Nor does the patient-centered model account for intercultural communication competency needed for inferences in multicultural interactions (Cameron & Williams, 1997; Candlin & Candlin, 2003; Roberts & Sarangi, 2005).

This Mixed Methods Research (MMR) (Johnson, Onwuegbuzie, & Turner, 2007) explores various stakeholder perceptions of (un)successful communication between plurilingual home care workers with elders and family caregivers. Qualitative results of the first stages of this sequential exploratory MMR used thematic content analysis to examine (a) forty semi-structured interviews, (b) four home observations of interaction between care workers and older adults, and (c) stimulated recalls with plurilingual caregivers.

Triangulation of qualitative data within and across groups show successful plurilingual care workers use sociopragmatic competence to (a) manage (Spencer-Oatey, 2008) complaints from elders with varied linguistic backgrounds and (b) navigate the local cultural order (Holmes, 2020) where *locals* (Tamura, 1994) use Hawai'i Creole English. Newcomers (e.g., care workers) align with elders with the elders' child home language or Hawai'i English (Draeger, 2012). Moreover, although care workers used prosodic and lexical features common to *elderspeak*, talk that may stereotype elders as incompetent (Coupland, 2013), family members positioned these workers as successful.

Six emergent constructs: (a) care, (b) appropriate assessment, (c) professional competency, (d) managing rapport, (e) cross-cultural communication, and (f) language choice/voice effect guided item creation in Survey 1 (S1), to identify salient speech acts for Survey 2's (S2) videos. Stakeholder assessment of videos in S2 will link prosodic features to sociopragmatic strategies in care work. This poster will show convergence and divergence of stakeholder perceptions through the mixing of quantitative and qualitative results.

# Speaking “to” not “at” constituents: Japanese Prime Minister Abe and his political arena in 2020

Poster

***Dr. Shoji Azuma***<sup>1</sup>

*1. University of Utah*

It is well known that politicians sometimes communicate in a manner that may be considered untrue or even inappropriate in various political situations. One reason for this is the simple but **crucial** fact that politicians often talk in a manner that is exceedingly focused on themselves rather than on their listeners. Political officials, it seems, really enjoy talking about what they plan to do and accomplish during their tenure, but less so about what the general public really wants to hear. Speaking more about themselves and less about their constituents, demonstrates that many politicians are clearly speaker-oriented and not listener-oriented.

Japan's current prime minister, Shinzo Abe, is an example of a politician who often uses a speaker-oriented approach. Through the lens of speaker versus listener orientation, this paper examines Abe's speaking style in various contexts, including Abe's comments during several political scandals, as well as Abe's speeches to constituents and global audiences. By studying Abe's communication style, we find that politicians may maximize their effectiveness when they orient their speech to listeners, instead of focusing on themselves.

This paper suggests that the listener-oriented approach aids politicians to convey a positive image through their political speeches which, in turn, helps convince people to vote for them. While the speaker-oriented approach has value in certain contexts, the listener-oriented approach seems to play a critical part in effective and influential political speeches.

The primary data for this study comes from the National Diet Session documentation files provided by the Japanese government, as well as major newspaper articles.

# Speech act disambiguation and prosody: The case of French indirect requests

Poster

***Dr. Nicolas Ruytenbeek<sup>1</sup>, Mr. Sean Trott<sup>2</sup>, Prof. Benjamin Bergen<sup>2</sup>***

***1. Ghent University, 2. University of California at San Diego***

Some utterances are pragmatically ambiguous. For instance, *Can you close the window?* can be meant as a yes/no question about the hearer's ability to close the window or as an "indirect request" (IR) to do so. Pragmatic ambiguity is prevalent, so how do language users manage to communicate with success? One possibility is that distinct pragmatic interpretations are reliably associated with different *prosodic cues*[1], which hearers can exploit to decipher a speaker's intentions.

Recent work suggests that English speakers and hearers use intonational cues to disambiguate IR expressions.[2] More precisely, ambiguous IR expressions are produced with higher intensity and more variation in intensity when they are meant as IRs, and participants' identifications of IRs are predicted by these features as well as by mean pitch and pitch slope. However, whether these findings extend to other languages remains unknown. In this research, we explore the intonational patterns associated with IRs in French, a language for which less is known about the relationship between prosody and pragmatic intent.[3] We ask which intonational cues are used by speakers of French when producing and interpreting IR expressions (negative state remarks such as *It's cold in here* and declaratives with rising intonation such as *You can VP?*). While in English a declarative with rising pitch indicates that the hearer is committed towards the truth of the sentence's propositional content[4], French rising declaratives do not convey this presupposition and they are the most frequent way to ask questions in spoken communication.

