

Master in Life Sciences

A cooperation between
BFH, FHNW, HES-SO, ZFH

Module title	Modelling and Exploration of Multivariate Data
Code	D3
Degree Programme	Master of Science in Life Sciences
Workload	3 ECTS (90 student working hours) <ul style="list-style-type: none"> - Lessons contact (total 42 of which 28 central teaching): 32 h - Self-study: 58 h
Module Coordinator	<p>Name: Thomas Ott Phone: +41 (0)58 934 56 84 Email: thomas.ott@zhaw.ch Address: ZHAW Life Sciences und Facility Management, Einsiedlerstrasse 31a, 8820 Wädenswil</p>
Lecturers	<ul style="list-style-type: none"> • Thomas Ott, ZHAW • Guest lecturer(s)
Entry requirements	Attending the module “Handling and Visualizing Data” is required. Prior to the module, additional mandatory preparatory reading, exercises and other material will be distributed to facilitate student preparation for the module. Students are advised to start five weeks before the module with the required preparatory work; a self-test will be made available.
Learning outcomes and competences	<p>After completing the module, students will be able to:</p> <ul style="list-style-type: none"> • use multiple regression models to answer research questions, understand their advantage over univariate methods; fit these models with R and quantify the fit of the model, describe the limitations of precision and reliability of inferential results; test the model assumptions; apply counter measures in case of problems with model assumptions • use elementary nonparametric regression methods to estimate the shape of not necessarily linear regression curves, understand the advantages and limitations of such flexible methods and apply related tools • perform elementary model selection and understand associated problems; test hypotheses, construct confidence and prediction intervals • identify typical pitfalls and amend these problems • explore multivariate data by means of dimensionality reduction techniques • explore and describe the structure of multivariate data using clustering • explore and describe time series data on the basis of suitable visualisations and analysis methods, • interpret, visualise and communicate the results of the analyses, • understand typical statements in empirical research articles.
Module contents	<p>This module introduces <u>regression models</u> and <u>exploratory methods</u> for data analysis.</p> <p><u>Modelling part:</u></p> <ul style="list-style-type: none"> • Simple linear regression (including transformations) • Nonparametric regression (regression splines, local regression) and quantile regression • Multiple linear regression (including regression diagnostics)

- Model selection (linked to hypothesis tests and p values) and inference (especially confidence intervals, prediction intervals)
- Model diagnostics: assessment the validity of the model assumptions, reflect on the tools used to do this assessment
- Possible strengths and limitations of parametric models (link to the exploratory part)

Exploratory part:

- Basic plots to characterise and visually inspect multivariate data and time series data
- Dimensionality reduction techniques (principal component analysis, multi-dimensional scaling)
- Clustering methods (k-means clustering and related approaches, hierarchical clustering, evaluation methods)

Both parts:

- Interpretation and visualization of the results using suitable graphical representations of the data and the results (e.g. 3D scatter plots with regression surface or biplots)
- Scientific reporting of the results, backtranslation from statistical methods to answer the original research questions to the data

Teaching / learning methods

This module has the following structure:

Week	<1	1	2	3	4	5	6	7	>7
Central		8L		8L		8L		4L	
Local		2L	4L		4L		4L		
Self-study	10h	38h							10h

In the spring semester, the schedule may be slightly amended due to holidays.

In the weeks before module start, students are expected to do preparatory work to level prior knowledge. This consists of preparations for the statistical topics as well as a minor brush-up of the course software R. The workload is expected to be roughly 10 hours.

The students receive preparatory and/or follow-up self-study work for each course day. The self-study consists e.g. of preparatory reading/videos, follow up exercises, examining case studies, etc.

Central teaching is a blend of classical lectures with more interactive teaching approaches such as large group activation methods and small group exercise sessions. Each course day contains an exercise session in which students work on the exercises, can ask questions and get individual support.

Local teaching consists of students actively solving exercises together with the local coaches. These exercises are meant to deepen the understanding of the material, give

Master in Life Sciences

BFH, FHNW, HES-SO, ZFH

	an opportunity to practice, provide extensions etc. The main type of tasks will be case studies which illustrate and exemplify the application of the material from central teaching to real life data sets and real problems. Local coaching can be timed flexibly, subject to taking place between the central teaching slots.
Assessment of learning outcome	Final written individualised exam (open book, using individual laptop computers to run data analyses) (100%)
Format	7-weeks
Timing of the module	For ZHAW and FHNW: Autumn semester, CW 45-51 For BFH and HES-SO: Spring semester, CW 15-21
Venue	For ZHAW and FHNW: Olten For BFH and HES-SO: Fribourg
Bibliography	Material will be provided on Moodle.
Language	English
Links to other modules	This module builds on module D1 "Handling and Visualising Data" and complements the module D2 "Design and Analysis of Experiments".
Comments	Material treated during local teaching is relevant for the exam. Students have to make sure that an updated version of R is installed. Details will be communicated in advance.
Last Update	8.4.2019