In a first step, we collect production data from 14 native speakers of French for the two types of IR expressions either as direct speech acts or as IRs, resulting in a total of 336 spoken utterances. Using the methodology developed by Trott et al. (2019), we compare the intonational properties of the direct vs. indirect utterances of these expressions. In the next step, participants are presented with these recorded utterances, which may contain intonational cues to pragmatic intent. We ask both whether participants' pragmatic interpretations are consistent with a speaker's original intent (i.e., whether prosody conveys any information), and which cues predict a participant's interpretation. We hope that this empirical contribution will pave the way for future work on prosody and speech act understanding, within and across languages. Our progress and results will be made available on this webpage:

# Subjunctive vs. Indicative: How Pragmatic Constraints Increase the Acceptability of the Indicative in ‘Subjunctive-requiring’ Clauses

Poster

***Mrs. Tris Faulkner<sup>1</sup>***

*1. Georgetown University*

Standard Spanish has certain classes of predicates which are described as embedding subjunctive clauses. Included under this classification are dubitatives (*dudar* ‘to doubt’), emotive-factives (*estar triste de que* ‘to be sad that’), negated epistemics (*no creer que* ‘to not believe that’), causatives (*hacer que* ‘to make that’), and directives (*aconsejar* ‘to advise’) (e.g., Portner, 2018; Real Academia Española, 2011; Romero, 2012). However, in spite of these traditional descriptions, non-standard and dialect-specific mood variation also occurs. For instance, it has been widely noted that emotive-factives also select for indicative (Bolinger, 1991; Blake, 1981; Crespo del Río, 2014; Gregory and Lunn, 2012; Lipski, 1978; Quer, 1998, 2001). This is said to take place in all varieties of Spanish (Crespo del Río, 2014). Similar variability between moods comes about with negation (Bolinger, 1991; Kowal, 2007; Quer, 1998, 2001, 2009) and verbs of uncertainty (Deshors and Waltermire, 2019; Kowal, 2007). On a lesser scale is the dialect-specific mood variation that occurs with directives (García and Terrell, 1977) and causatives (Maldonado, 2017). Whereas directives may select for the indicative in Mexican Spanish (García and Terrell, 1977), causatives can take indicative in Iberian Spanish (Maldonado, 2017).

When both moods are acceptable, it is widely suggested that the choice between subjunctive and indicative is meaningful (Bolinger, 1991; Kanwit and Geeslin, 2014, 2017; Faulkner, 2020). Gregory and Lunn (2012), for example, put forth that a speaker’s choice of mood is contextually constrained by: 1) what s/he perceives to be (ir)relevant; as well as 2) what the other interlocutors know or do *not* know. As such, they state that whereas the indicative is used to assert a proposition that is informative to the conversational participants (i.e., new information), the subjunctive is used to background information that they already know (i.e., old information) (Gregory and Lunn, 2012; Faulkner, 2020). Thus, speaker intent, rather than the type of clause alone, influences the mood that is selected.

Using Gregory and Lunn’s (2012) theory of ‘information quality’ as a guide, the aim of the present study was to further investigate mood variation in traditionally ‘subjunctive-requiring’ environments (emotive-factive, dubitative, causative, directive, and negated epistemic clauses). A 128-item Acceptability Judgment Task (AJT) was used to probe how context (the ‘newness’ or ‘oldness’ of the information at hand) affected how 222 native speakers of Spanish rated the acceptability of the indicative in 5 subjunctive-preferring environments. Results showed that the addressee’s (un)familiarity with the information in question increased its permissibility in ***all 5*** of the mentioned contexts. These findings demonstrate that even in instances where it has been said that an expression requires a particular mood, there can be variation, and the choice of mood is meaningful. Thus, in addition to the type of clause in question, pragmatic constraints influence a speaker’s choice of form.

# Teaching L2 Pragmatics through a research-based approach: a didactical project for Italian L2 student teachers.

Poster

***Dr. Nicola Brocca<sup>1</sup>***

***1. University of Innsbruck***

Teaching pragmatic competences for intercultural communication is a paramount goal of modern language curriculum (North et al. 2018). It is a goal accompanied by challenges for many L2 language teachers in view of the scarce attention given to pragmatic-didactics in teacher education and foreign language course books (Nuzzo 2015). Computer Mediated Communication (CMC) is one area that has yet to embrace didactical practices (Economidou-Kogetidis, 2011, Brocca in press).

The project LADDER (Brocca 2020-, Brocca, in revision), started in spring 2020 and conducted along three terms, is a research-based didactical project for foreign language student teachers at the University of Innsbruck. Students taking part in the project are requested to collect a corpus of interactions in digital media (e-mails and instant messages from WhatsApp) via role-plays on speech acts of requests and refusals in Italian from Italian native speakers and German-speaking Italian learners. The data is then analyzed and used to build data sets that address L2 acquisition and pragmatic research questions out of contexts that replicate authentic day-to-day interactions. The data set will be available in an open-access corpus of CMC speech acts by German-speaking Italian learners and Italian native speakers and can be used for further comparative and pragmatics analysis of L2 Italian instruction.

The aim of the project is to raise student teachers' awareness of different pragmalinguistics habits and let them inductively discover how those norms can be associated with sociopragmatics tools. Students are exposed to high variability, measure it with quantitative methods and learn how much individual variation below to learners' and natives' outputs. Moreover, the project provides a practical experience of research-based teaching, which students may transfer in their language classroom as teachers. The research also draws insights from a pre-post test conducted through *LimeSurvey* on students (n=25) taking part in the class. In the survey, students are asked to react to the content of a curriculum (A2 and B1 level of CEFR, North 2018) while evaluating their importance according to a Likert-Scale.

The paper deals with stories told by students of practical nursing. The data are gathered in optional study circles organised by the nursing school during a three years period. The students gather once a week in a small group together with at least one adviser. The data include 54 sessions which last from one and a half up to three hours. 12 sessions were picked out for detailed analysis because of the high frequency of student-initiated stories. Among the students there are both native and non-native speakers of Finnish.

The method applied is ethnomethodological conversation analysis. A story is defined as a sequence in which one speaker launches a multi-unit turn and in which functional story parts (introduction, climax and evaluation) can be located (Mandelbaum 2013).

The study deals with the hypothesis that the evaluation sequence may function as a possible learning space. Learning space is defined as situations in which the learner has the occasion to practice skills and to participate to an activity (Hanks 1991).

In this study learning is defined as an activity where participants together validate and assess things at issue. The creation of a learning space then presupposes recipients' up-take of the story and its integration to the mainline of talk.

The study's focus lies on the story's evaluation sequence. On the one hand, the analysis presents teller's technique making recipient reaction and affiliation relevant. On the other, the analysis deals with recipient affiliative activities and recipients' devices for story up-take (Jefferson 1978; Stivers 2008).

In my analysis I consider teller's devices to introduce the story. Teller may introduce a story by indicating the kind of story (funny, sad) she will tell. I investigate the correlation of story introductions, recipient evaluative and affiliative behaviour and the (non-)uptake of a story while shifting back to the main line of talk. The study suggests that recipients' affiliative behaviour influences the emergence of a shared learning experiences. On the contrary, recipients' lack of affiliative and evaluative behaviour may delete the story's potential to serve as possible learning space.

Key words: Storytelling, affiliation, evaluation, learning space, Finnish as L2

# The Acquisition of Apologies through Telecollaboration

Poster

***Ms. Sofía Di Sarno García<sup>1</sup>***

**1.** Universitat Politècnica de València

Some authors argue that telecollaboration offers the opportunity to practice discourse patterns in authentic environments thanks to its high sociocultural component, and for this reason it can be beneficial for the teaching and learning of interlanguage pragmatics (ILP) (Sykes, 2017; González-Lloret, 2019). In fact, seminal studies such as Belz and Kinginger (2002, 2003) already claimed that telecollaborative exchanges provide opportunities to interact with speakers of the target language (TL) in real conversations, and thus, improve students' pragmatic competence in the TL. In spite of this, the area of research of ILP in computer-assisted language learning (CALL) is still in its adolescence (Sykes, 2017; Sykes & González-Lloret, 2020), which is surprising considering that pragmatic competence is one of the main components of communicative competence (González-Lloret, 2019). Since not all language students have the possibility to study abroad or visit the TL country, telecollaboration gives them the possibility to compensate this lack of contact with TL speakers and their culture. For this reason, this study presents a telecollaborative exchange whose aim is to foster Spanish-speaking students' pragmatic competence through the realization of role-plays with highly proficient speakers of English in a virtual environment. In fact, studies such as Félix-Brasdefer (2010) claim that role-plays are a reliable method to collect data in ILP if enough contextual information is provided. In our particular study, the role-plays focus on the speech act of apologies, taking Leech's (2014) taxonomy as a model. Since we wanted to know if telecollaborative exchanges improve student's pragmatic competence, Spanish students from the Universitat Politècnica de València completed a pre- and a post-test. This subsequently allowed us to compare their use of apologies before and after the treatment received, which consisted of explicit instruction on apologies and in the interaction with students from the University of Bath through videoconference exchanges. A statistical analysis comparing the pre- and post-test will be provided. Thus, this paper displays the preliminary results leading to a doctoral dissertation where speech act performance will duly be analysed.

# The categorization of information sources in face-to-face interaction

Poster

***Prof. Johanna Miecznikowski<sup>1</sup>, Mrs. Elena Battaglia<sup>1</sup>, Mr. Christian Geddo<sup>1</sup>***

***1. Università della Svizzera italiana, Lugano***

When speakers inform others about a state of affairs, they may specify the source of the conveyed information, a specification that serves various functions related to epistemic support (Boye 2012) and epistemic status (Heritage 2012). The main classes of sources commonly distinguished are direct experience, report and inference (Willett 1988:57). Their categorization has been investigated focusing on grammaticalized evidential systems (e.g. Aikhenvald 2004) and on lexical means (e.g. Squartini 2008), whereas the process of source categorization in discourse, especially in face-to-face interaction, is underresearched. Which resources are available to participants to signal or infer an utterance's information source and how are they used in face-to-face interaction? In a research project started in 2020, we address these questions in a corpus-pragmatic and an interactional perspective. We start out from a model of source categorization that takes into account a range of resources: (a) elements that are perceptually accessible in the situational context (e.g. an interlocutor's preceding turn or events occurring at the time of utterance); (b) verbal and paraverbal means (grammatical, lexical and textual means, prosody); (c) entailments and implicatures based on the utterance's propositional content (e.g. future reference entailing the impossibility of direct experience).

We assume that source categorization is potentially relevant for utterances that have a certain degree of assertive force and can have the sequential status of informings or confirmation requests. Single resources or their combination may be used by participants to relate utterances to more or less specific types of sources; when no resources are used or available in situ, utterances are evidentially undetermined.

This model will be used to examine a corpus of 28 hours of video-recorded and transcribed conversation in Italian, which is currently being gathered. On one hand, it will be implemented in an annotation scheme (about the pragmatic annotation of evidential means cf. also Carretero & Zamorano-Mansilla 2015) that will be employed to describe assertive utterances in a corpus sample in order to obtain quantitative data about source types, the degree of specificity of source categorization, and used resources. On the other hand, the model will be used as a heuristic to investigate the interactional achievement of evidential distinctions in collections of cases taken from the entire corpus.

Our poster presents and illustrates the model and the annotation scheme that is being developed on its basis.

# The Context Effects on Negation Processing in Sentence Verification Tasks

Poster

***Ms. Shenshen Wang<sup>1</sup>, Dr. Chao Sun<sup>2</sup>, Prof. Richard Breheny<sup>1</sup>***

***1. UCL, 2. Leibniz Centre for General Linguistics***

Negated sentences are widely observed to be more cognitively demanding than affirmative sentences. Among different paradigms that have been employed to explore negation processing, sentence-picture verification task is widespread. Verification studies commonly report that it takes longer for judging affirmative sentences as false than true (FA>TA). However, the response time of negative sentences does not show a consistent pattern. Some studies find that response time to true negative is shorter than the false negative (TN<FN) ([1]); while in other studies, the opposite pattern (FN<TN) is reported ([2,3]). Composite model accounts of the FN<TN finding propose that the representation of the interpretation of negative sentence has a composite structure that reflects the structure of negated sentences per se. They propose that participants exploit this composite structure to complete the verification task in two steps: first evaluate the positive argument and then incorporate the meaning of negation where the truth-value response is reversed ([2-4]). This view, however, is both at odds with the incremental language processing and underestimates the effects of context on sentence processing. As an alternative, the dynamic pragmatic account ([5]) argues that the composite representation is not a necessary part of negation processing. The dynamic pragmatic model holds that the source of relevance for an utterance is computed in the same incremental timecourse as the content of the utterance. Elements of the linguistic stimulus can serve as a cue to the intended relevance of the utterance. In laboratory studies, in the absence of further information about intended relevance, participants perceive sentential negation as a very strong cue to a specific context, one in which the argument of negation is held to be a live possibility and where the speaker intends to exclude that possibility. In this way stimuli such as, ‘the banana is not peeled’, draw participants attention to the positive argument (peeled banana) creating interference when the task is sentence-picture verification; and it is this that leads to the well-known two-step strategy. In the experiment we manipulated cues to the source of relevance which shows that two-step responses can be eliminated where the context indicates that a negative question such as, ‘which one is not peeled’ is inferred as context for the sentence, ‘the banana is not peeled’.

# The Modalities of Turn-Taking in Online Education Spaces

Poster

***Dr. Maria Erofeeva<sup>1</sup>, Mr. Nils Klowait<sup>1</sup>***

*1. Russian Presidential Academy of National Economy and Public Administration*

This paper analyzes how the use of an online educational module in a video-mediated learning environment impacts the organization of the classroom's interaction order. We argue that the participants' situationally produced orientation to technical features of the environment creates novel interactional resources for the turn-taking management during an online class. Their use, in turn, leads to the production of a disciplinary interaction order encouraging the teacher to correct already correct answers which do not fit the established turn-taking system.

The study was carried out in the framework of multimodal conversation analysis. We analyzed video recordings of the telemediated interaction of Russia-based secondary school students and teachers within an online educational module. The analysis is focused on one specific strip of interaction in which a student's correct answer is nevertheless corrected by the teacher. The data is in Russian.

The interactional ecology of the studied setting is peculiar. Firstly, it is 'fractured', as the participants have asymmetric access to their shared environment: only two pupils have their cameras on; the sound is distorted; the teacher is screensharing, yet it is unclear what is mutually available to the participants. Secondly, the interaction has an institutional character, exhibiting normative characteristics typical of classroom interaction. Finally, the introduction of a digital learning platform adds an additional technological context to the institutional setting. We consider technologies as possessing communicative affordances - opportunities for action that are made possible or delimited by their use. The driving question of this study is what the participants orient to in an asymmetric institutional environment saturated with various communicative affordances.

We demonstrate that the teacher initiates the mentioned correction because they are guided by the ordering of the elements in the interface. In our case, the observed turn-taking system is not technologically determined, but established through the formation of the shared orientation to the teacher's mouse movement. Based on a detailed analysis of these movements in relation to ongoing turns-at-talk, we show that the orientation is procedurally produced and then sustained by all participants during the interaction. This research empirically demonstrates that technological affordances do not automatically become relevant to the interactants; their relevance is cooperatively and situationally produced, and this process involves the interweaving of the institutional and technical context of interaction.

The work contributes to classroom interaction studies, studies of video-mediated communication, and further develops the methodology of multimodal transcription for mediated contexts. The transcript convention developed by the authors augments classical Jeffersonian conventions with a system for relating recorded mouse movement to ongoing turns-at-talk, making it possible to track the speed of the mouse movement, as well as the duration of pauses at any given point in the transcript.

Our research opens up a discussion on the specificities of the interactional ecology of video-mediated learning environments, the relationship between communicative affordances and institutional norms in such environments, as well as methodological issues of transcription.

# The role of the language French-acquiring children hear and interact with on their early production of ‘subjects’

Poster

***Prof. Anne Salazar Orvig<sup>1</sup>, Prof. Edy Veneziano<sup>2</sup>***

***1. Université Sorbonne Nouvelle - CLESTHIA, 2. Université de Paris & CNRS, Laboratories LPPS & MoDyCo***

In French, notwithstanding a few exceptions (Leeman, 2006), the expression of a grammatical subject is obligatory. This does not however occur in the early stages of language acquisition. Several studies have shown that, at some point in the second half of the second year, young children start sporadically filling the preverbal position with undetermined elements – often called *fillers* in the literature – before they produce phonologically well-formed pronouns which are the elements mostly found at first in the subject position of children’s early productions. Several studies have shown that children also tend to follow the pragmatic principle of accessibility of the referent that in many languages, including French, regulates the realization of subjects (Ariel, 2008). It is not however clear to what extent children have an underlying knowledge of the notions of grammatical subject and of referent accessibility.

The aim of this paper is first to analyze in detail the language children closely interact with during one-to-one conversational exchanges with familiar partners. Then, to assess the role that this source of language may have on the development of children’s production of elements in subject position. These analyses will take into consideration the time and mode of the verbs (e.g. present, past) and the types of verbs children produce with and without ‘subjects’, as earlier studies have shown these features matter in their realization.

The data consist in the longitudinal studies of four French-acquiring children recorded audio-visually at home during spontaneous interactions with familiar adults. The data analyzed here concern the period between about 18 and 28 months, depending on the child.

Results will be discussed in terms of how the conversational exchanges in which children participate can throw some light on the status of the grammatical and pragmatic knowledge children have at different developmental periods, and on the way it is acquired.

# The Tendency of Japanese/American Teachers and Students' Suggestions in Task-based Interaction

Poster

***Ms. Lisa Shinke<sup>1</sup>***

**1. Japan Women's University**

Suggestion is the speech act which a speaker presents his/her idea to a hearer. By imposing the thought on the hearer, the speaker has possibility to step into the hearer's territory and offend him/her. Shigemitsu (2005) indicates that cultural and social backgrounds, such as "emphasizing the hierarchical relationship and understanding each person's position" for Japanese and "setting the relationship with high degree of familiarity" for Americans, have a big influence on Japanese and American conversation style. Thus, the style of both Japanese and American suggestion has high possibility to get influenced by those backgrounds. Many previous studies on native Japanese speakers' suggestions only treat the suggestions as the part of the interaction held at meeting and do not focus on the verbal expressions used during the suggestions. On the other hand, many previous studies on native American-English speakers' suggestions are done based on Brown & Levinson's politeness theory, which categorizes both suggestions and advice as the speech act which "S (a speaker) indicates that he thinks H (a hearer) ought to (perhaps) do some act A" (Brown and Levinson, 1978: 70-71). This leads many studies to focus on verbal expressions which are used in the situation of "advice" rather than in that of "suggestions". The study which focuses on the verbal expressions of Japanese and American-English suggestions only analyzes student-student interactions, and interactions of people with different age and position are not examined. Thus, this study attempts to clarify the tendency of the usage of verbal expressions for suggestions between two Japanese/American-English speakers with different positions, teachers and students, in task-based interaction by using the categorizations mentioned in Fujii (2016) (declarative statements, declarative statements with mitigating expressions, declarative questions, and question forms). The data of Japanese speakers clearly show that both teachers and students have the same tendency: the highest frequency of question forms. On the other hand, the data of American-English speakers show the difference: teachers have highest frequency of declarative statements, while students have the highest frequency of declarative statements with mitigating expressions. Moreover, there is one similarity between two data: in both data, teachers use the expressions which induce the partner's response, declarative questions and question forms, more than students, while students use the expressions which do not induce the partner's response, declarative statements and declarative statements with mitigating expressions, more than teachers. From these results, it became clear that, when they select verbal expressions for suggestions in task-based interaction, Japanese teachers and students tend to emphasize the construction of cooperation rather than their vertical relationship. On the other hand, American teachers and students tend to emphasize vertical (power) relationship rather than the construction of cooperation.

# Theory of mind narratives of Roma children in Romani language

Poster

***Prof. Hristo Kyuchukov<sup>1</sup>, Prof. Jill de Villiers<sup>2</sup>***

***1. University of Silesia, Katowice, 2. Smith College***

Romani is the mother tongue of thousands of Roma children in Europe. Very little is known about acquisition of the mental state verbs needed to enter the discourse about minds that is a part of literacy. The study has the goal to investigate how Roma children incorporate references to desires, thoughts and knowledge when telling stories. Earlier work in this tradition with other language and cultures has suggested that children make reference first to desire (*want, need*) and intention (*try*), then only later to beliefs (*think*) and knowledge (*know*) when making reference to characters in a story. That is, children are said to move from describing the landscape of action to stories that incorporate the landscape of consciousness. However, the range of cultures and language explored is quite narrow, focusing mostly on Western cultures and European languages, and with children who are well entrenched in book reading and literacy from an early age. In this research we use the same story type, namely wordless picture sequences, to elicit two narratives from a group of children growing up in a very different cultural milieu, namely Roma living in ghetto-type settlements in Eastern Europe.

However there are also differences between groups of Roma. The 15 Slovak Roma children tested live in a small town and their families live in dire poverty, with no electricity and no running water in the houses. The 15 Roma children tested in Bulgaria have access to electricity, internet, water, and they have better houses. In neither case is book-reading an activity in which the children commonly participate in their families, though oral folk tales are common in the culture. The dialects they speak are from the same group of non-Vlax dialects and contain the same mental state verbs.

Children were tested on narrative story-telling by a native Roma-speaker in their homes or preschools. Initial analyses counted the use of the verbs *want* (*mangav*), *think* (*mislínáv*) and *know* (*džanav*). The research is ongoing, but here we report data from two narratives from each of 30 children, both boys and girls. The two countries were equally represented in the following age groups: 3;6 - 4;0, 4;1-4;6 and 4;7 – 5;0 years.

The preliminary results suggest the same progression from desire to cognition. Desire verbs occur from the earliest age and stay constant. In contrast, verbs of cognition start becoming more common at age four. The differences between the cultural groups are also more apparent for the verbs of cognition, with more than twice as many from the Bulgarian than the Slovak children (30 versus 14). Results so far suggest a similar trajectory of understanding of the mental states of characters despite the cultural differences, but that conditions of extreme poverty may impact their expression.

# Undoing illocutionary action

---

Poster

---

**Dr. Mariya Chankova<sup>1</sup>**

**1.** South-West University N. Rilski - Blagoevgrad

Post-digital communication has been shaped by a novel dynamic in human (through bot) to human interaction, with social and discursive identities being constructed in digitally mediated interactions, constrained by digital communication affordances. This contribution looks into undoing illocutionary acts. As conventional acts – acts that rely on social agreement to come to be – illocutionary acts are by definition defeasible (Sbisa, forthcoming). As Austin suggested, it should be possible for hearers in principle to reject any illocutionary act (Austin 1962, 29). It should also be possible for the speaker to rectify or in another way revise their act. Caponetto (2020) proposed three strategies to undo what was done with words: annulment, retraction and amendment, themselves second-order speech acts.

The hearer has an important role to play in validating illocutionary acts; it must be equally important for the hearer to validate the undoing of the illocutionary action. In order to investigate what kinds of undoing the audience is willing to accept, what the cost for the speaker is, what part negotiation plays, what felicity conditions or performance requirements may be necessary and/or sufficient in order to annul an illocutionary act, I look at material taken from social media and content-sharing platforms in a variety of languages (French, English, Bulgarian and Russian). Strategic interaction settings are chosen to investigate the possibilities for revising and repairing that speakers and hearers have.

# What Is Interfering? On the Source of the Metaphor Interference Effect

Poster

**Mr. Shaokang Jin<sup>1</sup>, Prof. Richard Breheny<sup>2</sup>**

**1.** University College London, **2.** UCL

In the literal truth-value judgement task, participants take longer to judge metaphors (e.g., *Some jobs are jails*) as *literally false* than their scrambled counterparts, used as control sentences (e.g., *Some jobs are sharks*). This is known as the *metaphor interference effect* (MIE). Two models of metaphor processing provide explanations for the source of the MIE. The *attributive categorisation model* argues that the MIE results from automatically registered metaphorical meanings (Glucksberg 2008; Glucksberg, Gildea & Bookin 1982). The *structure-mapping model* postulates that the MIE only taps an initial stage of role-neutral alignment (e.g. Given the metaphor “*Socrates was a midwife*”, the initial symmetric alignment yields the common system *helps* and *produce* and the role-neutral connectivity *midwife-Socrates*, *mother-student*, and *child-idea*) in metaphor processing (Wolff & Gentner 2011; Wolff & Gentner 2000).

In the current study we assume metaphor interpretations are automatically generated but propose that an important factor contributing the MIE is uncertainty over which figurative meaning a sentence has, due to lack of context in typical MIE-task stimuli. Example (1.a-b-c) illustrates how metaphorical meanings are typically ambiguous and uncertain without context.

- (1) He is a cactus.  
 a. Judy's boyfriend is an awkward character and often says unkind things. *He is a cactus.*  
 b. Judy's boyfriend loves spending the day in the desert, in the hot sun. *He is a cactus.*  
 c. Judy's boyfriend is hard to come close to. *He is a cactus.*

It is well-established that unresolved ambiguity can tap resources (Duffy, Morris & Rayner 1988; Griffiths, Steyvers & Tenenbaum 2007) and this could delay the more controlled literal selection and evaluation task. Thus, we predict that a constraining context will eliminate or decrease the MIE. The attributive categorisation model predicts, if anything, context will increase the MIE due to greater salience of figurative meaning. The structure-mapping model's initial process is context independent (Gentner 1989) and so does not predict the MIE difference with context.

In the experiment, results of Task 1 (literal truth-value judgement task) confirm our prediction that the context eliminated the MIE. Task 2 (comprehensibility decision task) explores the time-course of participants deriving metaphorical meaning(s) and shows that, without context, metaphorical meaning derivation takes significantly longer than literal truth value judgement of metaphors; with context, figurative meanings are available at the same time as verification RTs in Task 1. We conclude that the MIE results from uncertainty over figurative meaning computation, leaving fewer resources for the controlled processing of literal truth verification task.

The effect of strong constraining context on the MIE is surprising for different theoretical accounts of the effect (Glucksberg, Gildea & Bookin 1982; Wolff & Gentner 2000). Our results support the marriage of an attributive model with current models of language processing under uncertainty.

# Why do Japanese Sign Language (JSL) bimorphemic toponyms outnumber monomorphemic ones?

Poster

***Dr. Johnny George<sup>1</sup>***

***1. Meiji University***

Contrary to the observation from Peng (1977) that JSL toponyms, or place names, are typically monomorphemic, and the widely accepted account that sign language lexicons generally decrease in markedness over time (Battison 1978, Brentari 1998), this study finds that nearly 60% of the JSL toponyms in an approximately 800 word corpus have a bimorphemic structure. Monomorphemic signs typically represent the majority of sign language lexicons, even JSL; however, with respect to toponyms it appears that the creation of a transparent indexical relationship between the Japanese name and JSL name outweighs the benefit of morphological efficiency. Purely structural analyses do not adequately account for the dominance of complex toponym outputs; therefore, this study posits that environmental effects such as literacy or support for intercultural communication promote the continued use and spread of complex toponyms in sign languages.

This study examines the structure of over 800 JSL place name signs from the *JSL Toponym Map* (Yoneyama et al. 2009). The place names were categorized as either endonymic or exonymic and then compared structurally. JSL has two broad productive lexical categories: endonyms via loan translation, and independent or exonymic signs grounded in metonymy (Peng 1976, Nonaka et al. 2015). Exonymic signs index local knowledge such as historical icons, traditional practices or natural features; such signs may have higher semantic transparency with respect to the place identified but they contain no direct connection to the spoken Japanese name. Despite the availability of strategies such as truncation that mitigate bimorphemic outputs in favor of more efficient monomorphemic forms, a majority of the JSL place name signs examined for this study are bimorphemic; therefore, representationally faithful and maximally associated with the Japanese source name.

Toponym formation in JSL highlights the tension between indexical transparency and structural efficiency seen in onomastic processes across sign languages. Signers appear to favor toponyms with endocentric, recoverable outputs. Other studies on sign language toponyms such as Revilla (2009) show that the use of bimorphemic toponyms is not unusual. The evidence suggests that some feature of name signs loosens constraints on the sign language preference for efficient morphological structure. Social factors such as literacy may also be in play (Nonaka et al. 2015).

# 'Like a rolling stone': How do similes differ from literal comparisons?

Poster

***Ms. Xinxin Yan<sup>1</sup>***

**1.** University College London

So far very few theoretical works in pragmatics have discussed the uses of similes, their relation to literal comparison statements, and their mental comprehension processes. While some have investigated the relationship between similes and corresponding metaphors (Bowdle & Gentner, 2005; Glucksberg & Haught, 2006), no empirical studies so far have looked into the potential processing and interpretive differences between similes and literal comparisons.

The primary aim of my research is to explicate simile as a figure of speech, using the relevance-theoretic framework: what are similes ('figurative comparisons' or 'hedged metaphors')? How do they differ from ordinary literal comparisons, on the one hand, and metaphors, on the other? I suggest that the continuity between literal and figurative (metaphorical) assertions claimed by standard relevance theory (Sperber & Wilson, 2008) carries over to comparison statements. Similarly, literal and figurative comparisons have no genuine, clear-cut distinctions in their uses and mental processing. However, the fact that similes convey figurative meanings by comparing entities that are not literally alike (e.g., 'John is like a rolling stone') calls for an extra step of property modification (to be more specific, 'property loosening') together with the basic mechanism employed in interpreting literal comparisons (e.g., 'John is like his father'). It is hypothesized that this additional pragmatic operation leads simile comprehension to be more difficult and effort-costing than the comprehension of literal comparisons. This property loosening process might also enable the derivation of more 'emergent properties' in interpreting similes than literal comparisons (e.g., a typical emergent property of the example simile above describes John as 'a person without ties to anyone or any place', which is not a property of a literal stone that is rolling).

I have experimentally tested these hypothesised differences between similes and literal comparisons from two perspectives: via on-line comprehension time measurement and off-line interpretation comparison, using the same set of target stimuli in both cases. A timed sensicality judgement study was carried out to compare the response accuracy and latencies of similes and corresponding literal comparisons (e.g., 'some lawyers are like sharks' vs. 'some whales are like sharks'). Participants were asked to judge whether the comparison makes sense or not as quickly and accurately as possible. Results revealed that interpreting similes differs from literal comparisons in both accuracy and reaction times. Similes were judged to be meaningless much more frequently and when found meaningful their processing tended to take longer to complete. This suggests that an interpretation of simile is harder to access than that of literal comparison. The number of emergent properties derived in people's interpretations of similes and literal comparisons was also compared using an offline production task. Results showed that similes tend to evoke a significantly greater number of emergent properties than literal comparisons.

Both of these studies indicate that even if similes and literal comparisons share a common basic processing mechanism, their interpretations do differ markedly in terms of the amount of cognitive effort involved as well as the contextual effects achieved.

# 'Moustaches' in English: adult L2 learners' acquisition of referential metonymy

Poster

***Ms. Josephine Bowerman<sup>1</sup>, Dr. Ingrid Falkum<sup>2</sup>, Dr. Nausicaa Pouscoulous<sup>1</sup>***

***1. University College London, 2. University of Oslo***

Referential metonymy, e.g. '*the moustache* (= man with a moustache) sits down first', appears early in L1 acquisition (Falkum, Recasens & Clark, 2017). Yet how does it emerge in pragmatically mature but linguistically developing adult L2 learners? We investigated metonymy comprehension and production in 34 Japanese adult L2 English learners and a control group of 31 monolingual native English speakers. We also examined the effects on metonym production of (i) a high-pressure context (limited time to respond), and (ii) exposure to examples. We used one comprehension and two production tasks, based on Falkum and colleagues (2017). Comprehension was tested using a picture-selection task (within-subjects literal and metonymic conditions; 6 literal, 6 metonymic targets). In a game-naming production task, participants read the rules for 4 novel learning games (e.g. answering language questions to win candies). A name was elicited for each game. In a character-naming production task, participants viewed 18 pairs of characters, each with a salient characteristic (e.g. a large hat). A name was elicited for the target character in each pair, manipulating 4 conditions: +/- exposure to examples of metonymic names, and +/- time pressure.

Our results show that Japanese adult L2 English learners are able to both comprehend and produce novel referential metonymy in L2. The picture-selection comprehension task revealed that the Japanese participants could successfully interpret transparent novel metonyms in English. In addition, the Japanese participants were able to produce not only 'shorthand' metonymic expressions for referring to *objects* (novel learning games), but also metonymic names for *individuals* (compare children acquiring L1, for whom metonymic naming of individuals was found to be more challenging than the metonymic labelling of objects (Falkum *et al.*, 2017)). Prior exposure to examples of metonymic names had a significant *facilitatory* effect on production ( $p < .001$ ), for both Japanese adult EAL learners and native speakers. Time pressure, however, significantly decreased metonymic name production, especially in the absence of examples ( $p < .001$ ). Further, the results indicate a possible explicitness vs production costs trade-off.

The study has pedagogical implications: referential metonymy (and other innovative/non-literal phenomena e.g. metaphor), may help adult L2 learners become more fluent and competent communicators in the target language; thus, L2 educators may wish to actively promote use of strategies like referential metonymy, for example through facilitation by 'modelling'.

# “Where are you from?” in English, Chinese and Korean : Intention and Perception of the Question

Poster

**Ms. Jihye Yun<sup>1</sup>**

**1.** University of Wisconsin-Madison

Nguyen, Nguyen, Iqbal and Ofek (2015) assert that the question “where are you from?” is classified into a setting topic of small talk, which enables interlocutors to turn a non-intimate subject into a highly personal topic. It is very likely to be uttered as a means of initiating small talk to build a rapport with a stranger. Brown & Levinson (1987) also say that asking the question is one of the positive politeness strategies used to build common ground with interlocutors. In contrast with these research results, some interviewers and media data claim that the question can make people feel strange , even uncomfortable. Based on Zhu (2019)’s research, this paper examines the kinds of contexts causes different perceptions between people. A recent questionnaire and internet-based data indicate that English speakers and Chinese speakers normally ask, “where are you from?” when they first meet someone new. Interestingly, in South Korea, Korean speakers do not ask the question at the first meeting, except in certain situations. However, the survey and online posts do not provide a detailed account of how people perceive the meta question. For this reason, in order to do in-depth analysis, I have collected heterogeneous data such as one-on-one interviews, sociology databases and a discussion between more than one interviewee. My analysis reveals that the question is deeply related to not only various contexts but also individual or social thoughts about hometown, homeland, and heritage.
